2006	L26	Perotin, Virginie. 2006. "Entry, Exit, and the Business Cycle: Are Cooperatives Different?" <i>Journal of Comparative Economics</i> , 34(2): 295-316. The paper revisits the question of why there are so few labor-managed firms in capitalist economies. Using new data on France, we present a comparative empirical examination of entry and exit among worker cooperatives and conventional firms. We estimate identical equations explaining annual entry and exit flows for the two groups of firms and test for the equality of the coefficients estimated. We find that cooperative creations are more countercyclical, but the effect of the business cycle on exit is the same for both groups of firms. Other factors influencing entry include organizational density and suggest that support structures are important for cooperative entrepreneurship.

"Employers' Flexibility and Employment Volatility: An Analysis of the U.S. Personnel Supply Industry, 1972-2000." <i>American Journal of Economics and Sociology</i> , 65(2): 347-82. Previous analyses of the strong secular growth in personnel supply employment have focused primarily on the relative impacts of demand and supply factors. This industry's dramatic growth has tended to mask its high degree of volatility, which may be more useful in understanding employers' motivations for hiring temporary employees. This article examines alternative explanations for the volatility of employment in the temporary supply industry from 1972 to 2000. Using a seemingly unrelated time-series estimator, we compare the volatility of temporary employment to that of regular full-time employment. We find that quarterly changes in temporary employment are more sensitive to the business cycle than regular full-time employment are and argue that temporary employment is likely to have a number of disadvantages as a reemployment strategy during a recession, since temporary employment typically declines during that time. Additionally, employment growth during this period is better explained by employers' efforts to achieve numerical rather than wage flexibility.

2006	N92	Garrett, Thomas A., and David C. Wheelock. 2006. "Why Did Income Growth Vary across States during the Great Depression?" <i>Journal of Economic History</i> , 66(2): 456-66. This note investigates the sources of variation in the growth of per capita personal incomes across U.S. states during the Great Depression. States entering the economic contraction with relatively low per capita incomes tended to suffer larger percentage declines in per capita income than did high income states. By contrast, low-income states tended to experience larger percentage gains during the recovery. Hence, state per capita incomes diverged during the contraction phase and converged during the recovery phase.
2006	N92	Fishback, Price V., William C. Horrace, and Shawn Kantor. 2006. "The Impact of New Deal Expenditures on Mobility during the Great Depression." <i>Explorations in Economic History</i> , 43(2): 179-222. Using county-level data on federal New Deal expenditures on public works and relief and Agricultural Adjustment Administration payments to farmers, this paper empirically examines the New Deal's impact on inter-county migration from 1930 to 1940. We construct a net-migration measure for each county as the difference between the Census's reported population change from 1930 to 1940 and the natural increase in population (births minus infant deaths minus non-infant deaths) over the same period. Our empirical approach accounts for both the simultaneity between New Deal allocations and migration and the geographic spillovers that likely resulted when economic activity in one county may have affected the migration decisions of people in neighboring counties. We find that greater spending on relief and public works was associated with significant migration into counties where such money was allocated. The introduction of our modern farm programs under the aegis of the Agricultural Adjustment Administration appears to have contributed to a net out-migration that sped the transition of people out of farming.

National Bureau of Economic Research, Inc, NBER Working Papers: 12287. Recent years witnessed a flourishing of literature on the implication of shifts from home-production to market production on the macro economy, and in particular, the real business cycle. This literature employs calibration techniques to emulate the fluctuations in market output, labor and capital inputs and productivity over the business cycle, assuming a representative consumer and using stylized parameters of the substitution elasticity between home and market goods, and of the home production function. This paper argues that the parameters used in this literature cannot be verified empirically because of econometric identification problems. Furthermore, using data from the late 90s from transition Russia, it is argued that one cannot capture the fluctuation between the home and the market by using a representative consumer, since there is a distinct difference between males and females in their reaction to loss of employment: men shift most of the time released from market work to leisure while women divide it almost equally between work at home and leisure. Finally it is shown that the switch from a controlled economy to a market economy resulted in significant increase in home productivity and an increase in the free time enjoyed by both Russian men and women.
2006	Q40	Denni, Mario, and G. Frewer. 2006. <i>New evidence on the relationship between crude oil and petroleum product prices</i> . Department of Economics - University Roma Tre, Departmental Working Papers of Economics - University Roma Tre: 0061. The present study aims at providing new evidence on the price relationships between crude oil and petroleum products. We employ single-equation error correction models (ECM) in which both changes in crude oil price and deviations from the long-run equilibrium are used to explain product price dynamics. A GARCH structure is applied to models' residuals to account for the time-varying volatility. Our key piece of innovation is the introduction of refining margin effects to the analysis of the asymmetric products price movements. Results suggest that the overall balance in the refinery sector plays an important part in the adjustment to crude price shocks.

2007	B16	Maddison, Angus. 2007. "Fluctuations in the Momentum of Growth within the Capitalist Epoch." <i>Cliometrica</i> , 1(2): 145-75. This paper reviews the history of cyclical and long wave analysis and examines the evidence on changes in the momentum of economic growth in 16 advanced capitalist countries from 1820 to 2001. It assesses the work of the main Business Cycle Research Institutes in Western Europe the USA and Russia, as well as that of Kondratieff, Kuznets, Schumpeter, Abramovitz and the long-wave revivalists--Rostow, Mandel and Mensch. It concludes that the existence of regular long-term rhythms in capitalist development is not proven, but distinguishes major changes in the momentum of growth due to disturbances of an ad hoc character. The role of system shocks and historical accidents is important but the role of policy error and success is also emphasised. It identifies five major phases of capitalist development since 1820.

Perception of the business cycle can differ among firms, which has been confirmed by extensive survey data. The question we want to answer in this paper is "What causes differences in business cycle perception?" by utilizing a newly designed questionnaire. Specifically, we match properties emphasizing the absolute level of economic activities or the direction of their changes and indicators of a firm's managerial and financial conditions, and examine the relationship between them. Based on our results, we could not find a particular indicator for the properties of firms that indicate level or trend change. However, a higher level of capital or number of employees suggests a tendency to emphasize change or rate of change, rather than the level of the business survey index. With regards to the time horizon of the business cycle, profit ratios (profit against sales or total assets) in general are good indicators. Firms with a high debt ratio tend to be myopic. Regression analysis shows that firms with high rates of investment/sales significantly tend to have a long-term vision.

2007	F55	Walsh, James Igoe. 2007. "How and Why Britain Might Join the Single Currency: The Role of Policy Failure." <i>Review of International Political Economy</i>, 14(5): 868-92. Why has Britain declined to adopt the single currency? The conventional view holds that there are multiple political and economic barriers to British entry into monetary union—large fractions of public opinion, business leaders, and the Conservative party oppose entry; Britain's economic cycle is not synchronized with that of the euro-zone; adoption of the single currency would harm foreign trade and investment; British political institutions make it difficult to muster support for such a move, and so on. I argue that policy failure is a more important influence on British economic policy. Major changes occur when extant policy fails and there exists an alternative policy idea that both explains this failure persuasively and prescribes a new and more effective way forward. A British government might advocate euro membership if the current framework for policy in Britain—central bank independence with a floating exchange rate—fails, and policies pursued by the European Central Bank address the source of this failure. This combination would also lead many politicians, business leaders, and voters to see the advantages of euro membership.
2007	F59	Conesa, Juan Carlos, Timothy J. Kehoe, and Kim J. Ruhl. 2007. <i>Modeling Great Depressions: The Depression in Finland in the 1990s</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 13591. This paper is a primer on the great depressions methodology developed by Cole and Ohanian (1999, 2007) and Kehoe and Prescott (2002, 2007). We use growth accounting and simple dynamic general equilibrium models to study the depression that occurred in Finland in the early 1990s. We find that the sharp drop in real GDP over the period 1990-93 was driven by a combination of a drop in total factor productivity (TFP) during 1990-92 and of increases in taxes on labor and consumption and increases in government consumption during 1989-94, which drove down hours worked in Finland. We attempt to endogenize the drop in TFP in variants of the model with an investment sector and with terms-of-trade shocks but are unsuccessful.
2007	H42	Bosi, Stefano, and Carine Nourry. 2007. "Growth and Fluctuations: The Role of Public Dividends and Public Spending." <i>Journal of Mathematical Economics</i>, 43(3-4): 420-45. In this paper, we consider a discrete-time version of the endogenous growth model developed by Barro [Barro, R. J., 1990. Government spending in a simple model of endogenous growth. <i>Journal of Political Economy</i> 98, 103-125], but augmented in order to envisage a public participation in the production of private goods. Public dividends are invested in order to provide a public good; in turn, the public good plays a role of indispensable production externality and, eventually, of growth engine. For what concerns the production of private goods, we find that an optimal policy is always based on a positive participation of the government as shareholder; also, when growth is slow, a public intervention or large substitution effects stabilize the economy. A right mix of short-run services and long-run infrastructures is suggested in slow economies to rule out expectation-driven fluctuations. Infrastructures are mainly recommended in presence of moderate income effects, while services are recommended in presence of strong income effects.
2007	H51	Atella, Vincenzo, and Giorgia Marini. 2007. "Is Health Care Expenditure Really a Luxury Good? Re-assessment and New Evidence Based on OECD Data." <i>Rivista di Politica Economica</i>, 97(3-4): 87-119. The aim of the paper is to present new evidence on the relationship between income and health expenditure allowing for (i) substitution and complementary relationships between private and public health expenditure, (ii) presence of structural breaks in the dependent variables, and (iii) presence of heterogeneous institutional setting (country-specific health systems). Our results show that income elasticity is quite sensitive to the inclusion of technology variables and to health system heterogeneity, that complementary and substitution relationships play an important role in determining public and private health expenditure and, finally, that public and private health expenditures are both related with a cyclical indicator of economic activity.

2007	I23 R58	Hill, Edward W. (Ned), and Iryna Lendel. 2007. "The Impact of the Reputation of Bio-life Science and Engineering Doctoral Programs on Regional Economic Development." <i>Economic Development Quarterly</i>, 21(3): 223-43. Retrospective data on the academic reputation of PhD programs in the biological and life sciences and engineering are used in regression models to measure the influence of academic quality on the growth in employment and in per capita income for metropolitan areas in the United States over the two parts of the recently completed business cycle (1994 to 2000 and 2001 to 2003). The quality of doctoral research programs in science and technology fields was positively associated with growth rates in employment and per capita income in metropolitan areas during the expansion phase of the business cycle. Regions with quality science and technology doctoral programs experienced declines in employment growth rates following the recession. There was an inverse relationship between academic quality and per capita income following the recession, indicating that regional earnings bubbles built up during the expansion. Strong path dependencies are exhibited in the models.

Year	DE	Title and Abstract
		investments, generating maturity mismatches and leading potentially to liquidity crises. The frequency of liquidity crises ("abnormal" volatility) and the volatility of growth ("normal" volatility) are found to have independent negative effects on growth. Financial development however dampens the growth cost of volatility, but only in the case of normal volatility. The growth cost of volatility therefore depends critically on the composition of normal and abnormal volatility, the latter being more costly for growth.
2007	K31 L88	de Graaf-Zijl, Marloes, and Ernest E. Berkhout. 2007. "Temporary Agency Work and the Business Cycle." <i>International Journal of Manpower</i> , 28(7): 539-56. The purpose of this paper is to test the relationship between gross domestic product (GDP) and agency work. The paper develops a theoretical model for the time interdependence of GDP, agency work and regular employment and tested model predictions using a VAR model. Results show that on the macro level temporary agency work leads GDP development. Temporary agency work is an excellent instrument for employers to adjust the size of their workforce to fluctuations in product demand. Temporary work agencies, however, have a tough job finding qualified personnel in tight labour markets because workers generally prefer the security of a permanent contract. It is shown in this paper that, as a result of these two countervailing forces, the number of hours worked through temporary work agencies precedes GDP development. Agency work increases in the last phase of a recession after regular workers have been dismissed. It expands further, in line with GDP, when the trough is passed until agency worker's labour supply stagnates. This leads to a decrease in agency hours even before the business cycle reaches its peak. Then agency work declines further, in line with GDP, until regular workers are dismissed and the cycle start again. Temporary work arrangements have become a key area of interest for firms, academics and policy makers. This paper shows how the use of these work arrangement fluctuates over time. Also, this paper shows that agency work can be used in predicting future GDP development.
2007	L31 Z12	Gruber, Jonathan, and Daniel M. Hungerman. 2007. "Faith-Based Charity and Crowd-Out during the Great Depression." <i>Journal of Public Economics</i> , 91(5-6): 1043-69. Interest in religious organizations as providers of social services has increased dramatically in recent years. Churches in the U.S. were a crucial provider of social services through the early part of the twentieth century, but their role shrank dramatically with the expansion in government spending under the New Deal. In this paper, we investigate the extent to which the New Deal crowded-out church charitable spending in the 1930s. We do so using a new nationwide data set of charitable spending for six large Christian denominations, matched to data on local New Deal spending. We instrument for New Deal spending using measures of the political strength of a state's congressional delegation, and confirm our findings using a different instrument based on institutional constraints on state relief spending. With both instruments we find that higher government spending leads to lower church charitable activity. Crowd-out was small as a share of total New Deal spending (3%), but large as a share of church spending: our estimates suggest that benevolent church spending fell by 30% in response to the New Deal, and that government relief spending can explain virtually all of the decline in charitable church activity observed between 1933 and 1939.
2007	L31	Irvin, Renee A. 2007. "Endowments: Stable Largesse or Distortion of the Polity?" <i>Public Administration Review</i> , 67(3): 445-57. As ever more private resources are held in foundations and nonprofit organizations' endowment funds, more scholars and practitioners are demanding that these assets be put to good use immediately. Those favoring the preservation of capital--primarily representing private foundations--sound unnecessarily cautious. This article examines endowment conservation from a variety of critical angles, finding strong rationales for both conserving and liquidating endowments. Policy responses to the buildup of endowment assets include requiring a faster payout or regulating the amount and type of administrative expenses included in annual payout. This article reviews the relationship of the business cycle and wealth distribution to annual giving. The most prudent course, in view of the cyclical nature of giving as well as the substantial generational wealth currently held by elders, appears to be to conserve significant assets now in order to establish a stable flow of future social benefits.
2007	L64	CV: Liu, Christina Y., Wei-Chiao Huang, and Chia-Wei Wang. 2007. "Cyclical Employment Changes in Taiwanese Industry." In <i>The Labour Market and Economic Development of Taiwan</i> , ed. Joseph S. Lee, 107-29. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2007	L64	Chou, Win Lin, Joshua J. S. Gau, and Kuo-Yuan Liang. 2007. "Industrial Business Cycle Linkages between Taiwan and the United States: Evidence from the IT Industry." <i>Journal of Asian Economics</i> , 18(3): 439-47. This paper uses a two-country model to investigate the international business cycle linkage in the information technology (IT) industry between Taiwan and the United States. Using panel Lagrange Multiplier unit root and panel cointegration analysis, we find that Taiwan's IT output is predominantly determined by supply-side factors such as the supply of IT parts from the United States. Our findings provide new insights in understanding the international business cycle linkage at the industrial level.
2007	L88	THE SAME AS K31 de Graaf-Zijl, Marloes, and Ernest E. Berkhout. 2007. "Temporary Agency Work and the Business Cycle." <i>International Journal of Manpower</i> , 28(7): 539-56.
2007	N37	Sheldon, Peter. 2007. "State-Level Basic Wages in Australia during the Depression, 1929-35: Institutions and Politics over Markets." <i>Australian Economic History Review</i> , 47(3): 249-77. State wage-fixation tribunals developed quite particular patterns of basic wage fixation during the Depression. They declined to follow the Commonwealth Court's 10 per cent wage cut, thereby confining its effect to about half the workforce and creating distinctly different State and Commonwealth basic wage patterns in each capital city. Further, tribunals' uneven patterns of basic wage adjustment to deflation meant that in some states, the real State basic wage increased. Patterns of state institutional behaviour and state politics therefore help explain the stickiness of real average wage levels during the Depression.
2007	N91	Healey, Richard G. 2007. <i>The Pennsylvania Anthracite Coal Industry 1860-1902: Economic Cycles, Business Decision-Making and Regional Dynamics</i> , Scranton and London: University of Scranton Press; distributed by University of Chicago Press. Provides a comprehensive examination of the role of economic and geographical factors in the development of the Pennsylvania anthracite coal industry during the latter part of the nineteenth century. Discusses recurrent and nonrecurrent economic fluctuations at the national level; constraints on business decision making--the impact of geology, topography, and mining technology; prior investment in mining and transportation infrastructure; railroad expansion and corporate control--network development strategies and the articulation of the anthracite distribution region in interior markets; tidewater markets, trunk line connections, and comparative economic performance; waxing and waning markets--sectoral shifts in the use of anthracite; the changing geography of market power; regional shifts, price behavior, and the changing size composition of anthracite production; corporations, competition, and the rise of the cartels--precursors and predisposing factors to industrywide combination; the 1873 combination and its successors; developing and managing the coal estate; region building--financing development in the mining economy; investment in new mining and railroad capacity; regional retrenchment--rationalization and reorganization in the Schuylkill region, 1872-1902; and regional dynamics, disequilibrium tendencies, and regional economic development. Healey is in the Department of Geography at the University of Portsmouth. Bibliography; index.

Year	DE	Title and Abstract
		indebtedness, economic stagnation and high unemployment to sustainable growth. The presence of a national development strategy seems to be the crucial institutional tool that allowed this transition.
2007	R58	Cadoret, Isabelle, and Christophe Tavera. 2007. "The Sources of Decentralised Output Fluctuations in France." <i>Papers in Regional Science</i> , 86(2): 309-20. This paper examines the sources of disturbances to short-term and long-term output variations in the French regions. We use an error-components model that decomposes decentralised output movements into common national, industry-specific, region-specific, and idiosyncratic effects. We find that industry-specific disturbances account for the major part of the variance of the systematic component of decentralised output fluctuations. Moreover, decentralised regional policy strategies that do not target specific sectors within the region only have a very limited impact on both short-term and long-term sectoral output variations.
2007	R58	THE SAME AS I23 Hill, Edward W. (Ned), and Iryna Lendel. 2007. "The Impact of the Reputation of Bio-life Science and Engineering Doctoral Programs on Regional Economic Development." <i>Economic Development Quarterly</i> , 21(3): 223-43
2007	R58	Gabe, Todd M. 2007. "Local Economic Instability and Business Location: The Case of Maine." <i>Land Economics</i> , 83(3): 398-411. This paper investigates the effects of local economic instability on business location in Maine. Instability is represented by the quarterly, six-month, and annual persistence of employment in Maine municipalities, and seasonal spikes in local employment. Regression results suggest that businesses are attracted to areas with high short-term and seasonal stability, but that annual fluctuations in local employment are not a significant deterrent to new business activity. Services businesses are particularly sensitive to local employment fluctuations, presumably because they are often highly integrated into the economy. Findings suggest that policymakers can jointly pursue the objectives of local economic growth and stability.
2007	Z12	Feldmann, Horst. 2007. "Protestantism, Labor Force Participation, and Employment across Countries." <i>American Journal of Economics and Sociology</i> , 66(4): 795-816. Using data from 80 countries, this article analyzes whether Protestant religion affects labor market outcomes. Controlling for the impact of labor market regulations, business regulations, the tax burden, the business cycle, the level of economic development, demographic and geographical conditions, wars, and the transition from planned to market economy as well as unobserved country and year effects, we find that countries in which the largest portion of the population practices Protestant religion have substantially higher labor force participation and employment rates, particularly among women. We obtain the same result for a subgroup of 19 industrial countries for which we have better data to control for the impact of labor market institutions and business cycle fluctuations.

2008	C02	Flaschel, Peter, and Michael Landesmann, eds. 2008. <i>Mathematical Economics and the Dynamics of Capitalism: Goodwin's Legacy Continued</i> , Routledge Frontiers of Political Economy. London and New York: Taylor and Francis, Routledge. Fourteen papers explore the macroeconomic, structural, and microeconomic contributions of Richard Goodwin to the field of economics. Papers discuss coexistence of multiple business cycles in Goodwin's 1951 model; an encompassing theory of macroeconomic growth and fluctuation; Kaleckian investment and employment cycles in postwar industrialized economies; a Goodwin cycle with changing regimes of industrial relations; varieties of capitalism--the flexicurity model; Goodwin cycles and the U.S. economy, 1948-2004; the classical growth cycle after fifteen years of new observations; debt-equity cycles in the twentieth century--empirical evidence and a dynamic Keynesian model; monetary policy rules in small open economies--a Keynesian perspective; semistructural Keynes-Goodwin modeling--elaboration and calibration of a baseline theoretical framework; decomposition methods for analyzing intraregional and interregional income distribution; computational explorations of vertically coupled markets; microfounded animal spirits and Goodwinian income distribution dynamics; and Goodwin's structural economic dynamics in the context of globalization.
2008	C31	Holly, Sean, and Ivan Petrella. 2008. <i>Factor demand linkages and the business cycle: Interpreting aggregate fluctuations as sectoral fluctuations</i> . Faculty of Economics, University of Cambridge, Cambridge Working Papers in Economics. This paper investigates the drivers of industry and aggregate fluctuations. We model the dynamics of a panel of highly disaggregated manufacturing sectors. This allows us to consider directly the linkages between sectors typical of any production system, in a framework where the sectors are fully heterogeneous. We establish that these features are fundamental for the propagation of the shocks in the aggregate economy. Aggregate fluctuations can be accounted for by small industry specific shocks. Moreover, a contemporaneous technology shock to all sectors in the economy, i.e. an aggregate technology shock, implies a positive response in both output and hours at the aggregate level. When this intersectoral channel is neglected we find a negative correlation as with much of the literature. This suggests that the standard technology driven Real Business Cycle paradigm is a reasonable approximation of a more complicated model featuring heterogeneously interconnected sectors.
2008	D85	Kichiji, Nozomi, and Makoto Nishibe. 2008. "Network Analyses of the Circulation Flow of Community Currency." <i>Evolutionary and Institutional Economics Review</i> , 4(2): 267-300. The Japanese economy is emerging from a long-term recession following the bubble and is in the economic recovery phase. However, problems stemming from the widening economic disparity and the decline of local economy have risen. The local economy received a heavy blow from the reduction in public investment because of public sector reform combined with depopulation and aging. Under these circumstances, community currency attracts much attention as a tool that can simultaneously solve the twin problems of the decline of the local economy and the decay of the community. However, little research and few studies have been conducted to quantify the extent to which community currency revitalizes the local economy. We participated in the Tomamae-cho community currency experiment and investigated its circulation flow. This paper highlights the circulation flow of community currency using several network analyses. The following results are presented: (1) various distributions of the networks obey a power-law distribution; (2) the networks display the characteristics of a "Small World" similar to those of organisms, (3) directional and weighted network analyses are important; and (4) the double triangle system is effective due to its complementarity effect because commercial transactions facilitate circulation flow of community currency for non-commercial transactions, and non-commercial transactions expand commercial transactions in the local economy.
2008	F52	Lee, Cheng-Te, and Yo-Yi Huang. 2008. "Military Threats, Defense Resources, and Labor Adjustment. (In Chinese. With English summary.)" <i>Journal of Economics and Management</i> , 4(1): 1-24. We observe that the period between Cold War era and the event of 911, variation in foreign military threats leads to variation in defense resources and fluctuations in the labor market. Using an intertemporal optimization dynamic model, this paper explores the impacts of foreign military threats on the civilian consumption sector and on labor allocation. We show that an increase in foreign military threats could lead to a migration of labor from the civilian sector to the defense sector.
2008	F53	Camacho, Maximo, Gabriel Perez-Quiros, and Lorena Saiz. 2008. "Do European Business Cycles Look Like One?" <i>Journal of Economic Dynamics and Control</i> , 32(7): 2165-90. This paper provides a comprehensive framework to analyze business cycle

Year	DE	Title and Abstract
		features other than synchronization. We use stationary bootstrap and model-based clustering methods to analyze similarities and differences among the European cycles. We find evidence that the length, deep and shape of cycles differ across European countries and that these differences are not decreasing over time. Finally, even though we find some correlation between business cycle synchronization and characteristics, there is important information in the characteristics that is not captured by the synchronization measures.
2008	G17	Truck, Stefan. 2008. "Forecasting Credit Migration Matrices with Business Cycle Effects--A Model Comparison." <i>European Journal of Finance</i>, 14(5-6): 359-79. Migration matrices are considered a major determinant for credit risk management. They are widely used for credit value-at-risk determination, portfolio management or derivative pricing. It is well known that migration matrices show strong variations and cyclical behavior through time. We compare a factor model approach and numerical adjustment methods for estimation and forecasting of conditional migration matrices. Our findings show that the methods may lead to quite different forecasting results. Although the numerical adjustment methods fail to outperform the naive approach of taking previous year's migration matrix as an estimator, the one-factor model provides significantly better in-sample and out-of-sample results. Additionally, on the basis of a chosen risk-sensitive goodness-of-fit criteria, we are able to interpret the results in terms of risk.
2008	I10	Sarferaz, Samad. 2008. <i>The Influence of the Business Cycle on Mortality</i>. Sonderforschungsbereich 649, Humboldt University, Berlin, Germany, SFB 649 Discussion Papers: SFB649DP2008-059 We analyze the impact of short-run economic fluctuations on age-specific mortality using Bayesian time series econometrics and contribute to the debate on the procyclicality of mortality. For the first time, we examine the differing consequences of economic changes for all individual age classes. We employ a recently developed model to set up structural VARs of a latent mortality variable and of unemployment and GDP growth as main business cycle indicators. We find that young adults noticeably differ from the rest of the population. They exhibit increased mortality in a recession, whereas most of the other age classes between childhood and old age react with lower mortality to increased unemployment or decreased GDP growth. In order to avoid that opposed effects may cancel each other, our findings suggest to differentiate closely between particular age classes, especially in the age range of young adults. The results for the U.S. in the period 1956-2004 are confirmed by an international comparison with France and Japan. Long-term changes in the relationship between macroeconomic conditions and mortality are investigated with data since 1933.
2008	K34	D'Amuri, Francesco, and Maria Rosaria Marino. 2008. "La detassazione del lavoro straordinario in Italia: Prime Valutazioni. (The Reduction of Overtime Income Taxation in Italy: A Preliminary Assessment. (With English summary)." <i>Politica Economica</i> , 24(2): 159-79. This article provides a preliminary assessment of the Law n. 126/2008, lowering taxes on overtime income in Italy. The tax reduction will positively affect workers with high labour market attachment and with relatively high marginal income tax rates, providing an incentive to work extra hours. Employment effects of the reform are expected to be limited, in particular in the long run. The tax reduction will have negligible redistributive effects, while it will lower the horizontal equity of the Italian Personal Income Tax. Given the procyclicality of overtime worked hours, the impact of business cycle on workers' disposable income will increase. Tax administration costs are expected to rise in order to limit the possibility to avoid taxes reducing the standard worked hours and increasing the overtime ones.
2008	L72	Swaray, Raymond. 2008. "Macroeconomic Determinants of Non-fuel Primary Commodity Price Movements." <i>Journal of Applied Business Research</i>, 24(1): 11-16. This paper uses cointegration and error correction modelling techniques to examine the relationship between non-fuel commodity prices and world macroeconomic and monetary variables. The results show that fluctuations in industrial production of OECD countries, real effective exchange rate of the U.S. dollar and oil prices have significant short- and long- run impact on non-fuel commodity prices. In addition, there is evidence of highly significant positive correlation between the index of non-fuel commodity prices and crude oil price. This implies non-fuel commodity-dependent developing countries that are net importers of oil can derive little benefit from upward movements in commodity prices.
2008	L72	Caballero, Ricardo J., and Stavros Panageas. 2008. "Hedging Sudden Stops and Precautionary Contractions." <i>Journal of Development Economics</i>, 85(1-2): 28-57. Even well-managed emerging market economies are exposed to significant external risk, the bulk of which is financial. At a moment's notice, these economies may be required to reverse the capital inflows that have supported the preceding boom. While capital flows crises are sudden nonlinear events (sudden stops), their likelihood fluctuates over time. The question we address in the paper is how should a country react to these fluctuations. Depending on the hedging possibilities the country faces, the options range from pure self-insurance to hedging the sudden stop jump itself. In between, there is the more likely possibility to hedge the smoother fluctuations in the likelihood of sudden stops. The main contribution of the paper is to provide an analytically and empirically tractable model that allows us to characterize and quantify optimal contingent liability management in a variety of scenarios. We show, with a concrete example, that the gains from contingent liability management can easily exceed the equivalent of cutting a country's external liabilities by 10% of GDP.
2008	M12	Eisfeldt, Andrea L., and Adriano A. Rampini. 2008. "Managerial Incentives, Capital Reallocation, and the Business Cycle." <i>Journal of Financial Economics</i>, 87(1): 177-99. We argue that when managers have private information about the productivity of assets under their control and receive private benefits, substantial bonuses are required to induce less productive managers to declare that capital should be reallocated. The need to provide incentives for managers to relinquish control links executive compensation to capital reallocation and managerial turnover over the business cycle, rendering them procyclical if expected managerial compensation increases when more managers are hired. Moreover, capital is less productively deployed in downturns because agency costs make reallocation more costly. Empirically, we find that both CEO turnover and executive compensation are remarkably procyclical.
2008	M16	Wan, William P., Daphne W. Yiu, Robert E. Hoskisson, and Heechun Kim. 2008. "The Performance Implications of Relationship Banking during Macroeconomic Expansion and Contraction: A Study of Japanese Banks' Social Relationships and Overseas Expansion." <i>Journal of International Business Studies</i>, 39(3): 406-27. We propose a social perspective emphasizing the opportunities and constraints of bank-firm relationships to understand the determinants of relationship banks' performance, using Japanese banks to test our theory. Using social exchange and role theories, we found banks that have strong social relationships performed differently during Japan's macroeconomic expansion and contraction cycles. However, our results indicate that social exchange and role relationships are context-specific: banks benefited from internationalization during a domestic macroeconomic expansion as a result of their home-country social relationships, but they were less constrained by the same social relationships in their international operations during a domestic macroeconomic contraction.

2008	Q42	Cognigni, Alessandro, and Matteo Manera. 2008. "Oil Prices, Inflation and Interest Rates in a Structural Cointegrated VAR Model for the G-7 Countries." <i>Energy Economics</i>, 30(3): 856-88. Sharp increases in the price of oil are generally seen as a major contributor to business cycle asymmetries. Moreover, the very recent highs registered in the world oil market are causing concern about possible slowdowns in the economic performance of the most developed countries. In this paper, a structural cointegrated VAR model has been considered for the G-7 countries in order to study the direct effects of oil price shocks on output and prices, and the reaction of monetary variables to external shocks. Our results can be summarized as follows: i) a stationary money demand, as suggested by the classic theory of money, can be identified for most countries; ii) according to the estimated coefficients of the structural part of the model, for all countries except Japan and U.K. the null hypothesis of an influence of oil prices on the inflation rate cannot be rejected. Inflation rate shocks are transmitted to the real economy by increasing interest rates; iii) impulse response analysis suggests, for most countries, the existence of an instantaneous, temporary effect of oil price innovations on prices; iv) impulse response functions indicate different monetary policy reactions to inflationary and growth shocks; v) the simulation exercises directed to estimate the total impact of the 1990 oil price shock indicate that for some countries (U.S.) a significant part of the effects of the oil price shock is due to the monetary policy reaction function. For other countries (Canada, France and Italy), however, the total impact is offset, at least in part, by an easing of monetary conditions.
2009		
2009	D03	McDonald, Ian M. 2009. "The Global Financial Crisis and Behavioural Economics." <i>Economic Papers</i>, 28(3): 249-54. Conventional economics, which is based on Homo economicus, cannot provide a satisfactory explanation for the global financial crisis. However, behavioural economics, and the concept of present bias, self-serving bias, 'new era' stories, money illusion, comparisons with reference levels and herding, can provide an explanation.
2009	D03	Klodt, Henning. 2009. "Sozialpsychologische Fallstricke und die Finanzkrise. (Socio-psychological Pitfalls and the Financial Crisis. With English summary.)" <i>Wirtschaftspolitische Blätter</i>, 56(3): 367-75. Traditional economic theory has tried to explain speculative bubbles as the result of rational economic behavior--and has failed. This calls for the integration of socio-psychological patterns, which allow capturing irrational behavior in economic analyses. The paper suggests four fundamental psychological pitfalls derived from the theory of cognitive dissonance, which might be at the roots of the present financial crisis and which should better not be ignored by monetary policy makers.
2009	D73	CV: Aidt, Toke S., and Jayasri Dutta. 2009. "A Theory of the Corrupt Keynesian." In <i>New and Enduring Themes in Development Economics</i> , ed. Bhaskar Dutta, Tridip Ray and E. Somanathan, 93-111. Statistical Science and Interdisciplinary Research series, vol. 5. Hackensack, N.J. and Singapore: World Scientific.
2009	D86	Tambovtsev, V. 2009. "The Financial Crisis and Economic Theory." <i>Problems of Economic Transition</i>, 52(4): 42-48. Treating money as contracts in the process of execution, or "under-executed contracts," the article describes its properties as an economic good. It is shown that money is a private good with valuable externalities, that is, a legitimate good. Based on this, the article concludes the need for state regulation of financial markets oriented toward minimizing negative externalities by restricting the use of the riskiest contracts.
2009	D86	Tonkiss, Fran. 2009. "Trust, Confidence and Economic Crisis." <i>Intereconomics/Review of European Economic Policy</i>, 44(4): 196-202. This article explores the role of trust and confidence in economic life, and their relevance to the current financial crisis. It outlines a recent history of research and debate on the relationship between social trust and economic prosperity, before introducing more recent data on trust against the backdrop of the financial downturn. It goes on to distinguish the informal and social bases of trust from three key formal mechanisms of economic confidence (information, contract, regulation), linking this distinction to Akerlof and Shiller's revival of Keynes' discussion of the "animal spirits" that animate economic behaviour. Finally the policy dimensions are considered.
2009	E16	Kaupilla, Jari. 2009. "Quantifying the Relative Importance of Export Industries in a Small Open Economy during the Great Depression of the 1930s: An Input-Output Approach." <i>Cliometrica</i>, 3(3): 245-73. This paper provides a quantification of the relative importance of export industries in a small open economy using new data provided by input-output tables describing the Finnish economy in 1928. The Finnish analysis of the Great Depression of the 1930s has been particularly focused on the importance of foreign trade. Despite the lack of quantified evidence, it is commonly accepted that the export industries had a major role in the economic development. The basic input-output framework is extended into a production-consumption model to produce a more elaborate model that provides a quantification of changes in final demand of some key industries in the economy. Results suggest that even though the role of export industries was dominant, domestic market industries and private consumption also had a significant role in the depression.
2009	E59	Abberger, Klaus, Wolfgang Nierhaus, and Shynar Shaikh. 2009. <i>Findings of the Signal Approach for Financial Monitoring in Kazakhstan</i>. CESifo Group Munich, CESifo Working Paper Series: CESifo Working Paper No. 2774. This study concentrates on the signal approach for Kazakhstan. It focuses on the properties of individual indicators prior to observed currency crises. The indicators are used to build composite indicators. An advanced approach uses principal components analysis for the construction of composite indicators. Furthermore, the common signal approach is improved by robust statistical methods. The estimation period reaches from 1997 to 2007. It is shown that most of the composite indicators are able to flag the reported crises at an early stage. In a second step it is checked whether the most recent crisis in 2009 is signalled in advance.
2009	F18	Garcia Andres, Gonzalo. 2009. "Apuntes para una teoria post-crisis de la intervencion publica en el sistema financiero. (With English summary.)" <i>Papeles de Economia Espanola</i>, 0(122): 180-92. The financial crisis has established the beginning of a new trend of change and intensification of public intervention in the financial system. It has become necessary to work towards ensuring the success of the major current reform considering the difficult challenge of making the most of the potential welfare generation of an open market-based financial system. Thoughts concerning the financial system and its relation with real economy in this article commence with the proposal of a new theoretical framework, as an alternative to that of financial markets' efficiency. At the same time, the fundamental issues to be applied by the new regulatory system are stated, considering the market failures that should

Year	DE	Title and Abstract
		be dealt with. We end, finally, in some of the challenges of the correct application of the regulation and treatment of systemic entities.
2009	F54	Ponczek, Vladimir, and Enlison Mattos. 2009. "Institutions and Economic Volatility: Democracy versus Risk of Expropriation." <i>Journal of Economic Studies</i> , 36(2): 184-94. The purpose of this paper is to decompose the effects of democracy and risk of expropriation on economic volatility. The authors follow Acemoglu et al. (2001, 2003) and use settler mortality in former colonies in the seventeenth, eighteenth and nineteenth centuries as an instrument of "risk of expropriation," in addition to a democracy index to capture institutional effects on economic stability. The authors present empirical evidence that the economic performance of more centralized former European colonies is not more volatile than that of democratic ones, once the exogenous variation of expropriation risk across countries is included in the model.
2009	F62	Bandoi, Anca, Dorel Berceanu, and Dana Danculescu. 2009. "Price Stability and Financial Stability in the Context of EUROSISTAM's Monetary Policy." <i>European Research Studies</i> , 12(4): 19-36. : In this article we propose to review some aspects of the relationship between price stability and financial stability in the current economic context. It is acknowledged that monetary policy of the EUROSISTAM still has as the main objective price stability, this being one of the most important ways of supporting sustainable economic growth. Although there are many theoretical approaches of the price stability concept all converging towards the idea of measuring and control of permanent inflation. Financial stability can be seen in the broad sense as the situation in which the financial system may ensure the efficient allocation of savings to investment opportunities and may face the shock without major disruptions. Viewed from this perspective the increased complementarity between price stability and financial stability is associated with economic globalization and, in particular, eliminating impediments to the free movement of capital flows. On the other hand the financial stability may be defined as a situation characterized by the absence of banking crises and by the existence of a certain level of price stability of the assets, including interest rates.
2009	H52	CV: Carranza, Luis, Jorge F. Chavez, and Jose Valderrama. 2009. "Success in Sustainability? The Case of Peru." In <i>Who Decides the Budget? A Political Economy Analysis of the Budget Process in Latin America</i> , ed. Mark Hallerberg, Carlos Scartascini and Ernesto Stein, 191-224. Washington, D.C.: Inter-American Development Bank; Cambridge: Harvard University, David Rockefeller Center for Latin American Studies; distributed by Harvard University Press.
2009	H57	Evenett, Simon J. 2009. "The Devil Is in the Details: The Implementation of Stimulus Packages and Their Effects on International Commerce." <i>Aussenwirtschaft</i> , 64(2): 111-37. Counter-cyclical fiscal policy has been an important tool used by governments during the past 12 months. The purpose of this paper is to consider the trade- and investment-related implications of such stimulus packages, in particular in the light of some high profile attempts to restrict additional government spending to purchases of domestically-produced goods. Necessarily our assessment is a tentative one, after all the downturn is not over and only a fraction of the outlays appropriated in many stimulus packages have been spent. Still, important preliminary findings concerning the potential for discrimination in the design and implementation of stimulus packages can be discerned and their implications for the design of government procurement provisions in trade agreements is discussed.
2009	K21	Lowe, Philip. 2009. "Competition Policy and the Economic Crisis." <i>Competition Policy International</i> , 5(2): 3-24. The Commission stands firm on the importance of maintaining the competition rules and a policy of robust competition policy enforcement. I propose to discuss in this article first why we believe that competition policy is one of the tools we need to deploy to help maintain the integrity of the EU single market and to help our economies out of the crisis, and then to examine, concretely, how the crisis has affected and is affecting our approach to enforcing the EC State aid rules, as well as the EC antitrust and merger control rules.
2009	K21	Wilks, Stephen. 2009. "The Impact of the Recession on Competition Policy: Amending the Economic Constitution?" <i>International Journal of the Economics of Business</i> , 16(3): 269-88. The strengths of the European competition regime are outlined before identifying challenges presented by the financial crisis. The argument moves from enforcement to systemic threats to the credibility of the economic models on which modern competition policy is based. It then turns from banking failures to the crisis in the European motor industry. It suggests that competition policy comprises an 'economic constitution' for the EU which is under threat, but registers the relative complacency of the competition agencies, and argues for a redefinition of policy. The conclusion suggests that the regulatory relationship between the state and the private sector will reflect scepticism about the market and that political changes in the UK and Europe offer radical choices between a reinforced or a marginalised competition policy which the competition policy 'community' needs to confront.
2009	K21	Lyons, Bruce. 2009. "Competition Policy, Bailouts, and the Economic Crisis." <i>Competition Policy International</i> , 5(2): 25-48. The aims of this paper are twofold. First, I explain the economics of bank bailouts as distinct from bailouts for other sectors of the economy. Why do all the rules of good competition policy appear to fly out of the window when the banks get into trouble? Does this mean that we should abandon the rules equally for car manufacturers and other industries in trouble? I argue that a unique combination of two characteristics made it essential to bailout or nationalize the banks in the current crisis. No other sector of the economy can claim the same justification. Second, I review the threat of a retreat to politically-determined industrial policy and the need for vigilant implementation of economic effects-based competition policy.
2009	K33	van Aaken, Anne, and Jurgen Kurtz. 2009. "Prudence or Discrimination? Emergency Measures, the Global Financial Crisis and International Economic Law." <i>Journal of International Economic Law</i> , 12(4): 859-94. Economists and political scientists have begun to isolate the causes and implications of the spread of the global financial crisis in late 2008. Critical attention--often accompanied by strident disagreement--has also focused on the efficacy of various domestic plans implemented in response to the crisis. International economic lawyers have started to explore the legal implications of these developments. Our analysis offers a contribution by examining whether and how certain aspects of international economic law might act as a credible constraint on state tendencies toward domestic preference when formalizing emergency responses to the crisis. We begin by offering a typology of emergency measures implemented to date. We then assess whether particular international economic law rules can target the nuanced forms of protectionism embedded in those responses. We survey both treaty commitments on trading relations (especially under the World Trade Organization) and the treatment of foreign investors. We argue that international investment law is, in the short term due to legal and extra-legal factors, more likely than any other area of international economic law to give rise to initiation of legal action and examine the most probable substantive norms likely to be violated.
2009	L24	Pontarollo, Enzo. 2009. "Editoriale: L'industria manifatturiera italiana ad un bivio: Deindustrializzazione relativa o declino irreversibile. (The Italian Industry at a Crossroad: Relative Deindustrialisation or Irreversible Decline. With English summary.)" <i>L'Industria, Nuova Serie</i> , 30(4): 575-82. The article reports the main conclusions of the XXXIII Conference organized by "l'Industria" together with the School of Industrial Economics of the University of Ferrara, concerning the future of the manufacturing industry in the midst of the most dramatic economic crisis since World War II. Manufacturing employment and value added are declining in all the industrialized countries, but at a different pace: very rapidly in the US and the UK, more slowly in Germany, Italy, and Japan. The reduction is mainly due to the very high productivity growth rate of the manufacturing sector, and to the increase of outsourcing of industrial goods. The EU Commission considers these developments a "relative

Year	DE	Title and Abstract
		deindustrialisation", since they do not affect the role of industry and do not lead to an absolute decline of manufacturing. However, many worries are linked to the growing public debts of many countries, that is going to affect the growth rate of the economy and to the credit crunch that heavily damages the small and medium sized companies, cause of many bankruptcies. The paper outlines then the measures that can be quickly adopted by the Italian Government to support the small and medium companies, mainly affected by the credit crunch.
2009	M14	CV: de Grauwe, Paul. 2009. "The Crisis as a Paradigm Shift." In <i>Aftershocks: Economic Crisis and Institutional Choice</i> , ed. Anton Hemerijck, Ben Knapen and Ellen van Doorne, 82-89. Amsterdam: Amsterdam University Press; distributed by University of Chicago Press.
2009	P30	Simon, Gyorgy. 2009. "Market Reforms and "Economic Miracle" in Kazakhstan." <i>Economic Annals</i> , 0(182): 67-92. : Kazakhstan's postcommunist transition is characterised by gradual changes under the conditions of a limited democracy. These changes have embraced extensive price and trade liberalisation, and resolutely promoted privatisation and the building of market institutions, although structural reforms and the struggle against corruption have made little progress. The country's financial independence was established with the introduction of the tenge in 1993. Transformational recession reached its maximum in 1995, since when only the 1998 Asian and Russian crises have interrupted continuous growth. However, the Kazakh economy is very sensitive to fluctuations in world energy and mineral prices, as the extractive industries, primarily oil and gas, have a crucial role in its development.
2009	Q24	Gaffney, Mason. 2009. <i>After the Crash: Designing a Depression-Free Economy</i> , Edited and with an introduction by Clifford W. Cobb. Studies in Economic Reform and Social Justice. Malden, Mass. and Oxford: Wiley-Blackwell. Explores the theoretical and policy errors that permitted the current economic crisis to arise. Discusses the role of land markets in economic crises; a new framework for macroeconomics--achieving full employment by increasing capital turnover; and money, credit, and crisis.
2009	Q52	Fischer, Carolyn, and Michael R. Springborn. 2009. <i>Emissions Targets and the Real Business Cycle: Intensity Targets versus Caps or Taxes. Resources For the Future, Discussion Papers.</i> For reducing greenhouse gas emissions, intensity targets are attracting interest as a flexible mechanism that would better allow for economic growth than emissions caps. For the same expected emissions, however, the economic responses to unexpected productivity shocks differ. Using a real business cycle model, we find that a cap dampens the effects of productivity shocks in the economy. An emissions tax leads to the same expected outcomes as a cap but with greater volatility. Certainty-equivalent intensity targets maintain higher levels of labor, capital, and output than other policies, with lower expected costs and no more volatility than with no policy.
2009	Z10	Benabou, Roland. 2009. <i>Groupthink: Collective Delusions in Organizations and Markets.</i> National Bureau of Economic Research, Inc. NBER Working Papers: 14764. I develop a model of (individually rational) collective reality denial in groups, organizations and markets. Whether participants' tendencies toward wishful thinking reinforce or dampen each other is shown to hinge on a simple and novel mechanism. When an agent can expect to benefit from other's delusions, this makes him more of a realist; when he is more likely to suffer losses from them this pushes him toward denial, which becomes contagious. This general "Mutually Assured Delusion" principle can give rise to multiple social cognitions of reality, irrespective of any strategic payoff interactions or private signals. It also implies that in hierarchical organizations realism or denial will trickle down, causing subordinates to take their mindsets and beliefs from the leaders. Contagious "exuberance" can also seize asset markets, leading to evidence-resistant investment frenzies and subsequent deep crashes. In addition to collective illusions of control, the model accounts for the mirror case of fatalism and collective resignation. The welfare analysis differentiates valuable group morale from harmful groupthink and identifies a fundamental tension in organizations' attitudes toward free speech and dissent.
2010		
2010	A21	Dalton, Peggy. 2010. "The Use of Narrative Interview in Teaching Principles of Macroeconomics." <i>Journal of Economic Education</i> , 41(3): 252-58. The author describes the design and implementation of one experiential learning assignment used in a principles of macroeconomics course. The learning exercise provides an active role for students and results in a relational experience that provides traditional undergraduate students with a frame of reference with which to interpret the impact of macroeconomic events and policy on their daily lives.
2010	B26	Toporowski, Jan. 2010. "Henry Simons and the Other Minsky Moment." <i>Studi e Note di Economia</i> , 15(3): 363-68. This paper examines the influence of Henry Simons on Hyman Minsky. Simons' proposals for banking reform are contrasted with Minsky's alternative 'big bank' and 'big government' programme for stabilising the economy. The paper concludes by arguing that Simons' proposals for stabilising banking would have prevented a credit bubble, but would not avoid economic instability. Nevertheless, Minsky remained an admirer of 'Simons' banking' approach to the study of capitalism.
2010	B26	Corsi, Marcella, and Giulio Guarini. 2010. "Le cause reali delle crisi finanziarie: L'approccio di Paolo Sylos Labini. (With English summary.)." <i>Studi e Note di Economia</i> , 15(3): 389-412. : In his "Le prospettive dell'economia mondiale" ("Prospects for the world economy") of 2003 Paolo Sylos Labini analyses the real and financial factors of the American economy and expresses pessimistic forebodings on the future economic trends in the USA and other parts of the world which, in the light of the events occurring as from 2007, can now be seen to have been justified. The aim of this paper is to provide his ideas with a place in the present debate on the American financial crisis and, to this end, the paper is divided into three parts. At first, we delineate the approach taken by Paolo Sylos Labini in examining the links between the financial system and economic system, highlighting the Classical, Schumpeterian, and Keynesian elements contained in it. We then turn the focus on the four key elements of financial crisis according to Sylos Labini: income distribution, innovation, market forms, and debt sustainability. Finally, we recall some considerations by Sylos Labini on the three themes central to the present debate on the American crisis, namely the rate of interest in monetary policy, the role of the managers, and expectations.
2010	C38	Badarau-Semenescu, Cristina, and Gregory Levieuge. 2010. "Assessing the Potential Strength of a Bank Capital Channel in Europe: A Principal Component Analysis." <i>Review of Finance and Banking</i> , 2(1): 5-16. The asymmetric impact of the recent financial crisis on the European countries' real activity raised the question of the heterogeneity of the transmission channels of shocks in the euro area. In this article, we suggest an assessment of this heterogeneity based on the banks' capital channel (BCC). To this end, we follow an original and global perspective, studying the combination of several key indicators through a principal component analysis (PCA). Based on data collected before the beginning of the crisis, the analysis identifies Germany and Italy as the European economies a priori the most exposed to a financial shock passing through the BCC, while Finland, France, or Spain would be the least exposed. The comparison of these a priori results to the post-crisis economic performance of the largest European countries supports the idea of a heterogeneous bank capital channel inside the union.

2010	C39	Abberger, Klaus, and Wolfgang Nierhaus. 2010. <i>The Ifo Business Cycle Clock: Circular Correlation with the Real GDP</i>. CESifo Group Munich, CESifo Working Paper Series: 3179. The Ifo Business Climate is the most important indicator for the business cycle in Germany. In 1993 the connection between the two components of the business climate--business situation and business expectations--was graphically portrayed by Ifo in a 4-quadrant scheme: the Ifo Business Cycle Clock. Today similar monitoring systems are firmly established and are presented by Eurostat, the OECD and others. The German Federal Statistical Office presents the real GDP in a 4-quadrant scheme. In the following, important qualities of the Ifo Business Cycle Clock are shown. The importance of orthogonal functions for the circular correlation is examined.
2010	C58	Kaushik, Abhay, Anita Pennathur, and Scott Barnhart. 2010. "Market Timing and the Determinants of Performance of Sector Funds over the Business Cycle." <i>Managerial Finance</i>, 36(7): 583-602. Market-timing skills of fund managers are an important issue for both mutual fund investors and researchers. The purpose of this paper is to analyze the market-timing skills and determinants of performance of sector funds across business cycles to see whether sector fund managers exhibit different market-timing abilities across business cycle. Single factor, five-factor conditional, and five-factor unconditional models were used to estimate the initial results for market timing of sector funds across the business cycle. Monthly data such as returns, Fama and French factors, and fund specific variables of sector funds from January 1990 to December 2005 were used to estimate initial and cross-sectional results. Cross-sectional analyses were done using two approaches: the traditional approach where alpha, the dependent variable, is estimated assuming that betas of predicting variables remain constant over time, and where alpha is estimated assuming that betas do change over time. Estimated alpha was estimated as a function of fund specific variables to examine which fund specific variables influence fund abnormal performance across the overall, recessionary, and expansionary periods. The benchmark used in the analysis (S&P vs sector specific) was shown to greatly influence the results. Sector funds demonstrate positive timing ability during recessions and negative timing ability during expansions when using the S&P 500 as the benchmark, but this timing ability disappears when sector specific benchmarks are used. As a whole, sector funds exhibit significant negative timing ability across all stages of the business cycle. When using the more appropriate industry specific benchmarks, only the utility sector demonstrates significant timing ability over both stages of the business cycle.
2010	C58	Hristu-Varsakelis, Dimitrios, and Catherine Kyrtsov. 2010. "Testing for Granger Causality in the Presence of Chaotic Dynamics." <i>Brussels Economic Review/Cahiers Economiques de Bruxelles</i>, 53(2): 323-27. An increasing number of recent articles applying powerful tests for non-linear causality have fuelled interest in discovering complex dynamics in macroeconomic and financial data. This paper is an attempt to add to the set of available tools by proposing a test for determining the source of causal relationships when a certain class of complex dynamics, that includes chaotic non-linearities, is present.
2010	E02	Alpanda, Sami, and Adam Honig. 2010. "Political Monetary Cycles and a De Facto Ranking of Central Bank Independence." <i>Journal of International Money and Finance</i>, 29(6): 1003-23. Political monetary cycles are less likely to occur in countries with independent central banks. Independent central banks can withstand political pressure to stimulate the economy before elections or finance election-related increases in government spending. Based on this logic and supporting evidence, we construct a de facto ranking of central bank independence derived from the extent to which monetary policy varies with the electoral cycle. The ranking avoids well-known problems with existing measures of central bank independence and provides independent information about average inflation and inflation volatility differences across countries.
2010	E69	Nersisyan, Yeva, and L. Randall Wray. 2010. <i>Does Excessive Sovereign Debt Really Hurt Growth? A Critique of This Time Is Different</i>, by Reinhart and Rogoff. Levy Economics Institute, The, Economics Working Paper Archive. The worst global downturn since the Great Depression has caused ballooning budget deficits in most nations, as tax revenues collapse and governments bail out financial institutions and attempt countercyclical fiscal policy. With notable exceptions, most economists accept the desirability of expansion of deficits over the short term but fear possible long-term effects. There are a number of theoretical arguments that lead to the conclusion that higher government debt ratios might depress growth. There are other arguments related to more immediate effects of debt on inflation and national solvency. Research conducted by Carmen Reinhart and Kenneth Rogoff is frequently cited to demonstrate the negative impacts of public debt on economic growth and financial stability. In this paper we critically examine their work. We distinguish between a nation that operates with its own floating exchange rate and nonconvertible (sovereign) currency, and a nation that does not. We argue that Reinhart and Rogoff's results are not relevant to the case of the United States.
2010	F65	Błasiak, Wojciech. 2010. "Światowy kryzys gospodarczy a globalna akumulacja kapitału. (The Global Economic Crisis and the Global Accumulation of Capital. With English summary)." <i>Contemporary Economics</i>, 4(2): 35-51. The article presents a thesis that the current global economic crisis is the Second Great Depression, after the First Great Depression of the 30s. This is a global crisis of capital accumulation, which is caused by insufficient global demand. The author analyses the theoretical output of John Maynard Keynes, Michal Kalecki, Paul Baran and Paul Sweezy. The post-war "Golden Age" of the capitalist economy ended in 1973 with a deep stagflation of the 70s and 80s. Capitals searching for profitable investment, started to be invested in financial speculation, growing since the 80s. This speculation was enabled on a global scale by the Washington Consensus in the 90s. The explosion of financialization of the global economy began. The author presents the analyses of Paul Sweezy and Harry Magdoff, who argued that this was financialization of global accumulation of capital in a form of world financial speculation. This process was completed by the financial crash in 2008, which was the implosion of global speculative balloons. Economics and global economic policy faced challenges of creating new world economic order.
2010	H83	Manole, Cristina. 2010. "Professional Performance Evaluation within the Romanian Administrative System." <i>Economia: Seria Management</i>, 13(2): 407-26. The current economic crisis, manifested in the entire world, highlights the need for sustained involvement of the local and regional authorities in each country, in conceiving and implementing Community policies (which already exist at European level) having an essential role in implementing the economic plans achievement. This view was shared by all European Union Member States, of which Romania is part, since 2007. Therefore, the economic crisis which is reflected in the Romanian society today, requires prompt and sustained intervention by the authorities in the execution of the economic recovery plan, implying the community strategies, due to sharply budgetary expenses cut, which is found in all European countries. In order to achieve this major objective, the Romanian authorities should have qualified and properly motivated personnel through an adequate remuneration, according to the training, skills, responsibilities, and especially individual performance obtained at each position, as it happens in most developed countries of the European Union. In this context, this study approaches the issues related to the performance evaluation of the public sector's employees. Considering the fact that strengthening and developing the human resources segment is a strategic goal of the Romanian administration for the period 2008-2013, which will lead to modernizing it and making it more efficient (at both central and local level), the personnel performance evaluation, at the organizational level represents a fundamental activity from the human resources' management perspective.
2010	I00	Bhalotra, Sonia, and Marcela Umana-Aponte. 2010. <i>The Dynamics of Women's Labour Supply in Developing Countries</i>. Department of Economics, University of Bristol, UK, The Centre for Market and Public Organisation. This paper investigates

Year	DE	Title and Abstract
		cyclicality in women's labour supply motivated by the hypothesis that it contributes to smoothing household consumption in environments characterised by income volatility. We use comparable individual data on about 1.1 million women in 63 developing and transition countries merged with country-level panel data on GDP during 1986-2006. The scope of these data is unprecedented in the small but growing literature on labour markets in developing countries. We find that the within-country relationship of women's employment and income is, on average, negative in Asia and Latin America but positive in Africa. We suggest that amongst reasons why African women behave differently are that the conventional family structure with income pooling is less the norm, there are fewer opportunities for paid employment, and aggregate income shocks are more closely tied to rainfall variation. The findings are robust to controls for country-specific trends and potentially correlated shocks. In Asia and Latin America, characteristics that strengthen counter-cyclical responses include low education, being married, being married to men with low education, low wealth, no landownings, rural residence and fertility. These findings suggest that insurance motives underpin the dynamics of women's work participation. Examination of cyclicality in the distribution of employment across types suggests that recessions in every region are associated with a rise in self-employment amongst women. In Asia and Latin America, there is a parallel rise in paid employment and a sharp drop in non-employment. In Africa, there is a decline in paid employment which overwhelms the rise in self-employment and this is how total employment comes to decline. The results have potentially important implications for understanding labour markets, fertility timing and child outcomes.
2010	I25	Palivos, Theodore, and Dimitrios Varvarigos. 2010. "Education and Growth: A Simple Model with Complicated Dynamics." <i>International Journal of Economic Theory</i> , 6(4): 367-84. We construct a simple model of education and growth in which children spend a fraction of their time and parents spend a fraction of their income on education. Both a strategic complementarity and an intergenerational externality are present. The interactions between each pair of consecutive generations lead to rich dynamics. We show that multiple growth equilibria arise, some of them periodic and some aperiodic. We also find a negative correlation between volatility and growth, without a one-way causal relationship between the two being, necessarily, present. Rather, this negative correlation is driven by the structural characteristics of the economy.

2010	K10	Supiot, Alain. 2010. "A Legal Perspective on the Economic Crisis of 2008." <i>International Labour Review</i> , 149(2): 151-62. The 2008 global financial meltdown was the symptom of an underlying crisis in law and institutions caused by the neoliberal utopia of Total Market--"scientific" depoliticization of the economy, full commodification of labour, land and money, and all-out competition, with even legal systems subject to "law shopping". Financial markets were so successfully deregulated, they were the first to collapse: taxpayers are now paying the bills. But the markets for natural and "human resources" are also at risk. In the spirit of the 1944 Declaration of Philadelphia, Supiot argues, the rule of law must be reinstated to end human subordination to economic efficiency.

"Credit Market Imperfections and the Power of the Financial Accelerator: A Theoretical and Empirical Investigation." <i>Journal of Macroeconomics</i> , 32(1): 118-44. We investigate, both theoretically and empirically, the relationship between credit market imperfections and the degree of shock amplification arising from the so-called financial accelerator. We begin by simulating a dynamic stochastic general equilibrium model with two types of financial frictions--costly contract enforcement and anti-creditor bias in the judicial system. Our model builds on the standard financial accelerator framework of Bernanke et al. (1999), to which we add imperfect judicial enforcement in the line of Krasa and Villamil (2000). According to our simulations, the power of the financial accelerator may either increase or decrease with financial frictions, depending on the source and initial level of such frictions. We then turn to the empirical investigation, based on panel data for 62 countries over 1981-1999. We rely on Djankov et al. (2005) and the World Bank's Doing Business Database for proxies of credit market imperfections. According to our results, which are consistent with the theoretical model's main predictions, macroeconomic volatility and the power of the financial accelerator seem to increase with contract enforcement costs, but vary non-monotonically with the degree of anti-creditor bias in the judicial and legal system.

2010	M54	Khan, Nafees A. 2010. "A Study on Performance Management through Recession Metrics during Downturn." <i>Asia-Pacific Journal of Social Sciences</i> , 2(2): 155-65. It is an essential for every company to know how to implement the right metric set for this very trying period. Performance management through recession metrics implemented is indeed a must, employee morale is one thing that is hard to maintain in any company during this extremely trying and frustrating period. Companies would expect the employee who survived inevitable retrenchment due to cost-cutting and still then he or she has been spared. Thus, even if they surpassed the survival of the fittest stage, their morale would still suffer ultimately. And any company with dwindling employee morale better prepare because things would definitely take a turn for the worse. Communication should definitely be one of the focus points of the recession metrics. Open communication should be administered because without this, the informal grapevine would then be the ultimate source of havoc in the company. Anxiety levels would be raised and the employees themselves would feel detached and angry because they are not being told everything that has been going on under their noses. The author in this paper, tries to reflect the modus operandi of performance management through the recession metrics to enhance the productivity during the downturn in order to do the fair justice to their job. The restructuring of the organization should also be included in the metric set. Downsizing is inevitable so there will certainly be a lot of people that the company would have to let go. More importantly, the employees left behind are the ones who need to do more work with fewer resources so they might need to work longer hours and shorter days--to maximize time and cut costs. Thus, the restructuring of the organization and the workforce should be done systematically so that employee morale would not be made to suffer more. Performance management is such a key, by which every organization can do

Year	DE	Title and Abstract
		the proper assessment of employees and their output which matters a lot to both the employees and the organization during the downturn.
2010	N77	Boshoff, Willem H., and Johan Fourie. 2010. "The Significance of the Cape Trade Route to Economic Activity in the Cape Colony: A Medium-Term Business Cycle Analysis." <i>European Review of Economic History</i> , 14(3): 469-503. Trade is a critical component of economic growth in newly settled societies. This article tests the impact of ship traffic on the Cape economy using a time-series smoothing technique borrowed from the business cycle literature and employing an econometric procedure to test for long-run relationships. The results suggest a strong systematic co-movement between wheat production and ship traffic, with less evidence for wine production and stock-herding activities. While ship traffic created demand for wheat exports, the size of the co-movement provides evidence that ship traffic also stimulated local demand through secondary and tertiary sector activities, supporting the hypothesis that ship traffic acted as a catalyst for growth in the Cape economy.
2010	P43	El-Kharouf, Farouk, Sulayman Al-Qudsi, and Shifa Obeid. 2010. "The Gulf Corporation Council Sovereign Wealth Funds: Are They Instruments for Economic Diversification or Political Tools?" <i>Asian Economic Papers</i> , 9(1): 124-51. Our research has two objectives. The first objective is to review the historical evolution of the Gulf Corporation Council (GCC) sovereign wealth funds (SWFs) and to demonstrate how their conception and evolution was in fact an integral part of an overall prescription for the cyclical economic and fiscal imbalances of the oil-based GCC economies. The second objective is to review economic and political claims and arguments that have been developed to trim the tide and influence of the GCC SWFs in Western economies. Applying institutional and factual analyses, the paper provides counterarguments that rebut these claims and arguments. For a long time, advocates of globalization have argued its benefits to all parties. The experience of SWFs puts such claims to the test. In the meantime, however, GCC SWFs should open up a bit more and reveal their investments profiles showing both gains and losses. This should quell fears and convince skeptics that the GCC SWFs confidentiality practices are not hiding any "threatening secrets." Finally, recent financial and global turmoil generated acceptance of SWFs in Western economies with policymakers touring the GCC to "welcome" more SWF flows into advanced economies. However, only time will tell if such Western policy gestures are sustainable in the end, or were merely temporary policy switches rendered under severe pressures from global and financial crises.

2011	C42	Baele, Lieven, Geert Bekaert, Seonghoon Cho, Koen Inghelbrecht, and Antonio Moreno. 2011. <i>Macroeconomic Regimes</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 17090. We estimate a New-Keynesian macro model accommodating regime-switching behavior in monetary policy and in macro shocks. Key to our estimation strategy is the use of survey-based expectations for inflation and output. We identify accommodating monetary policy before 1980, with activist monetary policy prevailing most but not 100% of the time thereafter. Systematic monetary policy switched to the activist regime in the 2000-2005 period through an aggressive lowering of interest rates. Discretionary policy spells became less frequent since 1985, but the Volcker period is identified as a discretionary period. Output shocks shift to the low volatility regime around 1985 whereas inflation shocks do so only around 1990, suggesting active monetary policy may have played role in anchoring inflation expectations. Shocks and policy regimes jointly drive the volatility of the macro variables. We provide new estimates of the onset and demise of the Great Moderation and the relative role played by macro-shocks and monetary policy.
2011	C44	Osamwonyi, Ifuero Osad, Sunday Osaretin Igbinsosa, and Joseph Efosa Aigbodua. 2011. "Operations Research Models and Market Microstructure." <i>Asian-African Journal of Economics and Econometrics</i> , 11(2): 511-31. The interactions that occur in the securities market have been posited as being among the fastest, most information-intensive, and most highly strategic of all economic phenomena. In the last few years, both the theoretical and empirical researches on financial markets have grown; however, literature on market microstructure in emerging economies is still thin. This paper attempts to contribute to the needed literature. The paper reviews various structures and design of capital markets including the Nigerian Stock Exchange, and examines major microstructure theories. The relevance and implications for the Nigerian capital market are then identified, with a conclusion and suggestions on methods to improve the fortunes of investors especially during economic recession.
2011	C46	Manas, Arnaud. 2011. "The Paretian Ratio Distribution--An Application to the Volatility of GDP." <i>Economics Letters</i> , 111(2): 180-83. Recently, Gabaix suggested that the volatility of GDP could come from the Pareto distribution of the firm sizes. This paper describes and gives an approximation of the Paretian Ratio Distribution (PRD), which represents the weight of the firm in GDP.
2011	C46	Barro, Robert J., and Tao Jin. 2011. "On the Size Distribution of Macroeconomic Disasters." <i>Econometrica</i> , 79(5): 1567-89. The coefficient of relative risk aversion is a key parameter for analyses of behavior toward risk, but good estimates of this parameter do not exist. A promising place for reliable estimation is rare macroeconomic disasters, which have a major influence on the equity premium. The premium depends on the probability and size distribution of disasters, gauged by proportionate declines in per capita consumption or gross domestic product. Long-term national-accounts data for 36 countries provide a large sample of disasters of magnitude 10% or more. A power-law density provides a good fit to the size distribution, and the upper-tail exponent, alpha, is estimated to be around 4. A higher alpha signifies a thinner tail and, therefore, a lower equity premium, whereas a higher coefficient of relative risk aversion, gamma, implies a higher premium. The premium is finite if alpha > gamma. The observed premium of 5% generates an estimated gamma close to 3, with a 95% confidence interval of 2 to 4. The results are robust to uncertainty about the values of the disaster probability and the equity premium, and can accommodate seemingly paradoxical situations in which the equity premium may appear to be infinite.
2011	C87	Bardsen, Gunnar, Stan Hurn, and Zoe McHugh. 2011. <i>Asymmetric unemployment rate dynamics in Australia</i> . National Centre for Econometric Research, NCER Working Paper Series: 71. The unemployment rate in Australia is modelled as an asymmetric and nonlinear function of aggregate demand, productivity, real interest rates, the replacement ratio and the real exchange rate. If changes in unemployment are big, the management of demand, real interest rates and the replacement ratio will be good instruments to start bringing it down. The model is developed by exploiting recent developments in automated model-selection procedures.

2011	H00	Deaton, Angus S. 2011. <i>The Financial Crisis and the Well-Being of Americans</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 17128. The Great Recession was associated with large changes in income, wealth, and unemployment, changes that affected many lives. Since January 2008, the Gallup Organization has been collecting daily data on 1,000 Americans each day, with a range of self-reported well-being (SWB) questions. I use these data to examine how the recession affected the emotional and evaluative lives of the population, as well as of subgroups within it. In the fall of 2008, around the time of the collapse of Lehman Brothers, and lasting into the spring of 2009, at the bottom of the stock market, Americans reported sharp declines in their life evaluation, sharp increases in worry and stress, and declines in positive affect. By the end of 2010, in spite of continuing high unemployment, these measures had largely recovered, though worry remained higher and life evaluation lower than in January 2008. The SWB measures do a much better job of monitoring short-run levels of anxiety as the crisis unfolded than they do of reflecting the evolution of the economy over a year or two. Even large macroeconomic shocks to income and unemployment can be expected to produce only small and hard to detect effects on SWB measures. SWB, particularly evaluation of life as a whole, is sensitive to question order effects. Asking political questions before the life evaluation question reduces reported life evaluation by an amount that dwarfs the effects of even the worst of the crisis; these order effects persist deep into the interview, and condition the reporting of hedonic experience and of satisfaction with standard of living. Methods for controlling these effects need to be developed and tested if national measures are to be comparable over space and time.
2011	H10	Attinasi, Maria-Grazia, Cristina Checherita-Westphal, and Malte Rieth. 2011. <i>Personal income tax progressivity and output volatility: evidence from OECD countries</i>. European Central Bank, Working Paper Series: 1380. This paper investigates empirically the effect of personal income tax progressivity on output volatility in a sample of OECD countries over the period 1982-2009. Our measure of tax progressivity is based on the difference between the marginal and the average income tax rate for the average production worker. We find supportive empirical evidence for the hypothesis that higher personal income tax progressivity leads to lower output volatility. All other factors constant, countries with more progressive personal income tax systems seem to benefit from stronger automatic stabilisers.
2011	H27	Tagkalakis, Athanasios. 2011. "Fiscal Policy and Financial Market Movements." <i>Journal of Banking and Finance</i>, 35(1): 231-51. This paper estimates fiscal policy reaction function in order to investigate the links between financial market movements and fiscal policy outcomes. An increase in asset prices affects in a positive and significant manner primary balances, with the response reflecting both an increase in government revenues and a fall in government spending. The most important impact on fiscal balances is due to changes in residential property prices. Changes in equity and commercial property prices are also important determinants of fiscal balances. Our findings suggest that the steepening of the slope of the yield curve contributes to expenditure based fiscal discipline.

2011	K00	Stevenson, Betsy, and Justin Wolfers. 2011. <i>Trust in Public Institutions over the Business Cycle</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 16891. We document that trust in public institutions--and particularly trust in banks, business and government--has declined over recent years. U.S. time series evidence suggests that this partly reflects the pro-cyclical nature of trust in institutions. Cross-country comparisons reveal a clear legacy of the Great Recession, and those countries whose unemployment grew the most suffered the biggest loss in confidence in institutions, particularly in trust in government and the financial sector. Finally, analysis of several repeated cross-sections of confidence within U.S. states yields similar qualitative patterns, but much smaller magnitudes in response to state-specific shocks.
2011	L50	Schwellnus, Cyrille. 2011. <i>Macroeconomic and Structural Policies to Further Stabilise the Mexican Economy</i>. OECD Publishing. OECD Economics Department Working Papers: 906. Improvements in the macroeconomic policy framework over the past two decades and prudent regulation of the financial system have contributed to reduce output volatility in Mexico relative to other OECD countries. The sharp recession in 2008-09 illustrated that output volatility has nonetheless remained high. The fiscal rule has helped to balance the federal budget and keep the level of government debt low, while strengthening fiscal credibility, but it could be improved further to provide a stronger buffer against shocks. Although output contracted sharply in early 2009, actual and expected inflation remained above target, in part because rigidities in product and labour markets limit price flexibility. This constrained the monetary policy response. The banking system withstood the recession of 2008-09 well, but the contraction in bank credit was sharper than in other OECD countries, in part related to a boom-and-bust cycle in consumer credit that preceded the recession. While in other OECD countries the services sector stabilises output, in Mexico it contributes to output volatility. The volatility partly reflects the dominance of services with strong links to manufacturing, while modern and more stable consumer-

Year	DE	Title and Abstract
		related services remain underdeveloped. Output volatility could be further reduced by amending the fiscal rule to accumulate larger buffers of financial assets during economic upswings or periods of high oil prices, and by taking measures to enhance the flexibility of prices. Mexico should also adopt internationally-accepted statistical conventions for its budget accounts to make them more easily comparable with those in other countries. There would be merit in moving towards macro-prudential regulation and supervision to reduce the pro-cyclicality of the financial system. Finally, entry barriers to services should be lowered to boost the development of a modern consumer-related services sector.
2011	L69	Nagia, Surender Kumar, Kanwarjeet Malik, and Kamlesh Rani. 2011. "Impact of Global Economic Recession on Indian Jewelry Industry." <i>International Journal of Business Economics and Management Research</i> , 2(8): 38-48. The impact of global crisis has been transmitted to the Indian economy through three distinct channels, viz., the financial sector, exchange rates, and exports. The study analyzed the financial performance of five (5) major listed jewelry companies in BSE as sample size n = 5 in two time window pre-recession and post-recession period. The research under consideration is used secondary information to measure the impact of economic recession on financial performance of firms during the period. The study did not find any significant change in ETR, NPR, OPR, and EPS except GPR which is significant at 10% per cent level of risk. Thus null hypotheses are accepted for financial performance of Indian jewelry industry except gross profit performance of the industry in global economic recession.
2011	N55 N75	CV: White, Ben. 2011. "A Historical Ethnography of Recessions: Crises in Yogyakarta." In <i>The Financial Crisis and Developing Countries: A Global Multidisciplinary Perspective</i> , ed. Peter A. G. van Bergeijk, Arjan de Haan and Rolph van der Hoeven, 65-82. 2011	O25	Manish, G. P. 2011. "Central Economic Planning and India's Economic Performance, 1951-1965." <i>Independent Review</i> , 16(2): 199-219. Many economists have hailed India's economic performance under the country's first three Five-Year Plans, a seeming exception to the rule that central economic planners do more harm than good. However, a close look at the neglected work of father and daughter economists B. R. Shenoy and Sudha Shenoy shows that despite impressive GDP growth, India under central planning suffered from both a stagnation in living standards and a massive malinvestment of resources in heavy industry.
2011	Q26	Cho, Seong-Hoon, Seung Gyu Kim, and Roland K. Roberts. 2011. "Values of Environmental Landscape Amenities during the 2000-2006 Real Estate Boom and Subsequent 2008 Recession." <i>Journal of Environmental Planning and Management</i> , 54(1): 71-91. This research suggests that consumers' marginal willingness to pay for environmental landscape attributes, such as water view, developed open space and forest-land open space, decreased during the 2008 recession compared to the 2000-2006 real estate boom. Estimates were obtained from a spatial hedonic housing price model after controlling for household location patterns and structural differences between the periods. Because the decline in amenity values was probably due to a temporary deterioration in economic conditions, the amenity values will probably rebound with economic recovery. Thus, development decisions based on the lower estimated amenity values measured during a temporary deterioration in economic conditions may be determined suboptimal post-economic recovery.

2012	C54	Kocenda, Evzen, Mathilde Maurel, and Gunther Schnabl. 2012. <i>Short-Term and Long-Term Growth Effects of Exchange Rate Adjustment</i> . CESifo Group Munich, CESifo Working Paper Series: 4018. The European sovereign debt crisis revived the discussion concerning the pros and cons of exchange rate adjustment in the face of asymmetric shocks. Exit from the euro area is to regain rapidly international competitiveness. Exchange rate stability with structural reforms could be beneficial for long-run growth. We augment the literature by analyzing short- and long-term growth effects of exchange rate flexibility in a panel-cointegration framework. Countries with a high degree of exchange rate stability exhibit lower short-term and higher long-term growth. The degree of business cycle synchronization with the anchor country matters for the impact of exchange rate flexibility on growth.
2012	D04	Cebula, Richard J. 2012. "Contemporary Economics and Policy Issues in the US." <i>International Advances in Economic Research</i> , 18(2): 131-37. This paper outlines a variety of contemporary policy issues facing the U.S. economy. These issues include impediments to sustained economic growth and reduced unemployment, such as tax uncertainty and ill-conceived federal income tax policies. In addition, it provides an overview of four studies that deal with such topics as budget deficits and reduced economic freedoms, the implications of raising property taxes as a source of funds for revenue-starved local governments, the regional impacts of the world-wide recession for a specific locality in the U.S., namely, Hampton Roads, Virginia, and the relationship between yield curve inversion and the incidence of recession.

With English summary.)." <i>Actual Problems of Economics</i> , 135(9): 36-46. The article considers the peculiarities of the enterprise potential formation taking into account the cyclicity of the economic processes. Basic principles and sources in potential formation of a business entity are determined.
2012	G02	Mueller, Andreas, and Malte Brettel. 2012. "Impact of Biased Pecking Order Preferences on Firm Success in Real Business Cycles." <i>Journal of Behavioral Finance</i> , 13(3): 199-213. Studies on behavioral corporate finance have documented that overconfident managers invest more than their more rational peers. Reasons include that overconfidence reduces managers' ability to perceive risk correctly. However, although it has been addressed in several theoretical models, the impact of overconfidence on firm success has received little empirical examination. Based on a unique 10-year panel dataset of German chief executive officers (CEOs) and their companies, we investigate the relationship between overconfidence and firm success. In line with principal agent theory and the hubris hypothesis, we find negative effects of CEO overconfidence during economic recessions. However, we also find a strong positive impact of CEO overconfidence on firm profitability and stock market performance during the early phases of the business cycle. These novel insights imply that overconfidence operates using different mechanisms in routine than in one-time

Year	DE	Title and Abstract
		situations. In particular, it hints at heightened individual effort and work performance of overconfident individuals as described in psychological studies. Our findings suggest a reciprocal relationship between macroeconomic developments and microeconomic decision-making, a finding that may help to illuminate aggregated patterns such as herding and investment bubbles and the current economic and financial crisis.
2012	G02	De Mello, Joao Manoel P., and Marcio G. P. Garcia. 2012. "Bye, Bye Financial Repression, Hello Financial Deepening: The Anatomy of a Financial Boom." <i>Quarterly Review of Economics and Finance</i>, 52(2): 135-53. Since the conquest of hyperinflation, with the Real Plan, in 1994, the Brazilian financial system has grown from early infancy to late adolescence. We describe the process of maturing with emphasis on the defining features of the Brazilian financial system over the last 20 years: (1) stabilization and the subsequent financial crisis; (2) universality of banks; (3) market segmentation through public lending; (4) institutional improvement. Further paraphrasing Diaz-Alejandro (1985), we raise some hypotheses on why, this time, the financial boom has not (at least yet) turned into a financial crash.
2012	G02	Fromlet, Hubert. 2012. "Predictability of Financial Crises: Lessons from Sweden for Other Countries." <i>Business Economics</i>, 47(4): 262-72. The predictability of financial crises is widely regarded as low. However, skills linked to market psychology (behavioral finance) and the understanding of history and macrofinancial aggregates have been insufficiently integrated in the forecasting and risk management of financial institutions. Traditional financial modeling can no longer be applied as nicely as in the past. In Sweden, the financial crises of the early 1990s and in the latter part of the past decade were caused by overconfidence, control illusion, and herd mentality--but also by shortcomings in management and corporate governance. There is no evidence that these two serious Swedish banking crises were not foreseeable. The general question is when and under which circumstances financial decision-makers and authorities should listen to the usual minority of warning voices. One conclusion is that economists should be more "in house-oriented," and top managers should heed their professional opinions. Conclusions from this paper can also be drawn for China, India, and other emerging markets both when it comes to financial deregulation policy and government debt risks in deregulated financial markets.
2012	G02	Blinder, Alan S., Andrew W. Lo, and Robert M. Solow, eds. 2012. <i>Rethinking the Financial Crisis</i>, New York: Russell Sage Foundation. Twelve papers, some previously published, present ways to reconsider the 2008 financial crisis and examine the implications of this rethinking for financial regulation. Papers discuss some reflections on the crisis and the policy response; the persistent concerns of financial macroeconomics; credit supply shocks and economic activity in a financial accelerator model; the efficient-market hypothesis and the financial crisis; behavioral finance in the financial crisis--market efficiency, Hyman Minsky, and John Maynard Keynes; why did so many people make so many ex post bad decisions?--the causes of the foreclosure crisis; ratings, mortgage securitizations, and the apparent creation of value; the role of asset-backed securities, credit default swaps, and collateralized debt obligations in the credit crisis and the economy; finance versus Wal-Mart--why are financial services so expensive?; shadow finance; the political economy of financial regulation after the crisis; and pay, politics, and the financial crisis.
2012	I14 I15	Lopez i Casanovas, Guillem, and Marina Soley Bori. 2012. "The Economic Crisis and Its Effects on the Social Determinants of Health." <i>Hacienda Publica Espanola/Revista de Economia Publica</i>, 0(201): 113-32. With the economic crisis, the fight against unemployment in most countries is coetaneous to the need to restrain public expenditure in closing budget deficits. As a consequence, spending cuts have started to affect a large number of decisions that directly or indirectly may be expected to have an impact on health. These effects are likely to be unevenly distributed among different groups within the population. Therefore, not just health levels but also their distribution may be at risk with the financial consequences of the crisis. The main message of this paper is to first show social concern on the nature of the trade-offs in redefining expenditure priorities. On the prescriptive side of our work we argue that in the present situation we should not focus so much on health expenditure as we should on the social protection system as a whole. In addition, fighting against poverty (and not focusing so much on income inequality in itself) should be the most important consideration for health policy design. Thus, more selective, tailored made combinations of integrated policies should be addressed. Fragile groups need to be prioritized at this stage in battling toward poverty alleviation (poverty induces health losses) and for a sound job creation economy (workfare strategies require health at the same time that they produce health). Universal old-style welfare policies commonly lack focus, are not financially sustainable, and, overall, they have lower redistributive impacts. Random, poorly understood effects in welfare may result from these policies due to side effects from economic crisis, unemployment and changes in life style. Results may also depend on the type of groups benefiting from sustained social spending in practice. A welfare function is required in order to compare "losers" and "winners." This is a part of the second welfare theorem where non-superior Pareto agreements are achievable, and lack of consensus may easily emerge in designing health strategies since politics may not build the necessary consensus for policies.
2012	I15	Cruces, Guillermo, Pablo Gluzmann, and Luis Felipe Lopez Calva. 2012. "Economic Crises, Maternal and Infant Mortality, Low Birth Weight and Enrollment Rates: Evidence from Argentina's Downturns." <i>World Development</i>, 40(2): 303-14. This study investigates the impact of recent crises in Argentina (including the severe downturn of 2001-02) on health and education outcomes. The identification strategy relies on both the inter-temporal and the cross-provincial co-variation between changes in regional GDP and outcomes by province. These results indicate significant and substantial effects of aggregate fluctuations on maternal and infant mortality and low birth weight, with countercyclical though not significant patterns for enrollment rates. Finally, provincial public expenditures on health and education are correlated with the incidence of low birth weight and school enrollment for teenagers, with worsening results associated with GDP declines.
2012	M40	Bezemer, Dirk J. 2012. "Modelos contables y comprension de la crisis financiera. (Understanding Financial Crisis through Accounting Models. With English summary.)" <i>Revista de Economia Institucional</i>, 14(26): 47-76. This paper presents evidence that macroeconomic accounting models helped to anticipate the credit crisis and economic recession, whereas equilibrium models, ubiquitous in mainstream policy and research, did not. This study traces the intellectual pedigree of the accounting approach as an alternative to neo-classical economics, and the post-war rise and decline of flow-of-funds models in policy use. The paper includes contemporary case studies of both types of models, and considers why the accounting approach has remained outside mainstream economics. Finally, it provides constructive recommendations for revising financial stability evaluation methods, and advocates an "accounting of economics."

2012	P50	Clift, Ben. 2012. "Comparative Capitalisms, Ideational Political Economy and French Post-Dirigiste Responses to the Global Financial Crisis." <i>New Political Economy</i>, 17(5): 565-90. This article advances the case for the more systematic incorporation of ideational factors into comparative capitalisms analysis as a corrective to the rational choice proclivities of the Varieties of Capitalism approach. It demonstrates the pay-off of such an ideationally attuned approach through analysis of French capitalist restructuring over the last 25 years, placing it in comparative context. A modus operandi for such ideational explanation is elaborated through delineating different national conceptions of the market, and setting out their impacts on practices of market-making. The

Year	DE	Title and Abstract
		claim made in this article is that understanding the evolution of French capitalism requires recognition of the ongoing market-making role of the French State, in combination with the French conception of the market and its embedding within a social context characterised by the inter-penetration of public and private elitist networks of France's 'financial network economy' which remains substantially intact. The ideational dimension is crucial because French understandings of the market and competition, the ideational building blocks of market-making, inform French state interventions and leave footprints on French institutions and market structures, and the evolutionary trajectory of French capitalism. In charting this trajectory, this article deploys the concept of post-dirigisme. We map out the parameters and causes of the post-dirigiste condition in France through examination of French bond market development, privatisation, the shift from a government- to a market-dominated financial system, and French capitalism's internationalisation. It then uses post-dirigisme to explain French state responses to the financial crisis and the banking bailout, noting how state actors, in concert with the banking elites, actively facilitated dominant market positions of French international champions.
2012	Q02	Diss: Savascin, Ozge. 2012. Endogenously Clustered Factor Approach to Macroeconomics. PhD diss. University of North Carolina. This dissertation constructs a novel factor approach to study the comovements of macroeconomic variables and introduced its two practical applications. Factor models have become useful tools for studying international business cycles. Block factor models can be especially useful as the zero restrictions on the loadings of some factors may provide some economic interpretation of the factors. These models, however, require the econometrician to predefine the blocks, leading to potential misspecification. IN my coauthored paper, we propose an alternative model in which the blocks are chosen endogenously. The model is estimated in a Bayesian framework using a hierarchical prior which allows series-level covariates to influence and explain how the series are grouped. Using similar international business cycle data as Kose, Otrok, and Whiteman (2005) we find our country clusters differ in important ways to those identified by geography alone. In particular, we find that similarities in institutions--e.g., legal systems, language diversity--may be just as important as physical proximity for analyzing business cycle comovements. In another application, I use the endogenously clustered dynamic factor model to gain a better understanding of commodity price comovements and their determinants. From a large dataset of commodity prices I extract the fundamental sources behind the price dynamics and find that commodity price comovements are mostly the result of sparse cluster factors that represent correlations of distinct group of commodities. Endogenous clustering of these groups does not represent the standard narrow classifications (indexes) of commodity prices as defined by statistical agencies (e.g. International Financial Statistics, Bureau of Labor Statistics). Characterization analysis on these factors identifies a wide range of macroeconomic variables like crude oil prices, fertilizer prices, and the federal funds rate as possible sources of commodity price comovements.
2012	Q02	Céspedes, Luis Felipe, and Andres Velasco. 2012. "Macroeconomic Performance during Commodity Price Booms and Busts." <i>IMF Economic Review</i> , 60(4): 570-99. Fluctuations in commodity prices are often associated with macroeconomic volatility. But not all nations are created equal in this regard. The macro response to commodity booms and busts depends both on the structural characteristics of the economy and on the policy framework that is in place. This paper investigates the macro response of a group of commodity-producing nations in episodes of large commodity prices shocks. First, it provides a theoretical framework to analyze how shocks to commodity prices affect the domestic economy. For this the paper uses a simple open-economy model with nominal rigidities and financial frictions. Then it provides empirical evidence (using commodity price boom and bust episodes) that commodity price shocks have a significant impact on output and investment dynamics. Economies with more flexible exchange rate regimes exhibit less pronounced responses of output during these episodes. The paper also provides evidence that the impact of those shocks on investment tends to be larger for economies with less developed financial markets. Moreover, it finds that international reserve accumulation, more stable political systems, and less open capital accounts tend to reduce the real exchange rate appreciation (depreciation) in episodes of commodity price booms (busts).
2012	Q22	Fotis, Panagiotis N. 2012. "Competition Policy in Periods of Economic Downturn." <i>International Journal of Economics and Business Research</i> , 4(5): 560-76. This paper attempts to cast light on the main principles of the industrial restructuring agreements (crisis cartels) from a European perspective. For this purpose, I will explore the basic fundamentals of theory of harm concerning the formation of cartels during economic downturn in specific oligopolistic markets and I will analyse basic characteristics of past European cases. I also survey the Greek fish farming crisis cartel case.
2012	Q55 Q57	CV: Courvisanos, Jerry. 2012. "Political Economy of Innovation and Sustainable Development." In <i>Crisis, Innovation and Sustainable Development: The Ecological Opportunity</i> , ed. 2012	Q57	Kallis, Giorgos, Christian Kerschner, and Joan Martinez-Alier. 2012. "The Economics of Degrowth." <i>Ecological Economics</i> , 84(1): 172-80. Economic degrowth is ecologically desirable, and possibly inevitable; but under what conditions can it become socially sustainable? How can we have full employment and economic stability without growth? What will happen to public spending and to public debt? How would production be organised in a degrowing economy? And under what plausible socio-political conditions could such grand changes happen? Standard economic theories and models ignore these questions. For them economic growth is an axiomatic necessity. This article reviews recent contributions in the economics of degrowth and identifies research avenues for ecological economists.
2012	Q57	THE SAME AS Q55 CV: Courvisanos, Jerry. 2012. "Political Economy of Innovation and Sustainable Development."
2012	R42	Karner, Alex, Anamarie Urrutia, and Deb Niemeier. 2012. "US Public Transit Fantasies: Performance and Economic Stimulus." <i>International Journal of Transport Economics</i> , 39(1): 39-55. Transit funding is often reduced, sometimes severely, during periods of economic downturn. Very little is known about how transit agencies modify operations when funds become scarce, particularly when they are being asked to carry a larger share of travelers. In this paper, we examine the performance of transit agencies since 1991, including during the recent economic crisis, to assess how transit operations have changed in response to changing economic circumstances. Using California data, we find that the effect of subsidies varies by the source of funding and the size of operator. For example, state subsidies and local subsidies are associated with increasing efficiency (vehicle revenue-miles per operating expenditures). We also identify the recent economic downturn's negative effect on both efficiency and overall operator performance (unlinked passenger trips per operating expenditures). Decreasing efficiency and overall performance are evidence of service-cutting behavior in the wake of operating shortfalls. Service cuts have a direct effect on revenue vehicle miles and ridership and would tend to decrease efficiency while increasing effectiveness (unlinked passenger trips per vehicle revenue miles) for the same number of trips. This study begins to unravel the practical effects of changing subsidies and lays the groundwork for further analysis. We conclude that without increasing funds for transit operations, this mode's hoped for role in climate change mitigation will remain only a fantasy.

Year	DE	Title and Abstract
2012	Z11	Katsuura, Masaki. 2012. "Lead-Lag Relationship between Household Cultural Expenditures and Business Cycles." <i>Journal of Cultural Economics</i>, 36(1): 49-65. This paper empirically examines how household cultural expenditures correspond to business cycles in Japan. Since income level is among the most important determinants of cultural demand, and income fluctuates with business cycles, examining the relationship between cultural expenditures and business cycles is useful, particularly in discussing income elasticity of cultural demand. The data used are monthly household expenditures for movies, live performances, and cultural establishments in the Family Income and Expenditure Survey. Turning points for cultural expenditures and related indicators are determined by estimating the regime-switching model. The lead-lag relationship between these series and the reference dates of Japanese business cycles are analyzed. The result indicates that cultural expenditures fluctuate cyclically with unstable leads and lags corresponding to business cycles. In addition, cultural expenditures adhere to smaller specific cycles within officially designated expansions, which imply that income elasticity has not been constant during past business cycles.

2013	B59	CV: Wallis, Stewart. 2013. "The Urgent Need to Transform Economics." In <i>Responsible Economics: E. F. Schumacher and His Legacy for the 21st Century</i> . E. F. Schumacher, 303-11. Edited by Hendrik Opdebeeck. Frontiers in Business Ethics, vol. 11. Oxford and Bern: Peter Lang.
2013	C99	Jorda, Oscar, and Alan M. Taylor. 2013. <i>The Time for Austerity: Estimating the Average Treatment Effect of Fiscal Policy</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 19414. Elevated government debt levels in advanced economies have risen rapidly as sovereigns absorbed private-sector losses and cyclical deficits blew up in the Global Financial Crisis and subsequent slump. A rush to fiscal austerity followed but its justifications and impacts have been heavily debated. Research on the effects of austerity on macroeconomic aggregates remains unsettled, mired by the difficulty of identifying multipliers from observational data. This paper reconciles seemingly disparate estimates of multipliers within a unified framework. We do this by first evaluating the validity of common identification assumptions used by the literature and find that they are largely violated in the data. Next, we use new propensity score methods for time-series data with local projections to quantify how contractionary austerity really is, especially in economies operating below potential. We find that the adverse effects of austerity may have been understated.
2013	D44	Diss: Mu, Yifei. 2013. <i>Banking Crises and the Volume of Trade</i> . PhD diss. Clemson University. This dissertation consists of three chapters. The first two chapters investigate the correlation between banking crises and bilateral trade flows. In the first chapter, we focus on how banking crises may impact the bilateral trade flows over time. We attempt to disentangle the financial shocks' impacts on trade flow by factors that are related to exporters and importers. The second chapter assesses how banking crises impact the extensive and intensive margin of the trade. The third chapter attempts to use frontier model to analyze the bidding behaviors and collusion in the different sub-markets of low price, sealed-bid construction procurement. Since 2007 banking crisis and the onset of Great Recession, there have been many studies that have provided insights linking between the Great Recession and dramatic fall in trade. The objective of Chapter 1 is to investigate the impact of banking crises more generally. We use the data for 173 countries and across 32 years. We find relatively robust results for the correlation between banking crises and bilateral trade flow fluctuations. Most of the impacts from banking crises go through the importers. There seems to be little evidence to support the hypothesis that banking crises directly lowers the exports. There is a relative constant negative impact on import for the time periods in advance of the onset of crises. After the crisis is over, the decline in import tends to intensify for another two years and starts to recover. Chapter 2 decomposes the bilateral trade flow into extensive margin and intensive margin. The results suggest different patterns of the financial shocks for exporters and importers in different margins. For exporters, the insignificant result from Chapter 1 is caused by neutralization of the opposite effects from extensive and intensive margin. During banking crisis exporters tend to export fewer varieties of goods and increase the volume for each variety. For importers, a banking crisis tends to have a larger negative impact on extensive margin and relatively smaller impacts on intensive margin. Chapter 3 adopts a frontier model to analyze the bidding behaviors and collusion in low-price, sealed-bid procurement. In a market without collusion, the objective function of each bidder is to maximize their own expect profit. In a market with collusion, the objective function is to maximize profit than separated profit between colluders. The bidding data from real world are usually the mixture of these two cases. Using frontier model can avoid the explicit objective function and give a hint about whether there might be collusion in a market.
2013	F63	Prabhakar, A. C. 2013. "Global Economy: New Trends." <i>Journal of Applied Finance and Banking</i>, 3(4): 229-44 The current global economic and financial crises led by free markets economies; that clearly indicates the collapse of Milton-Friedman's philosophy of Chicago university which was based on Adam Smith's classical economic theory, and policies of Thatcher-Reagan's free-market model; as dominated thinking for 30 years has been discredited. The systemic crisis of capitalism is looming right after. The pursuit of the model based on the growth of the real economy and of the consumption attached to it, has become, for the first time in history a real threat for the future of humankind and the planet. .

Papers discuss economic crisis, the quality of work, and social integration--issues and context (Duncan Gallie); economic crisis and employment change--the Great Regression (Michael Tahlin); distribution in the downturn (Tahlin); continuing training in times of economic crisis (Martina Dieckhoff); job control, work intensity, and work stress (Gallie and Ying Zhou); insecurity and the peripheral workforce (Vanessa Gash and Hande Inanc); work-family conflict and economic change (Frances McGinnity and Helen Russell); economic downturn and work motivation (Nadia Steiber); unemployment and subjective well-being (Russell, Dorothy Watson, and McGinnity); economic crisis, political legitimacy, and social cohesion (Javier Polavieja); and economic crisis, country variations, and institutional structure (Gallie).
2013	F66	Spiro, Peter S. 2013. "A Sectoral Analysis of Ontario's Weak Productivity Growth." <i>International Productivity Monitor</i>, 0(26): 20-35. Since 2005, labour productivity growth in Ontario's business sector has been zero, greatly under-performing the rest of Canada and being single-handedly responsible for most of what has been described as "Canada's dismal productivity growth." This article examines the issue through detailed sectoral data, and finds a wide range of variation underlying the average productivity growth rate. Some important sectors have maintained decent productivity growth. Other sectors, especially in manufacturing, saw the level of productivity decline significantly. Empirical evidence suggests that weak aggregate demand--due to the high Canadian dollar, the U.S. recession, and global restructuring--was the main cause of weak productivity. Weak demand led to lost economies of scale, particularly due to compositional shifts in the economy.

Year	DE	Title and Abstract
2013	H12	Asensio, Angel. 2013. "Coping with the European Public Debt Problem: The Desperate New "Growth Pact" of 2012 and Its Aftermath." <i>International Journal of Political Economy</i> , 42(2): 42-62. The paper examines the main instruments involved in Europe's "new" strategy in 2012. It explains why none are suited to the current challenges in terms of growth recovery and public debt control. The reason is basically that all the instruments focus on factor cost reductions (capital and labor), that is, on the supply side of the economy, while, the evidence clearly suggests that the main issue is on the demand side. Hence, drawing on a few basic equations, the paper discusses the conditions under which a fiscal stimulus might eventually reduce the public deficit and help control the debt by means of induced growth and fiscal revenues. This is not to say that a balanced budget per se is a desirable objective, for it is acknowledged that a public deficit may be desirable in the long run to foster economic growth. The purpose here is to show that, in the context of the European sovereign debt problem, a fiscal stimulus could eventually reduce the deficit and the debt ratio while stimulating economic growth. The formal condition proves to be reachable for the range of the key parameters observed in most member countries of the Organization for Economic Cooperation and Development. The paper also discusses the problems that could make the condition more difficult to deal with in the European context and how they could be solved.
2013	H12	CV: Marelli, Enrico, and Marcello Signorelli. 2013. "The Unemployment Impact of Financial Crises." In <i>Financial Crisis, Labour Markets and Institutions</i> , ed. Sebastiano Fadda and Pasquale Tridico, 192-211. Routledge Frontiers of Political Economy. London and New York: Taylor and Francis, Routledge.
2013	H12	Winkler, Adalbert. 2013. "Ordnung und Vertrauen--Zentralbank und Staat in der Eurokrise. (With English summary)." <i>Perspektiven der Wirtschaftspolitik</i> , 14(3-4): 198-218. The management of the euro crisis, i.e. the ECB's lender of last resort activities for crisis countries and crisis banks, as well as the establishment of the European Stability Mechanism and a European banking union, has been severely criticized by economists following the German ordoliberal tradition. They argue that crisis management violates key principles of economic policy, namely the principle of liability and the principle of stable money. Accordingly, euro crisis management undermines private sector confidence in the market economy and in the currency. This article argues that this view neglects the fact that the crisis itself reflects a loss of confidence. Thus, crisis management has to restore confidence first, which can only be achieved by measures that inherently conflict with ordoliberalism. As a result, the critique of euro crisis management is misplaced as ordoliberal principles provide a useful guideline for economic policies only after confidence has been restored.
2013	H12	Claessens, Stijn, Ayhan Kose, Luc Laeven, and Fabian Valencia. 2013. <i>Understanding Financial Crises: Causes, Consequences, and Policy Responses</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 9310. The global financial crisis of 2007-09 has led to an intensive research program analyzing a wide range of issues related to financial crises. This paper presents a summary of a forthcoming book, <i>Financial Crises: Causes, Consequences, and Policy Responses</i> , that includes 19 contributions examining these issues and distilling policy lessons. The book covers a wide range of crises, including banking, balance-of-payments, and sovereign debt crises. It reviews the typical patterns prior to crises, considers lessons on their antecedents, and analyzes their evolution and aftermath. It also provides valuable policy lessons on how to prevent, contain and manage financial crises.
2013	H12	Claessens, Stijn, and Ayhan Kose. 2013. <i>Financial Crises: Explanations, Types, and Implications</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 9329. This paper reviews the literature on financial crises focusing on three specific aspects. First, what are the main factors explaining financial crises? Since many theories on the sources of financial crises highlight the importance of sharp fluctuations in asset and credit markets, the paper briefly reviews theoretical and empirical studies on developments in these markets around financial crises. Second, what are the major types of financial crises? The paper focuses on the main theoretical and empirical explanations of four types of financial crises--currency crises, sudden stops, debt crises, and banking crises--and presents a survey of the literature that attempts to identify these episodes. Third, what are the real and financial sector implications of crises? The paper briefly reviews the short- and medium-run implications of crises for the real economy and financial sector. It concludes with a summary of the main lessons from the literature and future research directions.

2013	H12	Bouis, Romain, Lukasz Rawdanowicz, Jean-Paul Renne, Shingo Watanabe, and Ane Kathrine Christensen. 2013. <i>The Effectiveness of Monetary Policy since the Onset of the Financial Crisis</i> . OECD Publishing, OECD Economics Department Working Papers: 1081. In the wake of the Great Recession, a massive monetary policy stimulus was provided in the main OECD economies. It helped to stabilise financial markets and avoid deflation. Nonetheless, GDP growth has been sluggish and in some countries lower than expected given the measures taken, and estimated economic slack remains large. In this context, this paper assesses the effectiveness of monetary policy in recent years. It finds that notwithstanding an almost full transmission of policy interest rate cuts and unconventional policy measures to higher asset prices and lower cost of credit in and outside the banking sector in most countries, with the exception of vulnerable euro area economies, monetary policy stimulus did not show up in stronger growth due to a combination of three factors. First, lower policy interest rates may not have provided as much stimulus as expected given the evidence of a decrease in natural interest rates, resulting from the estimated decline in potential GDP growth in the wake of the crisis. Second, balance sheet adjustments of non-financial companies and households, large uncertainty as well as simultaneous and considerable fiscal consolidation in many OECD countries constituted important headwinds. Third, the bank lending channel of monetary policy transmission appears to have been impaired, mainly due to considerable balance sheet adjustments and prevailing uncertainty, which together limited banks' capacity and willingness to supply credit. The paper also stresses that the monetary accommodation risks having unintended negative consequences which are likely to increase with its duration.
2013	I13	Diss: Depew, Briggs. 2013. Public Policy and Its Impact on the Labor Market. PhD diss. University of Arizona. My dissertation consists of four chapters that are motivated by understanding the intended and unintended economic outcomes of public policy in the labor market. My particular focus is studying how individuals respond to incentives created by policy and welfare reform. The first chapter explores the effect of expanding dependent health insurance coverage to young adults. I study both the outcomes from state policies and the recent Affordable Care Act (ACA). In the second chapter I analyze the unintended consequences of a New Deal policy that paid farmers to reduce production. As a result, I find significant displacement of croppers and tenants in the Cotton South. The third chapter ties together the micro-foundations of the labor supply to the firm with the macroeconomic areas of on-the-job search theory and the business cycle. By using employee level data from two US manufacturing firms in the volatile interwar period, I show that these two firms had significantly more wage setting power during recessions than expansions. My final chapter addresses the question of how does reduced immigration restrictions affect the composition of immigrants in the US.
2013	I13	Burkhauser, Richard V., Mary C. Daly, and Brian T. Lucking. 2013. "Is Australia One Recession Away from a Disability Blowout? Lessons from Other Organisation for Economic Co-operation and Development Countries." <i>Australian Economic Review</i> , 46(3): 357-68. A blowout in disability-based cash transfer programmes resulted in fundamental reforms over the last decade in several Organisation for Economic Co-operation and Development countries. Similar reforms are being proposed in the United States in

Year	DE	Title and Abstract
		the wake of its disability programme growth following the Global Financial Crisis. We compare trends in US and Australian disability receipt with those of the Netherlands and Sweden and argue that Australia's current Disability Support Pension programme is vulnerable to the same forces that caused unsustainable programme growth in these countries. Absent fundamental reforms focused on return to work over benefit receipt means that Australia could be one recession away from disability benefit blowout.
2013	I13	Chandra, Amitabh, Jonathan Holmes, and Jonathan Skinner. 2013. "Is This Time Different? The Slowdown in Health Care Spending." <i>Brookings Papers on Economic Activity</i> , 0(0): 261-302. Why have health care costs moderated in the last decade? Some have suggested that the Great Recession alone was the cause, but health expenditure growth in the depths of the recession was nearly identical to growth prior to the recession. Nor can the Affordable Care Act (ACA) take credit, since the slowdown began prior to its implementation. Instead, we identify three primary causes of the slowdown: the rise in high-deductible insurance plans, state-level efforts to control Medicaid costs, and a general slowdown in the diffusion of new technology, particularly for use by the Medicare population. A more difficult question is: will this slowdown continue? On this question, we are pessimistic, and not entirely because a similar (and temporary) slowdown occurred in the early 1990s. The primary determinant of long-term growth is the continued development of expensive technology, and there is little evidence of a permanent slowdown in that pipeline. Proton beam accelerators are on target to double between 2010 and 2014, while the market for heart assist devices (costing more than \$300,000 each) is projected to grow rapidly. Accountable care organizations (ACOs) and emboldened insurance companies may yet stifle health care cost growth, but our best estimate over the next two decades is that health care costs will grow at GDP plus 1.2 percent, a rate lower than previous estimates but still on track to cause serious fiscal pain for taxpayers and workers who bear the costs of higher premiums.

2013	J88 K23	Valle, Victorio, Fernando Pampillon, and Angel Laborda. 2013. "Las reformas pendientes de la economía española. (The Remaining Reforms of the Spanish Economy. With English summary)." <i>Boletín de Estudios Económicos</i> , 68(209): 343-68. The current government reform effort to correct the serious imbalances accumulated by the Spanish economy in the last twenty years, needs to be complemented by other reforms that impulse and ensure a robust and fast solution to the crisis. The article ponders over the objectives that should be pursued reforms, lists those that are still pending, and focuses on three that considers essential: i) the tax position aimed at raising levels of European countries with lower restrictive effects and greater equity in the distribution of the costs of the crisis, ii) to complete labor reform to reverse the temporary employment and active and passive employment policy, and iii) reforming the public administration, especially in areas relating to institutional structure, professionalizing the civil service, and the transparency of its actions.
2013	L15	Drljaca, Miroslav, ed. 2013. <i>Hrvatsko društvo menadžera kvalitete. 14. međunarodni simpozij o kvaliteti. Kvalitetom protiv recesije. Zbornik radova. Rovinj, Croatia, 21-22 ožujka 2013. (Croatian Quality Managers Society 14th International Symposium on Quality: Quality against Recession: Proceedings: Rovinj, Croatia, March 21st-22nd, 2013.)</i> , Zagreb: Croatian Quality Managers Society. Fifty papers explore how to improve implementation of social reforms and quality of management in Croatia. Papers focus on quality against recession; quality and competitiveness; quality and social responsibility; process management in environmental protection; quality and implementation of EU directives; quality in manufacturing and construction; quality in education and sport; food safety management systems; quality and traffic systems; quality in health care and tourism; quality and media; and quality in the public sector. Drljaca is President of the Croatian Quality Managers Society. No index.
2013	L15	Kurlat, Pablo. 2013. "Lemons Markets and the Transmission of Aggregate Shocks." <i>American Economic Review</i> , 103(4): 1463-89. I study a dynamic economy featuring adverse selection in asset markets. Borrowing-constrained entrepreneurs sell past projects to finance new investment, but asymmetric information creates a lemons problem. I show that this friction is equivalent to a tax on financial transactions. The implicit tax rate responds to aggregate shocks, generating amplification in the response of investment and cyclical variation in liquidity.

2013	O44	Heutel, Garth, and Carolyn Fischer. 2013. <i>Environmental Macroeconomics: Environmental Policy, Business Cycles, and Directed Technical Change</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 18794. Environmental economics has traditionally fallen in the domain of microeconomics, but recently approaches from macroeconomics have been applied to studying environmental policy. We focus on two macroeconomic tools and their application to environmental economics. First, real business cycle models can incorporate pollution and pollution policy and be used to answer several questions. How can environmental policy adjust to business cycles? How do different types of policies fare in a context with business cycles? Second, endogenous technological growth is an important component of environmental policy. Several studies ask how policy can be designed to both tackle emissions directly and influence the adoption of clean technologies. We focus on these two aspects of environmental macroeconomics but emphasize that there are many other potential applications.
2013	O44	Varvarigos, Dimitrios. 2013. "Environmental Dynamics and the Links between Growth, Volatility and Mortality." <i>Bulletin of Economic Research</i> , 65(4): 314-31. I construct a model of a growing economy with pollution. The analysis of the model shows that the interactions between capital accumulation, endogenous lifetime, and environmental quality determine both the long-run growth rate and the pattern of convergence (i.e., monotonic or cyclical) towards the balanced growth path. I argue that such interactions can provide a possible explanatory factor behind the, empirically observed, negative correlation between growth and volatility. Furthermore, the model may capture the observed pattern whereby economic growth and mortality rates appear to be negatively related in the long run, but positively related in the short run.
2013	P45	Sheikh Tabaghi, Parvin Heydari. 2013. "Investigation of Business Cycle Synchronization in Selected Countries of OIC. (In Farsi. With English summary)." <i>Biquarterly Journal of Economic Essays</i> , 10(19): 125-40. One of the responses of countries to deal with the phenomenon of globalization is economic and regional integration. Today, along with globalization, the debate on the economic and regional integration has also flourished in various parts of the world. Islamic countries by relying on their advantages and different economic capabilities can increase flows of foreign investment, followed by, higher level of economic growth, to cope

Year	DE	Title and Abstract
		with globalization trend. Establishment of common economic union by reducing trade restrictions and barriers can, on one hand, increase openness, level of trade, production and growth. On the other hand, increasing the volume of trade between member countries can increase transfer of possible fluctuations between them. The purpose of this study was to investigate the relationship between trade intensity and business cycle synchronization between the Islamic Republic of Iran and other members of the OIC. To estimate the model, panel data approach for the period 1994-2011 were applied. This study used a panel of bilateral trade and business cycle data spanning 9 selected member countries over 18 years. The results showed although, there is a correlation between the business cycle in selected countries of OIC, but due to lack of homogeneity degree of development and economic structure of members, intensity of correlation between business cycles are not the same. Therefore, it is suggested that the anti-Cycle economic policies should be made with caution.
2013	Q37	Hernandez, Gonzalo. 2013. "Terms of Trade and Output Fluctuations in Colombia." <i>CEPAL Review</i>, 0(110): 109-31. This paper explores the impact of the terms of trade on output fluctuations in Colombia, a developing country where as much as 62% of export earnings come from just four commodities: oil (42%), coal (14%), coffee (5%), and nickel (1%). This research was prompted by: the particular role of short-run fluctuations in developing economies, the fact that the Colombian terms of trade are procyclical, and the discussion on economic policies towards sterilization of the effects of commodity prices. Following time series analysis for the period 1994 -2011, robust evidence was found indicating that around one third of Colombia's quarterly growth is attributable to changes in the terms of trade.
2013	Q47	Diss: Ginn, Vance. 2013. An Examination of the Macroeconomic Effects of Petroleum Prices. PhD diss. Texas Tech University. After the last decade of rising and volatile retail gasoline and diesel prices, their economic importance has resurfaced in the literature. If these trends continue, it will be vital to accurately predict these fuel prices. In Chapter I, I construct different retail fuel price forecasting models and estimate them with monthly data from 1983-2002. I examine the accuracy of these forecasting models by comparing the root mean squared errors from out-of-sample rolling forecasts during the following three distinct periods that occur around identified structural breaks in these fuel prices: 2003-2004, when fuel prices were stable yet increasing; 2005-2007, which included hurricane-induced fuel supply shocks; and 2008-2010, when fuel prices were highly volatile. I find that the gasoline futures price is best at predicting the retail gasoline price in all periods and the diesel futures price is best at forecasting the retail diesel price in the first two periods; however, during the high retail diesel price volatility period, the crude oil spot price provides the most precise forecast. Although exogenous shocks make it difficult to forecast fuel prices, these conclusions indicate that some variables are better than others at forecasting retail fuel prices during different periods of fuel price volatility. The mixed importance of an oil price shock to explaining U.S. business cycles and the potentially controversial short-run restrictions that identify structural shocks motivate Chapter II's inquiry into the responses of macro aggregates to an oil price shock with an alternative long-run structural approach. I consider a four-variable VAR model with monthly data for the 1968:1-2012:8 period for the unemployment rate, real oil price, Chicago Fed National Activity Index (CFNAI), and the inflation rate of the consumer price index (CPI). I construct a structural vector autoregressive (VAR) representation with fully recursive long-run restrictions that identify structural shocks to the natural rate of unemployment, oil price, aggregate supply, and aggregate demand. After finding what appears to be a structural break in the real oil price around 1986, I split the sample period in 1986 and compare the estimated impulse responses and variance decompositions of the macroeconomic aggregates to identified structural shocks. Since there is evidence that the primary underlying source of oil price fluctuations has been oil demand-related disturbances, especially global oil demand, I extend the four-variable VAR model by replacing the real oil price with Kilian's (2009b) global real economic activity index and impose long-run restrictions that attempt to extract a global oil demand shock from other oil market shocks. The results for the full sample indicate that the unemployment rate responds negatively and the CFNAI responds positively to both an oil price shock and a global oil demand shock. Inflation's response to an oil price shock is significantly positive for the first four months before returning to its long-run level; however, inflation responds negatively to a global oil demand shock and is positive two to six months after the shock. A comparison of the macro aggregate responses to an oil price shock before and after 1986 suggest that these responses have declined, except for inflation's positive response. I conclude by noting that these results suggest that monetary policymakers may not only concern themselves with the price of oil, but how their policies influence, or react, to different underlying sources of oil price fluctuations.
2013	R14	Kuminoff, Nicolai V., and Jaren C. Pope. 2013. "The Value of Residential Land and Structures during the Great Housing Boom and Bust." <i>Land Economics</i>, 89(1): 1-29. This study examines how the value of residential land and structures evolved during the great housing boom and bust, using data on more than a million residential properties that were sold in 10 metropolitan areas between 1998 and 2009. We use a hedonic estimator to disentangle the market value of land and structures at a local (Census tract) level. Our estimates reveal substantial heterogeneity in the evolution of the market value of land and structures within metropolitan areas. Surprisingly, lower-value land at the urban fringes of metropolitan areas was the most volatile during the boom-bust.
2013	R48	Gorecki, Paul K. 2013. "The Small Public Service Vehicle Market in Ireland: Regulation and the Recession." <i>Economic and Social Review</i>, 44(2): 247-72. The small public service vehicle (SPSV) market in Ireland appears to have adjusted well to the changed economic circumstances since the onset of the recession. Despite this, a prohibition has been introduced since June 2010 on new taxi and hackney licences, while a series of measures are being introduced in 2012 and 2013 that are likely to limit the flexibility of the SPSV market to respond to changes in demand and supply, especially during busy peak periods, while at the same time obscuring market signals and making regulation more difficult. Taken together these measures mean that there is a real danger that when the economy revives and demand for SPSV services increases that there will be increased waiting times, as there were in the 1990s when taxi numbers were restricted, while fare discounting will end much sooner than it otherwise would. In this paper, these issues are explored together with the implications for independence of the SPSV regulatory regime.

Table E37.F Examples of Publications according to New Links in 2006—2013

Year	DE	Title and Abstract
2006		
2006	E13	Kehoe, Patrick J. 2006. <i>How to Advance Theory with Structural VARs: Use the Sims-Cogley-Nason Approach</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 12575. The common approach to evaluating a model in the structural VAR literature is to compare the impulse responses from structural VARs run on the data to the theoretical impulse responses from the model. The Sims-Cogley-Nason approach instead compares the structural VARs run on the data to identical structural VARs run on data from the model of the same length as the actual data. Chari, Kehoe, and McGrattan (2006) argue that the inappropriate comparison made by the common approach is the root of the problems in the SVAR literature. In practice, the problems can be solved simply. Switching from the common approach to the Sims-Cogley-Nason approach basically involves changing a few lines of computer code and a few lines of text. This switch will vastly increase the value of the structural VAR literature for economic theory.
2006	F01	Jagic, Timotej, and Darja Borsic. 2006. "Stanje poslovnega cikla v Sloveniji in svetovnem gospodarstvu. (The State of the Business Cycle in Slovenia and the World Economy. With English summary.)." <i>Nase Gospodarstvo/Our Economy</i>, 52(5-6): 110-15. The world economy at the beginning of 2006 remains stable. While the US economy still seems to be slowing down, there is a positive outlook for Japan and Europe. Due to strong growth in the Chinese economy, world economic growth remains at a high level, but in 2007 it is expected to slow down. Inflation is still moderate. Assuming stable oil prices, it is expected to decrease further in 2007. Forecast dynamics for Slovenia show an acceleration of economic activity until the third quarter of 2006, when it is possible to detect upper points [are these "peaks"?] in the business cycle. Since the last three observations do not show any negative trend, it is not possible at this moment (April 2006) to forecast a slowdown in the last quarter and in 2007.
2006	F15	Pain, Nigel, Isabell Koske, and Marte Sollie. 2006. <i>Globalisation and Inflation in the OECD Economies</i>. OECD Economics Department, OECD Economics Department Working Papers: 524. Over the past 25 years inflation has moderated considerably in all OECD economies. At the same time, the production of many goods and services has become increasingly internationalised and the level of trade between the OECD and non-OECD economies has risen markedly. This paper investigates the extent to which the observed changes in the inflation process can be attributed to the increasing integration of non-OECD economies into the global economy. The results of the analysis show that i) import prices have become a more important driver of domestic consumer prices since the mid-1990s; ii) the sensitivity of inflation to domestic economic conditions has declined whereas the sensitivity to foreign economic conditions has risen, working through import prices; and iii) the strong GDP growth in the non-OECD economies over the past five years has contributed to the growth of real oil and metals prices. A scenario analysis shows that globalisation has put upward pressure on inflation via higher commodity prices and downward pressure via lower non-commodity import prices with the latter effect having dominated in most OECD economies.
2006	G23	Briere, Marie, Ombretta Signori, and Kokou Topeglo. 2006. <i>Bond Market "Conundrum": New Factors Explaining Long-term Interest Rates?</i>. Universite Libre de Bruxelles, Solvay Business School, Centre Emile Bernheim (CEB), Working Papers CEB: 06-024.RS. Interest rates behaved highly atypically from 2004 to 2006. While the US central bank raised its policy rate at every meeting, long-term interest rates remained so remarkably stable that Fed Chairman A. Greenspan described their behaviour as a "conundrum." Comparing long term rates to their theoretical level based on fundamental valuation model, we show that the anomaly was in average 40 bp. Various explanations have been put forward: investors' changed attitude toward risk, and the rise in US Treasury purchases by different categories of buyers. We show that, if these variables could theoretically be responsible for bond risk premium decline, by incorporating them in a fundamental model of bond rates, they can explain less than half of the anomaly. Their recent changing influence could nevertheless justify their use for prospective analysis of bond rates.

2006	P52	Hoeller, Peter, and Claude Giorno. 2006. <i>Nothing Ventured, Nothing Gained: The Long-run Fiscal Reward of Structural Reforms</i>. OECD Economics Department, OECD Economics Department Working Papers: 493. The recent reform of the Stability and Growth Pact provides more leeway for EU governments to temporarily breach the 3% deficit limit if this facilitates the implementation of initially expensive reforms. But the implementation of this principle is not obvious as budgets would need to specify the initial and multi-annual budgetary cost and benefit profile of reforms. Budgets should also be explicit about the fiscal cost of inaction to allow a balanced judgment of countries' trade-offs between the various options available. This paper first assesses the information requirements to implement this new form of flexibility built into the Stability and Growth Pact. It then provides simulation exercises to highlight the positive budgetary effects of coordinated structural reforms in the euro area as well as the need for an adequate monetary policy response to make sure that demand adjusts to the improved supply conditions swiftly. The budgetary gains would still depend on the type of reform and their impact on employment and productivity. On the other hand, national policy initiatives by a single country may only have a limited impact, especially in the short term and in the case of a large country. Indeed, in monetary union, the strength of endogenous adjustment mechanisms appears to be weaker in larger countries. Finally, the experience of New Zealand and Australia has shown that the longer-term benefits of reforms both in terms of the budget and overall economic performance are significant. Even so, it is not easy to disentangle the various forces at play. Fundamentally, structural reform and the implementation of smart fiscal frameworks tend to go hand in hand ? indeed may be two sides of the same coin.
2006	R31	Milas, Costas, Philip Rothman, and Dick van Dijk, eds. 2006. <i>Nonlinear Time Series Analysis of Business Cycles, Contributions to Economic Analysis series</i>, vol. 276. Amsterdam and San Diego: Elsevier. Fifteen papers explore issues in business cycle nonlinearity. Papers discuss dating business cycle turning points; combining predictors and combining information in modeling--forecasting U.S. recession probabilities and output growth; the importance of nonlinearity in reproducing business cycle features; the vector floor and ceiling model; a new framework to analyze business cycle synchronization; nonlinearity and instability in the euro area; nonlinear modeling of autoregressive structural breaks in some U.S. macroeconomics series; trend-cycle decomposition models with smooth-transition parameters--evidence from U.S. economic time series; modeling inflation and money demand using a Fourier-series approximation; random walk smooth transition autoregressive models; nonlinearity and structural change in interest rate reaction functions for the United States, United Kingdom, and Germany; state asymmetries in the effects of monetary policy shocks on output--some new evidence for the euro area; nonlinear dynamics in output, real exchange rates, and real money balances--Norway, 1830-2003; a predictive comparison of some simple long- and short-memory models of daily U.S. stock

2007	C01	Aruoba, S. Boragan, Francis Diebold, and Chiara Scotti. 2007. <i>Real-Time Measurement of Business Conditions</i>. Penn Institute for Economic Research, Department of Economics, University of Pennsylvania, PIER Working Paper Archive. We construct a framework for measuring economic activity in real time (e.g., minute-by-minute), using a variety of stock and flow data observed at mixed frequencies. Specifically, we propose a dynamic factor model that permits exact filtering, and we explore the efficacy of our methods both in a simulation study and in a detailed empirical example.
2007	C81 D57	Sancho, Ferran. 2007. <i>The Total Fiscal Cost of Indirect Taxation: an Approximation Using Catalonia's Recent Input-output Table</i>. Unitat de Fonaments de l'Anàlisi Econòmica (UAB) and Institut d'Anàlisi Econòmica (CSIC), UFAE and IAE Working Papers. In this note we quantify to what extent indirect taxation influences and distorts prices. To do so we use the networked accounting structure of the most recent input-output table of Catalonia, an autonomous region of Spain, to model price formation. The role of indirect taxation is considered both from a classical value perspective and a more neoclassical flavoured one. We show that they would yield equivalent results under some basic premises. The neoclassical perspective, however, offers a bit more flexibility to distinguish among different tax figures and hence provide a clearer disaggregate picture of how an indirect tax ends up affecting, and by how much, the cost structure.
2007	F20	De Ketelbutter, Bart, Ludovic Dobbelaere, and Filip Vanhorebeek. 2007. <i>Working Paper 10-07--Foreign trade in Modtrim</i>. Federal Planning Bureau, Belgium, Working Papers. This working paper gives an overview of the Modtrim team's recent research in the field of Belgian exports and export markets. In the first chapter a new leading indicator is introduced as a supplementary tool to determine a growth profile for Belgium's potential export markets in the first quarters of the forecasting period. In the second chapter, an attempt is made to improve forecasts of Belgium's exports by breaking down the model equation into a goods and a services component. Finally, the third chapter reveals that (a lack of) competitiveness is probably not the only reason for the losses of export market share in Belgium and in some of its main trading partners in the past 25 years.
2007	G10	Dowd, Kevin. 2007. "Temporal Dependence in Multi-step Density Forecasting Models." <i>Journal of Risk Model Validation</i>, 1(1): 3-22. Temporal dependence in multi-step density forecasting models is examined. If the underlying random variable has a known dependence structure this suggests that suitably transformed observations from the density forecasting model have a unique (and often simple) dependence structure of their own. Knowledge of this structure enables the model validator to carry out more efficient tests that take account of, and also test, the dependence structure itself. The tests themselves are extremely simple and powerful. An illustrative empirical application of the proposed approach to the evaluation of the Bank of England's "fan chart" forecasts of inflation uncertainty is also given.
2007	G15	Junttila, Juha. 2007. "Forecasting the Macroeconomy with Contemporaneous Financial Market Information: Europe and the United States." <i>Review of Financial Economics</i>, 16(2): 149-75. Using economic tracking portfolios (ETP), I find that it is possible to forecast future values of inflation and changes in industrial production in the United States and three core euro countries--Italy, France and Germany--utilizing only current and past financial market information. The longer the forecasting horizon, the better the forecasts based solely on financial market information compared to results from other methods. Of the countries I analyze, the overall forecasting performance of the tracking portfolios is the best for the U.S., and my method outperforms the forecasting performance of a VAR approach.
2007	J63	Barnichon, Regis. 2007. <i>The Shimer Puzzle and the Correct Identification of Productivity Shocks</i>. Centre for Economic Performance, LSE, CEP Discussion Papers. Shimer (2005a) claims that the Mortensen-Pissarides search model of unemployment lacks an amplification mechanism because it cannot generate the observed business cycle fluctuations in unemployment given labor productivity shocks of plausible magnitude. This paper argues that part of the problem lies with the correct identification of productivity shocks. Because of the endogeneity of measured labor productivity, filtering out the trend component as in Shimer (2005a) may not correctly identify the shocks driving unemployment. Using a New-Keynesian framework with search unemployment, this paper estimates that close to 50% of the Shimer puzzle is due to the misidentification of productivity shocks. In addition, I show that extending the search model with an aggregate demand side remarkably improves the ability of the standard search model to match the moments of key labor market variables.
2007	M51	Kaufmann, Sylvia. 2007. "Capturing the Link between M3 Growth and Inflation in the Euro Area--An Econometric Model to Produce Conditional Inflation Forecasts." <i>Monetary Policy and the Economy</i>, 0(0): 93-108. In this paper, we capture the link between M3 growth and inflation with a vector error correction model. The analysis also includes the 10-year government bond yield, the three-month EURIBOR interest rate and GDP. The long-run link between M3 growth and inflation is observable in the raw data. Over the years 1980-2006, we find that M3 growth and inflation are cointegrated, which means that deviations from long-term average real money growth lead to mean-reverting adjustment processes to restore the average level of real money growth. The full effect of an unexpected monetary shock thus materializes over time in the level of inflation, after a transitory period during which GDP and interest rates have been affected as well. Out-of-sample yearly conditional inflation forecasts are produced from 2001 to 2006 which are compared to Eurosystem staff projections. Qualitatively, the monetary model predicts future inflation rates which are consistent with the ECB's assessment of future inflation prospects.
2007	N01	Bordo, Michael D., Ali Dib, and Lawrence Schembri. 2007. <i>Canada's Pioneering Experience with a Flexible Exchange Rate in the 1950s:(Hard) Lessons Learned for Monetary Policy in a Small Open Economy</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 13605. This paper revisits Canada's pioneering experience with floating exchange rate over the period 1950-1962. It examines whether the floating rate was the best option for Canada in the 1950s by developing and estimating a New Keynesian small open economy model of the Canadian economy. The model is then used to conduct a counterfactual analysis of the impact of different monetary policies and exchange rate regimes. The main finding indicates that the flexible exchange rate helped reduce the volatility of key macro-economic variables. The Canadian monetary authorities, however, clearly did not understand all of the implications of conducting monetary policy under a flexible exchange rate and a high degree of capital mobility. The paper confirms that monetary policy was more volatile in the post-1957 period and Canada's macroeconomic performance suffered as a result.
2007	Q41	Jagric, Timotej, and Vita Jagric. 2007. "Ocena stanja poslovnega cikla. (The Current State of the Business Cycle. With English summary)." <i>Bančni Vestnik</i>, 56(1-2): 16-19. The world economy has lost momentum in the course of 2006. While capacity utilization started to decline in the US and in Japan, the upswing in Europe even firmed. Nevertheless, we are witnessing a cycle with new characteristics: extremely long upswing, diverging trends across the major economic regions, and extreme robustness to

Year	DE	Title and Abstract
		the shocks, In 2007, we expect further weakness in the US economy. The euro area expansion will remain relatively robust despite a significant dampening impact from fiscal policies. On the assumption of stable oil prices inflation will decline slowly over the forecast horizon New business cycle properties can also be observed in Slovene economy. Therefore it is important to include the changing nature of the business cycle in the forecasting model.

2008	C46	Giacomini, Raffaella, Andreas Gottschling, Christian Haefke, and Halbert White. 2008. "Mixtures of T-Distributions for Finance and Forecasting." <i>Journal of Econometrics</i>, 144(1): 175-92. We explore convenient analytic properties of distributions constructed as mixtures of scaled and shifted t-distributions. Particularly desirable for econometric applications are closed-form expressions for antiderivatives (e.g., the cumulative density function). We illustrate the usefulness of these distributions in two applications. In the first application, we produce density forecasts of U.S. inflation and show that these forecasts are more accurate, out-of-sample, than density forecasts obtained using normal or standard t-distributions. In the second application, we replicate the option-pricing exercise of Abadir and Rockinger [Density functionals, with an option-pricing application. <i>Econometric Theory</i> 19, 778-811.] and obtain comparably good results, while gaining analytical tractability.
2008	D72	Dreher, Axel, Silvia Marchesi, and James Raymond Vreeland. 2008. "The Political Economy of IMF Forecasts." <i>Public Choice</i>, 137(1-2): 145-71. We investigate the political economy of IMF forecasts with data for 157 countries (1999-2005). Generally, we find evidence of forecast bias in growth and inflation. Specifically, we find that countries voting with the United States in the UN General Assembly receive lower inflation forecasts as domestic elections approach. Countries with large loans outstanding from the IMF also receive lower inflation forecasts, suggesting that the IMF engages in "defensive forecasting." Finally, countries with fixed exchange rate regimes receive lower inflation forecasts, suggesting the IMF desires to preserve stability as inflation can have detrimental effects under such an exchange rate regime.
2008	F51 Q34 Q54 Q55 Q58	McKibbin, Warwick, Adele Morris, and Peter Wilcoxon. 2008. <i>EXPECTING THE UNEXPECTED: MACROECONOMIC VOLATILITY AND CLIMATE POLICY</i>. Australian National University, Centre for Applied Macroeconomic Analysis, CAMA Working Papers. To estimate the emissions reductions and costs of a climate policy, analysts usually compare a policy scenario with a baseline scenario of future economic conditions without the policy. Both scenarios require assumptions about the future course of numerous factors such as population growth, technical change, and non-climate policies like taxes. The results are only reliable to the extent that the future turns out to be reasonably close to the assumptions that went into the model. In this paper we examine the effects of unanticipated macroeconomic shocks to growth in developing countries or a global financial crisis on the performance of three climate policy regimes: a globally-harmonized carbon tax; a global cap and trade system; and the McKibbin-Wilcoxon hybrid. We use the G-Cubed dynamic general equilibrium model to explore how the shocks would affect emissions, prices, incomes, and wealth under each regime. We consider how the different climate policies tend to increase or decrease the shock's effect in the global economy and draw inferences about which policy approaches might better withstand such shocks. We find that a global cap and trade regime significantly changes the way growth shocks would otherwise be transmitted between regions while price-based systems such as a global carbon tax or a hybrid policy do not. Moreover, in the case of a financial meltdown, a price based system enables significant emissions reductions at low economic cost whereas a quantity target base system loses the opportunity for low cost emission reduction reductions because the target is fixed.

2009	A14	Gunnel, Stefan, and Karl-Heinz Todter. 2009. "Does Benford's Law Hold in Economic Research and Forecasting?" <i>Empirica</i>, 36(3): 273-92. First and higher order digits in data sets of natural and socio-economic processes often follow a distribution called Benford's law. This phenomenon has been used in business and scientific applications, especially in fraud detection for financial data. In this paper, we analyse whether Benford's law holds in economic research and forecasting. First, we examine the distribution of regression coefficients and standard errors in research papers, published in <i>Empirica</i> and <i>Applied Economics Letters</i> . Second, we analyse forecasts of GDP growth and CPI inflation in Germany, published in <i>Consensus Forecasts</i> . There are two main findings: the relative frequencies of the first and second digits in economic research are broadly consistent with Benford's law and in sharp contrast, the second digits of <i>Consensus Forecasts</i> exhibit a massive excess of zeros and fives, raising doubts on their information content.
2009	C58	Diss: Ibarra-Ramirez, Raul. 2009. Applications of Time Series in Finance and Macroeconomics. PhD diss. Texas A&M University. This dissertation contains three applications of time series in finance and macroeconomics. The first essay compares the cumulative returns for stocks and bonds at investment horizons from one to ten years by using a test for spatial dominance. Spatial dominance is a variation of stochastic dominance for nonstationary variables. The results suggest that for investment horizons of one year, bonds spatially dominate stocks. In contrast, for investment horizons longer than five years, stocks spatially dominate bonds. This result is consistent with the advice given by practitioners to long term investors of allocating a higher proportion of stocks in their portfolio decisions. The second essay presents a method that allows testing of whether or not an asset stochastically dominates the other when the time horizon is uncertain. In this setup, the expected utility depends on the distribution of the value of the asset as well as the distribution of the time horizon, which together form the weighted spatial distribution. The testing procedure is based on the Kolmogorov Smirnov distance between the empirical weighted spatial distributions. An empirical

Year	DE	Title and Abstract
		application is presented assuming that the event of exit time follows an independent Poisson process with constant intensity. The last essay applies a dynamic factor model to generate out-of-sample forecasts for the inflation rate in Mexico. Factor models are useful to summarize the information contained in large datasets. We evaluate the role of using a wide range of macroeconomic variables to forecast inflation, with particular interest on the importance of using the consumer price index disaggregated data. The data set contains 54 macroeconomic series and 243 consumer price subcomponents from 1988 to 2008. The results indicate that factor models outperform the benchmark autoregressive model at horizons of one, two, four and six quarters. It is also found that using disaggregated price data improves forecasting performance.
2009	C61	McCallum, Bennett T. 2009. <i>Causality, Structure, and the Uniqueness of Rational Expectations Equilibria</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 15234. Consider a rational expectations (RE) model that includes a relationship between variables x_t and z_{t+1} . To be considered structural and potentially useful as a guide to actual behavior, this model must specify whether x_t is influenced by the expectation at t of z_{t+1} or, alternatively, that z_{t+1} is directly influenced (via some inertial mechanism) by x_t (i.e., that z_t is influenced by x_{t-1}). These are quite different phenomena. Here it is shown that, for a very broad class of multivariate linear RE models, distinct causal specifications involving both expectational and inertial influences will be uniquely associated with distinct solutions--which will result operationally from different specifications concerning which of the model's variables are predetermined. It follows that for a given structure, and with a natural continuity assumption, there is only one RE solution that is fully consistent with the model's specification. Furthermore, this solution does not involve 'sunspot' phenomena.
2009	C90 D80	Pfajfar, D., and B. Zakerlj. 2009. <i>Experimental Evidence on Inflation Expectation Formation (Replaced by CentER DP 2011-091)</i> . Tilburg University, Center for Economic Research, Discussion Paper: 2009-007. Using laboratory experiments, we establish a number of stylized facts about the process of inflation expectation formation. Within a New Keynesian sticky price framework, we ask subjects to provide forecasts of inflation and their corresponding confidence bounds. We study individual responses and properties of the aggregate empirical distribution. Many subjects do not rely on a single model of expectation formation, but are rather switching between different models. About 40% of the subjects predominately use a rational rule when forecasting inflation and about 35% of agents simply extrapolate trend. Around 5% of subjects behave in an adaptive manner, while the remaining 20% behaves in accordance to adaptive learning and sticky information models. Furthermore, we find that subjects in only 60% of cases correctly perceive the underlying uncertainty in the economy when reporting confidence intervals. However, empirical analysis does not support a significant countercyclical behavior of individuals' confidence intervals.
2009	D12	Inoue, Atsushi, Lutz Kilian, and Fatma Burcu Kiraz. 2009. "Do Actions Speak Louder Than Words? Household Expectations of Inflation Based on Micro Consumption Data." <i>Journal of Money, Credit, and Banking</i> , 41(7): 1331-63. Survey data on household expectations of inflation are routinely used in economic analysis, yet it is not clear how accurately households are able to articulate their expectations in survey interviews. We propose an alternative approach to recovering households' expectations of inflation from their consumption expenditures. We show that these expectations measures have predictive power for consumer price index (CPI) inflation. They are better predictors of CPI inflation than household survey responses and more highly correlated with professional inflation forecasts, except for highly educated consumers, consistent with the view that more educated consumers are better able to articulate their expectations. We also document that households' inflation expectations respond to inflation news, as measured by the unpredictable component of inflation predictions in the Survey of Professional Forecasters. The response to inflation news tends to increase with households' level of education, consistent with the existence of constraints on household's ability to process this information.
2009	D24 D40 H31	Goldberg, Pinelopi, and Rebecca Hellerstein. 2009. <i>How Rigid Are Producer Prices?</i> . Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 193goldberg.pdf. How rigid are producer prices? Conventional wisdom is that producer prices are more rigid than and so play less of an allocative role than do consumer prices. In the 1987-2008 micro data collected by the U.S. Bureau of Labor Statistics for the PPI, we find that producer prices for finished goods and services in fact exhibit roughly the same rigidity as do consumer prices that include sales, and substantially less rigidity than do consumer prices that exclude sales. Large firms change prices two to three times more frequently than do small firms, and by smaller amounts, particularly for price decreases. Longer price durations are associated with larger price changes, though there is considerable heterogeneity in this relationship. Long-term contracts are associated with somewhat greater price rigidity for goods and services, though the differences are not dramatic. The size of price decreases plays a key role in inflation dynamics, while the size of price increases does not. The frequencies of price increases and decreases tend to move together, and so cancel one another out.

2009	D78	Rosa, Carlo. 2009. "Forecasting the Direction of Policy Rate Changes: The Importance of ECB Words." <i>Economic Notes</i> , 38(1-2): 39-66. This paper evaluates the predictive power of different information sets for the European Central Bank (ECB) interest-rate-setting behaviour. We employ an ordered probit model, i.e. a limited dependent variable framework, to take into account the discreteness displayed by policy rate changes. The results show that the forecasting ability of standard Taylor-type variables, such as inflation and output gap, is fairly low both in-sample and out-of-sample, and is comparable to the performance of the random walk model. Instead by using broader information sets that include measures of core inflation, exchange rates, monetary aggregates and financial conditions, the accuracy of the forecasts about ECB future actions substantially improves. Moreover, ECB rhetoric considerably contributes to a better understanding of its policy reaction function. Finally, we find that that the ECB has been fairly successful in educating the public to anticipate the overall future direction of its monetary policy, but has been less successful in signalling the exact timing of rate changes.

2009	G01 G18 R21 R28 R38	Khandani, Amir E., Andrew W. Lo, and Robert C. Merton. 2009. <i>Systemic Risk and the Refinancing Ratchet Effect</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 15362. The confluence of three trends in the U.S. residential housing market--rising home prices, declining interest rates, and near-frictionless refinancing opportunities--led to vastly increased systemic risk in the financial system. Individually, each of these trends is benign, but when they occur simultaneously, as they did over the past decade, they impose an unintentional synchronization of homeowner leverage. This synchronization, coupled with the indivisibility of residential real estate that prevents homeowners from deleveraging when property values decline and homeowner equity deteriorates, conspire to create a "ratchet" effect in which homeowner leverage is maintained or increased during good times without the ability to decrease leverage during bad times. If refinancing-facilitated homeowner-equity extraction is sufficiently widespread--as it was during the years leading up to the peak of the U.S. residential real-estate market--the inadvertent coordination of leverage during a market rise implies higher correlation of defaults during a market drop. To measure the systemic impact of this ratchet effect, we simulate the U.S. housing market with and without equity extractions, and estimate the losses absorbed by mortgage lenders by valuing the embedded put-option in non-recourse mortgages. Our simulations generate loss estimates of \$1.5 trillion from June 2006 to December 2008 under historical market conditions, compared to simulated losses of \$280 billion in the absence of equity extractions.
2009	G17	Blaskowitz, Oliver, and Helmut Herwartz. 2009. <i>On economic evaluation of directional forecasts</i> . Sonderforschungsbereich 649, Humboldt University, Berlin, Germany, SFB 649 Discussion Papers: SFB649DP2009-052. It is commonly accepted that information is helpful if it can be exploited to improve a decision making process. In economics, decisions are often based on forecasts of up { or downward movements of the variable of interest. We point out that directional forecasts can provide a useful framework to assess the economic forecast value when loss functions (or success measures) are properly formulated to account for realized signs and realized magnitudes of directional movements. We discuss a general approach to evaluate (directional) forecasts which is simple to implement, robust to outlying or unreasonable forecasts and which provides an economically interpretable loss/success functional framework. As such, the measure of directional forecast value is a readily available alternative to the commonly used squared error loss criterion.

Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 192goldberg.pdf. New goods play a central role in many trade and growth models. We use detailed trade and firm-level data from a large developing economy--India--to investigate the relationship between declines in trade costs, the imports of intermediate inputs and domestic firm product scope. We estimate substantial static gains from trade through access to new imported inputs. Accounting for new imported varieties lowers the import price index for intermediate goods on average by an additional 4.7 percent per year relative to conventional gains through lower prices of existing imports. Moreover, we find that lower input tariffs account on average for 31 percent of the new products introduced by domestic firms, which implies potentially large dynamic gains from trade. This expansion in firms' product scope is driven to a large extent by international trade increasing access of firms to new input varieties rather than by simply making existing imported inputs cheaper. Hence, our findings suggest that an important consequence of the input tariff liberalization was to relax technological constraints through firms' access to new imported inputs that were unavailable prior to the liberalization.
2009	N13	Ritschl, Albrecht, and Samad Sarferaz. 2009. <i>Crisis? What Crisis? Currency vs. Banking in the Financial Crisis of 1931</i> . C.E.P.R., Discussion Papers, CEPR Discussion Papers: 7610. This paper examines the role of currency and banking in the German financial crisis of 1931 for both Germany and the U.S. We specify a structural dynamic factor model to identify financial and monetary factors separately for each of the two economies. We find that monetary transmission through the Gold Standard played only a minor role in causing and propagating the crisis, while financial distress was important. We also find evidence of crisis propagation from Germany to the U.S. via the banking channel. Banking distress in both economies was apparently not endogenous to output or monetary policy. Results confirm Bernanke's (1983) conjecture that an independent, non-monetary financial channel of crisis propagation was operative in the Great Depression.

2010	C73	Guse, Eran A. 2010. "Heterogeneous Expectations, Adaptive Learning, and Evolutionary Dynamics." <i>Journal of Economic Behavior and Organization</i> , 74(1-2): 42-57. This paper presents a linear self-referential macroeconomic model with the possibility of multiple equilibria where agents have the choice of using one of two forecasting models (one of minimum state variable form and the other of sunspot form) to form expectations of current and future prices. Endogenous predictor selection is modeled as an evolutionary game where individuals choose among the forecasting models based on relative performance. Some Nash solutions are not relevant as they are not stable under evolutionary or adaptive learning. Finally, it is shown that the sunspot equilibrium is fragile against temporary shocks to information costs.
2010	H68	Guillemette, Yvan. 2010. <i>A Simulation Model of Federal, Provincial and Territorial Government Accounts for the Analysis of Fiscal-Consolidation Strategies in Canada</i> . OECD, Economics Department, OECD Economics Department Working Papers: 800. This paper presents a simulation model of the main budget aggregates of federal, provincial and territorial governments in Canada. The general approach is to use a cyclical indicator (output gap), estimate the sensitivity of government revenue and expenditure to this cyclical indicator using historical data, and use projections of the cyclical indicator to simulate budgetary outcomes under various economic scenarios. Provincial/territorial annual output gaps are estimated going back to 1984. These are used to jointly

Year	DE	Title and Abstract
		estimate for all governments the historical sensitivities of the main revenue and expenditure categories to provincial/territorial economic cycles using Seemingly Unrelated Regressions. Projections of potential output by province and territory are then made to 2020 and a multitude of paths for the evolution of provincial/territorial output gaps are generated to 2020. These output gap paths serve as bases for simulating medium-term fiscal outcomes under a variety of possible economic scenarios, allowing the construction of probability densities for fiscal outcomes. The paper also contains an analysis of the cyclicity of Canadian governments' fiscal policies between 1984 and 2007. Several jurisdictions are found to have had pro-cyclical fiscal policies over this period.

2010	O18 R12	Tunay, K. Batu. 2010. "Türkiye'de İller Temelinde Enflasyonun UZABHO Modellemesi ve Tahmini. (Starma Modeling and Estimation of Province-Based Inflation in Turkey. With English summary.)." <i>Hacettepe Üniversitesi İktisadi ve İdari Bilimler Fakültesi Dergisi/Hacettepe University Journal of Economics and Administrative Sciences</i> , 28(1): 1-36. In this study, Turkey's province-based inflation is estimated by space-time autoregressive moving average (STARMA) models. Study also aims to introduce STARMA models as efficient econometrical estimation tools for the analysis of geographical based economic variables. Findings obtained show us that statistical significance level and explanatory power of model are both expressively high. Consequently, this model can be used for forecasting of province-based inflation. Thus, political authorities can easily forecast inflation and thereby take necessary measures to cope with both province-based and country-wide inflation. As a result of these, success of executed policies will undoubtedly increase.
2010	O19	Duasa, Jarita, and Nursilah Ahmad. 2010. "Predicting the Global Crisis Recovery Period: Lessons from the 1997 Crisis." <i>Global Economic Review</i> , 39(1): 99-113. The objective of this paper is to identify the best indicator in forecasting the recovery period from the current global crisis for Malaysia. Initially, to determine the best indicator for the recovery period, we construct a simple forecasting model that incorporates three indicators: lagging, leading and coincidence indices, with two proxies of economic performance, macroeconomic and financial variables. We estimate a two-variable vector error correction model (VECM) using monthly and quarterly data covering the period 1980 to 2000. We alternate between the three indicators and we evaluate each model using out-of-sample forecast. Using the results of the initial process of analysis, we predict the recovery period of Malaysian economy from the current global economic crisis. It is found that lagging index is the best indicator of financial performance of the economy. From the half-life calculation base on error correction term, the study found that Malaysia was able to recover from the previous 1997 crisis within a two to four year period after the crisis. Given that the current crisis environment is similar to the previous 1997 crisis, a similar time period could apply to the current global crisis recovery.
2010	O34	Holden, Tom. 2010. <i>Products, patents and productivity persistence: A DSGE model of endogenous growth</i> . University of Oxford, Department of Economics, Economics Series Working Papers: 512. This paper builds a dynamic stochastic general equilibrium (DSGE) model of endogenous growth that is capable of generating substantial degrees of endogenous persistence in productivity. When products go out of patent protection, the rush of entry into their production destroys incentives for process improvements. Consequently, old production processes are enshrined in industries producing non-protected products, resulting in aggregate productivity persistence. Our model also generates sizeable delayed movements in productivity in response to preference shocks, providing a form of endogenous news shock. Finally, if we calibrate our model to match a high aggregate mark-up then we can replicate the negative response of hours to a positive technology shock, even without the inclusion of any frictions.
2010	P27	2010. "The "Dobrescu Macromodel" of the Romanian Market Economy--2005 Version--Yearly Forecast--Summer Forecast for 2010." <i>Romanian Journal of Economic Forecasting</i> , 13(2): 320-24. The macromodel estimates the short and medium-term economic implications for internal policies and changes in the international context. This version of the Romanian macromodel incorporates the experience accumulated through the utilization of its previous forms--either experimental (tested during 1991-1995) or operational (developed during 1996-2003). At the same time, it introduces some methodological and informational improvements. The most significant of them is the structural decomposition of the economy, associated with input-output techniques. Due to the relatively advanced stage of the transitional processes in Romania, the behavioural functions were accommodated--as much as possible--to the standard relationships. Unlike the versions that used the statistical series beginning in 1980, the present one is based exclusively on information concerning the period 1989-2004. Therefore, we have considered more adequately naming this variant the macromodel of the Romanian market (not transition, as before) economy. In this article, we present the Summer forecast for 2010 (May estimations).
2010	R12	de Dios Tena, Juan, Antoni Espasa, and Gabriel Pino. 2010. "Forecasting Spanish Inflation Using the Maximum Disaggregation Level by Sectors and Geographical Areas." <i>International Regional Science Review</i> , 33(2): 181-204. This article evaluates different strategies for forecasting Spanish inflation using information from price series for fifty-seven products and eighteen regions in Spain. We consider vector equilibrium correction (VeqCM) models that include cointegration relationships between Spanish prices and prices in the regions of Valencia, Andalusia, Madrid, Catalonia, and the Basque Country. This approach is consistent with economic intuition and is shown to be of tangible importance after suitable econometric evaluation. It is found that sectoral disaggregate models are useful for forecasting inflation in the five largest Spanish regions. Moreover, aggregate inflation forecasts in Spain can be significantly improved by aggregating projections from different sectors and geographical areas and by considering cointegration relationships between regional and national prices. However, in spite of the existence of long-run relationships between sectoral and national prices, they include deterministic components that are not consistent with the law of one price.

2011	B52	Bezemer, Dirk J. 2011. "Causes of Financial Instability: Don't Forget Finance". Levy Economics Institute, The Economics Working Paper Archive. Given the economy's complex behavior and sudden transitions as evidenced in the 2007-08 crisis, agent-based models are widely considered a promising alternative to current macroeconomic practice dominated by DSGE models. Their failure is commonly interpreted as a failure to incorporate heterogeneous interacting agents. This paper explains that complex behavior and sudden transitions also arise from the economy's financial structure as reflected in its balance sheets, not just from heterogeneous interacting agents. It introduces "flow-of-funds" and "accounting" models, which were preeminent in successful anticipations of the recent crisis. In illustration, a simple balance-sheet model of the economy is developed to demonstrate that nonlinear behavior and sudden transition may arise from the economy's balance-sheet structure, even without any

Year	DE	Title and Abstract
		microfoundations. The paper concludes by discussing one recent example of combining flow-of-funds and agent-based models. This appears a promising avenue for future research.
2011	C54	Stanica, Cristian Nicolae. 2011. "Modeling Government Policies Used for Sustaining Economic Growth in Romania." <i>Romanian Journal of Economic Forecasting</i> , 14(4): 90-105. This paper presents some government policies scenarios and proposes the appropriate policies for stimulating the economic growth in Romania. The GDP dynamics, budgetary revenues, employment and wages are forecasted using a macroeconomic model of the Romanian economy. The direct effects of the fiscal policies and the indirect effects of the economic growth changes are investigated by three alternative scenarios as compared to a baseline scenario. The baseline should meet the following requirements: update of the macroeconomic indicators and maintenance of the same fiscal policy in the forecast period 2012-2013 as to 2011.
2011	C67	Romanian Academy. 2011. "The Dobrescu Macromodel of the Romanian Market Economy--2005 Version Yearly Forecast Preliminate for 2011, November Estimates." <i>Romanian Journal of Economic Forecasting</i> , 14(4): 197-99. The macromodel estimates the short and medium-term economic implications for internal policies and changes in the international context. This version of the Romanian macromodel incorporates the experience accumulated through the utilization of its previous forms--either experimental (tested during 1991-1995) or operational (developed during 1996-2003). At the same time, it introduces some methodological and information improvements. The most significant is the structural decomposition of the economy, associated with input-output techniques. Due to the relatively advanced stage of the transitional processes in Romania, the behavioral functions were accommodated--as much as possible--to the standard relationships. Unlike the versions that used the statistical series beginning in 1980, the present one is based exclusively on information concerning the period 1989-2004. Therefore, we have considered more adequately naming this variant the macromodel of the Romanian market (not transition, as before) economy. In this article we present the prelimitate forecast for 2011.
2011	C92	Pfajfar, D., and B. Zakelj. 2011. <i>Uncertainty and Disagreement in Forecasting Inflation: Evidence from the Laboratory</i> . Tilburg University, Center for Economic Research, Discussion Paper: 2011-053. We establish several stylized facts about the behavior of individual uncertainty and disagreement between individuals when forecasting inflation in the laboratory. Subjects correctly perceive the underlying inflation uncertainty in only 60% of cases, which can be interpreted as the overconfidence bias. Determinants of individual uncertainty, disagreement among forecasters and properties of aggregate distribution are analyzed. We find that the interquartile range of the aggregate distribution has the highest correlation with inflation variability; however the average confidence interval performs best in a forecasting exercise. Allowing subjects to insert asymmetric confidence intervals results in wider upper intervals than lower intervals on average, thus perceiving higher uncertainty with respect to inflation increases. In different treatments we study the influence of different monetary policy designs on the formation of confidence bounds. Inflation targeting produces lower uncertainty and higher accuracy of intervals than inflation forecast targeting.
2011	C92	Pfajfar, D., and B. Zakelj. 2011. <i>Inflation Expectations and Monetary Policy Design: Evidence from the Laboratory (Replaces CentER DP 2009-007)</i> . Tilburg University, Center for Economic Research, Discussion Paper: 2011-091. Using laboratory experiments within a New Keynesian macro framework, we explore the formation of inflation expectations and its interaction with monetary policy design. The central question in this paper is how to design monetary policy in the environment characterized by heterogeneous expectations. Rules that use actual rather than forecasted inflation produce lower inflation variability and alleviate expectational cycles. Degree of responsiveness to deviations of inflation from its target in the Taylor rule produces nonlinear effects on inflation variability. We also provide considerable support for the existence of heterogeneity of inflation expectations and show that a significant proportion of subjects are rational in our experiment. However, most subjects rather than using a single model they tend to switch between alternative models.
2011	D14	King, Robert, and Frank Landram. 2011. "Understanding the Economic Decline and Duration: A Household Liquidity Approach." <i>Empirical Economics Letters</i> , 10(5): 425-29. This paper is to forecast the duration of the recession based on the debt of consumers compared to their personal disposable income levels. The liquidity of households is an effective measure to determine the duration of the recession since it indicates how households are utilizing their financials and how governmental stimulus packages are changing the future of the economy. Through utilizing a liquidity ratio, that compares consumer credit outstanding (CCO) to disposable personal income (DPI) the recession duration can be predicted.
2011	E25	De Bruin, Wandt Bruine, Charles F. Manski, Giorgio Topa, and Wilbert Van Der Klaauw. 2011. "Measuring Consumer Uncertainty about Future Inflation." <i>Journal of Applied Econometrics</i> , 26(3): 454-78. We introduce a survey-based measure of uncertainty about future inflation, asking consumers for density forecasts across inflation outcomes. Consumers are willing and able to express uncertainty, showing high response rates and response patterns that are reliably related to qualitative measures of uncertainty. Heterogeneity in expressed uncertainty is associated with demographic characteristics and financial literacy, and measures of central tendency derived from density forecasts are strongly correlated with point forecasts. Furthermore, expressed uncertainty is positively related to point forecast levels and to larger revisions in point forecasts over time.
2011	F02	Fichtner, Ferdinand, Rasmus Ruffer, and Bernd Schnatz. 2011. "The Forecasting Performance of Composite Leading Indicators: Does Globalisation Matter?" <i>OECD Journal: Journal of Business Cycle Measurement and Analysis</i> , 0(0): 55-72. Using OECD Composite Leading Indicators (CLI), we assess empirically whether the ability of the country-specific CLIs to predict economic activity has diminished in recent years, e.g., due to rapid advances in globalisation. Overall, we find evidence that the CLI encompasses useful information for forecasting industrial production, particularly over horizons of four to eight months ahead. The evidence is particularly strong when taking cointegration relationships into account. At the same time, we find indications that the forecast accuracy has declined over time for several countries. Augmenting the country-specific CLI with a leading indicator of the external environment and employing forecast combination techniques improves the forecast performance for several economies. Over time, the increasing importance of international dependencies is documented by relative performance gains of the extended model for selected countries.
2011	G33	Kinsella, Stephen. 2011. <i>Words to the Wise: Stock Flow Consistent Modeling of Financial Instability</i> . Geary Institute, University College Dublin, Working Papers: 201130. The crisis has exposed the failure of economic models to deal sensibly with endogenously generated crises propagating from the financial sectors to the real economy, and back again. The goal of this paper is to review the method of stock flow consistent modeling to highlight areas in which it is deficient. I argue there is a fruitful research agenda in shoring up these deficiencies. The objective of stock flow modeling should be the ability to practically model unstable macroeconomies, and in particular their interactions with the financial sector. These models should provide 'Words to the Wise', and until they do, they are just thought experiments.
2011	G33	Khalil, Saed, and Stephen Kinsella. 2011. <i>Bad banks choking good banks: simulating balance sheet contagion</i> . Geary Institute, University College Dublin, Working Papers: 201126. 2011	J31	Contini, Bruno. 2011. "Forecasting Errors: Yet More Problems for Identification?" <i>Economia Politica</i> , 28(2): 185-93. Forecasting errors pose a serious problem of identification, often neglected in empirical applications. Any attempt of estimating choice models under uncertainty may lead to severely biased results in the presence of forecasting errors even when individual expectations on future events are observed together with the standard outcome variables. The problem is illustrated by an empirical study on job changing behavior.
2011	L83	Fuleky, Peter, and Carl Bonham. 2011. <i>Forecasting Based on Common Trends in Mixed Frequency Samples.</i> University of Hawaii at Manoa, Department of Economics, Working Papers: 201110. We extend the existing literature on small mixed frequency single factor models by allowing for multiple factors, considering indicators in levels, and allowing for cointegration among the indicators. We capture the cointegrating relationships among the indicators by common factors modeled as stochastic trends. We show that the stationary single-factor model frequently used in the literature is misspecified if the data set contains common stochastic trends. We find that taking advantage of common stochastic trends improves forecasting performance over a stationary single-factor model. The common-trends factor model outperforms the stationary single-factor model at all analyzed forecast horizons on a root mean squared error basis. Our results suggest that when the constituent indicators are integrated and cointegrated, modeling common stochastic trends, as opposed to eliminating them, will improve forecasts.
2011	Q33	Gomez, David M., Guillermo J. Ortega, Benno Torgler, and German Debat. 2011. <i>Co-movements in commodity prices: a note based on network analysis.</i> School of Economics and Finance, Queensland University of Technology, School of Economics and Finance Discussion Papers and Working Papers Series: 274. This paper analyses co-movements in a wide group of commodity prices during the time period 1992-2010. Our methodological approach is based on the correlation matrix and the networks inside. Through this approach we are able to summarize global interaction and interdependence, capturing the existing heterogeneity in the degrees of synchronization between commodity prices. Our results produce two main findings: (a) we do not observe a persistent increase in the degree of co-movement of the commodity prices in our time sample, however from mid-2008 to the end of 2009 co-movements almost doubled when compared with the average correlation; (b) we observe three groups of commodities which have exhibited similar price dynamics (metals, oil and grains and oilseeds) and which have increased their degree of co-movement during the sampled period. These results suggest that speculation and uncertainty are drivers of the sharp slump in commodity prices synchronization.

2012	C18	Poskitt, D. S., and Wenying Yao. 2012. <i>VAR Modeling and Business Cycle Analysis: A Taxonomy of Errors.</i> Monash University, Department of Econometrics and Business Statistics, Monash Econometrics and Business Statistics Working Papers: 11/12. In this article we investigate the theoretical behaviour of finite lag VAR(n) models fitted to time series that in truth come from an infinite order VAR(?) data generating mechanism. We show that overall error can be broken down into two basic components, an estimation error that stems from the difference between the parameter estimates and their population ensemble VAR(n) counterparts, and an approximation error that stems from the difference between the VAR(n) and the true VAR(?). The two sources of error are shown to be present in other performance indicators previously employed in the literature to characterize, so called, truncation effects. Our theoretical analysis indicates that the magnitude of the estimation error exceeds that of the approximation error, but experimental results based upon a prototypical real business cycle model indicate that in practice the approximation error approaches its asymptotic position far more slowly than does the estimation error, their relative orders of magnitude notwithstanding. The experimental results suggest that with sample sizes and lag lengths like those commonly employed in practice VAR(n) models are likely to exhibit serious errors of both types when attempting to replicate the dynamics of the true underlying process and that inferences based on VAR(n) models can be very untrustworthy.
2012	C35	El-Shagi, Makram, and Gregor von Schweinitz. 2012. <i>Qual VAR Revisited: Good Forecast, Bad Story.</i> Halle Institute for Economic Research, IWH Discussion Papers: 12. Due to the recent financial crisis, the interest in econometric models that allow to incorporate binary variables (such as the occurrence of a crisis) experienced a huge surge. This paper evaluates the performance of the Qual VAR, i.e. a VAR model including a latent variable that governs the behavior of an observable binary variable. While we find that the Qual VAR performs reasonably well in forecasting (outperforming a probit benchmark), there are substantial identification problems. Therefore, when the economic interpretation of the dynamic behavior of the latent variable and the chain of causality matter, the Qual VAR is inadvisable.
2012	C35	Ng, Eric C. Y. 2012. "Forecasting US Recessions with Various Risk Factors and Dynamic Probit Models." <i>Journal of Macroeconomics</i> , 34(1): 112-25. This paper extends probit recession forecasting models by incorporating various recession risk factors and using the advanced dynamic probit modeling approaches. The proposed risk factors include financial market expectations of a gloomy economic outlook, credit or liquidity risks in the general economy, the risks of negative wealth effects resulting from the bursting of asset price bubbles, and signs of deteriorating macroeconomic fundamentals. The model specifications include three different dynamic probit models and the standard static model. The out-of-sample analysis suggests that the four probit models with the proposed risk factors can generate more accurate forecasts for the duration of recessions than the conventional static models with only yield spread and equity price index as the predictors. Among the four probit models, the dynamic and dynamic autoregressive probit models outperform the static and autoregressive models in terms of predicting the

Year	DE	Title and Abstract
		recession duration. With respect to forecasting the business cycle turning points, the static probit model is as good as the dynamic probit models by being able to flag an early warning signal of a recession.
2012	D22	Borraz, Fernando, and Leandro Zipitria. 2012. "Retail Price Setting in Uruguay." <i>Economia: Journal of the Latin American and Caribbean Economic Association</i> , 12(2): 77-102. We analyze the behavior of prices in Uruguay using a unique database of 30 millions daily prices. We find that prices change about 5 times a year with no seasonal pattern. Prices changes are highly synchronized and concentrated on the first day of the month. Our paper is the first to present evidence of high synchronization of prices, which in turn could be explained mainly by the data periodicity. Overall the analysis seems to be consistent with state-dependent pricing models, although we found some interesting features of prices that could not be explained by these models.

2012	F23 F43	Chen, Jo-Hui, and Francis Diaz. 2012. "Trade and Monetary Factors in Reoccurring Economic Expansions of Developed Nations." <i>International Research Journal of Applied Finance</i> , 3(2): 232-44. This paper utilizes parametric shared-frailty model to examine nine developed countries' expansion periods. Trade factors and monetary variables, at different time horizons, are seen to have significant effects on an economy's reoccurring recovery time. Consistent with previous literatures, constant increase in real effective exchange rate, M1 and changes in consumer prices and steady decrease in lending to deposit ratio are seen to slow down recovery time. Other variables, such as current account and foreign direct investment both have positive and negative effects given specific periods. Also, economic openness and international reserves, specifically in the 1980s, help in the continuous expansion of an economy. These findings prove that parametric shared-frailty model is reliable and can serve as an additional tool for academicians and policy-makers in modeling business cycles.
2012	I18	Verikios, George, James M. McCaw, Jodie McVernon, and Anthony H. Harris. 2012. "H1N1 Influenza and the Australian Macroeconomy." <i>Journal of the Asia Pacific Economy</i> , 17(1): 22-51. Early 2009 saw the emergence of an H1N1 influenza epidemic in North America that eventually spread to become the first pandemic of the twenty-first century. Previous work has suggested that pandemics and near-pandemics can have large macroeconomic effects on highly affected regions; here, we estimate what those effects might be for Australia. Our analysis applies the MONASH-Health model: a computable general equilibrium model of the Australian economy. We deviate from previous work by incorporating two important short-run mechanisms in our analytical framework: quarterly periodicity and excess capacity. The analysis supports the assertion that an H1N1 epidemic could have significant short-run macroeconomic effects but the size of these effects is highly dependent on the degree of inertia in the markets for physical capital and labour.

2012	L61	Nguyen, T. Thanh-Binh. 2012. "Gold and USD Price as the Predictors of Future Inflation in Vietnam." <i>International Journal of Economics</i> , 6(1): 185-98. Vietnam has experienced galloping inflation and faced serious dollarization since its reform. In order to effectively control inflation for promoting price stability and sustainable economic growth, it is necessary to find efficacious leading indicators. This study discovers the predictive power of both gold and USD price for future inflation in Vietnam. Using monthly data over the period from January 2002 to June 2011 for investigation, it is found that the signal of inflation can be seen in the preceding 12 months of gold price, earlier than at the past 3 months of USD price. Especially when inflation is caused by the increase in USD price, the inflation uncertainty directly affects the inflation rate, while the situation is quite different when inflation is rooted by gold price.

2012	O24	Diss: Harvey, Simon. 2012. Essays in Inflation and Monetary Dynamics in Developing Countries. PhD diss. University of Nebraska. This dissertation consists of three essays. In the first essay, I analyze how the information contained in the disaggregate components of aggregate inflation helps improve the forecasts of the aggregate series using inflation data from Ghana. Direct univariate forecasting of the aggregate inflation data by an autoregressive (AR) model is used as the benchmark with which all autoregressive (AR), moving average (MA) and vector autoregressive (VAR) models of the disaggregates are compared. The results show that directly forecasting the aggregate series from the benchmark model is generally superior to aggregating forecasts from the disaggregate components. Additionally, including information from the disaggregates in the aggregate model rather than aggregating forecasts from the disaggregates performs best in all forecast horizons when appropriate disaggregates are used. The implication of these results is that better inflation forecasts for Ghana are produced by using information from relevant disaggregates in the aggregate model rather than direct forecasts of the aggregate or aggregating forecasts from the disaggregates. In the second essay, I use a structural vector autoregression (SVAR) to model inflation so as to identify the relative importance of shocks to real output growth, monetary growth and exchange rate depreciation in inflation dynamics in Ghana. The results show that neither monetary growth alone nor structural factors alone explain the inflation experience in Ghana and that the structural factors dominate monetary growth in the inflation dynamics. There is a fairly strong feedback between inflation and exchange rate depreciation both of which have weak relationship with monetary growth. These suggest that policies that boost domestic supply and therefore reduce import demand will be more potent than direct monetary management to curb inflation in Ghana. Finally, in the third essay, I test whether the West African Monetary Zone (WAMZ) is a common currency area by using a vector autoregressive model to study the variance decomposition, impulse responses of key economic variables and linear

Year	DE	Title and Abstract
		dependence of the underlying structural shocks of the countries in the zone. The variance decomposition shows that the zone a whole does not have common sources of shock, which is expected because of the diverse economic structures of these countries. The correlation of the structural shocks also shows that these countries respond asymmetrically to common supply, demand and monetary shocks and will therefore respond differently to a common monetary policy. It is therefore not in the interest of the individual countries to go into a monetary union now or in the near future unless the economies of these countries converge further.
2012	O24	CV: Kurniati, Yati, and Aida S. Budiman. 2012. "Embracing ASEAN Economic Integration 2015: A Quest for an ASEAN Business Cycle from Indonesia's Point of View." In <i>The Indonesian Economy: Entering a New Era</i> , ed. Aris Ananta, Muljana Soekarni and Sjamsul Arifin, 313-44. Singapore: Institute of Southeast Asian Studies; Jakarta: Bank Indonesia.
2012	R20 R30	Geanakoplos, John, Robert Axtell, Doynne J. Farmer, Peter Howitt, Benjamin Conlee, Jonathan Goldstein, Matthew Hendrey, Nathan M. Palmer, and Chun-Yi Yang. 2012. <i>Getting at Systemic Risk via an Agent-Based Model of the Housing Market</i>. Cowles Foundation for Research in Economics, Yale University, Cowles Foundation Discussion Papers: 1852. Systemic risk must include the housing market, though economists have not generally focused on it. We begin construction of an agent-based model of the housing market with individual data from Washington, DC. Twenty years of success with agent-based models of mortgage prepayments give us hope that such a model could be useful. Preliminary analysis suggests that the housing boom and bust of 1997-2007 was due in large part to changes in leverage rather than interest rates.
2013		
2013	G00	Beber, Alessandro, Michael W. Brandt, and Maurizio Luisi. 2013. <i>Distilling the Macroeconomic News Flow</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 19650. We propose a simple cross-sectional technique to extract daily factors from economic news released at different times and frequencies. Our approach can effectively handle the large number of different announcements that are relevant for tracking current economic conditions. We apply the technique to extract real-time measures of inflation, output, employment, and macroeconomic sentiment, as well as corresponding measures of disagreement among economists about these indices. We find that our procedure provides more timely and accurate forecasts of future changes in economic conditions than other real-time forecasting approaches.
2013	H23 H24	Diss: Kabukcuoglu, Ayse. 2013. <i>Essays on Fiscal and Monetary Policy in Open Economics</i> . PhD diss. University of Texas. Essay 1: The Redistributive Consequences of Tax Reform Under Financial Integration. I quantify the welfare effect of eliminating the U.S. capital income tax under international financial integration. I employ a two-country, heterogeneous-agent incomplete markets model calibrated to represent the U.S. and the rest of the world. Short-run and long-run factor price dynamics are key: after the tax reform, post-tax interest rate increases less under financial openness relative to autarky. Therefore the wealth-rich households gain less. Post-tax wages also fall less, so the wealth-poor are hurt less. Hence, the fraction in favor of the reform increases, although the majority still prefers the status quo. Aggregate welfare effect to the U.S. is a permanent 0.2% consumption equivalent loss under financial openness which is 85.5% smaller than the welfare loss under autarky. Essay 2: What Helps Forecast U.S. Inflation?—Mind the Gap! (With Enrique Martinez-Garcia). In macroeconomic analysis and inflation forecasting, the traditional Phillips curve has been a widely-used model that captures broadly the empirical relationship between inflation and domestic economic activity. Empirical evidence shows that the performance of Phillips curve-based forecasts of U.S. inflation relative to naive forecasts has deteriorated since mid-1980s. This poses a difficulty for policy-making and private sector's long-term nominal commitments. The literature suggests globalization may be one reason for this phenomenon. To test this, we evaluate the forecasting ability of global slack measures under an open economy Phillips curve. The results vary across measures of inflation, forecast horizons and estimation samples. We find however, terms of trade gap, measured as HP-filtered terms of trade, is a good and robust variable to forecast U.S. inflation. Moreover, our forecasts based on the simulated data from a workhorse new open economy macro (NOEM) model indicate that better monetary policy and good luck (i.e. a remarkably benign sample of economic shocks) account for the empirical observations on forecasting accuracy, while globalization has a negligible effect. Essay 3: The Optimum Quantity of Debt in a Small Open Economy. In their seminal paper, Aiyagari and McGrattan (JME, 1998) suggest issuing government debt in a closed economy increases the interest rate and can enhance welfare when households have precautionary savings motives. Higher debt also causes investment crowding-out and higher tax burden on households as in standard models. These benefit and cost channels determine the optimum level of government debt and positive debt may be optimal. I show that this result no longer holds in a small open economy and zero or negative debt may be optimal. This is because the world interest rate is fixed and the only (and negative) channel to consider is the tax channel.
2013	J30	Angelini, Elena, Alistair Dieppe, and Beatrice Pierluigi. 2013. <i>Learning about wage and price mark-ups in euro area countries</i>. European Central Bank, Working Paper Series: 1512. In this paper we show that higher flexibility, measured by lower wage and price mark-ups leads to reduced inflationary pressures, increase in competitiveness, and higher output. A rational expectation and a learning version of the ECB's New Multi-Country Model are used to understand plausible dynamics of labour cost and price adjustments. In the rational expectation version of the model gains are quicker but more short-lived than in a learning environment. We argue that a rational expectation model appears appropriate to describe the abrupt wage adjustment which took place in the Baltic States. By contrast, a learning model appears better suited to capture the gradual wage adjustment of Germany during the 2000s and the one that started in Spain and Italy after the 2008-09 crisis. In fact, in view of implementation lags and the need to change institutions, in the above countries the adjustment should be expected to deliver output gains less quickly than in the Baltic States. In this paper we use the linked version of the model to evaluate the aggregate impact of the imposed shocks as well as possible spillover effects within the euro area. All in all, spillover effects are relatively small.
2013	Q02	Fulli-Lemaire, Nicolas. 2013. "An Inflation-Hedging Strategy with Commodities." <i>Journal of Investment Strategies</i>, 2(3): 23-50. Recent academic studies have shown that, since the mid-1990s, the pass-through of exogenous oil shocks into headline inflation has been increasing, while the pass-through into core inflation seems to have ceased. This paper explores the implications for inflation-hedging portfolios for which these recent works have paved the way, in terms of commodity allocation. We proceed by evidencing a link between the headline-to-core inflation spread and tradable commodities. We subsequently intend to exploit this link in two ways: by devising an efficient strategic allocation using core inflation forecasts to determine the commodities' natural weight in the portfolio as dictated by our macro approach, and by testing a tactical allocation strategy which would time the pass-through cycle to dynamically determine the optimal share of commodities in the allocation.
2013	Q13	Isengildina-Massa, Olga, Berna Karali, and Scott H. Irwin. 2013. "When Do the USDA Forecasters Make Mistakes?" <i>Applied Economics</i>, 45(34-36): 5086-5103. This study analysed forecasts for all US corn, soya bean and wheat categories published within the World Agricultural Supply and Demand Estimates (WASDE) reports over the 1987/88 through 2009/10 marketing years in an attempt to identify patterns and better understand when the USDA forecasters make mistakes. Two general sources of errors were investigated: behavioural and macroeconomic factors. The first objective was to examine how these factors affect the size of the

Year	DE	Title and Abstract
		forecast error and the second concentrated on the direction of the error due to these effects. Our findings suggest that the largest increase in the size of USDA forecast errors was associated with structural changes in commodity markets that took place in the mid-2000s. Corn, soya bean and wheat forecast errors also grew during the periods of economic growth and with changes in exchange rates, while inflation and changes in oil price had a much smaller impact. With respect to behavioural sources, we identified patterns consistent with leniency and pessimism across different categories. Predictability of forecast errors based on the information available at the time the forecasts are made provides evidence of inefficiency and suggests that these forecasts may be improved using the findings of this study.
2013	Q48	Kang, Wensheng, and Ronald A. Ratti. 2013. "Structural Oil Price Shocks and Policy Uncertainty." <i>Economic Modelling</i>, 35(0): 314-19. Increases in the real price of oil not explained by changes in global oil production or by global real demand for commodities are associated with significant increases in economic policy uncertainty and its four components (the volume of newspaper coverage of policy uncertainty, CPI forecast interquartile range, tax legislation expiration, and federal expenditures forecast interquartile range). Oil-market specific demand shocks account for 31% of conditional variation in economic policy uncertainty and 22.9% of conditional variation in CPI forecast interquartile range after 24 months. Positive oil shocks due to global real aggregate demand for commodities significantly reduce economic policy uncertainty. Structural oil price shocks appear to have long-term consequences for economic policy uncertainty, and to the extent that the latter has impact on real activity, the policy connection provides an additional channel by which oil price shocks have influence on the economy. As a robustness check, structural oil price shocks are significantly associated with economic policy uncertainty in Europe and energy-exporting Canada.
2013	R41	Askitas, Nikolaos, and Klaus F. Zimmermann. 2013. "Nowcasting Business Cycles Using Toll Data." <i>Journal of Forecasting</i>, 32(4): 299-306. Nowcasting has been a challenge in the recent economic crisis. We introduce the Toll Index, a new monthly indicator for business cycle forecasting, and demonstrate its relevance using German data. The index measures the monthly transportation activity performed by heavy transport vehicles across the country and has highly desirable availability properties (insignificant revisions, short publication lags) as a result of the innovative technology underlying its data collection. It is coincident with production activity due to the prevalence of just-in-time delivery. The Toll Index is a good early indicator of production as measured, for instance, by the German Production Index, provided by the German Statistical Office, which is a well-known leading indicator of the gross national product. The proposed new index is an excellent example of technological, innovation-driven economic telemetry, which we suggest should be established more around the world.

Year	DE	Title and Abstract
2006		
2006	C51	Cameron, Gavin, John Muellbauer, and Anthony Murphy. 2006. <i>Was There a British House Price Bubble? Evidence from a Regional Panel</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 5619. This paper investigates the bubbles hypothesis with a dynamic panel data model of British regional house prices between 1972 and 2003. The model consists of a system of inverted housing demand equations, incorporating spatial interactions and lags and relevant spatial parameter heterogeneity. The results are data consistent, with plausible long-run solutions and include a full range of explanatory variables. Novel features of the model include transaction cost effects influencing the speed of adjustment, and interaction effects between an index of credit availability and real and nominal interest rates. No evidence for a recent bubble is found.
2006	D12 D14 D61 E21 E22 E51 H59 R20 R31	Erlandsen, Espen, Jens Lundsgaard, and Felix Hufner. 2006. <i>The Danish housing market: less subsidy and more flexibility</i> . OECD Economics Department, OECD Economics Department Working Papers: 513. While Denmark has fairly flexible labour and product markets in most respects, the housing market stands out with large direct and indirect subsidies for all types of housing and a highly regulated rental market hindering mobility, probably resulting in a mismatch between housing needs and use. In the current housing policy framework there is quite a contrast between the well-functioning market for transactions of owner-occupied housing (supported by the highly liberalised mortgage market) and the highly regulated rental housing market. This paper assesses the recent development in Danish house prices, followed by a discussion of ways of replacing the costly government intervention in the Danish housing market with more market-based mechanisms, thereby achieving policy objectives in a more efficient and targeted way. The paper reviews the main areas for reform, including overall subsidisation of housing, rent regulation, social housing, and how housing supply could be made more responsive.
2007		
2007	E20 P25 R21	Egert, Balazs, and Dubravko Mihaljek. 2007. <i>Determinants of House Prices in Central and Eastern Europe</i> . CESifo GmbH, CESifo Working Paper Series: CESifo Working Paper No. 2152. This paper studies the determinants of house prices in eight transition economies of central and eastern Europe (CEE) and 19 OECD countries. The main question addressed is whether the conventional fundamental determinants of house prices, such as GDP per capita, real interest rates, housing credit and demographic factors, have driven observed house prices in CEE. We show that house prices in CEE are determined to a large extent by the underlying conventional fundamentals and some transition-specific factors, in particular institutional development of housing markets and housing finance and quality effects.
2008		
2008	Q11	Mitra, Sophie, and Jean-Marc Boussard. 2008. <i>A Nonlinear Cobweb Model of Agricultural Commodity Price Fluctuations</i> . Fordham University, Department of Economics, Fordham Economics Discussion Paper Series. Recent developments in world food markets stress the importance of identifying the sources of food price volatility. This paper develops a nonlinear Cobweb model with endogenous volatility which accounts for several characteristics of agricultural commodity markets (seasonality, storage) and leads to price series with positive skewness and autocorrelation, as in actual commodity prices. Practical consequences may imply a rethinking of the current methods of world food market regulation.
2009		
2009	E62	Posch, Olaf. 2009. <i>Explaining Output Volatility: The Case of Taxation</i> . CESifo Group Munich, CESifo Working Paper Series: CESifo Working Paper No. 2751. This paper presents empirical evidence against the popular perception that macro volatility is exogenous. We obtain tax effects on macro aggregates in the stochastic neoclassical model. Taxes are shown to affect the second moment of output growth rates without affecting the first moment. Exploiting heterogeneity patterns in a panel of OECD countries, we estimate tax effects on macro volatility, explicitly modeling the unobserved variance process. We find a strong empirical link between taxes and output volatility. Accounting for non-stationarity of taxes and output volatility, we find empirical evidence of a cointegrating relationship.
2009	G12 G19	Cooley, James. 2009. <i>Stock Market Returns and Partisan Political Business Cycles</i> . Southern Methodist University, Department of Economics, Departmental Working Papers: 0902. Excess returns in the stock market are significantly higher during Democratic presidential administrations. Previous research concludes that partisan return differentials are anomalous since they are not due to differences in required returns. We find that partisan return differentials are, instead, likely due to differences in cash flows—capital income growth—during the first years of presidential administrations as predicted by the rational partisan model of the business cycle. The first major finding of this paper is that there is a statistically and economically significant partisan difference in capital income growth in the first year of presidential terms. The second finding of the paper is that significant partisan differences in excess returns are also found only in the first year of presidential terms. Further, it is differences in unexpected returns during that first year that is the source of partisan return differentials. We find no statistically significant partisan differences in unexpected returns during the rest of the term. This result holds across market capitalization deciles and book-to-market value deciles. The third finding is that there is a positive and statistically significant relationship between unexpected returns and capital income growth and real GDP growth one and two quarters ahead. Lastly, we find that the unexpected returns are related to the degree of electoral surprise as predicted by the rational partisan model. We conclude that there is strong evidence in favor of the rational partisan model as an explanation for partisan return differences in the stock and bond markets.
2010		
2010	B22 B31 E59	Heymann, Daniel. 2010. "Fluctuaciones periféricas: Notas sobre el análisis macroeconómico de Raul Prebisch. (Peripheral Fluctuations: Notes on the Macroeconomic Analysis of Raul Prebisch. With English summary)." <i>Ensayos Economicos</i> , 0(57-58): 7-32. The work of Prebisch covers a long period of time, during which the configuration of Argentina's economy as well as the contents and methods of economic theory underwent significant changes. His concern to explore the mechanisms of economic fluctuations in peripheral economies, particularly Argentina, and their analytical implications, is expressed very early and

	<p>throughout his voluminous work. Apart from the diversity of emphasis and approaches, and the time lag between different pieces of work, several continuities emerge in central aspects of his arguments, particularly with regard to the primacy of external impacts in the economic fluctuations of the periphery, and to the specific processes which operate in these economies in comparison to the economic centers. These arguments motivate Prebisch's reservations concerning the Keynesian emphasis on inconsistencies between savings and investments as the central determinants of changes in economic activity. This paper deals with the contributions of Prebisch in the macroeconomic field on the basis of a subset of his writings and, in particular, the detailed lecture notes of a course given at University of Buenos Aires in 1944, about monetary theory and policy and business cycle analysis, with special reference to Argentina's experience. The discussions carried out by Prebisch on those topics show his effort to use abstract reasoning in order to reveal, not to hide, concrete economic processes and, at the same time, it presents arguments relating to particular issues supported by analytical frameworks built upon an understanding and a critique of the current theory. The mix of theoretical reasoning and practical considerations present in the work of Prebisch carries an integration of elements that are rarely found together, and invites the reader to continue to think and to analyze further. The methods, techniques, and approaches of economic analysis may have changed, but Prebisch should not be read with an archaeological perspective; his work continues to talk about issues and problems which remain intellectually challenging and relevant in practice.</p>

Table E40.F Examples of Publications according to New Links in 2006—2013

Year	DE	Title and Abstract
2006		
2006	B50	Arestis, Philip, and Malcolm Sawyer, eds. 2006. <i>A Handbook of Alternative Monetary Economics</i> , Cheltenham, U.K. and Northampton, Mass.: Elgar. Twenty-nine papers explore topics of money and finance within heterodox economics. Papers discuss money--an alternative story; endogenous money--accommodationist; endogenous money--structuralist; the endogeneity of money--empirical evidence; chartalism and the tax-driven approach to money; French circuit theory; the Italian circuitist approach; the theory of money emissions; Keynes and money; Minsky on financial instability; Kalecki on money and finance; Karl Marx's theory of money and credit; the transmission mechanism of monetary policy--a critical review; monetary policy; monetary policy in an endogenous money economy; central bank and lender of last resort; the theory of interest rates; the role of banks in the context of economic development with reference to South Korea and India; credit rationing; liquidity preference theory; financial liberalization and the relationship between finance and growth; deregulation; banking and financial crises; a post-Keynesian analysis of financial crisis in the developing world and directions for reform; financial bubbles; Keynesian uncertainty and money; speculation, liquidity preference, and monetary circulation; money and inflation; and interest and money--the property explanation.
2006	B50	Lavoie, Marc. 2006. <i>Introduction to Post-Keynesian Economics</i> , Houndmills, U.K. and New York: Palgrave Macmillan. Presents an introduction to post-Keynesian economics. Discusses post-Keynesian heterodoxy; heterodox microeconomics; a macroeconomic monetary circuit; the short period--effective demand and the labor market; and the long period--old and new growth models. Slightly modified version of L'Economie postkeynesienne (2004).
2006	C31	Salibian-Barrera, Matias, Stefan Van Aelst, and Gert Willems. 2006. "Principal Components Analysis Based on Multivariate MM Estimators with Fast and Robust Bootstrap." <i>Journal of the American Statistical Association</i> , 101(475): 1198-1211. We consider robust principal components analysis (PCA) based on multivariate MM estimators. We first study the robustness and efficiency

Year	DE	Title and Abstract
		of these estimators, particularly in terms of eigenvalues and eigenvectors. We then focus on inference procedures based on a fast and robust bootstrap for MM estimators. This method is an alternative to the approach based on the asymptotic distribution of the estimators and can also be used to assess the stability of the principal components. A formal consistency proof for the bootstrap method is given, and its finite-sample performance is investigated through simulations. We illustrate the use of the robust PCA and the bootstrap inference on a real dataset.
2006	C33	Tsomocos, Dimitrios P. 2006. <i>Towards a Measure of Financial Fragility</i>. University of Oxford, Department of Economics, Economics Series Working Papers: 2006-FE-04. This paper proposes a measure of financial fragility that is based on economic welfare in a general equilibrium model calibrated against UK data. The model comprises a household sector, three active heterogeneous banks, a central bank/regulator, incomplete markets, and endogenous default. We address the impact of monetary and regulatory policy, credit and capital shocks in the real and financial sectors and how the response of the economy to shocks relates to our measure of financial fragility. Finally we use panel VAR techniques to investigate the relationships between the factors that characterise financial fragility in our model--i.e. banks' probabilities of default and banks' profits--to a proxy of welfare.
2006	C71	Shubik, Martin. 2006. <i>The Theory of Money and Financial Institutions: A Summary of a Game Theoretic Approach</i>. Cowles Foundation, Yale University, Cowles Foundation Discussion Papers: 1572. A game theoretic approach to the theory of money and financial institution is given utilizing both the strategic and coalitional forms for describing the economy. The economy is first modeled as a strategic market game, then the strategic form is used to calculate several cooperative forms that differ from each other in their utilization of money and credit and their treatment of threats. It is shown that there are natural upper and lower bounds to the monetary needs of an economy, but even in the extreme structures the concept of "enough money" can be defined usefully, and for large economies the games obtained from the lower and upper bounds have cores that approach the same limit that is an efficient price system. The role of disequilibrium is then discussed.
2006	D01 I31 I38	CV: Ng, Yew-Kwang. 2006. "Public Policy Implications of Behavioral Economics and Happiness Studies." In <i>Happiness and Public Policy: Theory, Case Studies and Implications</i> , ed. Yew-Kwang Ng and Lok Sang Ho, 237-52. Houndmills, U.K. and New York: Palgrave Macmillan.
2006	D53	Hellwig, Christian, and Guido Lorenzoni. 2006. <i>Bubbles and Self-Enforcing Debt</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 12614. We characterize equilibria with endogenous debt constraints for a general equilibrium economy with limited commitment in which the only consequence of default is losing the ability to borrow in future periods. First, we show that equilibrium debt limits must satisfy a simple condition that allows agents to exactly roll over existing debt period by period. Second, we provide an equivalence result, whereby the resulting set of equilibrium allocations with self-enforcing private debt is equivalent to the allocations that are sustained with unbacked public debt or rational bubbles; for the latter, there exist well known existence and characterization results. In contrast to the classic result by Bulow and Rogoff (AER 1989), positive levels of debt are sustainable in our environment because the interest rate is sufficiently low to provide repayment incentives.
2006	D60 H00	Butier, Willem H. 2006. <i>How Robust is the New Conventional Wisdom? The Surprising Fragility of the Theoretical Foundations of Inflation Targeting and Central Bank Independence</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 5772. Flexible inflation targeting cannot be rationalised using conventional welfare economic criteria, except in a single, practically uninteresting special case. New-Keynesian DSGE models imply that optimal monetary policy implements the Bailey-Friedman Optimal Quantity of Money rule and that actual inflation fully validates or accommodates core inflation. Flexible inflation targeting is also inconsistent with the mandates of leading inflation targeters like the Bank of England and the ECB. These mandates are lexicographic in price stability and therefore does not permit a trade-off between inflation volatility and output gap volatility in the monetary policy maker's objective function. Operational independence of the central bank is limited by the central bank's intertemporal budget constraint. Price stability, or an externally imposed inflation target, may not be independently financeable by the central bank. In that case, active budgetary support from the Treasury is necessary to make the inflation target financeable. Independent monetary policy is fully compatible with coordinated and cooperative monetary and fiscal policy. Central bank operational independence precludes substantive accountability; it is compatible only with a weak form of formal accountability: reporting obligations. Central bank independence will only survive if it is viewed as legitimate by the polity and its citizens. A necessary condition for this is that the central bank restricts its activities and public discourse to its natural core mandate: price stability and the capacity and willingness to act as lender of last resort. The Protocol on the Statute of the ESCB and the ECB has given the ECB a mandate that goes beyond this natural core mandate. Such behaviour represents a threat to its continued independence.
2006	D86	Martin, Antoine, and Cyril Monnet. 2006. "Contracts and Money Revisited." <i>B.E. Journal of Macroeconomics: Topics in Macroeconomics</i>, 6(1): 1-15. Jovanovic and Ueda (1997) consider a principal-agent model with moral hazard and renegotiation. A noisy signal of the agent's output is observed before renegotiation takes place and actual output is revealed after renegotiation. If the agent is restricted to choose pure strategies it can be shown that the only renegotiation-proof contracts which induce optimal effort by the agent depend only on the signal and not on actual output. In this paper we show the restriction to pure strategies is crucial to the result, at least when the quality of the signal is not very good.
2006	E65 H25	Kehoe, Patrick, and Varadarajan V. Chari. 2006. <i>Modern Macroeconomics in Practice: How Theory is Shaping Policy</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 12476. Theoretical advances in macroeconomics made in the last three decades have had a major influence on macroeconomic policy analysis. Moreover, over the last several decades, the United States and other countries have undertaken a variety of policy changes that are precisely what macroeconomic theory of the last 30 years suggests. The three key developments that have shaped macroeconomic policy analysis are the Lucas critique of policy evaluation due to Robert Lucas, the time inconsistency critique of discretionary policy due to Finn Kydland and Edward Prescott, and the development of quantitative dynamic stochastic general equilibrium models following Finn Kydland and Edward Prescott.
2006	G13	CV: Labadie, Pamela. 2006. "Aggregate Risk Sharing and Equivalent Financial Mechanisms in an Endowment Economy of Incomplete Participation." In <i>Recent Developments on Money and Finance: Exploring Links between Market Frictions, Financial Systems and Monetary Allocations</i> , ed. Gabriele Camera, 127-47. Studies in Economic Theory, vol. 24. Berlin and New York: Springer.
2006	G32	CV: Howells, Peter. 2006. "The Endogeneity of Money: Empirical Evidence." In <i>A Handbook of Alternative Monetary Economics</i> , ed. Philip Arestis and Malcolm Sawyer, 52-68. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2006	G32	CV: Dymski, Gary A. 2006. "Banking and Financial Crises." In <i>A Handbook of Alternative Monetary Economics</i> , ed. Philip Arestis and Malcolm Sawyer, 385-402. Cheltenham, U.K. and Northampton, Mass.: Elgar.

2006	I31	Cardoso, Fernanda, and Gilberto Tadeu Lima. 2006. "Diagnosticando Patologias Monetarias: Seus Impactos sobre a Atividade Produtiva na Visao de Keynes e Veblen. (With English summary)." <i>Estudos Economicos</i> , 36(2): 293-321. This paper, which draws upon Keynes' conception of monetary pathologies, focuses on the psychological dimension of monetary relations--money-loving and money-making--and their impacts on the production process and social well-being. In an attempt to provide a more elaborated analytical and theoretical foundation to such conception, we also draw upon some of Veblen's writings, with a view to suggest some tentative answers to an intriguing question one may raise upon reading Keynes' 1930 essay "The economic possibilities for our grandchildren": why--and how--would come about a change of values such as the one envisaged by Keynes, which would lead people to assess the money-motive at its true value, as a pathology, and to devote the major attention to the true art of good life?
2006	I31	THE SAME AS D08 CV: Ng, Yew-Kwang. 2006. "Public Policy Implications of Behavioral Economics and Happiness Studies."
2006	I38	THE SAME AS D08 CV: Ng, Yew-Kwang. 2006. "Public Policy Implications of Behavioral Economics and Happiness Studies."
2006	J31 J63	Diss: Galenianos, Manolis. 2006. <i>Essays on Frictional Markets.</i> PhD diss. University of Pennsylvania. Chapter 1: Directed Search with Multiple Job Applications (joint with Philipp Kircher)--Job Market Paper. We develop an equilibrium directed search model of the labor market where workers can simultaneously apply for multiple jobs. The main result is that all equilibria exhibit wage dispersion despite the fact that workers and firms are homogeneous. Wage dispersion is driven by the simultaneity of application choice. Risk-neutral workers apply for both 'safe' and 'risky' jobs. The former yield a high probability of a job offer, but for low pay, and act as a fallback option; the latter provides higher potential payoff, but are harder to get. Furthermore, the density of posted wages is decreasing, consistent with stylized facts. Unlike most directed search models, the equilibria are not constrained efficient. Chapter 2: Dispersion of Money Holdings and Efficiency (joint with Philipp Kircher)--preliminary and incomplete. We consider a monetary economy with multilateral meetings between buyers and sellers. Every seller has a single indivisible good and all buyers have the same valuation for the good, though they may hold different amounts of money. The number of buyers that visit a particular seller is random due to lack of coordination. The good is allocated using a second price auction. We show that in equilibrium ex ante identical buyers choose different money holdings: carrying more money increases the probability of winning the auction, but it is costly because of discounting and inflation. The unique equilibrium distribution of money holdings is explicitly characterized and it is shown to be non-degenerate and continuous, while its shape depends on the inflation rate. When inflation is high, buyers hold lower real balances on average which results in lower expected profits for sellers. Efficient entry of sellers occurs only when the inflation rate approaches the Friedman rule, rendering holding money costless. In that case the distribution of money collapses to a mass point. Chapter 3: Hiring Through Referrals--in progress. I propose a model of endogenous network formation among workers to provide an explanation as to why firms use referrals in order to hire. Workers have high or low productivity, which is imperfectly observed by firms. Before entering the labor market, workers observe each other's abilities and form costly bilateral links. When hiring, a firm can ask one of its current employees to refer a friend (link), in addition to posting a vacancy. High ability workers are more likely to be employed and hence they are more desirable as friends; therefore they only link with each other. This leaves low ability workers no choice but to link among themselves, which they do because they are employed with positive (though lower) probability. Therefore, in equilibrium the network is completely segregated across ability which means that a firm with a vacancy has an incentive to hire a referred applicant if it believes that the current employee has high ability. In this way, the informal network alleviates the informational problems of firms and the market frictions that workers face.
2006	K10 N41	Grubb, Farley. 2006. "The US Constitution and Monetary Powers: An Analysis of the 1787 Constitutional Convention and the Constitutional Transformation of the US Monetary System." <i>Financial History Review</i> , 13(1): 43-71. The monetary powers embedded in the U.S. Constitution were revolutionary and led to a watershed transformation in the nation's monetary structure. They included determining what monies could be legal tender, who could emit fiat paper money, and who could incorporate banks. How the debate at the 1787 constitutional convention over these powers evolved and led the founding fathers to the specific powers adopted is presented and deconstructed. Why they took this path rather than replicate the successful colonial system and why they codified such powers into supreme law rather than leaving them to legislative debate and enactment are addressed.
2006	L26 P14	CV: Heinsohn, Gunnar, and Otto Steiger. 2006. "Interest and Money: The Property Explanation." In <i>A Handbook of Alternative Monetary Economics</i> , ed. Philip Arestis and Malcolm Sawyer, 490-507. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2006	L72 N83	Munro, John. 2006. <i>Entrepreneurship in Early-Modern Europe (1450 - 1750): An Exploration of Some Unfashionable Themes in Economic History.</i> University of Toronto, Department of Economics, Working Papers. Entrepreneurship, by its very essence, concerns the theory of the firm - the individual enterprise - which in turn is the essential core of micro-economics. A major theme of this study, however, is to demonstrate the interaction of micro- and macro-economic phenomena: to show how such firms or enterprises, and entrepreneurship itself, were often shaped by, and often helped shape, such macro-economic forces as demographic changes, monetary changes, price changes - in terms of both deflation and inflation - long distance trade, overseas exploration and expansion (colonialism), and indeed related changes in social institutions and socio-cultural values that were also influenced by such macro-economic changes. One generalization about macro-economic changes involving inflations and deflations has both general and considerable importance in the history of European business enterprises and entrepreneurship itself: for long-term inflations (when moderate) tend to cheapen or reduce the relative factor costs of labour, land (rent contracts), and capital (fixed interest rates in loan contracts). Similarly, long term deflations tend, in reverse fashion, to increase the real or relative factor costs of labour, land, and capital, especially with pronounced wage-stickiness, and related 'stickiness' in leasehold rent contracts (and more so with customary tenures), and with loan contracts--even if the long-term trends in real interest rates was falling over this long period. At the same time, both inflations and deflations are accompanied by changes in the relative prices of key industrial inputs. The key question to be posed is this: how did entrepreneurs respond to such changes in their factor costs, both short term and long term? This study commences by demonstrating how deflation in mid-15th century Europe, in increasing the purchasing power of silver, provided the stimulus for two major technological innovations in silver-mining and smelting that led to the South German silver-copper mining boom of 1460-1540, which also meant major changes in commercial-industrial entrepreneurship and in industrial scales. That mining boom in turn laid the foundations for the 130 year inflation of the Price Revolution (1520-1650) - an inflation further fostered by a financial revolution in credit and banking institutions (from the 1520s), and then further fuelled by the influx of Spanish-American silver.. The heart of this study is on the role of inflation, and

Year	DE	Title and Abstract
		associated macro-economic changes, in producing the roots of modern capitalist entrepreneurship, during what is often called Tawney's Century (1540-1640). We begin, however, with two famous related theses: Hamilton's thesis of 'Profit Inflation' (in which wages lag behind consumer prices), a wrongly-constructed thesis that endures only because Keynes endorsed it; and Nef's thesis of the 'Tudor Stuart industrial revolution' - a much ridiculed response to Hamilton - whose merit lies in revealing the capitalist entrepreneurship, major technological changes, and changes in industrial scale that resulted from the substitution of coal - the hear of modern industrialization - for every more costly wood charcoal. Tawney's three theses themselves concern the origins of modern agrarian capitalist, the related 'Rise of the Gentry' debate (on the role of inflation in shifting land ownership from the aristocracy to the capitalist gentry landowners), and the Weber-Tawney thesis on Religion (Protestantism) and the Rise of Capitalism, which, I endeavour to show has its real relevance only from the late 17th century. Associated with the Price Revolution era is the Age of Overseas Expansion (involving one of the most momentous technological and entrepreneurial change of the early modern era: the development of the Full Rigged Atlantic ship, with heavy artillery). England joined that overseas commercial-colonial race rather late, in the 1550s, but in doing developed the foundations of modern capitalism in creating the joint stock company. The study ends with the following era of monetary scarcity and deflation provided another macro-economic challenge whose response was revolutionary changes in banking and financial institutions - i.e., in financial-commercial entrepreneurship. It also fostered the growth and spread of rent-seeking Mercantilist philosophies that also influenced the character of early-modern capitalist entrepreneurship.
2006	M31	Mishra, Himanshu, Arul Mishra, and Dhananjay Nayakankuppam. 2006. "Money: A Bias for the Whole." <i>Journal of Consumer Research</i> , 32(4): 541-49. We document the phenomenon of "bias for the whole," wherein greater value is perceived for money in the form of a whole (large denomination) than for equivalent amounts of money in parts (smaller denominations), resulting in a lower inclination to spend with the whole. We demonstrate across four experiments that the bias arises from greater processing fluency experienced in processing the whole as opposed to parts. This processing fluency is hedonically marked and generates positive affect that is attributed to the money, which results in an overvaluation of the whole, making one reluctant to spend with the whole.
2006	N41	Knodell, Jane. 2006. "Rethinking the Jacksonian Economy: The Impact of the 1832 Bank Veto on Commercial Banking." <i>Journal of Economic History</i> , 66(3): 541-74. Revisiting an old debate between "traditional" historians and "New" economic historians about the short-run monetary effects of President Jackson's war on the Second Bank, I offer new arguments for the traditionalists. I develop a framework accounting for growth in commercial bank credit based on the "investment club" characteristics of antebellum state-chartered banking and apply it to state bank balance sheet data for 1830-1836. The removal of the Second Bank indeed magnified the boom in commercial banking, and the replacement of Second Bank branches with state-chartered banks as lenders and federal government depositories amplified the boom in frontier lands and state debt.

"Disagreement over the Emergence of Private Property Rights: Alternative Meanings, Alternative Explanations." <i>Review of Austrian Economics</i> , 19(1): 47-68. This paper is an exercise in the history of thought, which compares Austrian and neoclassical theories of the emergence of private property rights, and examines, in part, the extent to which Austrians can be said to offer a commonly-agreed upon explanation that parallels Carl Menger's exemplary story of the emergence of money. We address the sources of disagreement (and apparent conflict) among emergence theorists in both schools. We try to show that some of the disagreement hinges on an unclear meaning of the term 'emergence,' which is resolvable, while other sources of disagreement are fundamental at the methodological level.

2006	P42	Ahmed, Habib. 2006. "Money and Exchange Rate in an Islamic Economy." <i>Journal of Islamic Economics and Finance</i> , 2(1): 43-58. The paper discusses the nature of money in an Islamic economy and determines its value (exchange rate). The determinants of the demand for and the supply of money from an Islamic perspective are first discussed. Money supply in an Islamic economy is backed by claims on assets, gold, and foreign currency. A monetarist model of an exchange rate determination from an Islamic viewpoint is then outlined. The model indicates that as long as the money supply increases in the same proportion as the increase in money demand, the exchange rate will be stable. The paper shows that transactions based on Islamic principles have some inherent features of exchange rate stability. Policy implications for stable exchange rate are also pointed out. The establishment of Islamic institutions and financial instruments, however, are preconditions to the development of an international environment that will enable economies to pursue exchange rate policies in accordance to Shariah principles.
2006	Q00	Frankel, Jeffrey A. 2006. <i>The Effect of Monetary Policy on Real Commodity Prices</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 12713. Commodity prices are back. This paper looks at connections between monetary policy, and agricultural and mineral commodities. We begin with the monetary influences on commodity prices, first for a large country such as the United States, then smaller countries. The claim is that low real interest rates lead to high real commodity prices. The theory is an analogy with Dornbusch overshooting. The relationship between real interest rates and real commodity prices is also supported empirically. One channel through which this effect is accomplished is a negative effect of interest rates on the desire to carry commodity inventories. The paper concludes with a consideration of implications for monetary policy.

2007	E01	Hallegatte, Stephane, and Michael Ghil. 2007. <i>Endogenous Business Cycles and the Economic Response to Exogenous Shocks</i> . Fondazione Eni Enrico Mattei, Working Papers: 2007.20. In this paper, we investigate the macroeconomic response to exogenous shocks, namely natural disasters and stochastic productivity shocks. To do so, we make use of an endogenous business cycle model in which cyclical behavior arises from the investment-profit instability; the amplitude of this instability is constrained by the increase in labor costs and the inertia of production capacity and thus results in a finite-amplitude business cycle. This model is found to exhibit a larger response to natural disasters during expansions than during recessions, because the exogenous shock amplifies pre-existing disequilibria when occurring during expansions, while the existence of unused resources during recessions allows for damping the shock. Our model also shows a higher output variability in response to stochastic productivity shocks

Year	DE	Title and Abstract
		during expansions than during recessions. This finding is at odds with the classical real-cycle theory, but it is supported by the analysis of quarterly U.S. Gross Domestic Product series; the latter series exhibits, on average, a variability that is 2.6 times larger during expansions than during recessions.
2007	F00	Dincer, N. Nergiz, and Barry Eichengreen. 2007. <i>Central Bank Transparency: Where, Why, and with What Effects?</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 13003. Greater transparency in central bank operations is the most dramatic change in the conduct of monetary policy in recent years. In this paper we present new information on its extent and effects. We show that the trend is general: a large number of central banks have moved in the direction of greater transparency since the late 1990s. We then analyze the determinants and effects of central bank transparency in an integrated empirical framework. Transparency is greater in countries with more stable and developed political systems and deeper and more developed financial markets. Our preliminary analysis suggests broadly favorable if relatively weak impacts on inflation and output variability.
2007	F00	Shachmurove, Tomer, and Yochanan Shachmurove. 2007. <i>In the Same Boat: Exchange Rate Interdependence in the Asia-Pacific Region</i>. Penn Institute for Economic Research, Department of Economics, University of Pennsylvania, PIER Working Paper Archive. This paper utilizes Vector Auto Regression (VAR) models to analyze the interdependence among exchange rates of twelve Asian-Pacific nations, Australia, China, Indonesia, Japan, Malaysia, New Zealand, Philippines, South Korea, Singapore, Taiwan, Thailand, and Vietnam. The daily data span from 1995 to 2004. It finds strong regional foreign exchange dependency, varying from 32 to 73 percent. This network of markets is highly correlated, with shocks to one reverberating throughout the region. Despite the linkages of the Chinese exchange rate to the United States dollar, the Chinese foreign exchange is not as independent with respect to its South-Asian neighbors as previously thought.
2007	F21	Diss: Curdia, Vasco Rafael Da Silva. 2007. <i>Essays in Open Economy Macroeconomics</i>. PhD diss. Princeton University. The first essay proposes a model to investigate the effects of monetary policy in an emerging market economy that experiences a sudden stop of capital inflows. I show that the higher the elasticity of foreign demand, the lower the contraction in output—leading, at the extreme, to the possibility of an expansion. Interest rate rules reacting to inflation and output stabilize the output more than a fixed exchange rate regime. Low credibility and the risk of loose policy imply increased trade-offs, stronger contraction of the economy, and higher interest rates. The second essay builds on the framework presented in the first essay to consider how monetary policy should react to a sudden stop of capital inflows. Optimal monetary policy boosts export revenues through the depreciation of the domestic currency in order to minimize the impact on the domestic economy but a hike in interest rates and a recession cannot be avoided. For the relevant parameterizations, optimal policy is fairly well approximated by a flexible targeting rule, in which a combination of domestic prices, exchange rate and output is stabilized. Strict exchange rate targeting achieves low welfare levels relative to other simple rules based on inflation and output in which the exchange rate is taken into account but not fully fixed. The third essay, coauthored with Daria Finocchiaro, estimates a small open economy model for Sweden. We account for a regime change in monetary policy, from an exchange rate target zone to flexible exchange rates and inflation targeting. Results suggest that monetary policy reacted primarily to exchange rate deviations from central parity under the target zone, but inflation and output were not neglected. In the inflation targeting regime the interest rate reacted mainly to inflation. Expectations of realignment and risk premium volatility were the main sources of volatility in the target zone period. In the inflation targeting period, monetary shocks were important in the short run but in the long run labor supply and preference shocks are relatively more important. Shocks to foreign variables were more destabilizing in the target zone period than in the inflation targeting regime.
2007	H26	Diss: Ahiabu, Stephen. 2007. <i>Essays on Money, Search and the Underground Economy</i>. PhD diss. University of Toronto. This thesis sheds light on the interaction between micro-level decisions and the macroeconomy. Chapter 1 addresses the micro foundations of money. Chapters 2 and 3 examine how individual decisions and macroeconomic variables interact to impact policy and the extent of tax evasion. In the first chapter, I show that when goods are perfectly divisible, the fundamental and speculative equilibria of Kiyotaki and Wright (1989) can coexist. This validates welfare comparisons. The speculative equilibrium is always a better lubricated economy with a higher quantity of commodity money circulating. When goods with high storage costs start to circulate, they crowd out the circulation rate of goods with lower storage costs, resulting in a version of Gresham's law. A direct consequence is that the speculative equilibrium is not Pareto superior. The second chapter studies the optimal rate of seigniorage in an economy characterized by bilateral trade and a tax-evading underground sector. Optimal inflation depends on which sector, formal or underground, is more congested with buyers. If the underground sector is more congested, the optimal inflation rate in Peru is about 42.69% per annum. This offers a possible motivation for the high rates of inflation observed in that country in the 1980s. A policy that returns this economy to Friedman rule delivers a welfare loss that is equivalent to a 14% drop in consumption for the representative household. If the formal sector is more congested however, optimal inflation falls to 1.48%, close to the rate observed in 2005. In a progressive tax system, earnings inequality implies differences in marginal tax rates; and hence differences in the marginal incentive of each agent to evade those taxes. Although individual differences in tax evasion incentives can be eliminated by a simple flat tax regime, little is known about the potential effect of such a policy on the tax-evading sector. In the third chapter, I study quantitatively the effect of a revenue-neutral flat tax reform on the degree of tax evasion in the United States. I find that although flat tax reform brings fundamental changes in the distribution of wealth and formal sector earnings, the relative size of the tax-evading sector is hardly affected.

2008	C11	Nimark, Kristoffer, and Jarkko Jaaskela. 2008. <i>A Medium-scale Open Economy Model of Australia</i>. Department of Economics and Business, Universitat Pompeu Fabra, Economics Working Papers. We estimate an open economy dynamic stochastic general equilibrium (DSGE) model of Australia with a number of shocks, frictions and rigidities, matching a large number of observable time series. We find that both foreign and domestic shocks are important drivers of the Australian business cycle. We also find that the initial impact on inflation of an increase in demand for Australian commodities is negative, due to an improvement in the real exchange rate, though there is a persistent positive effect on inflation that dominates at longer horizons.
2008	C11	Jaaskela, Jarkko, and Kristoffer Nimark. 2008. <i>A Medium-scale Open Economy Model of Australia</i>. Reserve Bank of Australia, RBA Research Discussion Papers. We estimate an open economy dynamic stochastic general equilibrium (DSGE) model of Australia with a number of shocks, frictions and rigidities, matching a large number of observable time series. We find that both foreign and domestic shocks are important drivers of the Australian business cycle. We also find that the initial impact on inflation of an increase in demand for Australian commodities is negative, due to an improvement in the real exchange rate, though there is a persistent positive effect on inflation that dominates at longer horizons.
2008	F35	Adam, Christopher, Paul Collier, and Victor A. B. Davies. 2008. "A Symposium on Post-conflict Transitions: Postconflict Monetary Reconstruction." <i>World Bank Economic Review</i>, 22(1): 87-112. During civil wars governments typically resort to inflation to raise revenue. A model of this phenomenon is presented, estimated, and applied to the choices and constraints faced during the postconflict period. The results show that far from there being a fiscal peace dividend, postconflict governments tend to face even more pressing needs after than during war. As a result, in the absence of postconflict aid, inflation increases sharply, frustrating a more general monetary recovery. Aid decisively transforms the path of monetary variables in the postconflict period, enabling the economy to regain peacetime characteristics. Postconflict aid thus achieves a monetary "reconstruction" analogous to its more evident role in infrastructure.
2008	G01	Cherep, Alla, and Denys Nosenko. 2008. "Ukrainian Money and Credit Policy in a Condition of Financial Crisis." <i>Journal of European Economy</i>, 7(4): 418-25. In the given article, theoretical aspects and general characteristics of money and credit (monetary) policy are described, basic internal and external causes of financial crisis in Ukraine are established, and possible measures of monetary policy that are necessary for stabilizing the financial market condition are defined and systematized.
2008	P12	Lunghini, Giorgio. 2008. "From Natural Order to Case: Money and Machineries." <i>European Journal of Economic and Social Systems</i>, 21(2): 165-78. Political economy is characterized by two extreme and juxtaposed visions concerning the capitalistic system. Upheld both by Classic and Neoclassic, the hegemonic vision maintains that the economic system rests on either a natural order or moral principles that lead it towards a unique and stable configuration of (general) equilibrium. Money and machinery are the main institutions of the capitalist mode of production, but only the critical theories understood the different way of utilizing them by the capitalists, and that these institutions embodied the capitalist form of power.

2009	C02	Farmer, Roger E. A., Tao Zha, and Daniel F. Waggoner. 2009. <i>Understanding Markov-Switching Rational Expectations Models</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 14710. We develop a set of necessary and sufficient conditions for equilibria to be determinate in a class of forward-looking Markov-switching rational expectations models and we develop an algorithm to check these conditions in practice. We use three examples, based on the new-Keynesian model of monetary policy, to illustrate our technique. Our work connects applied econometric models of Markov-switching with forward looking rational expectations models and allows an applied researcher to construct the likelihood function for models in this class over a parameter space that includes a determinate region and an indeterminate region.
2009	C45	Binner, Jane M., Alicia M. Gazely, and Graham Kendall. 2009. "An Evaluation of UK Risky Money: An Artificial Intelligence Approach." <i>Global Business and Economics Review</i>, 11(1): 1-18. In this paper, we compare the performance of three indices in an inflation forecasting experiment. The evidence not only suggests that an evolved neural network is superior to traditionally trained networks in the majority of cases, but also that a risky money index performs at least as well as the Bank of England Divisia index when combined with interest rate information. Notably, the provision of long-term interest rates improves the out-of-sample forecasting performance of the Bank of England Divisia index in all cases examined.
2009	F32	Bougrine, Hassan, and Mario Seccareccia. 2009. "Financing Development: Removing the External Constraint." <i>International Journal of Political Economy</i>, 38(4): 44-65. A salient feature of the international monetary system is the existence of a hierarchy of currencies. Unlike the major industrialized countries where there exists an international market for their currencies and whose citizens are in a privileged position to be able to borrow internationally and accumulate debt that is denominated in their own national currencies, this is not the case for the vast majority of countries, especially in the developing world. Historical and empirical evidence demonstrate that exchange rates volatility hurts economic growth in developing countries, particularly when these countries are heavily indebted to the major foreign lenders with loans denominated in foreign currencies. Indeed, developing countries are often presented as typical examples of deficient saving (i.e. having trade deficits) and technological backwardness. To remedy these problems, developing countries must rely on foreign lenders to finance important projects, requiring capital imports, which are crucial to their development. The problem is that when exchange rates are volatile, these countries find themselves in a situation where they have to bear the burden of the adjustment which is crippling for domestic growth. We propose an institutional mechanism for settling international payments and imbalances that would protect poor countries without necessarily hurting the interests of international money lenders.
2009	G38	Diamond, Douglas W., and Raghuram G. Rajan. 2009. <i>Illiquidity and Interest Rate Policy</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 15197. The cheapest way for banks to finance long term illiquid projects is typically to

Year	DE	Title and Abstract
		borrow short term from households. But when household needs for funds are high, interest rates will rise sharply, debtors will have to shut down illiquid projects, and in extremis, will face more damaging runs. Authorities may want to push down interest rates to maintain economic activity in the face of such illiquidity, but intervention may not always be feasible, and when feasible, could encourage banks to increase leverage or fund even more illiquid projects up front. This could make all parties worse off. Authorities may want to commit to a specific policy of interest rate intervention to restore appropriate incentives. For instance, to offset incentives for banks to make more illiquid loans, authorities may have to commit to raising rates when low, to counter the distortions created by lowering them when high. We draw implications for interest rate policy to combat illiquidity.
2009	H87	Donath, Liliana, and Alexandra-Codruta Popescu. 2009. "Money as a Global Public Good." <i>Timisoara Journal of Economics and Business</i>, 2(3): 137-40. The main objective of this paper is to discuss a complex and yet not taken into consideration global public good: money. Money is a social convention created and accepted by people in order to facilitate economic transactions, being a symbol, without an intrinsic value (fiduciary money). It is universally used and it has value only in connection with the products and services that can be acquired, based on people's consent and their psychological acceptance. In other words, its value lies in the purchasing power given by the quantity of commodities and services that can be bought with money. Throughout history, as people began to become fully aware of the importance of money for their own survival, economic growth, and development, institutions were created to manage and pass the necessary rules and regulations to grant stability to the financial intermediation process. The entire process was possible because money were always perceived as a particular "asset": to society as a whole and to each individual as well. The strength of each currency reflects the strength of the public authorities that contribute to its creation (central banks, government, and society) as well as the strength of the economy it reflects. Besides its social value, money bear psychological value for each individual, as they serve in facilitating the fulfilment of necessities and dreams of all people could ever want or need in their lives. Moreover, money can be regarded as a constant throughout history: changeable over time and yet at the same, of vital importance in people's lives.
2009	I23	Saros, Daniel E. 2009. "Teaching Undergraduate Money and Banking: T-Bill Auctions and Stock Market Models." <i>Journal of Economic Education</i>, 40(3): 315-30. The author offers innovative approaches to 3 topics that are typically only briefly mentioned (if at all) in money and banking courses. The first topic is a Treasury bill auction experiment in which students have an opportunity to participate directly. The results from a class of 14 money and banking students are used to explain how an instructor might conduct such an experiment in the classroom. Relatively simple algebraic models are also developed for 2 types of stock market transactions: short selling and margin buying. Three analytical exercises are presented with complete solutions to demonstrate how an instructor might assign related problems for students. These experiments and models give students a lasting understanding of a number of rarely discussed topics in money and banking courses.
2009	L51	CV: Evans, Trevor. 2009. "Money and Finance Today." In <i>Global Finance and Social Europe</i>, ed. John Grahl, 1-28. New Directions in Modern Economics. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2009	R32	French, Shaun, Andrew Leyshon, and Nigel Thrift. 2009. "A Very Geographical Crisis: The Making and Breaking of the 2007-2008 Financial Crisis." <i>Cambridge Journal of Regions, Economy and Society</i>, 2(2): 287-302. The paper argues that the origins of the financial crisis of 2007-2008 can ultimately be located in four spaces: in international financial centres, in particular, in the longstanding competition that has existed between London and New York; in the insularity of the everyday geographies of money that have emerged in such centres in the wake of the apparent hegemony of financialization; in the geographical recycling of surpluses and deficits and, more particularly, the structural dependency that has grown up between China and the USA, and, finally; in the growing power of the financial media, centred in international financial centres and an increasingly significant agent in performing money and the economy in general, and in engendering mimetic forms of rationality.

2010	D64	White, Richard J., and Colin C. Williams. 2010. "Re-thinking Monetary Exchange: Some Lessons from England." <i>Review of Social Economy</i>, 68(3): 317-38. This paper critically evaluates the recent shift away from a "thin" reading of monetary exchange, which views money transactions as universally market-like and profit-motivated, towards "thicker" readings of exchange, which identify the permeation of wider economic relations and not-for-profit logics. To do this, an empirical study is reported of what happens when money penetrates informal exchanges between family, friends, and neighbours. The research findings lead to a more nuanced reading of monetary exchange being brought to light. The main finding is that the imagery and perception of paid informal transactions may be constructed and interpreted in "thin" terms by participants, even if the core motives and personal relations involved in paid mutual aid remain "thick." Significantly, while such a finding does not constitute a change in behaviour towards "thin" marker readings of economic exchange, it may explain why some people are dissuaded from undertaking paid mutual aid. In this way, while the paper does not reject the social and cultural embeddedness of economic exchange, it does serve to problematize the move towards thicker descriptions.
2010	D85	Kunigami, Masaaki, Masato Kobayashi, Satoru Yamadera, Takashi Yamada, and Takao Terano. 2010. "A Doubly Structural Network Model: Bifurcation Analysis on the Emergence of Money." <i>Evolutionary and Institutional Economics Review</i>, 7(1): 65-85. This paper presents a new model of micro-macro social learning model for a classical economic problem "the emergence of money". We propose doubly structural network (DSN) model, which consists of one global social network of agents and internal networks that represent agents' recognition. DSN model enables us to describe the emergence of proto-money as a self-organization process of the common recognition of exchangeability. We conduct an analytical method and a numerical approach into bifurcation phenomena of a new mean-field dynamics derived from this DSN Model. The main contribution of the paper is summarized as follows. (1) The proto-money can emerge from commodities without distinctive properties. (2) The social network degree is a definitive factor for non-/single-/multiple-emergence of proto-money. (3) The variance of the social network degree (existence of hub-agents) also affects emergence of proto-money.
2010	F23 L66	Pike, Andy, and Jane Pollard. 2010. "Economic Geographies of Financialization." <i>Economic Geography</i>, 86(1): 29-51. This article argues that financialization--shorthand for the growing influence of capital markets, their intermediaries, and processes in contemporary economic and political life--generates an analytical opportunity and political economic imperative to move finance into the heart of economic geographic analysis. Drawing upon long-standing concerns about the relatively marginal location of finance in economic geography, we emphasize the integral role of finance in connecting the entangled geographies of the economic to the social, the cultural, and the political. In the wake of various "turns" in the discipline, we develop this integrationist approach to finance in ways that retain political economies of states, markets, and social power in our interpretations of geographically uneven development. In this article, we discuss the plural nature of emergent work on financialization and develop three analytical themes to shape our discussion of financialization. Next, we elaborate our analytical approach by warning against functional, political, and spatial disconnections traced in the literature on the geographies of money. We then explore how financialization is

Year	DE	Title and Abstract
		broadening and deepening the array of agents, relations, and sites that require consideration in economic geography and is generating tensions between territorial and relational spatialities of geographic differentiation. Finally, we address the relative dearth of empirical work by examining the financialization of brands that have shaped the evolution of the brewing business and the development of new derivative instruments to hedge against weather risks. We conclude by arguing that our analysis of financialization demonstrates how finance occupies an integral position within economic geographies and reveals some of the sociospatial relations, constructions, and reach of existing and new actors, relations, and sites in shaping the uneven development of financialized contemporary capitalism.
2010	F59	Stockhammer, Engelbert. 2010. <i>Financialization and the Global Economy</i>. Political Economy Research Institute, University of Massachusetts at Amherst, Working Papers. In this chapter from the forthcoming book, <i>The Political Economy of Financial Crises</i> , edited by Gerald Epstein and Martin H. Wolfson, (Oxford University Press, 2012) Engelbert Stockhammer discusses 'financialization', i.e. changes in the role of the financial sector. This will highlight (1) changes in household behavior, in particular with regards to household debt, (2) changes in the behaviour of non-financial businesses, such as shareholder value orientation and increased financial activity and (3) changes in the financial sector, in particular the emergence of the (hardly regulated) shadow banking sector, a shift towards household credit (rather than business credit) and a shift to investment banking/fee generating business. Second, the chapter discusses the international dimension of financialization. Here the liberalization of capital flows and its consequences, the determination of exchange rates by capital flows (rather than by current account disequilibria), will be discussed. International financial liberalization has not fulfilled the neoliberal promise of generating investment-based growth, but rather has given rise to a series of financial crises that were typically driven by a swing of capital inflows ('capital flow bonanza') followed by capital flow reversals. Third, the chapter offers an interpretation of the finance-dominated accumulation regime as having given rise to two distinct growth models (based on Stockhammer 2010): a credit-financed consumption-driven growth model (mostly in Anglo-Saxon countries) and an export-driven growth model (in Germany, Japan, and, possibly, China). Both growth models suffer from a structural demand deficiency, which is due to wage suppression, but each try to overcome this by different means (credit-financed consumption or export orientation). The chapter thus highlights how financialization with its domestic and international effects have interacted with a polarization of income distribution to generate the structural imbalances that led to the crisis 2007-09.
2010	G17	Puah, Chin-Hong, Muzafar Shah Habibullah, and Venus Khim-Sen Liew. 2010. "Is Money Neutral in Stock Market? The Case of Malaysia." <i>Economics Bulletin</i>, 30(3): 1852-61. The objective of this study is to examine whether the notion of monetary neutrality holds in Malaysian stock market. Our findings indicate that there is considerable evidence against the long-run neutrality (LRN) of money in Malaysian stock market. The important implication is that the stock market is inefficient with respect to money supply. Agents might have the opportunity to gain excess profit from the stock market using the information on changes in the stock of money to predict the movements in stock indexes.

2010	K20 L50	Conway, Paul, Richard Herd, and Thomas Chalaux. 2010. <i>Reforming China's Monetary Policy Framework to Meet Domestic Objectives</i>. OECD Publishing, OECD Economics Department Working Papers: 822. As a result of reforms and financial sector development, the People's Bank of China (PBoC) now exerts significant control over money market interest rates. With money market conditions increasingly influencing effective commercial lending rates, the PBoC is also able to affect the cost of credit without recourse to its benchmark commercial bank rates. Furthermore, interest rates are an important determinant of investment spending in China, via the user cost of capital, and aggregate economic activity influences inflation. Hence, greater use of interest rates in implementing monetary policy would enhance macroeconomic stabilisation while avoiding a number of drawbacks of the current quantity-based approach. In addition, increased flexibility in the exchange rate would enhance its role in offsetting macroeconomic shocks and allow the PBoC more scope to tailor monetary policy to domestic macroeconomic conditions. Concurrently, changes in the PBoC's policy stance should be predicated on informed judgments based on the monitoring of a set of indicators in conjunction with a flexible inflation objective as the nominal anchor. This paper relates to the 2010 OECD Economic Review of China (www.oecd.org/eco/surveys/china).

2010	O50 O52	Weisbrot, Mark, and Rebecca Ray. 2010. <i>Latvia's Recession: The Cost of Adjustment With An "Internal Devaluation"</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. The Latvian recession, which is now more than two years old, has seen a world-historical drop in GDP of more than 25 percent. The IMF projects another 4 percent drop this year, and predicts that the total loss of output from peak to bottom will reach 30 percent. This would make Latvia's loss more than that of the U.S. Great Depression downturn of 1929-1933. This paper argues that the depth of the recession and the difficulty of recovery are attributable in large part to the decision to maintain the country's overvalued fixed exchange rate, because it prevents the government from pursuing the policies necessary to restore economic growth.

2010	R30	Lee, Gabriel, Victor Dorofeenko, and Kevin Salyer. 2010. Risk Shocks and Housing Markets. University of California at Davis, Department of Economics, Working Papers. This paper analyzes the role of uncertainty in a multi-sector housing model with financial frictions. We include time varying uncertainty (i.e. risk shocks) in the technology shocks that affect housing production. The analysis demonstrates that risk shocks to the housing production sector are a quantitatively important impulse mechanism for the business cycle. Also, we demonstrate that bankruptcy costs act as an endogenous markup factor in housing prices; as a consequence, the volatility of housing prices is greater than that of output, as observed in the data. The model can also account for the observed countercyclical behavior of risk premia on loans to the housing sector.

2011	C13	Song, Song, and Peter J. Bickel. 2011. Large Vector Auto Regressions. Sonderforschungsbereich 649, Humboldt University, Berlin, Germany, SFB 649 Discussion Papers: SFB649DP2011-048. One popular approach for nonstructural economic and financial forecasting is to include a large number of economic and financial variables, which has been shown to lead to significant improvements for forecasting, for example, by the dynamic factor models. A challenging issue is to determine which variables and (their) lags are relevant, especially when there is a mixture of serial correlation (temporal dynamics), high dimensional (spatial) dependence structure and moderate sample size (relative to dimensionality and lags). To this end, an integrated solution that addresses these three challenges simultaneously is appealing. We study the large vector auto regressions here with three types of estimates. We treat each variable's own lags different from other variables' lags, distinguish various lags over time, and is able to select the variables and lags simultaneously. We first show the consequences of using Lasso type estimate directly for time series without considering the temporal dependence. In contrast, our proposed method can still produce an estimate as efficient as an oracle under such scenarios. The tuning parameters are chosen via a data driven "rolling scheme" method to optimize the forecasting performance. A macroeconomic and financial forecasting problem is considered to illustrate its superiority over existing estimators.
2011	D03 D87	Bourgeois-Gironde, Sacha, and Marianne Guille. 2011. "Anatomie de l'illusion monétaire. (With English summary)." <i>Economie et Institutions</i>, 0(16): 91-120. Our aim in this article is to provide a joint account of the economic and the psychological nature of money-illusion. This behavioral anomaly was mostly left unaccounted for by economic theory since the 1960s, due to the prevailing postulate according to which agents are endowed with perfect rationality. However, in the recent period, experimental economists and neuroeconomists gave credence to the existence of this behavioral anomaly at the individual level and actually documented that individuals tend to stick, in their assessments of the value of money, to its nominal frame. This fact was confirmed by brain-imaging studies which uncovered particular neurobiological factors which may contribute to money illusion. We consider these experimental data should be integrated into a more interdisciplinary approach of the nature and role of money.
2011	D87	Bourgeois-Gironde, Sacha, and Marianne Guille. 2011. "Keynes's Animal Spirits Vindicated: An Analysis of Recent Empirical and Neural Data on Money Illusion." <i>Journal of Post Keynesian Economics</i>, 34(2): 331-52. The tendency of people to think of money in nominal, rather than real, terms is now well documented by recent empirical data. In particular, experimental and neurobiological data provide new insights on the individual and subindividual (neurobiological processes) anchoring of money illusion. The sensitivity of the reward brain system to the nominal format of money may explain money illusion at a biological level and provide a sort of physical demonstration of Keynes animal spirits hypothesis. These findings make it more difficult to ignore the hedonic or emotional dimension of money, which lies outside the scope of homo economicus.
2011	D87	Becchio, Cristina, Joshua Skewes, Torben E. Lund, Uta Frith, Chris Frith, and Andreas Roepstorff. 2011. "How the Brain Responds to the Destruction of Money." <i>Journal of Neuroscience, Psychology, and Economics</i>, 4(1): 1-10. Is our attitude to money like that to any other tool even though its use is symbolic and is not implemented in its physical structure? Knowledge of the functional use of concrete tools, such as hammers or screwdrivers, has been associated with activation of a left hemisphere network including the posterior temporal cortex, supramarginal gyrus, inferior parietal lobule, and lateral precuneus. Here we demonstrate that observing bank notes being cut up or torn, a critical violation of their function, elicits activation within the same temporo-parietal network. Moreover, this activation is the greater the higher the value of the banknote. This lends plausibility to a genuinely psychological interpretation of the explanation of money as a tool for parametrically symbolizing exchange.
2011	H10 H44	Wray, L. Randall. 2011. "Keynes after 75 Years: Rethinking Money as a Public Monopoly". Levy Economics Institute, The Economics Working Paper Archive. In this paper I first provide an overview of alternative approaches to money, contrasting the orthodox approach, in which money is neutral, at least in the long run; and the Marx-Veblen-Keynes approach, or the monetary theory of production. I then focus in more detail on two main categories: the orthodox approach that views money as an efficiency-enhancing innovation of markets, and the Chartalist approach that defines money as a creature of the state. As the state's "creature," money should be seen as a public monopoly. I then move on to the implications of viewing money as a public monopoly and link that view back to Keynes, arguing that extending Keynes along these lines would bring his theory up to date.
2011	H31	Anderson, Emily, Atsushi Inoue, and Barbara Rossi. 2011. Heterogeneous consumers and fiscal policy shocks. Department of Economics and Business, Universitat Pompeu Fabra, Economics Working Papers. This paper studies empirical facts regarding the effects of unexpected changes in aggregate macroeconomic fiscal policies on consumers that are allowed to differ depending on their individual characteristics. We use data from the Consumption Expenditure Survey (CEX) to estimate individual-level impulse responses as well as multipliers for government spending. The main empirical finding of this paper is that unexpected fiscal shocks have substantially different effects on consumers depending on their income and age levels. In particular, the wealthiest individuals tend to behave according to the predictions of standard RBC models, whereas the poorest individuals tend to behave according to standard IS-LM (non-Ricardian) models, most likely due to credit constraints. Furthermore, government spending policy shocks tend to decrease consumption inequality.

2012	C23	Honore, Bo E., Daniel Kaufmann, and Sarah Marit Lein. 2012. <i>Asymmetries in Price-Setting Behavior: New Microeconomic Evidence from Switzerland</i> . Swiss National Bank, Working Papers: 2012-09. In this paper we follow the recent empirical literature that has specified reduced-form models for price setting that are closely tied to (S, s)-pricing rules. Our contribution to the literature is twofold. First, we propose an estimator that relaxes distributional assumptions on the unobserved heterogeneity. Second, we use the estimator to examine asymmetries in price-setting behavior. Using micro price data underlying the Swiss CPI we find that a substantial share of asymmetries in the frequency of price changes can be traced back to a rising aggregate price level. We show that asymmetries would be reduced substantially in the absence of aggregate inflation.
2012	C36	Zhang, Nellie. 2012. <i>Estimating the Demand for Settlement Balances in the Canadian Large Value Transfer System</i> . Bank of Canada, Working Papers. This paper applies a static model of an interest rate corridor to the Canadian data, and estimates the aggregate demand for central-bank settlement balances in the Large Value Transfer System (LVTS). The empirical specification controls for various calendar effects that have been shown to cause fluctuations in LVTS payment flows. The analysis takes into account the downward divergence of the overnight interest rate from the target rate, which has been persistent since 2005. The results suggest that a target of \$3 billion for LVTS settlement balances does not seem excessive during the time period when Canadian monetary policy was operating at the effective lower bound (ELB). Specifically, the model projects that, if the consistent downward divergence of overnight interest rate is taken into account, then on average \$2.405 billion of LVTS settlement balances would probably have been sufficient to achieve the goal of keeping the overnight interest rate at or very close to the lower bound of the corridor. However, by targeting a slightly higher level, the Bank of Canada could be 95% certain that the overnight interest rate would on average not exceed its policy rate at the lower bound of the corridor. In addition, the estimation shows that the point elasticity of overnight interest rate is around 0.17 when the daily level of settlement balances is targeted at \$3 billion under the ELB framework.
2012	C52	Waggoner, Daniel F., and Tao Zha. 2012. <i>Confronting Model Misspecification in Macroeconomics</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 17791. We estimate a Markov-switching mixture of two familiar macroeconomic models: a richly parameterized DSGE model and a corresponding BVAR model. We show that the Markov-switching mixture model dominates both individual models and improves the fit considerably. Our estimation indicates that the DSGE model plays an important role only in the late 1970s and the early 1980s. We show how to use the mixture model as a data filter for estimation of the DSGE model when the BVAR model is not identified. Moreover, we show how to compute the impulse responses to the same type of shock shared by the DSGE and BVAR models when the shock is identified in the BVAR model. Our exercises demonstrate the importance of integrating model uncertainty and parameter uncertainty to address potential model misspecification in macroeconomics.

Presents a broad survey of the history of American thinking about money, from the colonial period to the present, focusing mainly on the problem of race. Discusses the colonial Atlantic economy and the special conditions that affected the English colonies in North America, including paper money and slavery; banking on slavery; the controversy over paper money, racial equality, and "inflated value"; gold money and the constitution of man; a bank in human form; and words and bonds.
2012	O20 R58	Green, Maia, Uma Kothari, Claire Mercer, and Diana Mitlin. 2012. "Saving, Spending, and Future-Making: Time, Discipline, and Money in Development." <i>Environment and Planning A</i> , 44(7): 1641-56. Money is a distributed technology for the government of futures. Using ethnographically informed accounts of social practices around saving and collective remittances in poor countries, this paper examines how the malleability of money enables it to have the potential for formalisation which allows it to be brought into formal relations of future-making and foreclosure, at the same time as its potential for investments and reallocation enables it to be the basis of flexible and adaptive strategies of future-making. We show how individuals engaged in development aspirations strive to achieve futures through the collection, care, and use of money, and how strategies of formalisation, discipline, and framing accord money developmental capacities. The liquidity of money renders it a flexible vehicle for personal and collective aspirations while representing risk of leakage to other persons and ventures. The paper examines the strategies used by low-income savers and hometown associations in their concerns with establishing rules and discipline around the flexibility of money.

In a model of platform management, we find that it will not likely be profitable for such currencies to expand to become fully convertible competitors to state-sponsored currencies.
2013	D73 G33	Schneck, Ottmar. 2013. "No Banks No Crisis." <i>Banks and Bank Systems</i> , 8(4): 13-18. The USA narrowly escaped state bankruptcy in January 2013. Cyprus is on the verge of bankruptcy and many other European states require the extension of public sector loans or debt rescheduling to sustain the confidence they enjoy in the money and capital markets. Politics is reacting in a Pavlov-reflex manner by further tightening the knot on the regulation of credit institutes and is already debating Basel IV--a long-known separation of loan and deposit businesses by banks. It is becoming clearer in the process that an ever-stricter and thus more bureaucratic and transaction-cost-generating process of regulating banks is quickly reaching its limits. The system of money and capital markets is, therefore, questioned by scientists while alternatives are being sought. Alternatives can be free banking, regional currencies, bartering systems or Irving Fischer's 100 percent money. This article shows us these alternatives and the opportunities in the future.
2013	E02	Cour-Thimann, Philippine, and Bernhard Winkler. 2013. <i>The ECB's non-standard monetary policy measures: the role of institutional factors and financial structure</i> . European Central Bank, Working Paper Series: 1528. This paper aims to make two contributions: to review the ECB's non-standard monetary policy measures in response to the financial and sovereign debt crisis against the background of the institutional framework and financial structure of the euro area; and to interpret this response from a flow-of-funds perspective. The paper highlights how the rationale behind the ECB's nonstandard measures differs from that underlying quantitative easing policies. As a complement to rather than a substitute for standard interest rate decisions, the non-standard measures are aimed at supporting the effective transmission of monetary policy to the economy rather than at delivering additional direct monetary stimulus. The flow-of-funds analysis proposes an interpretation of central banks' crisis responses as fulfilling their traditional role as lender of last resort to the banking system and, more broadly, reflecting their capacity to act as the "ultimate sector" that can take on leverage when other sectors are under pressure to deleverage. It also provides examples that trace the impact of non-standard measures across different sectors and markets.
2013	E02	Dequech, David. 2013. "Is Money a Convention and/or a Creature of the State? The Convention of Acceptability, the State, Contracts, and Taxes." <i>Journal of Post Keynesian Economics</i> , 36(2): 251-73. This article begins by presenting the idea of money as a convention, first in the economics of conventions and then in post Keynesian economics, also examining whether and how one can reconcile money as a convention with Keynes's essential properties of money. The article then considers the view of money as a creature of the state, in two versions, which connect money to contracts or to taxes, respectively. Finally, it further explores the monetary foundations of a market economy, the conventional foundation of money, and the role of the state. Acknowledging that money is ultimately or fundamentally a convention requires recognizing limits to the state's ability to impose its money on the private agents. At the same time, the state is usually in a much better position than any private agent to influence the process through which the convention of acceptability of money emerges and is reproduced. A stronger proposition is that without state money there would be no stable money in a market economy. Both the fundamental conventionality of money and the essential role of the state can be thus emphasized.
2013	E02	Gorton, Gary B., and Guillermo Ordóñez. 2013. <i>The Supply and Demand for Safe Assets</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 18732. There is a demand for safe assets, either government bonds or private substitutes, for use as collateral. Government bonds are safe assets, given the government's power to tax, but their supply is driven by fiscal considerations, and does not necessarily meet the private demand for safe assets. Unlike the government, the private sector cannot produce riskless collateral. When the private sector reaches its limit (the quality of private collateral), government bonds are net wealth, up to the government's own limits (taxation capacity). The economy is fragile to the extent that privately-produced safe assets are relied upon. In a crisis, government bonds can replace private assets that do not sustain borrowing anymore, raising welfare.

Year	DE	Title and Abstract
2013	F55	Caldentey, Esteban Perez, and Matias Vernengo. 2013. <i>Reading Keynes in Buenos Aires: Prebisch and the Dynamics of Capitalism</i>. University of Utah, Department of Economics, Working Paper Series, Department of Economics, University of Utah. Keynes had a profound influence on Prebisch in terms of the diagnosis about the main failures of market economies and the need to pursue pro-active and anti-cyclical policies. However, Prebisch was critical of some aspects of Keynes' General Theory of Employment, Interest and Money, in particular on the theory of interest and the multiplier. His attitude can be explained by a difference in the object and method of analysis. Prebisch interests focused on dynamics and the cycle, themes that were peripheral to Keynes' central message. Prebisch's Keynesian influence and his rejection of some aspects of Keynes magnum opus explains why at the same time that Prebisch is often described as the Latin American Keynes, he is portrayed as concerned mainly with the long-run development problem of Latin America and without proper consideration to demand factors as fundamental determinants of output and employment.
2013	G33	THE SAME AS D73 Schneck, Ottmar. 2013. "No Banks No Crisis." <i>Banks and Bank Systems</i>, 8(4): 13-18.
2013	H51 L24 L32	Pontones Rosa, Carolina, and Rosario Perez Morote. 2013. "El Value for Money en los servicios sociales: El caso de Nottinghamshire. (Value for Money in the Social Services: The Case of Nottinghamshire. With English summary.)." <i>CIRIEC-Espana, Revista de Economía Publica, Social y Cooperativa</i>, 0(79): 145-65. The main objective of this paper is to verify how the management measures applied to the social services have contributed to "value for money" improvement in the UK. This term can be understood as a combination of variables such as quality, a rational use of resources and convenience in the provision of services. Nottinghamshire County Council is one of the local public entities that has implemented policies focused on generating "value for money" in the field of the social services. It is worth highlighting the design of prevention plans, the implementation of the personal budgets system, outsourcing arrangements, cooperation between the Social Services and the National Health Service and citizen participation in public decisions. To this end, the authors conducted a qualitative analysis of the results from a set of interviews with municipal management officers of that county, carried out in 2011.
2013	K00 M40	Peacock, Mark S. 2013. "Accounting for Money: The Legal Presuppositions of Money and Accounting in Ancient Greece." <i>Business History</i>, 55(1-2): 280-301. This paper aims to extend the purview of Business History to the ancient world by exploring the hypothesis that the development of money was stimulated by legal institutions which regulated payment of compensation for torts. The hypothesis was propounded by Philip Grierson who argued that the Germanic institution of wergeld established the earliest concept of value which underlies money's function as a unit of account. It considers Grierson's thesis in the context of archaic Greece. Although archaic Greek law developed differently from the Germanic wergeld, the legal-political sphere in Greece provides decisive impetus to the development of money and accounting. The article examines the role of commerce in archaic Greece and its relationship to monetisation.
2013	K41 M41	Kasap, Murat. 2013. "Adli Muhasebecilik Meslegi ve Aklama Sucuyla Mucadele. (Forensic Accounting Profession and Prevention of Money Laundering. With English summary.)." <i>Cankiri Karatekin Universitesi Iktisadi ve Idari Bilimler Fakultesi Dergisi/Cankiri Karatekin University Journal of the Faculty of Economics and Administrative Sciences</i>, 3(1): 121-32. In today's world, globalization and the increased use of information technology have resulted in significant increases of economic crimes in recent years. Accordingly, financial crimes, such as money laundering misconducts have increased significantly. The police play active roles in the fight against money laundering and related crimes in Turkey. However, professional support is essential in order to effectively combat money laundering. In other words, not only a good level of economics, finance, accounting knowledge is critical; but also, a decent level of law information is crucial in the detection and prevention of these crimes. Increasing the effectiveness of the forensic accounting profession, especially in the USA, has an important role in the prevention and detection of money laundering since forensic accountants have skills and capacities of litigation support, investigative accounting and expertise.

2013	M40	THE SAME AS K00 Peacock, Mark S. 2013. "Accounting for Money: The Legal Presuppositions of Money and Accounting in Ancient Greece." <i>Business History</i>, 55(1-2): 280-301.
2013	M40	Peacock, Mark. 2013. <i>Introducing Money</i>, London and New York: Taylor and Francis, Routledge. Provides a historical and theoretical examination of the evolution of money. Discusses Carl Menger and the exchange theory of money; the "state" or "chartalist" theory of money; money in the ancient Near East--the "beginnings"; money in archaic Greece--evidence from Homeric epic; the religious origins of money in "Homeric society"; "the value of a man"--wergeld, accounting, and archaic law; coinage and money in classical Greece; monetization in colonial contexts--famine, class, and markets in "development" strategies; and the moral economy of parallel currencies--the case of local exchange trading systems.
2013	M41	THE SAME AS K41 Kasap, Murat. 2013. "Adli Muhasebecilik Meslegi ve Aklama Sucuyla Mucadele. (Forensic Accounting Profession and Prevention of Money Laundering. With English summary.)." <i>Cankiri Karatekin Universitesi Iktisadi ve Idari Bilimler Fakultesi Dergisi/Cankiri Karatekin University Journal of the Faculty of Economics and Administrative Sciences</i>, 3(1): 121-32.
2013	P36	Yang, Qian, Kaiping Peng, Xueya Zhou, Ruoqiao Zheng, and Wanhua Peng. 2013. "The Monetary Effect of Power: How Perception of Power Affects Monetary Value Judgments in China and US." <i>Annals of Economics and Finance</i>, 14(1): 69-83. Previous research has found a positive correlation between the perception of power and the perception of a number of social attributes (e.g., attractiveness, height, personality traits), but most of the studies were conducted in the US, and none has investigated the relationship between power perception and monetary value judgments. The current study found dramatic differences between Americans and Chinese on value estimations; the Chinese seem to perceive much higher monetary values for all items people found or lost, regardless of the power status of the protagonists, than do Americans, controlling for inflation and currency exchange rates. We also found interesting cultural interactions in that Chinese were more likely to judge the items found by powerful people to be more valuable than the ones found by less powerful people, while Americans were more likely to judge the items found by less powerful people to be more valuable than those found by powerful people. In addition, American participants were more likely to judge the items lost by powerful people to be more valuable than those lost by less powerful people. These differences may be caused by culturally different attitudes toward power status. Implications for understanding the relationship between physical reality and psychological reality as well as the scope of cultural differences are discussed.

Year	DE	Title and Abstract
2013	Q56	CV: Hornborg, Alf. 2013. "Possible Moneys and Impossible Machines: To Intervene in the Logic of Capitalism." In <i>Global Ecology and Unequal Exchange: Fetishism in a Zero-Sum World</i> . Alf Hornborg, 139-60. Routledge Studies in Ecological Economics. London and New York: Taylor and Francis, Routledge.
2013	Q56 Q57	Kuzminski, Adrian. 2013. <i>The Ecology of Money: Debt, Growth, and Sustainability</i> , Lanham, Md. and Plymouth, U.K.: Rowman and Littlefield, Lexington Books. Explores the current ecological crisis as a consequence of our productive efforts to meet the demands of our financial system and the lack of natural resources available to sustain this effort. Discusses growth and money; equal and unequal exchanges; the commercial revolution; the financial revolution; the industrial revolution; natural and unnatural interest; the people's money; and understanding money.

2006	C15	Warne, Anders. 2006. <i>Bayesian inference in cointegrated VAR models - with applications to the demand for euro area M3</i>. European Central Bank, Working Paper Series: 692. The paper considers a Bayesian approach to the cointegrated VAR model with a uniform prior on the cointegration space. Building on earlier work by Villani (2005b), where the posterior probability of the cointegration rank can be calculated conditional on the lag order, the current paper also makes it possible to compute the joint posterior probability of these two parameters as well as the marginal posterior probabilities under the assumption of a known upper bound for the lag order. When the marginal likelihood identity is used for calculating these probabilities, a point estimator of the cointegration space and the weights is required. Analytical expressions are therefore derived of the mode of the joint posterior of these parameter matrices. The procedure is applied to a money demand system for the euro area and the results are compared to those obtained from a maximum likelihood analysis.
2006	D58	Diss: Wang, Lian. 2006. The Welfare Cost of Inflation in Generalized General Equilibrium Models. PhD diss. Binghamton University. The objective of my dissertation is to study the welfare cost of inflation in a general equilibrium framework that takes into account more realistic factors in the real world, a framework with more generalized model settings of money demand side and money supply side. On the money demand side, we introduced interest-bearing deposits applying the monetary aggregation theory; on the supply side, we established a banking sector that produces interest-bearing deposits. We found that the welfare cost of inflation is substantially low compared with the estimates in the model with only non-interest-bearing assets, and is much lower than that estimated by Lucas (2000). We interpreted this phenomenon by the following reasons. First, the share of non-interest-bearing assets is fairly low. Second, the steady state user cost of bank deposits is invariant to the steady state rate of inflation.

Year	DE	Title and Abstract
		Consequently, the lower the share of non-interest-bearing deposits, the smaller percentage of the monetary portfolio would be exposed to inflation, and the lower the welfare cost. Third, the effect of inflation on consumption mitigates the distortion to the economy caused by inflation. As inflation increases, substituting away from monetary portfolio increases steady state consumption, which leads to increases in steady state utility. We also showed that higher inflation can raise or lower the rate of convergence to steady state depending on the coefficient of relative risk aversion, but the effect is weak. We also investigated the role of required reserves and excess reserves. Required reserves are equivalent to the introduction of a tax wedge on the supply price of financial assets, and it is passed entirely to the household in general equilibrium. The prices of interest-bearing deposits are no longer invariant to changes in the rate of inflation. The welfare cost of inflation increases because interest-bearing deposits will be only partially shielded from the costs of inflation. People tend to substitute toward the monetary assets subject to lower reserve requirements. Excess reserve is treated as an input to the production technology of the banking sector. The user cost of excess reserves is the nominal interest rate. An increase in the rate of inflation will cause substitution away from excess reserves to the other inputs, labor and capital. The increase in the demand for labor and capital will then reduce the labor and capital inputs in the goods production, therefore reducing output available for consumption. This effect increases the welfare cost of inflation. We found that the estimates of the welfare cost of inflation are much higher than it would have been if there were no reserve requirements and excess reserves. The estimates show that the welfare loss caused by reserve requirements is trivial and is not sensitive to changes in reserve requirements. But the effect of excess reserves on the economy is strong, which leads to much higher welfare loss and even reduction in the steady state consumption, and the welfare cost of inflation is very sensitive to changes in the share of excess reserves. If the estimates are believed, namely if required reserves and excess reserves are considered, then the welfare cost of inflation cannot be ignored, and the central bank's effort to fight inflation receives a support to some extent. Since the welfare cost of inflation depends on the degree to which user costs of interest-bearing deposits vary with the rate of inflation, we conducted a research on the empirical relationship between the nominal interest rates and inflation. Using a cross-country sample, we found the empirical support to the non-linear relationship between inflation and interest rates. A new two-threshold specification has been developed to ensure that the estimated values are continuous at the thresholds. Bootstrap approach has been used to estimate the thresholds in order to get more accurate estimations. For OECD countries, who are developed countries, there is only one threshold level of inflation below which inflation have stronger positive effect on interest rates than that above this level, and the effect of inflation on the user cost of deposit is even negative when the rate of inflation is above the threshold. When investigating the sample including OECD and all other countries, two threshold levels of inflation were found. Inflation has negative effect on the deposit and lending interest rates when it is below the lower threshold, and positive effect when it is above the lower threshold. The positive effect becomes much stronger when the rate of inflation is higher than the higher threshold. The effect of inflation on the user cost is always positive, but weaker when the rate of inflation is between the two thresholds. In all cases, the user cost is at most modestly responsive to inflation, it suggest that incorporating an inflation effect on the user cost of deposits into the basic model and calibrating it could lead to a modest upward revision of the welfare cost of inflation. This is consistent with what we found in Chapter III when required reserves and excess reserves are incorporated into the basic model.
2006	D58	Dubey, Pradeep, and John Geanakoplos. 2006. <i>Money and Production, and Liquidity Trap</i>. Cowles Foundation, Yale University, Cowles Foundation Discussion Papers: 1574. We prove the existence of monetary equilibrium in a finite horizon economy with production. We also show that if agents expect the monetary authority to significantly decrease the supply of bank money available for short term loans in the future, then the economy will fall into a liquidity trap today.
2006	E01	Bosker, E. M. 2006. "On the Aggregation of Eurozone Data." <i>Economics Letters</i>, 90(2): 260-65. Constructing eurozone aggregates is common practice in empirical studies. This study shows that the choice of aggregation method does not only matter on a theoretical basis. A brief study on eurozone money demand indicates the empirical importance of choosing the correct aggregation method as different aggregates give substantially different outcomes.
2006	L94	Hanousek, Jan, and Filip Palda. 2006. "Problems Measuring the Underground Economy in Transition." <i>Economics of Transition</i>, 14(4): 707-18. An easy and popular method for measuring the size of the underground economy is to use macro data such as money demand or electricity demand to infer what the legitimate economy needs, and then to attribute the remaining consumption to the underground economy. Such inferences rely on the stability of parameters of the money demand and electricity demand equations, or at very least on knowledge of how these parameters are changing. We argue that the pace of change of these parameters is too variable in transition economies for the above methods of estimating the size of the underground economy to be applicable. We make our point by using Czech Republic and other transition country data from the financial and electricity sectors.
2006	Q53	Hanousek, Jan, and Filip Palda. 2006. "Problems Measuring the Underground Economy in Transition." <i>Economics of Transition</i>, 14(4): 707-18. We make our point by using Czech Republic and other transition country data from the financial and electricity sectors.
2007		
2007	C54	Beijnen, Christine, and Wilko Bolt. 2007. <i>Size matters: economies of scale in European payments processing</i>. Netherlands Central Bank, Research Department, DNB Working Papers. This paper investigates the existence and extent of economies of scale in the European payment processing industry. It is expected that the creation of a Single European Payments Area (SEPA) will spur consolidations and mergers among European payment processors to more fully realize payment economies of scale. We find evidence for the existence of significant economies of scale using data of eight European payment processors during the year 1990-2005. The analysis also reveals that ownership structure is an important factor to explain cost differences across European ACHs.
2007	D01	Wakker, Peter P., Veronika Kobberling, and Christiane Schwioren. 2007. "Prospect-Theory's Diminishing Sensitivity versus Economics' Intrinsic Utility of Money: How the Introduction of the Euro Can Be Used to Disentangle the Two Empirically." <i>Theory and Decision</i>, 63(3): 205-31. The introduction of the euro gave a unique opportunity to empirically disentangle two components of utility: intrinsic value, a rational component central in economics, and the numerosity effect (going by numbers while ignoring units), a descriptive and irrational component central in prospect theory and underlying the money illusion. We measured relative risk aversion in Belgium before and after the introduction of the euro, and could consider changes in intrinsic value while keeping numbers constant, and changes in numbers while keeping intrinsic value constant. Intrinsic value

Year	DE	Title and Abstract
		significantly affected risk aversion, and the numerosity effect did not. Our study is the first to confirm the classical hypothesis of increasing relative risk aversion while avoiding irrational distortions due to the numerosity effect.
2007	D30	Heer, Burkhard, Alfred Maussner, and Paul D. McNelis. 2007. <i>The Money-Age Distribution: Empirical Facts and Limited Monetary Models</i>. CESifo GmbH, CESifo Working Paper Series: CESifo Working Paper No. 1917. The money-age distribution is hump-shaped for the US post-war economy. There is no clear cut relation between the variation of money holdings within generations and age. Furthermore, money is found to be only weakly correlated with both income and wealth. We analyze three motives for money demand in an overlapping generations model in order to explain these observations: 1) money in the utility, 2) an economy with costly credit service, and 3) limited participation. All three models are consistent with the hump-shaped relation between average money holdings and age, yet they predict a much closer association between money holdings, income, wealth, and age than we find in the data. Only the limited-participation model partly replicates the low bivariate correlation between money and income as well as between money and interest bearing assets. None of the three models satisfactorily explains these stylized facts.
2007	D61	Todter, Karl-Heinz, and Bernhard Mancke. 2007. <i>The welfare effects of inflation: a cost-benefit perspective</i>. Deutsche Bundesbank, Research Centre, Discussion Paper Series 1: Economic Studies: 2007,33. This paper reviews theory and evidence of the welfare effects of inflation from a cost-benefit perspective. Basic models and selected empirical results are discussed. Historically, in assessing the welfare effects of inflation, the distortion of money demand played a prominent role. More recently, interactions of inflation and taxation came into focus. Growth effects of inflation as well as welfare effects of unanticipated inflation and of inflation uncertainty are also addressed. To assess the policy question whether inflation should be reduced or eliminated, the costs of disinflation play a role. Finally, the trade-off between the benefits of reducing inflation and the costs of disinflation is discussed and an overall assessment of the net welfare effects of achieving price stability is provided.
2007	H61	Rangvid, Jesper. 2007. "The Effects of Temporary Exchange-Rate-Based Stabilizations When Money Serves a Productive Role." <i>Open Economies Review</i>, 18(4): 453-77. This paper investigates the effects on production, consumption, and welfare that result from a temporary exchange-rate-based (ERB) stabilization plan. The analysis is based on a dynamic optimizing model of a small open economy where real money is assumed to be a factor that is used in the production of goods. The assumption of money serving a productive role makes the model capable of generating a boom-bust cycle in output, as is often experienced during ERB stabilization plans. It is shown that if the stabilization plan is expected not to be too short and/or the costs associated with the breakdown of the plan are not too high, a temporary decrease in the rate of exchange rate devaluation will increase economic welfare. It is also found that if some of the increase in output in the initial phase of the stabilization plan is saved for periods after the plan has broken down, there is a greater chance that the ERB plan will increase economic welfare. On the other hand, if the plan is not sufficiently credible at the outset, or there is not enough intertemporal transference of output, the stabilization plan is likely to be harmful to economic welfare.

2007	L80 M55	CV: Yotopoulos, Pan A. 2007. "Asymmetric Globalization: Impact on the Third World." In <i>The Asymmetries of Globalization</i> , ed. Pan A. Yotopoulos and Donato Romano, 7-27. Routledge Studies in Development Economics. London and New York: Taylor and Francis, Routledge.
2007	M11	Basci, Erdem, Syed F. Mahmud, and Eray M. Yucel. 2007. "Money and Productive Efficiency: Evidence from a High-Inflation Country." <i>Emerging Markets Finance and Trade</i>, 43(1): 64-73. This paper examines how money balances held by manufacturing firms affect their efficiency in generating sales revenue in a high-inflation economy. The analysis employs data from Turkish firms to estimate a stochastic frontier model, finding a strong positive association between the firms' money holdings and their efficiency. However, the role of money balances seems to diminish as firms hold higher raw material inventories.

2008		
2008	C63 C78	de Araujo, Pedro. 2008. <i>Calculating Welfare Costs of Inflation in a Search Model with Preference Heterogeneity: A Calibration Exercise</i>. Center for Applied Economics and Policy Research, Economics Department, Indiana University Bloomington, Caep Research Working Papers: 2008-012. Using U.S. cross-sectional data, this paper calculates the welfare cost of a 10% inflation for different individuals and finds that the difference in cost between the poorest 10%, measured by their expenditure share on cash goods, and the richest 10% is in the order of 176%. That is, a poor person is on average willing to forgive 176% more of their total consumption in order to have inflation reduced from 10% to 0. In absolute terms this represents a cost of 2.687% of consumption for the poorest and 0.974% for the richest. I accomplish this by introducing preference heterogeneity in a monetary search model first developed by Lagos and Wright (2005), and calibrate the model to match the expenditure share on cash goods and total expenditures for each individual type using data from the Consumer Expenditure Survey (CEX) for the second quarter of 1996. I also show that this welfare difference increases to 210% (10.522% for the poorest 10% and 3.401% for the richest 10%) whenever frictions in the use of money are imposed (holdup problem). The ability to explicitly model these frictions is the advantage of using this model. Hence, inflation in this framework, as other studies have shown, acts as a regressive consumption tax; and this regressiveness is augmented with the holdup problem.
2008	C83	Beyer, Andreas, and Katarina Juselius. 2008. <i>Does it Matter How to Measure Aggregates? The Case of Monetary Transmission Mechanisms in the Euro Area</i>. University of Copenhagen, Department of Economics (formerly Institute of Economics), Discussion Papers: 08-07. Beyer, Doornik and Hendry (2000, 2001) show analytically that three out of four aggregation methods yield

Year	DE	Title and Abstract
		problematic results when exchange rate shifts induce relative-price changes between individual countries and found the least problematic method to be the variable weight method of growth rates. This papers shows, however, that the latter is sensitive to the choice of base year when based on real GDP weights whereas not on nominal GDP weights. A comparison of aggregates calculated with different methods shows that the differences are tiny in absolute value but highly persistent. To investigate the impact on the cointegration properties in empirical modelling, the monetary model in Coenen & Vega (2001) based on fixed weights was re-estimated using flexible real and nominal GDP weights. In general, the results remained reasonably robust to the choice of aggregation method.
2008	D02 O21	Ajayi, Sir Ibi. 2008. "Institutions and Economic Planning in Nigeria in Time Perspective." <i>Nigerian Journal of Economic and Social Studies</i> , 50(1): 123-43. It is a great pleasure to be here to give this lecture at the 50th Anniversary and the 48th Annual Conference of the Nigerian Economic Society. I was thinking that I would be asked to reflect and provide an update on such issues as 'recent developments in the theory and empirical analysis of the demand for money', or indeed 'the econometric analysis of import demand'. These were leading issues under debate in the 1970s, with the former topic leading to the TATOO debate and the latter leading to debates on 'walking through the marshes'. Or perhaps, I might be asked to discuss the issue of 'capital flight' or 'globalization'. These are areas in which I have been making contributions in recent times. The organizers of the conference have, however, asked me to write on 'institutions and economic planning in Nigeria in time perspective' I must let you know that I already feel like an infinitely-lived economist (with apology to my colleagues at the Ibadan School of Economics) having been asked to talk in 'time perspective' and what comes to my mind is the intergeneration model to explain this. That of course is not the intention of this talk. That can be left for another day and another time!
2008	D92	Liu, Jin-Tan, Meng-Wen Tsou, and Ping Wang. 2008. "Differential Cash Constraints, Financial Leverage and the Demand for Money: Evidence from a Complete Panel of Taiwanese Firms." <i>Journal of Macroeconomics</i> , 30(1): 523-42. This paper studies firms' demand for money by developing a differential-cash-constraint framework with firms' entire wage bills requiring cash in advance and a fraction of investment purchases being financed by credits. In addition to conventional scale and opportunity-cost factors, firms' financial status and profitability are crucial determinants for their money demand behavior. Employing a new data set consisting of a panel of Taiwanese firms over 1990-97, our econometric analysis lends empirical support to our theory. The estimates suggest that economies of scale in firms' cash management are present and that lower financial leverage or higher profitability raises money demand significantly.
2008	F43	Akiba, Hiroya. 2008. "Exchange Market Pressure for a Small Emerging Country." <i>Asia Pacific Journal of Economics and Business</i> , 12(2): 3-25. This paper constructs a model of exchange market pressure (EMP) applicable to a small, open (emerging) country that is characterized by a non-existing exchange rate pass-through for exports, but also by an exchange rate-sensitive demand for money. Philippines is selected for this empirical analysis because it is a small country that satisfies the postulated characteristics, and it has changed its exchange rate regimes several times. This paper focuses on the effectiveness of intervention by the Philippines monetary authority conducted to mitigate EMP. It is concluded that the overall intervention activity was successful over the sample period.
2008	L11	CV: Angelini, Paolo, and Francesco Lippi. 2008. "Did Prices Really Soar after the Euro Cash Changeover? Evidence from ATM Withdrawals." In <i>The Euro, Inflation and Consumers' Perceptions: Lessons from Italy</i> , ed. Paolo Del Giovane and Roberto Sabbatini, 109-24. Berlin and Heidelberg: Springer.
2008	L16	Li, Zhiguo. 2008. "Money Demand Elasticity, Effective Money Supply and Money Market Disequilibrium: "China's Puzzle" and Long-Term Excessive Liquidity." <i>Frontiers of Economics in China</i> , 3(2): 209-22. Chinese excessive liquidity problems are more serious than other main countries. The upgrading industrial structure and the increasing opening degree lead to the excessive money demand and higher money demand elasticity. Bad credits weaken money supply effectiveness and lead to illusive increasing money. We set up the money market disequilibrium model under the condition of the excessive liquidity. The imbalance between money demand and money supply is the key of Chinese excessive liquidity problems.
2008	N25	Kuroda, Akinobu. 2008. "Concurrent but Non-integrable Currency Circuits: Complementary Relationships among Monies in Modern China and Other Regions." <i>Financial History Review</i> , 15(1): 17-36. The coexistence of a number of monies with fluctuating exchange rates in modern China and other Asian regions appeared chaotic to foreign observers. However, behind this apparently confused situation lay a multiplicity of currency circuits, each of which consisted of pairing a trade zone with a particular currency. Their concurrence resulted from the difference of temporality and space in monetary usage. The difficulty of matching heterogeneous demands for money to uneven supplies of currencies made for multiple currency circulation. Such a multiplicity caused some merchants to make use of imaginary units which were alive only in account books. Though complementary relationships between incompatible monies prevailed in China, India and other regions, a combination of a remittance system and local credit supply in some societies happened to synchronise currency streams to make a compatible monetary system. This comparative study suggests that currency streams often had to pass through multiple market layers, and that some friction in the streams meant that the market required plural monies.

2009	C61	Seitz, Franz, Dietrich Stoyan, and Karl-Heinz Todter. 2009. <i>Coin migration within the euro area</i> . Deutsche Bundesbank, Research Centre, Discussion Paper Series 1; Economic Studies; 2009.27. This paper analyses how many euro coins outflow from Germany and which composition of coins is to be expected in the long run. To this end, a simple mathematical model is formulated and calibrated for euro 1 coins. The introduction of the euro coins in 2002 presented a unique opportunity to analyse the cross-border migration and the mixing process of coins in different euro-area countries. Based on research by Stoyan and depending on growth assumptions, the annual outflow of German euro 1 coins is calculated to lie somewhere between 4% and 5%. In the long run, the ratio of German euro 1 coins in Germany is likely to converge to around 50%.

2009	D40	Schlegel, Martin, and Sebastien Kraenzlin. 2009. <i>Demand for Reserves and the Central Bank's Management of Interest Rates</i>. Swiss National Bank, Working Papers: 2009-15. The implementation of monetary policy is prevalently done by interest rate targeting with a short term market rate serving as operational target. The instruments for achieving the operational target are the provision of reserves and the interest rate charged in these transactions. This paper presents a model for the estimation of the demand curve for reserves, derived from the central bank's fixed rate tender auction and the interbank money market. Using data from Switzerland, the slope of the demand curve is estimated. Furthermore, properties of the demand curve such as the slope patterns in the course of a maintenance period and the slope in different monetary regimes are assessed. We find a steeper demand curve towards the end of the maintenance period and an increasing slope when the general interest rate level is high. Further, we investigate the role of the Swiss National Bank's (SNB) interest rate in the fixed rate tender auctions. There is evidence that the SNB uses its auction rate to guide the interbank market rate.
2009	F24	Vargas-Silva, Carlos. 2009. "The Tale of Three Amigos: Remittances, Exchange Rates, and Money Demand in Mexico." <i>Review of Development Economics</i>, 13(1): 1-14. The author analyzes the relationship between remittances, exchange rates, and money demand in Mexico. He finds that shocks to remittances have a positive impact on domestic money demand. The results also suggest the existence of a bi-directional relationship between remittances and the exchange rate. Furthermore, positive shocks to remittances are found to have a negative impact on Mexico's real exchange rate. This indicates that remittances appreciate the Mexican peso and therefore may impact on the competitiveness of the tradable sector negatively.
2009	H27	Munro, John. 2009. <i>Warfare, Liquidity Crises, and Coinage Debasements in Burgundian Flanders, 1384-1482: Monetary or Fiscal Remedies?</i>. University of Toronto, Department of Economics, Working Papers. Coinage debasements were a prevalent and generally very harmful feature of most economies in late-medieval western Europe, and most certainly in Burgundian Flanders (1384-1482). Flanders also experienced several economic recessions or contractions from three related sources: warfare; the so-called 'bullion famines', with liquidity crises; and the irredeemable decline of its former mainstay, the woollen textile industries. Since many of my previous publications dealt with the Flemish cloth industry, this paper focuses on the other two major economic problems, of which warfare was the most important factor. The question posed therefore is simply this: did the Burgundian dukes undertake coinage debasements principally as a monetary or as a fiscal policy? In a recent and highly praised monograph, Sargent and Velde (The Big Problem of Small Change, 2002) have contended that almost all late-medieval and early-modern coinage debasements were undertaken to remedy not just coin shortages, but especially shortages of petty or billon coins. For the Burgundian era, one may make a strong prima facie case that Flanders (and all the Burgundian Low Countries) suffered from two major 'bullion famines', or certainly from severe coinage scarcities, including very severe scarcities of petty coins: from the 1390s to about 1415, and from the early 1440s to the early 1470s. In both periods, moreover, Flanders suffered from very severe deflations. In this paper, I contend that warfare was indeed, directly and indirectly, a primary cause of those monetary scarcities, especially in reducing the income velocity of money and thus in increasing hoarding--in my view, far more important than any supposed balance of payments deficits and 'bullion outflows to the East'. Nevertheless, I can find no convincing evidence that the Burgundian rulers ever undertook coinage debasements to remedy these coinage scarcities and to combat deflation (with one minor exception, in 1457, for petty coins). Instead, the thesis of this paper is that the Burgundian rulers undertook coinage debasements primarily as aggressive fiscal policies, and primarily to finance warfare. Almost all medieval princes exacted a seigniorage tax on bullion minted. They sought to maximize these revenues both by increasing this tax rate and by enticing much larger quantities of bullion into their mints: by both the techniques of debasement and by auxiliary bullionist policies. The paper seeks to show that the Flemish coinage debasements were generally successful, by satisfying three conditions: (1) that merchants delivering bullion to the mints received in return a greater number and greater face value of coins than before (and a greater value than from any competing mints); (2) that the public continued to accept debased, or more debased, coins at nominal face value, receiving them by 'tale' rather than by weight and intrinsic value; and (3) that such merchants, also benefitting from asymmetric information, were able to spend their new coins before their gains were eroded by inflation. This paper demonstrates that the inflationary consequences from Flemish coinage debasements were always less than would be predicted from strictly mathematical formula for price changes--perhaps because the debasements did not counteract the prevailing forces of monetary contraction and deflation. At the same time, however, because so many principalities then pursued coinage debasements as veritable guerres monetaires, many princes undertook coinage debasements for purely defensive reasons: to protect their domestic mints from foreign competition and their realms from influxes of foreign debased and especially counterfeit imitations: i.e., to counteract Gresham's Law. This study concludes with a striking anomaly in Spanish monetary history: Spanish monarchs, having agreed to abjure and forgo seigniorage taxes on coinage, did not engage in any debasements, of either the gold or silver coinages, from 1497 to 1686. But they had the luxury of alternative revenues from taxes on imports of vast quantities of silver from the Spanish Americas during most of this era. The Burgundian dukes had no such alternative sources of revenue to finance their wars.
2009	H27	Munro, John. 2009. <i>Coinage and Monetary Policies in Burgundian Flanders during the late-medieval 'Bullion Famines', 1384-1482</i>. University of Toronto, Department of Economics, Working Papers. This paper seeks to answer two questions: were the coinage debasements in Burgundian Flanders (1384-1482) undertaken principally as monetary or fiscal policies; and were they beneficial or harmful? In a recent monograph, Sargent and Velde (Big Problem of Small Change: 2002) contend that monetary objectives governed almost all medieval, early-modern debasements, especially to remedy the chronic shortages of petty coins. Despite overwhelming evidence that Burgundian Flanders, along with most of north-west Europe in the later 14th and 15th centuries, experienced severe monetary scarcities and liquidity crises, especially in the periods ca. 1390--ca. 1415 and ca. 1440--ca. 1470, both periods of severe deflations, eras commonly known as 'bullion famines', there is no compelling evidence that the Burgundian rulers debased their coinages on the basis of any such monetary policies. My thesis is that the Burgundian rulers of Flanders, in competition with neighboring princes, undertook their debasements primarily as aggressive fiscal policies, specifically to finance warfare. Their goal was to increase their seigniorage revenues, the tax imposed on bullion brought to their mints, by two means: by increasing the tax rate itself, and by enticing an increased influx of bullion into their mints, both by the debasement techniques themselves and by auxiliary bullionist policies. Those policies were successful so long as three conditions were met: (1) that merchants supplying bullion received more coins of the same face value and thus with a greater aggregate money-of-account value than before (or than from other mints); (2) that the public accepted such debased coins at the same face value, by tale; and (3) that the merchants spent their increased supply of coins quickly, before any ensuing inflation eroded those gains. This study further demonstrates that the inflationary consequences of debasements were always less than those predicted by mathematical formulae--possibly because those debasements failed to counteract the prevailing forces of monetary contraction and deflation. Because so many princes pursued similar fiscal policies, many others engaged in debasement for purely defensive reasons: to protect their mints from foreign competition and to protect their domestic money supplies from influxes of debased and also counterfeit imitations: i.e., to counteract Gresham's Law. If many debasements were retaliatory measures against a neighbour's bullionist policies, those policies in general, and not just debasements, were also products of late-medieval warfare, which was also the primary culprit responsible for periodic monetary contractions: by impeding coinage circulations and bullion flows, and by provoking increased hoarding. The answer to the final question is that debasements were usually far more harmful than

Year	DE	Title and Abstract
		beneficial. Note that this is an extensively revised and shortened version of an earlier working paper (no. 355), correcting some errors in that paper (concerning Spanish coinage): with the same tables, but with a new set of graphs.
2009	J13	Maksymenko, Svitlana. 2009. "Fertility, Money Holdings, and Economic Growth: Evidence from Ukraine." <i>Comparative Economic Studies</i>, 51(1): 75-99. This paper investigates declining fertility in Eastern Europe. By synthesising recent theoretical findings, this paper identifies the channels through which the economy and fertility interact. The study uses a multi-variable vector autoregression model to determine the short- and the long-run responses of fertility to unemployment, money holdings, and output growth disturbances in the Ukrainian economy. We find that labour market conditions and households' money holdings are indeed important determinants of family decisions to bear and rear children. Unemployment disturbances and monetary incentives explain more than a third of fertility variations. The impulse response, variance decomposition, and sensitivity analyses suggest a wide range of policy options to address the issue of declining fertility in transition countries.
2009	N26 N96 O18	Nicolini, Esteban A., and Maria Paula Parolo. 2009. "La circulacion de moneda en el Norte argentino despues de la Independencia: El caso de Tucuman entre 1820 y 1850. (Currency Circulation in Northern Argentina after Independence: Tucuman between 1820 and 1850. With English summary)." <i>Revista de Historia Economica</i>, 27(1): 75-102. The study of monetary phenomena in Argentina between 1810 and 1850 is complicated by the lack of historical sources and the coexistence of various currencies. According to previous research, the north of the country and specially Tucuman have been strongly influenced by Bolivian monetary policy and its currency devaluation through the issue of coins known as "feble". However, so far, a quantitative analysis of the circulation of money in this region for this period does not exist. This article shows that probate inventories have a great potential for advancing the exploration of these issues and presents an analysis of all the inventories available for Tucuman between 1820 and 1850. With this information the demand for money for this period is estimated and we confirm that money in circulation would have become more abundant in the 1840s, the period of highest levels of issue of "feble" coins, but without an obvious break with previous decades.

2010	D64	Tin, Jan. 2010. "Bequest Motives and Household Money Demand." <i>Journal of Economics and Finance</i>, 34(3): 269-83. The bequest motive is an important motive determining intergenerational transfers of income, saving, and money. However, it has received little or no attention from past studies on money demand. This study utilizes panel data to show that the bequest motive is positively related to money demand and interacts with the life-cycle motive during various stages of an individual's life. Householders with bequest motives are more likely to transfer a greater proportion of their permanent incomes to monetary assets than those without bequest motives.
2010	E69	Fischer, Andreas M. 2010. <i>Immigration and large banknotes</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 8065. Do immigrants have a higher demand for large denominated banknotes than natives? This micro study examines whether banknote orders for CHF 1,000 notes, a banknote used for storage purposes, is concentrated in Swiss municipalities with a high foreign-to-native ratio. The evidence for 251 Swiss municipalities finds that immigrants hoard fewer CHF 1,000 banknotes than natives. This result means that immigration reduces seigniorage (per person) as measured by banknote orders. A 1% increase in the immigrant-to-native ratio is coincident with a reduction in banknote orders by CHF 4,000. This reduction is attributed to wealth and age effects linked to immigrants.
2010	G24	Bhaduri, Amit. 2010. <i>A Contribution to the Theory of Financial Fragility and Crisis</i>. Levy Economics Institute, The Economics Working Paper Archive. The paper examines three aspects of a financial crisis of domestic origin. The first section studies the evolution of a debt-financed consumption boom supported by rising asset prices, leading to a credit crunch and fluctuations in the real economy, and, ultimately, to debt deflation. The next section extends the analysis to trace gradual evolution toward Ponzi finance and its consequences. The final section explains the link between the financial and the real sector of the economy, pointing to an inherent liquidity problem. The paper concludes with comments on the interactions between the three aspects.

2010	L21	Natke, Paul A., and Gregory A. Falls. 2010. "Economies of Scale and the Demand for Money." <i>Small Business Economics</i>, 35(3): 283-98. Cross-sectional data from four Surveys of Small Business Finance demonstrate that economies of scale in money holding exist, that these economies appear to be increasing over time, and that the magnitudes are greater than those estimated for large US corporations. Firms not practising several specific cash management techniques and firms facing constraints in the credit market hold lower money balances. Minority-owned firms exhibit economies of scale similar to the overall sample but cash management practices and credit constraint variables generally do not influence their money holding behavior. Scale economies vary widely across industries but overall means are relatively stable over time.

2010	N33	Davidson, Paul. 2010. "How Does a Capitalist Economy Work in the Real World?." In <i>Macroeconomics, Finance and Money: Essays in Honour of Philip Arestis</i>. Philip Arestis, 163-76. Edited by Giuseppe Fontana, John McCombie, and Malcolm Sawyer. New York: St. Martin's Press, Palgrave Macmillan. The study of monetary phenomena and an understanding of price determination in modern Europe are too often limited by scarcity of good-quality data sets on the evolution across time of such variables as money holdings, income, or wealth. In this article, we show that information contained in probate inventories can be extremely useful in circumventing this problem. In particular, we combine a data set of 116 inventories from Palencia (in northern Spain) between 1750 and 1770 with census information (Catastro de Ensenada) in order to create a cross-section estimate of money demand, a first for any period before the nineteenth century. Results provide meaningful insights about relationships among money demand, wealth, urbanization, and structural change in a pre-industrial economy; they also highlight the potential of probate inventories for improving our general understanding of the monetary history of modern Europe.

2011	B20 B51	Wray, L. Randall. 2011. "Is There Room for Bulls, Bears, and States in the Circuit?." Levy Economics Institute, The Economics Working Paper Archive. This paper takes off from Jan Kregel's paper "Shylock and Hamlet, or Are There Bulls and Bears in the Circuit?" (1986), which aimed to remedy shortcomings in most expositions of the "circuit approach." While some "circuitists"

Year	DE	Title and Abstract
	B52	have rejected John Maynard Keynes's liquidity preference theory, Kregel argued that such rejection leaves the relation between money and capital asset prices, and thus investment theory, hanging. This paper extends Kregel's analysis to an examination of the role that banks play in the circuit, and argues that banks should be modeled as active rather than passive players. This also requires an extension of the circuit theory of money, along the lines of the credit and state money approaches of modern Chartalists who follow A. Mitchell Innes. Further, we need to take Charles Goodhart's argument about default seriously: agents in the circuit are heterogeneous credit risks. The paper concludes with links to the work of French circuitist Alain Parguez.
2011	B26	Labye, Agnes. 2011. "La crise financiere actuelle: Une application du modele de Minsky? (The Current Financial Crisis: An Application of Minsky Model? With English summary.)." <i>Revue d'Economie Financiere</i> , 0(102): 263-84. The currently observed turmoil in financial markets, which is believed to have been ignited by the collapse of the American subprime mortgage market, has recently brought to prominence the ideas of Hyman Minsky, member of the post-Keynesian school of economics. Many commentators are of the view that Minsky's framework of thinking accurately anticipated the current financial crisis. The key mechanism that pushes the economy towards a crisis is the accumulation of debt during the period of prosperity. So, the economy becomes more and more fragile. Financial innovations and deregulation in a context of globalisation are responsible of this situation. It's an important point of his analysis. It's an aspect of the "financial instability hypothesis" (FIH). Another aspect of FIH is that during good times, banks and other intermediaries try to lure investors to buy debt by means of sophisticated innovations. So the major role of financial intermediaries in a process of crisis is showed. Definitely, it's possible to show that the current crisis is an application of Minsky's model.

2011	C35	Arango, Carlos, Kim Huynh, and Leonard Sabetti. 2011. <i>How Do You Pay? The Role of Incentives at the Point-of-Sale</i> . Bank of Canada, Working Papers. This paper uses discrete-choice models to quantify the role of consumer socioeconomic characteristics, payment instrument attributes, and transaction features on the probability of using cash, debit card, or credit card at the point-of-sale. We use the Bank of Canada 2009 Method of Payment Survey, a two-part survey among adult Canadians containing a detailed questionnaire and a three-day shopping diary. We find that cash is still used intensively at low value transactions due to speed, merchant acceptance, and low costs. Debit and credit cards are used more frequently for higher transaction values where safety, record keeping, the ability to delay payment and credit card rewards gain prominence. We present estimates of the elasticity of using a credit card with respect to credit card rewards. Reward elasticities are a key element in understanding the impact of retail payment pricing regulation on consumer payment instrument usage and welfare.
2011	C58	Diss: Guo, Zhengfeng. 2011. Three Essays on Nonlinear Time Series Econometrics. PhD diss. Vanderbilt University. This dissertation is comprised of three chapters on time series econometrics. The first chapter investigates the asymptotic and finite sample properties of the lag selection procedure based on the final prediction error (FPE) when the additive structure is a priori known in the nonparametric autoregression. The simulation results show a significant improvement in the finite sample performance over the case of unrestricted estimation. The second chapter proposes a model-free cotrending rank selection procedure, in the presence of both stochastic and nonlinear deterministic trends. Simulation results suggest good finite sample properties of the new rank selection criteria. The proposed method is then illustrated through an application of Japanese money demand function allowing for the cotrending relationship among money, income and interest rates. The third chapter develops a smooth transition GARCH model with an asymmetric transition function, which allows an asymmetric response of volatility to the size and sign of shocks, and an asymmetric transition dynamics for positive shocks and negative shocks. The model is applied to the empirical financial data: the NASDAQ index and the individual stock IBM daily returns.
2011	C81	Schmidt, Tobias. 2011. <i>Fatigue in payment diaries--empirical evidence from Germany</i> . Deutsche Bundesbank, Research Centre, Discussion Paper Series 1: Economic Studies: 2011,11. In this paper we analyse whether the recording behaviour of consumers keeping a payment diary changes over the diary period. Using data from a large study on the payment behaviour of German consumers we find that individuals tend to report a higher number of transactions on the first day of the diary period than on subsequent days. Contrary to existing literature we also find that the number of small cash payments recorded does not decrease during the one-week diary period. Our findings indicate that short diaries may be enough to reflect adequately the payment behaviour of all consumers. However, the precision of the estimates increases with longer diaries, at small additional costs. Longer diaries are especially helpful when it comes to analysing subgroups of payment types or rare events.
2011	D62	Chiu, Jonathan, and Miguel Molico. 2011. "Uncertainty, Inflation, and Welfare." <i>Journal of Money, Credit, and Banking</i> , 43(0): 487-512. This paper studies the welfare costs and the redistributive effects of inflation in the presence of idiosyncratic liquidity risk, in a microfounded search-theoretical monetary model. We calibrate the model to match the empirical aggregate money demand and the distribution of money holdings across households and study the effects of inflation under the implied degree of market incompleteness. We show that in the presence of imperfect insurance the estimated long-run welfare costs of inflation are on average 40% to 55% smaller compared to a complete markets, representative agent economy, and that inflation induces important redistributive effects across households.

2011	G14	Lester, Benjamin, Andrew Postlewaite, and Randall Wright. 2011. "Information and Liquidity." <i>Journal of Money, Credit, and Banking</i> , 43(0): 355-77. We study how recognizability affects assets' acceptability, or liquidity. Some assets, like U.S. currency, are readily accepted because sellers can easily recognize their value, unlike stock certificates, bonds or foreign currency, say. This idea is common in monetary economics, but previous models deliver equilibria where less recognizable assets are always accepted with positive probability, never probability 0. This is inconvenient when prices are determined through bargaining, which is difficult with private information. We construct models where agents reject outright assets that they cannot recognize, at least for some parameters. Thus, information frictions generate liquidity differences without overly complicating the analysis.
2011	G14	Rocheteau, Guillaume. 2011. "Information and Liquidity: Discussion." <i>Journal of Money, Credit, and Banking</i> , 43(0): 379-84. I discuss the model of asset liquidity by Lester, Postlewaite, and Wright (2011, this issue, Forthcoming). I consider a model with bilateral matching and bargaining in which a perfectly divisible asset serves as means of payment. A recognizability problem is introduced by assuming that the asset can be counterfeited at a positive cost. In contrast to Lester, Postlewaite, and Wright, in equilibrium sellers always accept objects that they do not recognize. The private information problem manifests itself by smaller quantities traded in uninformed matches.
2011	Q41	Sharifi, Alimorad, and Aboozar Shakeri. 2011. "Subsidies of Energy Carriers and Dynamic Energy Demand Analysis in the Iranian Manufacturing Industries. (In Farsi. With English summary.)." <i>Quarterly Journal of the Economic Research</i> , 0(3): 1-25. Energy

Year	DE	Title and Abstract
		is considered one of the major inputs of production along with other inputs such as labor and capital that contribute to the production process. Moreover, most energy sources have fossil origin and are irreversible, so on the one hand, the basic features of the finitude of other energy inputs to production are distinct and the necessity of energy saving and the possibility of substituting them with the renewable forms are self-evident. Industrial energy demand analysis has always been one of the leading fields of research in economics. This issue is more critical in the case of developing countries, especially those with transitional experiences. In this paper, third generation of dynamic factor demand models for the Iranian manufacturing industries is estimated to analyze the speed of adjustment in factor demands. Using the quadratic functional form, the result was the elimination of energy subsidies in the short term which has a great impact on the industry to reduce energy demand. But, it is believed that in the long run, the intensity of this effect will be diminished. Furthermore, the results show that the speed of adjustment in capital stock of factory industry is very low.

2012	E02	Gorton, Gary B., Stefan Lewellen, and Andrew Metrick. 2012. <i>The Safe-Asset Share</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 17777. We document that the percentage of all U.S. assets that are "safe" has remained stable at about 33 percent since 1952. This stable ratio is a rare example of calm in a rapidly changing financial world. Over the same time period, the ratio of U.S. assets to GDP has increased by a factor of 2.5, and the main supplier of safe financial debt has shifted from commercial banks to the "shadow banking system." We analyze this pattern of stylized facts and offer some tentative conclusions about the composition of the safe-asset share and its role within the overall economy.
2012	E59	Hillinger, Claude, Bernd Sussmuth, and Marco Sunder. 2012. <i>The Quantity Theory of Money and Friedmanian Monetary Policy: An Empirical Investigation</i> . CESifo Group Munich, CESifo Working Paper Series: 3754. We introduce an approach for the empirical study of the quantity theory of money (QTM) that is novel both with respect to the specific steps taken as well as the general methodology employed. Empirical studies of the QTM have focused directly on the relationship between the rate of change of the money stock and inflation. We believe that this is an inferior starting point for several reasons and focus instead on the Cambridge form of the QTM. We find that the coefficient k fluctuates strongly in the short run, but has a low and steady rate of change in the long run, which makes the QTM a useful instrument for the long-run control of inflation. An important finding that contradicts all of the previous literature is that the QTM holds for low inflation as well as for high inflation. We discuss how our findings relate to monetarism generally and propose an adaptation of McCallum's rule for a Friedmanian monetary policy.
2012	F11 F54 N41	Grubb, Farley. 2012. <i>Chronic Specie Scarcity and Efficient Barter: The Problem of Maintaining an Outside Money Supply in British Colonial America</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 18099. Colonial Americans complained that gold and silver coins (specie) were chronically scarce. These coins could be acquired only through importation. Given unrestricted trade in specie, market arbitrage should have eliminated chronic scarcity. A model of efficient barter and local inside money is developed to show how chronic specie scarcity in colonial America could prevail despite unrestricted specie-market arbitrage, thus justifying colonial complaints. The creation of inside fiat paper monies by colonial governments was a welfare-enhancing response to preexisting chronic specie scarcity, not the cause of that scarcity.
2012	F40	De Santis, Roberto A. 2012. <i>Quantity theory is alive: the role of international portfolio shifts</i> . European Central Bank, Working Paper Series: 1435. We challenge the view that the relationship between money and prices is too loose in countries with low inflation rates and argue that cross-border portfolio shifts are the root cause of the volatility in real money balances. The novelty of this paper is that we model jointly in the euro area and the United States (i) the equilibrium in the money market that takes into account the cross-border portfolio shifts, and (ii) the equilibrium in the domestic asset markets, by finding a no-arbitrage relation between domestic long-horizon expected stock and bond returns. We estimate a stable money demand in the long-run and find that the short-run correlation between annual inflation and model-based excess money growth is not statistically different from unity in both the euro area and the United States. We also find that the resulting long-run equity risk premium comoves counter-cyclically with quarterly real GDP growth in both economies.

2012	G02	Noussair, Charles N., Gregers Richter, and Jean-Robert Tyran. 2012. "Money Illusion and Nominal Inertia in Experimental Asset Markets." <i>Journal of Behavioral Finance</i> , 13(1): 27-37. We test whether large but purely nominal shocks affect real asset market prices. We subject a laboratory asset market to an exogenous shock, which either inflates or deflates the nominal fundamental value of the asset while holding the real fundamental value constant. After an inflationary shock, nominal prices adjust upward rapidly, and we observe no real effects. However, after a deflationary shock, nominal prices display considerable inertia and real prices adjust only slowly and incompletely toward the levels that would prevail in the absence of a shock. Thus, an asymmetry is observed in the price response to inflationary and deflationary nominal shocks.

2013	B50	Sobel, Richard. 2013. "The 'Desire for Money:' Aristotelian Blind Spot in the Field of Economics? A French Heterodox Point of View." <i>Journal of Philosophical Economics</i> , 6(2): 2-22. If the field of economics has today become the archetype for determinism in the social sciences, it comes at the price of a form of objectivity founded on the complex process of the reduction and naturalization of a certain type of social relation, a process best described via the real approach or the 'approach by value.' A radical critique of this process requires the deconstruction of this dominant approach, characterized by the articulation of neoclassical theory and economic liberalism. It is only once the repression of the desire for money, a repression constitutive of false economic objectivity, has been denounced that the standard model can then be subject to such a critique. This will in turn open the possibility of an economic theory which is radically anti-naturalist.
2013	E60	Keating, John, and Andrew Lee Smith. 2013. <i>Price Versus Financial Stability: A role for money in Taylor rules?</i> . University of Kansas, Department of Economics, WORKING PAPERS SERIES IN THEORETICAL AND APPLIED ECONOMICS: 201307. This paper analyzes optimal monetary policy in a standard New-Keynesian model augmented with a financial sector. The banks in the model are subject to shocks which impede their ability and willingness to produce financial assets. We show these financial market supply shocks decrease both the natural rates of output and interest. The implication is that an optimizing central bank with real time data on only inflation, output, interest rate spreads and monetary aggregates will respond positively to the growth rate of monetary aggregates which signal movement in the natural rate from these financial shocks. This simple rule is implementable by central banks as it makes the policy instrument a function of only observables and does not require precise knowledge of the model or the parameters. The key is the use of the Divisia monetary aggregate which provides a parameter--and estimation--free approximation to the true monetary aggregate. We show policy rules reacting to the Divisia monetary aggregate have well-behaved determinacy properties--satisfying a novel Taylor principle for monetary aggregates. Finally, we conclude with a minimax robust policy prescription given the uncertainty surrounding parameters driving the financial and other structural shocks.
2013	F62	Paudel, Ramesh Chandra, and Nelson Perera. 2013. "Does Financial Liberalisation Boost Money Demand? Evidence from Sri Lanka." <i>Indian Journal of Economics and Business</i> , 12(2): 223-42. This paper examines the role of financial liberalization on money demand in Sri Lanka covering the duration over 1963 to 2008. Taking the structural break into consideration, it is detected that financial liberalization does not have such a strong positive association with money demand as suggested by McKinnon-Shaw hypothesis; rather it is negative in both the long-run and the short-run. However, we found strong evidence that the exchange rate and interest rate reform initiated in 1977 has a substantial contribution to expand both narrow and broad money demand.
2013	K14 R12	Ardizzi, Guerino, Massimiliano Piacenza, Carmelo Petraglia, and Gilberto Turati. 2013. "L'economia non osservata fra evasione e crimine: Una rivisitazione del Currency Demand Approach con una applicazione al contesto italiano. (With English summary.)." <i>Rivista di Politica Economica</i> , 102(1-3): 229-69. This study contributes to the debate on estimating the size of underground economy, by proposing a reinterpretation of the Currency Demand Approach (CDA). Three main innovations are introduced. First, a direct measure of cash transactions is taken as dependent variable in the money demand equation. Second, indicators of detected tax evasion substitute difficult-to-find proxies for all the relevant determinants of noncompliance. Third, a control for cash used in criminal activities is introduced. The application of this 'modified-CDA' to Italian provinces reveals that the provinces in Centre-North exhibit a higher incidence on GDP of both the underground economy and illegal production.
2013	N55 N95 Q11	Kaminishi, Miriam. 2013. "The Seasonal Demand for Multiple Monies in Manchuria: Re-examining Zhang Zuolin's Government's Economic Policy during the 1920s." <i>Financial History Review</i> , 20(3): 335-59. This article reviews the political economy of Manchuria under the rule of Zhang Zuolin, which resulted in the economic instability that occurred during the winter of 1928. One can conjecture that the economic instability did not occur only because of the arbitrariness of the political and military regional government. The instability appears to be related to an ongoing seasonal demand for monies, which was relatively high between the months of September and March, since it corresponded to the period of commerce in soybeans--the region's main economic activity--the migration of seasonal workers, and also the festive period of the Chinese New Year. The analysis was conducted based on primary materials published by the South Manchuria Railway Company, such as currency issuance and the variation of the exchange rate of the major currencies in circulation among foreign and Chinese currencies.
2013	P52	Delatte, Anne-Laure, Julien Fouquau, and Carsten Holz. 2013. <i>Understanding Money Demand in the Transition from a Centrally Planned to a Market Economy</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 9721. Fundamental changes in institutions during the transition from a centrally planned to a market economy present a formidable challenge to monetary policy decision makers. For the case of China, we examine the institutional changes in the monetary system during the process of transition and develop money demand functions that reflect these institutional changes. We consider seasonal unit roots and estimate long run, equilibrium money demand functions, explicitly taking into consideration the changes in the institutional characteristics of China's financial system. Using a newly compiled dataset that covers an unprecedented long time period of 1984-2010 at the quarterly frequency, we are able to draw conclusions on the transitions in households', firms', and aggregate money demand, on the role of the credit plan and interest rates, on the mechanisms of macroeconomic control during economic transition, and on theoretical questions in the development and money literature.
2013	Q11	THE SAME AS N55 Kaminishi, Miriam. 2013. "The Seasonal Demand for Multiple Monies in Manchuria: Re-examining Zhang Zuolin's Government's Economic Policy during the 1920s." <i>Financial History Review</i> , 20(3): 335-59.
2013	Q58	Franck, Marieke, Johan Eyckmans, and Sandra Rousseau. 2013. "Valuating Noise Reduction Benefits with Hedonics: Heterogeneity in NDSIs from Road Noise." <i>Review of Business and Economic Literature</i> , 58(1): 2-33. Policy evaluations (such as cost-benefit analysis) of noise reduction measures require reliable estimates of society's willingness to pay for improving environmental quality. Hedonic regressions are widely used in the literature for that purpose. The results of this technique are often compared in terms of their Noise Depreciation Sensitivity Index (NDSI). Heterogeneity in the results (i.e. NDSI) is usually ascribed to differences in, for instance functional forms, cut-off points and the independent variables. The aim of this paper is to

Year	DE	Title and Abstract
		discuss these options in more depth. It will become clear that there is a need for transparency regarding these choices and their impact on the NDSI.

2006	C61	Giannoni, Marc. 2006. <i>Robust Optimal Policy in a Forward-Looking Model with Parameter and Shock Uncertainty</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 11942. This paper characterizes a robust optimal policy rule in a simple forward-looking model, when the policymaker faces uncertainty about model parameters and shock processes. We show that the robust optimal policy rule is likely to involve a stronger response of the interest rate to fluctuations in inflation and the output gap than is the case in the absence of uncertainty. Thus parameter uncertainty alone does not necessarily justify a small response of monetary policy to perturbations. However uncertainty may amplify the degree of "super-inertia" required by optimal monetary policy. We finally discuss the sensitivity of the results to alternative assumptions.

Year	DE	Title and Abstract
2006	D43	Head, Allen, Alok Kumar, and Beverly Lapham. 2006. <i>Market Power, Price Adjustment, and Inflation</i>. Queen's University, Department of Economics, Working Papers: 1089. We study the responses of real and nominal prices to random fluctuations in costs and money growth using a monetary search economy in which there are no costs or temporal restrictions on sellers' ability to change prices. The economy exhibits a form of price stickiness in that the price level may react incompletely to either type of shock as a result of endogenous changes in the average mark-up driven by movements in consumers' search intensity. The average mark-up falls as inflation rises, a finding consistent with empirical observations. As a result of this reduction in market power, prices become more responsive to shocks as inflation rises. Our results are consistent with empirical findings that the degree of price adjustment in response to both cost and money growth shocks is increasing in the average rate of inflation, that the variance of inflation increases with its average level, and that positive and negative shocks to money growth have asymmetric effects.
2006	D60	Dubey, Pradeep, and John Geanakoplos. 2006. <i>Money and Production, and Liquidity Trap</i>. Cowles Foundation, Yale University, Cowles Foundation Discussion Papers: 1574. We prove the existence of monetary equilibrium in a finite horizon economy with production. We also show that if agents expect the monetary authority to significantly decrease the supply of bank money available for short term loans in the future, then the economy will fall into a liquidity trap today.
2006	D73	CV: Riles, Annelise. 2006. "Real Time: Unwinding Technocratic and Anthropological Knowledge." In <i>Frontiers of Capital: Ethnographic Reflections on the New Economy</i>, ed. Melissa S. Fisher and Greg Downey, 86-107. Durham and London: Duke University Press.
2006	D85	Akerberg, Daniel A., and Gautam Gowrisankaran. 2006. "Quantifying Equilibrium Network Externalities in the ACH Banking Industry." <i>RAND Journal of Economics</i>, 37(3): 738-61. We seek to determine the causes and magnitudes of network externalities for the automated clearing house (ACH) electronic payments system. We construct an equilibrium model of customer and bank adoption of ACH. We structurally estimate the parameters of the model using an indirect inference procedure and panel data. The parameters are identified from exogenous variation in the adoption decisions of banks based outside the network and other factors. We find that most of the impediment to ACH adoption is from large customer fixed costs of adoption. Policies to provide moderate subsidies to customers and larger subsidies to banks for ACH adoption could increase welfare significantly.
2006	F00	Eden, Benjamin. 2006. <i>International Seigniorage Payments</i>. Department of Economics, Vanderbilt University, Working Papers: 0622. What are the "liquidity services" provided by over-priced assets? How do international seigniorage payments affect the choice of monetary policies? Does a country gain when other hold its over-priced assets? These questions are analyzed here in a model in which demand uncertainty (taste shocks) and sequential trade are key. It is shown that a country with a relatively stable demand may issue "over priced" debt and get seigniorage payments from countries with unstable demand. But this does not necessarily improve welfare in the stable demand country.
2006	F50	CV: Helleiner, Eric. 2006. "Below the State: Micro-level Monetary Power." In <i>International Monetary Power</i>, ed. David M. Andrews, 72-90. Cornell Studies in Money. Ithaca and London: Cornell University Press.
2006	F50	CV: Cooper, Scott. 2006. "The Limits of Monetary Power: Statecraft within Currency Areas." In <i>International Monetary Power</i>, ed. David M. Andrews, 162-83. Cornell Studies in Money. Ithaca and London: Cornell University Press.
2006	H74 N91	Pecquet, Gary M., and Clifford F. Thies. 2006. "Texas Treasury Notes and the Election of 1844." <i>Independent Review</i>, 11(2): 237-60. The U.S. presidential election of 1844 pitted James Polk, who favored the immediate annexation of Texas, against Henry Clay, who favored annexation only if other conditions were met. Financial-market data from that era provide important clues about the public's changing estimations of who would win.
2006	H82 L82	Cooper, Russel, Gary Madden, Ashley Lloyd, and Michael Schipp, eds. 2006. <i>The Economics of Online Markets and ICT Networks</i>, Contributions to Economics series. Heidelberg and New York: Springer, Physica-Verlag. Sixteen papers, originally presented at the International Telecommunications Society's Africa-Asia-Australasia Regional Conference held in Perth in August 2005, analyze the economics of online markets and information and communications technology networks. Papers discuss pricing and bundling of shared information goods--the case of cable channels; the development of electronic payment systems; behavioral frictions in online contracting--evidence from Yankee auctions; online channel competition in a differentiated goods market; competition and growth in virtual markets; mobile network prospects--a multisided platform analysis of competition; real options and telecommunications regulation; a discrete real options approach to access pricing; optimal pricing with sunk cost and uncertainty; efficient spectrum policy using real options and game theoretic methods; a real options approach to investment evaluation with a network externality; mixed logit analysis of carrier market share with stated-preference data; information technology, corporate performance, and firm size; a contingent valuation of terrestrial digital multimedia broadcasting; consumer preference for new wireless data services; and an international small- and medium-sized enterprise e-marketplace networking model.
2006	J11	CV: Pozo, Susan. 2006. "Dollarization and Illegal Immigration: Implications for NAFTA." In <i>Monetary Integration and Dollarization: No Panacea</i>, ed. Matias Vernengo, 93-108. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2006	K35	2006. "Recent Developments in Consumer Credit and Payments: Conference Summary." <i>Federal Reserve Bank of Philadelphia Business Review</i>, 0(0): 35-43. In September 29 and 30, 2005, the Federal Reserve Bank of Philadelphia's Research Department and Payment Cards Center organized the fourth in a series of conferences exploring new academic research on the topic of consumer credit and payments. Nearly 100 participants attended the conference, which included seven research papers on topics such as the design of consumer bankruptcy law, predatory lending, consumers' choice of borrowing terms and indebtedness, the function of credit reporting agencies, and pricing in credit card and ATM networks.
2006	L41	Gabeiras, Jose. 2006. "Una critica economica a la resolucion ServiRed del TDC sobre tasas de intercambio. (With English summary)." <i>Papeles de Economia Espanola</i>, 0(0): 84-102. There has been an intense debate in the last few years concerning the decisions made by regulatory agencies with regard to interchange fees charged in card payment systems. The Spanish case has not been an exception. In this article we undertake a critical analysis on the resolutions made by the Tribunal de Defensa de la Competencia (TDC), the Spanish Antitrust Authority on this field. Using both theoretical and empirical evidence from various of the main academic contributions on this topic, we show that the decisions made by the TDC do not seem to have economic support in the aim of achieving a higher social welfare.
2006	L41	Perez-Bustamante Koster, Jaime, and Pedro Suarez Fernandez. 2006. "Una vision critica de los recientes cambios en la aplicacion de la normativa de competencia espanola al sector de las tarjetas de pago. (With English summary)." <i>Papeles de Economia Espanola</i>, 0(0): 160-69. Three simultaneous rulings by the Spanish Competition Defence Tribunal (TDC) of April last are evidence of a dramatic change in its attitude towards the working of the payment card sector. Our contribution is focused on the legal analysis of the reasons employed by the TDC for such a major change in its point of view. The theory that we defend is that,

Year	DE	Title and Abstract
		irrespective of whether the change introduced by the TDC may be criticisable from an economic standpoint, the law requires that a change in the application of a legal norm of such economic and social importance should be effected in a properly justified manner. Our study sets out some of the reasons why the TDC rulings do not meet this requirement. In particular, we point out the serious weakness of the legal substantive arguments used by the TDC to justify its change of outlook and the inadequate definition of the transitory period granted to the means of payment systems so as to come into line with the new model.
2006	L82	THE SAME AS H82 Cooper, Russel, Gary Madden, Ashley Lloyd, and Michael Schipp, eds. 2006. <i>The Economics of Online Markets and ICT Networks</i> , Contributions to Economics series. Heidelberg and New York: Springer, Physica-Verlag.
2006	N01	Richardson, Gary. 2006. <i>Bank Distress during the Great Depression: The Illiquidity-Insolvency Debate Revisited</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 12717. During the contraction from 1929 through 1933, the Federal Reserve System tracked changes in the status of all banks operating in the United States and determined the cause of each bank suspension. This essay analyzes chronological patterns in aggregate series constructed from that data. The analysis demonstrates both illiquidity and insolvency were substantial sources of bank distress. Periods of heightened distress were correlated with periods of increased illiquidity. Contagion via correspondent networks and bank runs propagated the initial banking panics. As the depression deepened and asset values declined, insolvency loomed as the principal threat to depository institutions.

2007		
2007	C63	Castillo, Paul, Carlos Montoro, and Vicente Tuesta. 2007. <i>Inflation Premium and Oil Price Volatility</i> . Centre for Economic Performance, LSE, CEP Discussion Papers. This paper provides a fully micro-founded New Keynesian framework to study the interaction between oil price volatility, pricing behavior of firms and monetary policy. We show that when oil has low substitutability, firms find it optimal to charge higher relative prices as a premium in compensation for the risk that oil price volatility generates on their marginal costs. Overall, in general equilibrium, the interaction of the aforementioned mechanisms produces a positive relationship between oil price volatility and average inflation, which we denominate inflation premium. We characterize analytically this relationship by using the perturbation method to solve the rational expectations equilibrium of the model up to second order of accuracy. The solution implies that the inflation premium is higher when: a) oil has low substitutability, b) the Phillips Curve is convex, and c) the central bank puts higher weight on output fluctuations. We also provide some quantitative evidence showing that a calibrated model for the US with an estimated active Taylor rule produces a sizable inflation premium, similar to the levels observed in the US during the 70s.
2007	D86	Gholizadeh, Ahad. 2007. "An Analysis to Electronic Approval of Transactions. (In Farsi. With English summary)." <i>Iranian Journal of Trade Studies</i> , 11(42): 167-206. Electronic approval is the ratification of transactions via electronic communication instruments, particularly through the Internet. Preparing the ground for concluding the transaction, e.g., introducing the goods, accomplishing the negotiations, and finally, transmission of offer and acceptance in a documentary environment and in a manner almost free of charges and ceremonies; also possibility of automatic ratification, are some advantages of electronic approval in comparison to other ways of doing it. This paper is devoted to review of electronic transactions ratification. So, validity of electronic ratification of contract, required essential conditions for its drawing up, automatic approval of transactions by computer program, the time of contract's electronic approval, and shrink wrap licenses are closely examined. This study shows that from the legal viewpoint, electronic ratification is not a preference for a transaction; hence a transaction concluded electronically does not legally differ from contracts concluded otherwise. Difficulties subsisting in ratification, recognition, and validity of other ways of transacting, more or less persist in this kind of drawing up a contract.
2007	G01	Marques Pereira, Jaime. 2007. "Monnaie, coordination et risque systemique dans la crise argentine de 2001/2002 et son issue. (With English summary)." <i>Economie et Institutions</i> , 0(10-11): 99-153. This paper revisits the institutional explanation for sudden reversals of expectations, as was the case in the Argentinean crisis 2001/2002. Coordination is considered to reflect the trust set in national currency. The analysis is based on the thesis that trust represents simultaneously a symbolic, a political, and an economic process deeply rooted in routine trade, in the management of the economic situation and in a vision of national development. Using the matrix proposed by B. Theret to represent the interactions between those dimensions of money enlightening it as a total social phenomenon, we argue that the possibility of a systemic risk results from the illusions fostered by the authorized economic wisdom on promises of future income founding the political compromises which are inherent to the monetary regime. To be more precise, the expected long term results of the "true" economic models influencing economic actors and decision-makers lead to unsustainable financial gambles because their understanding of the risk neglects the link between money and the time factor in income creation and distribution. The conclusion identifies the lessons of this case study regarding a positive analysis of collective action and the ethic problems of this crisis and of the actual world crisis, due to the hegemony of neo-quantitative theory of money.
2007	H31 J10 J31 J45 J81 N93	Munro, John. 2007. <i>The Usury Doctrine and Urban Public Finances in Late-Medieval Flanders: Annuities, Excise Taxes, and Income Transfers from the Poor to the Rich</i> . University of Toronto, Department of Economics, Working Papers. The objectives of this paper are three-fold. The first is to rebut Charles Kindleberger's famous dictum that usury 'belongs less to economic history than to the history of ideas'; and in particular to demonstrate that the resuscitation of the anti-usury campaign from the early 13th century led to a veritable financial revolution in late-medieval French and Flemish towns: one that became the 'norm' in modern European states from the 16th century (in England, from 1693): a shift in public borrowing from interest-bearing loans to the sale of annuities, usually called rentes or renten. That anti-usury campaign had two major features: (1) the decrees of the Fourth Lateran Council of 1215, which provided harsh punishments - excommunication--for both unrepentant usurers and princes who failed to suppress them; and (2) the establishment of the two mendicant preaching orders: the Franciscans (1210) and the Dominicans (1216), whose monks preached hellfire and eternal damnation against all presumed usurers - including, of course, anyone who received any interest on government loans. There is much evidence that from the 1220s, many financiers in many French and Flemish towns, fearing for their immortal souls, preferred to accept far lower returns on buying rentes than the interest they would have earned on loans. These rentes, based on 8th-century Carolingian census contracts, had two basic forms: (1) life-annuities, by which a citizen purchased from the government, with a lump sum of capital, an annual income stream lasting a lifetime, or the lifetime of his wife as well; (2) perpetual annuities, by which the annual income stream was indeed perpetual, or until such time as the government chose to redeem the rentes, at par. Initially, some theologians opposed sales of rentes as subterfuges to cloak evasion of the usury doctrine. But in 1250-1, Pope Innocent IV declared them to be non-usurious contracts, essentially because they were not loans. Subsequent popes in the 15th century confirmed his views and the non-usurious character of rentes, on two conditions: (1) that the buyer of the rente could never demand redemption or repayment, and (2) that the annual

Year	DE	Title and Abstract
		annuity payments (and any ultimate redemptions) be in accordance with actual rent contracts: i.e., that the funds be derived from the products of the land. Ecclesiastical authorities soon agreed that taxes on the consumption of the products of the land (and sea) met this test: i.e., taxes on beer and wine (which always accounted for the largest share), bread, textiles, fish, meat, dairy products, etc. The second objective of this paper is to measure the importance of renten in the civic finances of Flemish towns, in terms of both revenues and expenditures: from the annual town accounts Ghent (14th century only), and Aalst (1395-1550), where they had far greater importance. The related third objective is to measure the burden of the excise taxes for master building craftsmen in Aalst, in tables that measure the values of the excise tax revenues expressed in real terms: first, in the equivalent number of 'baskets of consumables' (which form of the base of the Consumer Price Index), and second their value in terms of the annual money-wage incomes of master masons (for 210 days). This provides an entirely new look at the late-medieval 'standard of living' controversy - with indications that this consumption-tax burden sometimes rose from about 13,200 to almost 30,000 days' wage income, for a town of perhaps 3600 inhabitants (but obviously less dramatic on a per capita basis). That tax burden rose the most strongly when, by other indications, real wages (RWI = NWI/CPI) were also finally rising; and thus possibly these real wage gains were largely eliminated. That per capita tax burden would have been all the greater if, in the course of the 15th century, Aalst had experienced the same decline as did small towns of Brabant, to the east, on the order of 25%, and some other Flemish towns, in which the population decline varied from 9% to 28%. In earlier publications I had challenged the widespread view that the era following the Black Death, with a radical change in the land:labour ratio, came to be a 'Golden Age' of the artisan and labourer. I contended instead that frequent inflations eroded or eliminated wage gains, and thus that periodic rises in real wages were due essentially to steep deflations combined with pronounced wage-stickiness. As I also calculated, English artisans in the 1340s had earned real wages that were about 50% of the Flemish; but by the 1480s, they had narrowed that gap (with much less inflation) to about 80%. That gap was probably even smaller, until the 1640s, when England's Parliament finally imposed similar excise taxes on consumption.
2007	J15	Jankowski, Carrie, Richard D. Porter, and Tara Rice. 2007. "Against the Tide--Currency Use among Latin American Immigrants in Chicago." <i>Federal Reserve Bank of Chicago Economic Perspectives</i> , 31(2): 2-21. While the U.S. continues to transition away from cash toward electronic payment methods, some population segments continue to rely heavily on cash. In this study of foreign-born Latin Americans in Chicago, the authors find that the dramatic increase in the number of immigrants is supporting a growing demand for currency, notably in the \$100 denomination.
2007	J31	Pelagidis, Theodore, and Taun Toay. 2007. "Expensive Living: The Greek Experience under the Euro." <i>Intereconomics/Review of European Economic Policy</i> , 42(3): 167-76. Apart from its widely accepted direct advantages, the introduction of the euro has been widely perceived as causing a surge of inflation in most of the EU member states. Particularly in Greece there has been a decided shift in sentiment concerning EMU membership. Is the common perception among Greeks that the euro has been the primary cause of recent price hikes correct?

2007	M21	Young, Andrew T., and Alexander K. Blue. 2007. "Retail Prices during a Change in Monetary Regimes: Evidence from Sears, Roebuck Catalogs, 1938-1951." <i>Managerial and Decision Economics</i> , 28(7): 763-75. We present microeconomic evidence on US pricing dynamics pre- and post-establishment of the Bretton Woods (BW) monetary regime. We track prices of 49 goods (1,172 observations) in 1938-1951 Sears, Roebuck catalogs. The average length between (nominal) price changes was over 2 years. The average was higher (2.05 years) in the pre-BW period than in the later (2.01 years). We find that prices of brand name goods were relatively rigid; three never changed price. Price changes were larger during the 1945-1951 period than pre-BW by between 0.60 and 1.83%. Price changes displayed a higher correlation with inflation pre-BW.
2007	N93	THE SAME AS H31 Munro, John. 2007. <i>The Usury Doctrine and Urban Public Finances in Late-Medieval Flanders: Annuities, Excise Taxes, and Income Transfers from the Poor to the Rich</i> . University of Toronto, Department of Economics, Working Papers.
2007	O18	Theret, Bruno, and Miguel Zanabria. 2007. "Sur la pluralite des monnaies publiques dans les federations. Une approche de ses conditions de viabilite a partir de l'experience argentine recente. (With English summary)." <i>Economie et Institutions</i> , 0(10-11): 9-66. Despite political and monetary sovereignties should not be confused, the principles of organization of the monetary system have to be coherent with those of the political community. If this idea is true, the monetary sovereignty cannot take the same form in a political federation as in a unitary State. Thus when studying the money of political systems organised along federal principles, one has to take into account the peculiarity of this type of political organisation on the monetary regime. Argentina is a good example of the institutional inconsistencies resulting from a monetary system shaped according to a centralist unitary view within an actual political order of a federal type, the come back of the repressed taking the recurrent form of fiscal hand-to-hand currencies issued by the Provinces. A first section presents the theoretical and historical framework within which we analyse these monetary experiments. The second section comparatively describes the contrasted cases of the successful patacon, issued in the Buenos Aires province, and the failed federal issued by the Entre Rios provincial government. A third section addresses more generally the problem of the viability of this type of monies by enlarging the comparison to three other provinces (Cordoba, Corrientes, and Santa Fe--a non issuing Province), in order to display empirical regularities informing the explicative power of various economic, political, and symbolical variables on success or failure of these monetary experiments.
2007	Q38 Q41	Al-Sahlawi, Mohammed A. 2007. "An Alternative Oil-Pricing Currency and OPEC's Foreign Assets." <i>Journal of Energy and Development</i> , 33(1): 81-90.
2007	Q57	Spiegelman, Eli, George B. Spiegelman, and Jonah Spiegelman. 2007. "Money as Social Exergy." <i>Journal of Bioeconomics</i> , 9(3): 265-77. It has been proposed that open thermodynamic systems will act to dissipate available energy gradients by self-organizing into coherent structures that, with time, evolve and develop into nested hierarchies--panarchies--that adapt to internal and external changes according to a characteristic adaptive cycle. This paper seeks to apply these ideas in the purely societal realm by investigating the role of money in economic systems. Money represents the value embodied in goods; a value that is separate from the exact nature of those goods. We suggest that money thereby liberates the 'free value' of economic desire and that this free value has properties analogous to energy. The result is the self-organization of structures and systems ('econosystems') that dissipate this 'free value'. Econosystems act at different scales, and nested levels of econosystems form a panarchy, having effects that can be observed. In particular, it appears that money facilitates the creation of relationships between econosystem actors, increasing the connectedness of the econosystems that envelop those actors. We have identified a phenomenon whereby freed social value (i.e., money) can aggregate, or pool, at a larger econosystem scale in structures such as banks. These pools act as

Year	DE	Title and Abstract
		gradients that actors at the neighborhood scale can exploit for self-organization in the ecosystem. Thus, ecosystem actors appear to be freed from thermodynamic constraints by using money as a means of self-organization. However, because of these pools of aggregated social exergy, connectedness is increased at the larger scale of the ecosystem. The potential consequence of this dynamic is that money may act to push larger scale ecosystems toward a state of heightened vulnerability to collapse, while freeing smaller scale actors from apparent constraints. In this way, we propose that money acts to skew information feedback loops between ecosystem actors and larger scale structures such as economies and ecosystems.
2007	R41	CV: Anromin, Gene, Carrie Jankowski, and Richard D. Porter. 2007. "Transforming Payment Choices by Doubling Fees on the Illinois Tollway." <i>Federal Reserve Bank of Chicago Economic Perspectives</i> , 31(2): 22-47. Using data from the Illinois Tollway, the authors study the effectiveness of a particular application of pricing incentives, in conjunction with a mass-marketing campaign, to foster adoption of electronic toll collection. Dissecting the consumer response by income level, the authors reveal interesting heterogeneity of consumer payment choice in this environment.

2008	F37	CV: Schulz, Alexander, and Guntram B. Wolff. 2008. <i>Sovereign bond market integration: the euro, trading platforms and globalization</i> . Deutsche Bundesbank, Research Centre, Discussion Paper Series 1: Economic Studies: 2008,12. We disentangle different driving factors of sovereign bond market integration by studying yield co-movements of EMU countries, the UK, the US and 16 German Lander in the last 15 years. At a low frequency of weeks, bond market integration has increased gradually in the course of the last 15 years in EMU countries, as well as the UK, the US and the German Lander. The euro, as well as increasing international capital flows, appear to drive low frequency integration. In contrast, yield adjustments to changes of the German benchmark bond at high frequencies, i.e., 2 days, remain relatively low until October 2000, when a sharp increase in integration can be observed in all samples. The increase in high frequency integration can be attributed to electronic trading platforms becoming functional. The change-over from national currencies to the euro can not explain the dramatic increase in high frequency integration.
2008	H72 H83 Q54 R50	CV: Pirog, Maureen A., and Craig L. Johnson. 2008. "Electronic Funds and Benefits Transfers, E-Government, and the Winter Commission." <i>Public Administration Review</i> , 68(6): S103-14. This article examines how electronic funds transfers and electronic benefit transfers have become integral components of digital government. These technologies have forwarded many of the principles of the Winter Commission, including the development of lean, responsive government. The greater efficiency and cost savings for the federal and most state governments have not been achieved without encountering and dealing with serious matters related to customer service, contracting, collaboration, management, and implementation. These issues arise in the normal daily use of electronic payment technologies, but they are magnified in crisis situations, as demonstrated by disaster relief operations during Hurricane Katrina.
2008	I31	CV: Wunder, Christoph, Johannes Schwarze, Gerhard Krug, and Bodo Herzog. 2008. "Welfare Effects of the Euro Cash Changeover." <i>European Journal of Political Economy</i> , 24(3): 571-86. Using merged data from the British Household Panel Survey (BHPS) and the German Socio-Economic Panel (SOEP), this paper applies a parametric difference-in-differences approach to assess the real effects of the introduction of the euro on subjective well-being. A complementary nonparametric approach is also used to analyze the impact of difficulties with the new currency on well-being. The results indicate a loss in well-being associated with the introduction of the new currency, with the predicted probability that a person is contented with his/her household income diminishing by 9.7 percentage points. We calculate a compensating income variation of approximately one-third. That is, an increase in post-government household income of more than 30% is needed to compensate for the clear decline in well-being. The reasons for the negative impact are threefold. First, perceived inflation overestimates the real increase in prices resulting in suboptimal consumption decisions. Second, money illusion causes a false assessment of the budget constraint. Third, individuals have to bear the costs from the conversion and the adjustment to the new currency. Moreover, it is thought that losses are higher for persons who have difficulties with the new currency. However, the impact of difficulties in using and converting the new currency is rather small, and the initial problems were overcome within one year of the introduction of euro cash.

2008	L13	CV: Rochet, Jean Charles, and Jean Tirole. 2008. "Tying in Two-Sided Markets and the Honor All Cards Rule." <i>International Journal of Industrial Organization</i> , 26(6): 1333-47. Payment card associations offer both debit and credit cards and sometimes engage in a tie-in on the merchant side through the so-called honor-all-cards (HAC) rule. This article analyzes the impact of the HAC rule, using a simple model with two types of transactions subject to different competitive pressures. In the no-HAC-rule benchmark model, the interchange fee (IF, the transfer from the merchant's bank to the cardholder's bank) on the card subject to platform competition is socially too low, and the IF on the card protected from competition is either optimal or too high. In either case, the HAC rule not only benefits the multi-card platform but also raises social welfare, due to a rebalancing effect. The paper then investigates a number of extensions of the benchmark model, including varying degrees of substitutability between the two cards;

Year	DE	Title and Abstract
		merchant heterogeneity; and platform differentiation. While the HAC rule may no longer raise social welfare under all values of the parameters, the basic and socially beneficial rebalancing effect unveiled in the benchmark model is robust.
2008	N63	Pascual Domenech, Pere, and Carles Sudria Triay. 2008. "Industrializacion, desarrollo financiero y oferta monetaria en Barcelona a mediados del siglo XIX. (Industrialization, Financial Development and Money Supply: Barcelona in the Mid-Nineteenth Century. With English summary.)." <i>Investigaciones de Historia Economica</i> , 0(12): 45-77. The article deals with the need, inherent in any process of industrialization, to increase money supply in order to avoid deflationary tensions. We examine the case of a major financial and commercial centre: Barcelona in the mid-nineteenth century. The paper specifies the volume of different types of fiat money in circulation (bank notes, "validated" cheques, internal pay orders, short-term bonds . . .) and their characteristics as means of payment. The aim of the study is to show that, in a context of "free banking" without legal tender of the paper money, there was an automatic process towards a balance between supply and demand for money and that any possible oversupply was eliminated through a "crowding out" effect. In such systems, money-supply growth seems not to have significant effects on prices, but instead, sudden contractions of money supply did have intense upward impacts on interest rate.

2008	P45	Meera, Ahamed Kameel Mydin. 2008. "Integrating al-Rahn with the Gold Dinar: The Initial Building-Blocks towards a Gold-Based Economy." <i>Review of Islamic Economics</i> , 12(1): 125-35. Pursuant to arguments put forward by Meera and Larbani (2006a and 2006b) that the maqasid al-Shari'ah are unattainable within the present fiat monetary system and that real money systems based on commodities like gold and silver are indeed compatible with the maqasid, this paper presents a way to introduce a gold-based payment system within the fiat monetary environment. A practical way is to introduce the gold-payment system as a dual system within the fiat money environment. In the initial phase, individuals and businesses should be made to own gold gradually and once the 'critical mass' is there, to turn the gold ownership into a payment system. Integrating al-rahm, the Islamic pawn-broking, with the gold dinar is one initial building-block that can be pursued. This paper attempts to provide the mechanisms for integrating al-rahm with the gold dinar payment system.

This paper examines the debate on the gold standard from 1870 to 1914. In this period the gold standard becomes the world's monetary regime, but this political success is disputed by a considerable part of the coeval economic theory. The different critical positions showed the imperfections of the gold standard and the critical economists proposed several solutions. The most radical solutions wished a return to the bimetallic regime or the adoption of experimental system, like the symmetallism proposed by Marshall. Other critical positions were direct towards attempts of reforms, which led to the definition of the principles of the gold exchange standard, destined later on to regulate, without success, the international monetary regime after World War One, and then to be repropose at the Bretton Woods Conference and to become the basis of a long period of monetary stability.
2009	C33	Canova, Fabio, Matteo Ciccarelli, and Eva Ortega. 2009. <i>Do institutional changes affect business cycles? Evidence from Europe</i> . Department of Economics and Business, Universitat Pompeu Fabra, Economics Working Papers. We study the effects that the Maastricht treaty, the creation of the ECB, and the Euro changeover had on the dynamics of European business cycles using a panel VAR and data from ten European countries--seven from the Euro area and three outside of it. There are slow changes in the features of business cycles and in the transmission of shocks. Time variations appear to be unrelated to the three events of interest and instead linked to a process of European convergence and synchronization.
2009	C53	Brixiova, Zuzana, Margaret Morgan, and Andreas Worgotter. 2009. <i>Estonia and Euro Adoption: Small Country Challenges of Joining EMU</i> . OECD, Economics Department, OECD Economics Department Working Papers: 728. Estonia gave up the exchange rate and monetary policy tools of macroeconomic management when it introduced its currency board in 1992. While the currency board arrangement served the country well during transition in the 1990s, it offers limited flexibility to implement policies that would ease the EU convergence as well as mitigate the global financial and economic crisis. The ongoing financial crisis has made euro adoption more attractive than ever and put it on the top of the country's policy agenda. However, shocks affecting Estonia are only weakly synchronized with those of the euro area, and the structure of its economy also notably differs from the euro zone. To benefit fully from joining the EMU, Estonia must strengthen other adjustment mechanisms to shocks, including flexibility of the labour market, further improving its environment to do business and a framework, which allows for anti-cyclical fiscal policies.
2009	C93	Soetevent, Adriaan R. 2009. <i>Payment Choice, Image Motivation and Contributions to Charity</i> . Tinbergen Institute, Tinbergen Institute Discussion Papers: 09-015/1. This paper examines the impact of payment choice on charitable giving with a door-to-door fund-raising field experiment. Respondents can donate cash only, use debit only, or have both options. Cash donations have lower visibility vis-a-vis solicitors than debit card donations. When debit replaces cash, participation drops by 87 percent. Conditional on participation, donors in the Debit-only treatment give more than donors in Cash-only. In Cash&Debit, almost all donors prefer cash; participation decreases compared to Cash-only. Physical attractiveness of both female and male solicitors increases contributions. Solicitor self-confidence has a negative impact.

2009	E27	McKibbin, Warwick, and Waranya Pim Chanthapun. 2009. <i>Exchange Rate Regimes in the Asia-Pacific Region and the Global Financial Crisis</i> . Australian National University, Centre for Applied Macroeconomic Analysis, CAMA Working Papers. Rising economic integration in Asia and periodic volatility in global and national financial markets raise the issue of the optimal degree and form of monetary cooperation among Asian economies. There is a large literature on the benefits and costs of monetary cooperation, however, less can be found with a specific focus on Asia. A number of studies have explored whether Asia might form an optimal currency area, although these have focused on the nature of shocks, in particular business cycle correlations, as well as the extent of trade linkages among economies. Less has been done on the impact of portfolio shifts and financial shocks, and how these shocks impact on financial cooperation. This paper has two goals. The first is to explore the impacts of the current

Year	DE	Title and Abstract
		global financial crisis on Asian economies under existing monetary and exchange rate arrangements. The second is to explore how alternative forms of cooperation and exchange rate regimes might change the economic outcomes in Asia. In particular, the paper explores the impact of current regimes compared to one of three hypothetical regimes: (i) all countries peg to the US dollar, (ii) all Asian economies are in an Asian Currency Union with an Asian Central Bank setting policy, or (iii) floating exchange rates with each central bank in Asia independently choosing optimal time-consistent, close-loop policy rules to target a loss function consisting of deviation in inflation and output growth from desired levels.
2009	F51	Warburton, Christopher E. S. 2009. "War and Exchange Rate Valuation." <i>Economics of Peace and Security Journal</i>, 4(1): This article investigates the extent to which the dominance of the United States (U.S.) dollar as an international currency has been contingent on American diplomacy rather than the prosecution of expensive wars. Four wars are examined, the Korean War (1950-1953), the Vietnam War (1964-1975), the Persian Gulf War (1990-1991), and the Iraq War (2003-present). The historical performance of the dollar is examined in times of war and peace, and the Box-Jenkins forecasting algorithm is employed to make a short-term projection of the dollar coinciding with the Iraq war. The price of gold is used as a measure of the value of the U.S. dollar and investor confidence in the dollar during times of war and peace. The empirical evidence shows a short-term depreciation of the U.S. dollar coinciding with the Iraq War, which is not atypical of the value of the U.S. dollar in a time of war. Problems with the value of the U.S. dollar in times of war lead to the exploration of alternative forms of money, which if very successful, can erode the continued dominance of the U.S. dollar as an international currency.
2009	F54	Allard, Patrick. 2009. "Ce sacre dollar. (That Damned Dollar. With English summary)." <i>Revue d'Economie Financiere</i>, 0(94): 55-79. Both the US currency and a universal mean of exchange, the US dollar is closely bound to US power. Indeed, it is one of the most visible attributes of the former. To many, the dollar is forced upon the rest of the world to serve US hegemonic or imperialistic interests and it either is a symbol, a consequence or the cause of US power. As such, for reasons mixing every register of knowledge and passion, the dollar has remained, across times and changing international monetary systems, simultaneously an object of desire and repulsion, as widely rejected as it is used, ostracized but hoard, denounced but chosen, by the same actors, be they states, politicians, academics, investors, businessmen, or laymen.
2009	G30	Bryan, Dick, Randy Martin, and Mike Rafferty. 2009. "Financialization and Marx: Giving Labor and Capital a Financial Makeover." <i>Review of Radical Political Economics</i>, 41(4): 458-72. Financialization challenges some established ways of thinking within Marxist categories. We explore the way in which financialization is not simply shifting the balance of power between classes and generating economic volatility, but also re-constituting our understanding of class (as a formal economic category) and class relations. In particular, we examine how financialization is re-constituting labor as a form of capital, and giving capital a fluidity which serves to intensify competition.

2009	H27	Munro, John. 2009. <i>Warfare, Liquidity Crises, and Coinage Debasements in Burgundian Flanders, 1384-1482: Monetary or Fiscal Remedies?</i>. University of Toronto, Department of Economics, Working Papers. Coinage debasements were a prevalent and generally very harmful feature of most economies in late-medieval western Europe, and most certainly in Burgundian Flanders (1384-1482). Flanders also experienced several economic recessions or contractions from three related sources: warfare; the so-called 'bullion famines', with liquidity crises; and the irredeemable decline of its former mainstay, the woollen textile industries. Since many of my previous publications dealt with the Flemish cloth industry, this paper focuses on the other two major economic problems, of which warfare was the most important factor. The question posed therefore is simply this: did the Burgundian dukes undertake coinage debasements principally as a monetary or as a fiscal policy? In a recent and highly praised monograph, Sargent and Velde (<i>The Big Problem of Small Change</i> , 2002) have contended that almost all late-medieval and early-modern coinage debasements were undertaken to remedy not just coin shortages, but especially shortages of petty or billon coins. For the Burgundian era, one may make a strong prima facie case that Flanders (and all the Burgundian Low Countries) suffered from two major 'bullion famines', or certainly from severe coinage scarcities, including very severe scarcities of petty coins: from the 1390s to about 1415, and from the early 1440s to the early 1470s. In both periods, moreover, Flanders suffered from very severe deflations. In this paper, I contend that warfare was indeed, directly and indirectly, a primary cause of those monetary scarcities, especially in reducing the income velocity of money and thus in increasing hoarding--in my view, far more important than any supposed balance of payments deficits and 'bullion outflows to the East'. Nevertheless, I can find no convincing evidence that the Burgundian rulers ever undertook coinage debasements to remedy these coinage scarcities and to combat deflation (with one minor exception, in 1457, for petty coins). Instead, the thesis of this paper is that the Burgundian rulers undertook coinage debasements primarily as aggressive fiscal policies, and primarily to finance warfare. Almost all medieval princes exacted a seigniorage tax on bullion minted. They sought to maximize these revenues both by increasing this tax rate and by enticing much larger quantities of bullion into their mints: by both the techniques of debasement and by auxiliary bullionist policies. The paper seeks to show that the Flemish coinage debasements were generally successful, by satisfying three conditions: (1) that merchants delivering bullion to the mints received in return a greater number and greater face value of coins than before (and a greater value than from any competing mints); (2) that the public continued to accept debased, or more debased, coins at nominal face value, receiving them by 'tale' rather than by weight and intrinsic value; and (3) that such merchants, also benefitting from asymmetric information, were able to spend their new coins before their gains were eroded by inflation. This paper demonstrates that the inflationary consequences from Flemish coinage debasements were always less than would be predicted from strictly mathematical formula for price changes--perhaps because the debasements did not counteract the prevailing forces of monetary contraction and deflation. At the same time, however, because so many principalities then pursued coinage debasements as veritable guerres monetaires, many princes undertook coinage debasements for purely defensive reasons: to protect their domestic mints from foreign competition and their realms from influxes of foreign debased and especially counterfeit imitations: i.e., to counteract Gresham's Law. This study concludes with a striking anomaly in Spanish monetary history: Spanish monarchs, having agreed to abjure and forgo seigniorage taxes on coinage, did not engage in any debasements, of either the gold or silver coinages, from 1497 to 1686. But they had the luxury of alternative revenues from taxes on imports of vast quantities of silver from the Spanish Americas during most of this era. The Burgundian dukes had no such alternative sources of revenue to finance their wars.
2009	H27	Munro, John. 2009. <i>Coinage and Monetary Policies in Burgundian Flanders during the late-medieval 'Bullion Famines', 1384-1482</i>. University of Toronto, Department of Economics, Working Papers. This paper seeks to answer two questions: were the coinage debasements in Burgundian Flanders (1384-1482) undertaken principally as monetary or fiscal policies; and were they beneficial or harmful? In a recent monograph, Sargent and Velde (<i>Big Problem of Small Change</i> : 2002) contend that monetary objectives governed almost all medieval, early-modern debasements, especially to remedy the chronic shortages of petty coins.

Year	DE	Title and Abstract
		Despite overwhelming evidence that Burgundian Flanders, along with most of north-west Europe in the later 14th and 15th centuries, experienced severe monetary scarcities and liquidity crises, especially in the periods ca. 1390--ca. 1415 and ca. 1440-ca. 1470, both periods of severe deflations, eras commonly known as 'bullion famines', there is no compelling evidence that the Burgundian rulers debased their coinages on the basis of any such monetary policies. My thesis is that the Burgundian rulers of Flanders, in competition with neighboring princes, undertook their debasements primarily as aggressive fiscal policies, specifically to finance warfare. Their goal was to increase their seigniorage revenues, the tax imposed on bullion brought to their mints, by two means: by increasing the tax rate itself, and by enticing an increased influx of bullion into their mints, both by the debasement techniques themselves and by auxiliary bullionist policies. Those policies were successful so long as three conditions were met: (1) that merchants supplying bullion received more coins of the same face value and thus with a greater aggregate money-of-account value than before (or than from other mints); (2) that the public accepted such debased coins at the same face value, by tale; and (3) that the merchants spent their increased supply of coins quickly, before any ensuing inflation eroded those gains. This study further demonstrates that the inflationary consequences of debasements were always less than those predicted by mathematical formulae--possibly because those debasements failed to counteract the prevailing forces of monetary contraction and deflation. Because so many princes pursued similar fiscal policies, many others engaged in debasement for purely defensive reasons: to protect their mints from foreign competition and to protect their domestic money supplies from influxes of debased and also counterfeit imitations: i.e., to counteract Gresham's Law. If many debasements were retaliatory measures against a neighbour's bullionist policies, those policies in general, and not just debasements, were also products of late-medieval warfare, which was also the primary culprit responsible for periodic monetary contractions: by impeding coinage circulations and bullion flows, and by provoking increased hoarding. The answer to the final question is that debasements were usually far more harmful than beneficial. Note that this is an extensively revised and shortened version of an earlier working paper (no. 355), correcting some errors in that paper (concerning Spanish coinage): with the same tables, but with a new set of graphs.

2009	M15	Pousttchi, Key, Max Schiessler, and Dietmar G. Wiedemann. 2009. "Proposing a Comprehensive Framework for Analysis and Engineering of Mobile Payment Business Models." <i>Information Systems and e-Business Management</i> , 7(3): 363-93. Although in the era of third generation (3G) mobile networks technical hurdles are minor, the continuing failure of mobile payments (m-payments) withstands the endorsement by customers and service providers. A major reason is the uncommonly high interdependency of technical, human, and market factors which have to be regarded and orchestrated cohesively to solve the problem. In this paper, we apply Business Model Ontology in order to develop an m-payment business model framework based on the results of a precedent multi case study analysis of 27 m-payment procedures. The framework is depicted with a system of morphological boxes and the interrelations between the associated characteristics. Representing any m-payment business model along with its market setting and influencing decisions as instantiations, the resulting framework enables researchers and practitioners for comprehensive analysis of existing and future models and provides a helpful tool for m-payment business model engineering.
2009	M15	CV: Bradford, Terri. 2009. "Nonbanks and Risk in Retail Payments: EU and U.S.." In <i>Managing Information Risk and the Economics of Security</i> , ed. M. Eric Johnson, 17-53. New York: Springer.
2009	N51	Davis, Joseph H., Christopher Hanes, and Paul W. Rhode. 2009. "Harvests and Business Cycles in Nineteenth-Century America." <i>Quarterly Journal of Economics</i> , 124(4): 1675-1727. Most major American industrial business cycles from around 1880 to the First World War were caused by fluctuations in the size of the cotton harvest due to economically exogenous factors such as weather. Wheat and corn harvests did not affect industrial production; nor did the cotton harvest before the late 1870s. The unique effect of the cotton harvest in this period can be explained as an essentially monetary phenomenon, the result of

Year	DE	Title and Abstract
		interactions between harvests, international gold flows, and high-powered money demand under America's gold-standard regime of 1879-1914.
2009	N96	Nicolini, Esteban A., and Maria Paula Parolo. 2009. "La circulacion de moneda en el Norte argentino despues de la Independencia: El caso de Tucuman entre 1820 y 1850. (Currency Circulation in Northern Argentina after Independence: Tucuman between 1820 and 1850. With English summary.)." <i>Revista de Historia Economica</i> , 27(1): 75-102. The study of monetary phenomena in Argentina between 1810 and 1850 is complicated by the lack of historical sources and the coexistence of various currencies. According to previous research, the north of the country and specially Tucuman have been strongly influenced by Bolivian monetary policy and its currency devaluation through the issue of coins known as "feble". However, so far, a quantitative analysis of the circulation of money in this region for this period does not exist. This article shows that probate inventories have a great potential for advancing the exploration of these issues and presents an analysis of all the inventories available for Tucuman between 1820 and 1850. With this information the demand for money for this period is estimated and we confirm that money in circulation would have become more abundant in the 1840s, the period of highest levels of issue of "feble" coins, but without an obvious break with previous decades.
2009	O34	CV: Hunt, Robert M., Samuli Simojoki, and Tuomas Takalo. 2009. "Intellectual Property Rights and Standard Setting in Financial Services: The Case of the Single European Payments Area." 2009	O41	Minea, Alexandru, and Patrick Villieu. 2009. "Threshold Effects in Monetary and Fiscal Policies in a Growth Model: Assessing the Importance of the Financial System." <i>Journal of Macroeconomics</i> , 31(2): 304-19. We extend the [Barro, R., 1990. Government spending in a simple model of economic growth. <i>Journal of Political Economy</i> 98, 103-125] model to money financing of public expenditures, in a setup where money demand is motivated by a "transaction cost" technology, exhibiting the "cash-in-advance" specification as a special case, in the spirit of [Palivos, T., Yip, C., 1995. Government expenditure financing in an endogenous growth model: a comparison. <i>Journal of Money, Credit and Banking</i> 27, 1159-1178]. Allowing for productive public spending yields threshold effects between long-run growth and both income taxation and seigniorage, thus reproducing recent stylized facts. Moreover, in the cash-in-advance special case, we show that, to maximize long-run growth and/or welfare, government must use seigniorage-only or taxes only, depending on parameters, and in particular on the degree of financial development. In contrast, the general form of money demand motivated by a "transaction cost" technology produces interior solutions in which both seigniorage and taxes are used. An empirical section confirms our theoretical results.
2009	Q30 Q40	Frey, Laure, and Benoit Mojon. 2009. "Le dollar et l'inflation mondiale. (Dollar and World Inflation. With English summary.)." <i>Revue d'Economie Financiere</i> , 0(94): 81-106. The relations between the world inflation and the dollar are analysed through the monetary policies and the price variations of the raw materials. According to the authors, the American monetary policy is not directly responsible for the correlation of the worldwide inflation. These correlations result rather from the effects of different monetary policies in different areas. On the other hand, being the main reserve and trade currency, the dollar may have furthered the strong rise of the price of the raw materials during these last years.
2009	Q43	Kilian, Lutz. 2009. <i>Oil Price Shocks, Monetary Policy and Stagflation</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers, 7324. One of the central questions in recent macroeconomic history is to what extent monetary policy as opposed to oil price shocks contributed to the stagflation of the 1970s. Understanding what went wrong in the 1970s is the key to learning from the past. One explanation explored in Barsky and Kilian (2002) is that worldwide shifts in monetary policy regimes not related to the oil market played a major role in causing both the major oil price increases of the 1970s and stagflation in many economies. A competing view exemplified by Bernanke, Gertler and Watson (1997) is that the oil price shocks of the 1970s and 1980s arose exogenously with respect to global macroeconomic conditions, but were propagated by the reaction of monetary policy makers, causing stagflation in the process. This paper reviews the evidence for these two main explanations, interprets recent events in light of this evidence, and outlines implications for monetary policy.

2010	D63	Raj, Madhusudan. 2010. "The Credit Card Fraud: Inflation, Culture of Borrowing and Rising Economic Inequality." <i>Romanian Economic and Business Review</i> , 5(3): 56-62. The use of credit card has become a fashion and a symbol of social status, but very few people understand the problems related with its use. Credit card is a tool of the practice of fractional reserve banking of today's banking industry. This paper tries to explore the implications of the use of credit card in specific, and through that the fractional reserve banking in general. It shows how credit card generates inflation, how it promotes the culture of borrowing by discouraging honest living and how it increases economic inequality in the society.
2010	E02	Blinder, Alan. 2010. <i>How Central Should the Central Bank Be?</i> . Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 198blinder.pdf. About six years ago, I published a small book entitled <i>The Quiet Revolution</i> (Blinder 2004). Though its subtitle was <i>Central Banking Goes Modern</i> , I never imagined the half of it. Since March 2008, the Federal Reserve has gone post-modern with a bewildering variety of unprecedented actions that have either changed the nature and scope of the central bank's role or stretched it beyond the breaking point, depending on your point of view. And that leads straight to the central question of this essay: What should--and shouldn't--the Federal Reserve do?
2010	E02	Sims, Christopher. 2010. <i>Commentary on Policy at the Zero Lower Bound</i> . Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 201sims.pdf. Several aspects of the difficulties of policy at the zero lower bound are discussed: The difficulty of credible commitment to higher future inflation, as most New Keynesian models imply is necessary; the need for fiscal and monetary policy coordination; the pitfalls in the taking of quasi-fiscal actions by the central bank.

Year	DE	Title and Abstract
		of national economies, as well financial systems, which have become interdependent. The central banks activities are conditioned by higher sensibility of the financial markets regarding expectations. Stability in the value of euro and the single monetary policy can contribute to the stability of the world economy.
2010	G38	den Butter, Frank A. G. 2010. <i>The Macroeconomics of the Credit Crisis: In Search of Externalities for Macro-Prudential Supervision</i> . Tinbergen Institute, Tinbergen Institute Discussion Papers: 10-052/3. In the analysis of the credit crisis of 2007-2010 a clear distinction should be made between (i) the initial shock; (ii) the propagation and amplification of the initial shock to the systemic crisis of the financial markets; and (iii) the transmission of the credit crisis to the real economic sector causing a major cyclical downturn now known as the great recession. This paper argues that banking supervision failed to anticipate and repair the market failure that caused the huge amplification of the relatively small initial shock. As the repair of market failure is the only sound economic argument for regulation, banking supervisors should now focus on the externalities that caused the amplification of the shock and use that knowledge for adequate macro-prudential supervision in the future. Macro-economic models can be helpful in this search for externalities. The character and timing of future shocks are unpredictable, but contagion in the propagation mechanisms should be mitigated as much as possible.
2010	I30	Centorrino, Mario, Ferdinando Ofria, and Domenica Farinella. 2010. "Processi di convergenza e divergenza tra Mezzogiorno e Centro-Nord a dieci anni dall'adozione dell'UME. (Convergence and Divergence Processes between the Mezzogiorno and the Centre-North Ten Years after the Adoption of the EMU. With English summary.)." <i>Rivista Economica del Mezzogiorno</i> , 24(3): 453-86. In the mid 1990s, a number of essays have explored the possible effects of a European Monetary Union (EMU) in the weakest areas and the South of Italy. In particular, these studies have started a debate on the hypothesis that a common currency could help solving the "Southern Question" ("Questione meridionale")--a debate raising both optimistic and pessimistic answers. Firstly, the proposed paper reconstructs such a debate on the effects of a common currency for the Southern economy. Secondly, it tries to produce an ex-post analysis in order to understand whether a convergence process has been started. Our analysis shows that the South of Italy, with the exclusion of Abruzzi, in the years the unification process began, has converged towards the North in terms of per capita income. Nevertheless, such a result cannot be generalized when the analysis includes other socio-economic and structural variables (quality of life, labour market, poverty rates, consumption, crime and public sector's performances).
2010	L42	Bourreau, Marc, and Marianne Verdier. 2010. "Private Cards and the Bypass of Payment Systems by Merchants." <i>Journal of Banking and Finance</i> , 34(8): 1798-1807. This paper studies the incentives of a merchant to bypass a payment platform by issuing private cards. In our model, a payment platform allocates the total cost of a card transaction between a monopolistic issuer and a monopolistic acquirer by choosing an "interchange fee". We determine how the level of the interchange fee impacts a merchant's decision to issue private cards, if there are strategic interactions between merchants. We prove that the payment platform can only deter entry by lowering the level of the interchange fee. If the payment platform chooses to accommodate entry, we find that the total user surplus increases, but that entry is beneficial to social welfare only if the entry cost is sufficiently low.
2010	L98	Alleman, James, and Paul Rappoport. 2010. "Mobile Money: Implications for Emerging Markets." <i>Communications and Strategies</i> , 0(79): 15-28. Developing countries lack effective infrastructure: transportation, telecommunications, financial systems, etc. The positive economic impact of the improved telecommunications infrastructure has been demonstrated. The ability of microfinance has been shown to stimulate and enhance economic activity. Now a hybrid of the technologies has begun to emerge: mobile money. The ubiquity of cell phone service, coupled with the notion of microfinance offers the possibility of service in remote areas of a country where it would be otherwise economically unsustainable to provide banking services. Mobile money has all of the attributes of money including store of value and medium of exchange. This paper addresses the economics and policy issues of mobile money: what are the economics of mobile money, what policy issues does it raise; is it a threat to the traditional banking system; how should it be regulated; what can we learn from the microfinance literature; and do we have empirical evidence of its impact on growth and development?
2010	L98	Flores-Roux, Ernesto M., and Judith Mariscal. 2010. "The Enigma of Mobile Money Systems." <i>Communications and Strategies</i> , 0(79): 41-62. In this paper, we argue that the success of mobile banking models represents an enigma in terms of their replicability to other countries. These models offer the opportunity to diminish the financial exclusion suffered by the poor by providing access to credit, savings, and transfers, which are key tools capable of transforming the livelihoods of the poor as well as the efficiency of the market. We show that mobile phones need a complete ecosystem that supports its application to a functioning mobile banking service. The aim of this paper is to contribute to existing knowledge of mobile money across the value chain by providing insight into the mechanisms of m-money and the value propositions within the business of m-banking. We develop a taxonomy of the key drivers of the business model to help assess the replicability of these models in other countries. We focus on models developed in Kenya, the Philippines, and Brazil, and explore if some of the conditions present in these models are lacking for a widespread adoption in others. We conclude, however, that there appears to be no set of clearly identifiable variables that serve as a basis for success and that those necessary conditions for the replication of m-banking models identified by the existing literature to other countries around the world do not guarantee results. Moreover, we find that some of these conditions are not present in countries where m-banking models have been successful.
2010	N33	Nightingale, Pamela. 2010. "Gold, Credit, and Mortality: Distinguishing Deflationary Pressures on the Late Medieval English Economy." <i>Economic History Review</i> , 63(4): 1081-1104. This article uses national and local records of debt and evidence from coins, prices, and wages to discuss the economic effects of the gold coinage that was introduced into England in 1344. It distinguishes between the deflationary effects of gold and those of the falling population on prices and credit, and shows that a coinage dominated by gold reduced the volume of credit and transactions far more than the mortality rate and the total circulation of coin would indicate was likely. It relates these findings to the economic and social changes of the fifteenth century.
2010	N85	Bulgarelli, Odoardo, and Francesco Pomponio. 2010. "L'argento nella storia monetaria del Vicino Oriente Antico--L'Assiria (Una introduzione). (Silver in the Monetary History of the Ancient Near East--Assyria [Introduction]. With English summary.)." <i>Rivista di Storia Economica, N.S.</i> , 26(3): 377-86. Seven articles on the economic and financial features of the Babylonian history have been published in the n. 1/2009 issue of the Rivista di Storia Economica. In this issue and in the next one, the Rivista plans to publish, four additional essays concerning the economic and financial history of Assyria in the old Assyrian, Middle Assyrian, and Neo-Assyrian periods, as well as the Nuzi documentation. Thousands of tables with an economic and administrative content coming from Assyrian archives confirm the presence of private "enterprises", pursuing profits and taking risks. Like the Babylonians, the Assyrians used silver as a means of payment, store of value, and unit of account. In these pre-monetary functions, silver was joined by other items, above all annaku (tin or lead) in the Middle Assyrian period, and barley.
2010	O21	Clayton, Anthony. 2010. "Do Local Currency Systems Have a Role in Economic Regeneration?" <i>Social and Economic Studies</i> , 59(1-2): 243-87. Depressed areas and concentrations of poverty are symptoms of underperforming economies, but can persist even in growing economies, because many of them contain clusters of negative social and economic factors which can interlock

Year	DE	Title and Abstract
		and become mutually reinforcing. Two common features of economically marginalized communities in otherwise prosperous nations are a low level of cash circulation and expensive capital. One of the more radical ideas proposed to re-integrate these communities back into the wider economy is a local currency system, and a few countries have now experimented with local currencies as a way to increase local economic activity, promote self-help, increase social interactions, and thereby rebuild trust. Experiences in the UK, Austria, Australia, and Venezuela are compared. The experience of successful projects suggests that a local currency can make a useful social contribution, when embedded in local economic development strategies, as a means of encouraging social cohesion and embryonic economic development. A local currency is, in effect, a reinvention of local banking which, by supplying soft money, can play a positive but transitional role in improving social cohesion and thereby encouraging economic regeneration in poor areas within otherwise prosperous countries.
2010	O50	Weisbrot, Mark, and Rebecca Ray. 2010. <i>Latvia's Recession: The Cost of Adjustment With An "Internal Devaluation"</i> . Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. The Latvian recession, which is now more than two years old, has seen a world-historical drop in GDP of more than 25 percent. The IMF projects another 4 percent drop this year, and predicts that the total loss of output from peak to bottom will reach 30 percent. This would make Latvia's loss more than that of the U.S. Great Depression downturn of 1929-1933. This paper argues that the depth of the recession and the difficulty of recovery are attributable in large part to the decision to maintain the country's overvalued fixed exchange rate, because it prevents the government from pursuing the policies necessary to restore economic growth.
2010	Q23	COMBES, Jean-Louis, Pascale COMBES MOTEL, Alexandru MINEA, and P. VILLIEU. 2010. <i>Disinflation against the Environment? An application to the trade-off between seigniorage and deforestation</i> . CERDI, Working Papers: 201014. The forest still covers an important share of land area in many developing countries and represents an important source of revenue for governments. Another major contribution to government revenues comes from printing money, namely the seigniorage. Building on a simple theoretical model where governments target inflation and aim at reducing deforestation while minimising a welfare loss function, we exhibit the potential substitution effect between seigniorage and deforestation revenues. Regressions run on a panel of developing countries show that there exists a non-negligible substitution effect between seigniorage and deforestation revenues, which is, as suggested by the theoretical model, even stronger if the endogenous character of seigniorage is taken into account. Adding variables suggested by the theoretical model as well as usual control variables in deforestation equations, do not alter the main result. As a consequence, disinflation policies as recommended by the IMF, may hasten deforestation. The model is extended to address this problem, which shows that international transfers dedicated to rainforest protection may upturn the positive correlation between tighter monetary policies and deforestation and give some additional support to REDD's advocates.
2010	Q31	Gaur, Arti, and Monica Bansal. 2010. "A Comparative Study of Gold Price Movements in Indian and Global Markets." <i>Indian Journal of Finance</i> , 4(2): 32-37, 46. Since the earliest times, gold has been important for mankind. The basic reason for this being its unique physical properties. Gold as a commodity, as a currency, continues to play its ancient role as the only true standard of value in times of war or crisis. History tells us that only gold retains its value during war; change of empires and governments and at the time of crisis. Although now officially, gold held to be of only industrial value, gold is the oldest and most respected currency in the world and the only respected currency in the world when national paper money lose value. That is why every central bank of any significance buys and holds gold in reserve in a world of almost universal paper money. The monetary use of gold, along with silver, has been very wide spread since ancient times. Gold and silver coins have been most readily acceptable medium of exchange due to intrinsic values of the two metals. The major problem in this use of gold as a coinage metal is its short supply. It is produced only by a few countries mainly South Africa (producing 3/4th of the total world production) Soviet Union, Canada, USA, Ghana, Philippines, and Australia. In India gold has maintained an important presence since very early times.

2011	B52 H10 H30 H40 H44	Wray, L. Randall. 2011. <i>"Keynes after 75 Years: Rethinking Money as a Public Monopoly"</i> . Levy Economics Institute, The Economics Working Paper Archive. In this paper I first provide an overview of alternative approaches to money, contrasting the orthodox approach, in which money is neutral, at least in the long run; and the Marx-Veblen-Keynes approach, or the monetary theory of production. I then focus in more detail on two main categories: the orthodox approach that views money as an efficiency-enhancing innovation of markets, and the Chartalist approach that defines money as a creature of the state. As the state's "creature," money should be seen as a public monopoly. I then move on to the implications of viewing money as a public monopoly and link that view back to Keynes, arguing that extending Keynes along these lines would bring his theory up to date.
2011	B52	Wray, L. Randall. 2011. <i>Money in Finance</i> . Levy Economics Institute, The Economics Working Paper Archive. This paper begins by defining, and distinguishing between, money and finance, and addresses alternative ways of financing spending. We next examine the role played by financial institutions (e.g., banks) in the provision of finance. The role of government as both regulator of private institutions and provider of finance is also discussed, and related topics such as liquidity and saving are explored. We conclude with a look at some of the new innovations in finance, and at the global financial crisis, which could be blamed on excessive financialization of the economy.
2011	B52	Wray, L. Randall. 2011. <i>"The Financial Crisis Viewed from the Perspective of the "Social Costs" Theory"</i> . Levy Economics Institute, The Economics Working Paper Archive. This paper examines the causes and consequences of the current global financial crisis. It largely relies on the work of Hyman Minsky, although analyses by John Kenneth Galbraith and Thorstein Veblen of the causes of the 1930s collapse are used to show similarities between the two crises. K.W. Kapp's "social costs" theory is contrasted with the recently dominant "efficient markets" hypothesis to provide the context for analyzing the functioning of financial institutions. The paper argues that, rather than operating "efficiently," the financial sector has been imposing huge costs on the economy-costs that no one can deny in the aftermath of the economy's collapse. While orthodox approaches lead to the conclusion that money and finance should not matter much, the alternative tradition-from Veblen and Keynes to Galbraith and Minsky-provides the basis for developing an approach that puts money and finance front and center. Including the theory of social costs also generates policy recommendations more appropriate to an economy in which finance matters.
2011	C25	Fischer, Christoph. 2011. <i>Currency blocs in the 21st century</i> . Deutsche Bundesbank, Research Centre, Discussion Paper Series 1: Economic Studies: 2011,12. Based on a classification of countries and territories according to their regime and anchor currency choice, the study considers the two major currency blocs of the present world. A nested logit regression suggests that long-term structural economic variables determine a given country's currency bloc affiliation. The dollar bloc differs from the euro bloc in that there exists a group of countries that peg temporarily to the US dollar without having close economic affinities with the bloc. The estimated parameters are consistent with an additive random utility model interpretation. A currency bloc equilibrium in the spirit of Alesina and Barro (2002) is derived empirically.

Year	DE	Title and Abstract
2011	C26	Klaassen, Franc. 2011. <i>Identifying the Weights in Exchange Market Pressure</i>. Tinbergen Institute, Tinbergen Institute Discussion Papers: 11-020/2. Exchange market pressure (EMP) measures the pressure on a currency to depreciate. It adds to the actual depreciation a weighted combination of policy instruments used to ward off depreciation, such as interest rates and foreign exchange interventions, where the weights are their effectiveness. The key difficulty in the literature is how to identify these weights. We exploit the persistence of pressure and add instruments based on currency crisis theories to identify the weights, and we propose a simple IV regression to estimate them. An application to the European Monetary System crisis in 1992-1993 shows that a one percentage point higher interest rate wards off a depreciation of about 0.2 percent.
2011	D53	Pascoa, Mario R., Myrian Petrassi, and Juan Pablo Torres-Martinez. 2011. "Fiat Money and the Value of Binding Portfolio Constraints." <i>Economic Theory</i>, 46(2): 189-209. We establish necessary and sufficient conditions for the individual optimality of a consumption-portfolio plan in an infinite horizon economy where agents are uniformly impatient and fiat money is the only asset available for intertemporal transfers of wealth. Next, we show that fiat money has a positive equilibrium price if and only if for some agent the zero short sale constraint is binding and has a positive shadow price (now or in the future). As there is always an agent that is long, it follows that marginal rates of intertemporal substitution never coincide across agents. That is, monetary equilibria are never full Pareto efficient. We also give a counter-example illustrating the occurrence of monetary bubbles under incomplete markets in the absence of uniform impatience.
2011	F44	Markovic, Bojan, and Laura Povoledo. 2011. "Does Asia's Choice of Exchange Rate Regime Affect Europe's Exposure to US Shocks?" <i>Economic Issues</i>, 16(2): 1-38. In this paper, we use a stylised three-country model to analyse how the transmission of US shocks to Europe might be affected by Asia's choice of exchange rate regime. We find that if Asia decides to peg her exchange rate to the dollar, the impact of US shocks on European output and inflation is likely to be bigger than it otherwise would have been. This happens because, without nominal exchange rate flexibility, Asian firms react to the shocks originating in the United States by implementing significant price adjustments, which in turn affect Europe's relative competitive position. On the theoretical side, our results contribute to the literature by suggesting that the shock insulation property of floating exchange rates extends beyond the two countries that have currencies that are free to move. The transmission of shocks between two countries can also be dampened by the choice of floating exchange rates in a third country. On the practical side, we can extend our results to China, the largest Asian economy. If China did eventually decide to float her currency, Europe's exposure to US shocks would decrease. But, our results also suggest that the overall fall in volatility of Europe's inflation and output, following China's floating, might be modest in size.
2011	F44	della Paolera, Gerardo. 2011. "The Unending Search for a New Global Monetary and Financial Architecture." <i>Middle East Development Journal</i>, 3(1): 11-28. After the 2007-2009 economic deluge, the policy and theoretical case for a New Global Monetary and Financial Architecture gained momentum. This article analyzes some key features of the global crisis that severely limited the range of action of modern central banking. Earlier episodes of concerted institutional or implicit collective efforts to "anchor" a global system and the search for a stable international key currency in a cooperative atmosphere have, in general, failed. The incentives to reinvent a new Gold Standard or Bretton Woods are always inversely related to the international business cycle. Questions regarding the heterodox political open economy stance of the new emerging economies during the contemporaneous crisis are also discussed.
2011	F44	Teulon, Frederic. 2011. "EMU: The Sustainability Issue." <i>International Journal of Business</i>, 16(3): 272-88. The euro area is experiencing a sovereign debt crisis; as a result, the foundations of its monetary union have been shattered. This crisis, which is an extension of an international financial crisis, shows that the European Union is not an optimum currency area. Robert Mundell's work remains an indispensable reference on this subject: a monetary union among greatly different countries and animated by a weak solidarity is problematic. In the present context, the possibilities are limited for durably improving the situation, for transforming sovereign debts into sustainable ones, and for regaining a higher level of growth. Experience seems to show that a single currency cannot accommodate national budgetary policies and that national policies are hindered by the existence of a single currency in a context of asymmetries. Eventually, a scenario where the euro area would collapse becomes highly probable. This paper puts forward a model of debt sustainability and discusses eight related proposals.
2011	F44	Savona, Paolo, John J. Kirton, and Chiara Oldani, eds. 2011. <i>Global Financial Crisis: Global Impact and Solutions</i>, Global Finance Series. Farnham, U.K. and Burlington: Ashgate. Nineteen papers explore the impacts of the financial crisis of 2008 and policy responses in North America, Asia, Europe, the BRICs countries (Brazil, Russia, India, and China), and the developing world. Papers discuss crisis, response, and innovation in America and abroad; crisis, response, and innovation in Japan; the macroeconomics of the global financial and economic crisis; crisis, response, and innovation in Europe; Europe--from one crisis to the other; Europe's institutional, inflation, investment, and incentive challenges; mediating financial instability--China, the BRICs countries, and continuing rise; Russia--impact and response; Brazil and Latin America--impact and response; sub-Saharan Africa--impact and response; Africa in the face of the crisis; the broader impacts on the developing world; the move from the dollar standard to a supranational money; the role of international money; asymmetries in the international monetary system; reconciling the Gs--the G8, the G5, and the G20 in a world of crisis; the G8, the G20, and civil society; the G8 and the G20--rejuvenated by the crisis; and the contribution of the G8's 2009 L'Aquila Summit.
2011	F65	Moiso, Valentina. 2011. "I fenomeni finanziari nella letteratura sociologica contemporanea: L'emergenza di nuove prospettive. (New Perspectives on Financial Phenomena in Contemporary Sociological Studies. With English summary.)." <i>Stato e Mercato</i>, 0(92): 313-42. Sociology is looking for new theoretical and analytical tools to study the financialization of the world economy and its social consequences. The article focuses on two much debated aspects: a) traders activity, based on expert knowledge and high technology skills; and b) personal finance, regarding how people manage money, credits, and debts, interacting with financial intermediates. The aim is to disentangle the practices and the institutionalised processes regulating money exchanges: in this way, it is possible to conceptualise the finance world as a social system characterized by power differentials as effects of the financial capital circulation.

2011	H22 J43	Munro, John. 2011. <i>From Gutsherrschaft to Grundherrschaft: Demographic, Monetary, and Fiscal Factors in the Late-Medieval Decline of English Manorial Demesne Agriculture</i>. University of Toronto, Department of Economics, Working Papers. This study on the late-medieval decline of English manorial demesne agriculture is based on the Germanic paradigm of Gutsherrschaft and Grundherrschaft, which historians have utilized to explain the transformation of feudal agriculture, east of the Elbe River, from the 15th to the 18th centuries. The former is a manorial regime in which the lord derived his incomes primarily from the commercial exploitation of his demesne lands, using the compulsory labour services of servile tenants. The latter is a manorial regime in which the lord derived his incomes instead primarily from cash rents paid by largely free peasants. In East Elbia, the

Year	DE	Title and Abstract
		early-modern shift was from Grundherrschaft to Gutsherrschaft. Late medieval manorial England experienced a reverse shift: from Gutsherrschaft to Grundherrschaft. To explain this transformation, this paper employs a supplementary monetary and fiscal model to prove that the standard Ricardian demographic model is insufficient to explain these changes. My monetary model, based on my prior publications on the deflationary consequences of the first late-medieval bullion famine, from ca. 1375 to ca. 1420, demonstrates that all agrarian prices fell (in nominal terms), while the Ricardian model stipulates that the price fall was limited to grains, and further that the consequent rise in living standards would have led to rising livestock product and other agrarian prices. It also demonstrates that the rise in real wages (agrarian) was partly the result of deflation combined with institutional wage stickiness. My fiscal model demonstrates that the imposition of heavy fixed (specific and not ad valorem) taxes on exports of English wools, by so seriously injuring the chief consumers, the woollen draperies in the Low Countries, quickly led to sharply falling wool sales and (real) wool prices. With such a damaging price-cost scissors, English landlords found that the continued commercial exploitation of their demesnes based on grains and wool was no longer profitable, while leasing those lands to free peasants (abolishing most vestiges of serfdom) was very profitable, since the leasehold tenants had to pay rents whose real value rose during the era of this deflation (ca 1375 to ca. 1420).

2012	A11	Wray, L. Randall. 2012. "A Meme for Money". Levy Economics Institute, The, Economics Working Paper Archive. This paper argues that the usual framing of discussions of money, monetary policy, and fiscal policy plays into the hands of conservatives. That framing is also largely consistent with the conventional view of the economy and of society more generally. To put it the way that economists usually do, money "lubricates" the market mechanism-a good thing, because the conventional view of the market itself is overwhelmingly positive. Acknowledging the work of George Lakoff, this paper takes the position that we need an alternative meme, one that provides a frame that is consistent with a progressive social view if we are to be more successful in policy debates. In most cases, the progressives adopt the conservative framing and so have no chance. The paper advances an alternative framing for money and shows how it can be used to reshape discussion. The paper shows that the Modern Money Theory approach is particularly useful as a starting point for framing that emphasizes use of the monetary system as a tool to accomplish the public purpose. It is not so much the accuracy of the conventional view of money that we need to question, but rather the framing. We need a new meme for money, one that would emphasize the social, not the individual. It would focus on the positive role played by the state, not only in the creation and evolution of money, but also in ensuring social control over money. It would explain how money helps to promote a positive relation between citizens and the state, simultaneously promoting shared values such as liberty, democracy, and responsibility. It would explain why social control over money can promote nurturing activities over the destructive impulses of our "undertakers" (Smith's evocative term for capitalists).

2012	C54	Kocenda, Evzen, Mathilde Maurel, and Gunther Schnabl. 2012. Short-Term and Long-Term Growth Effects of Exchange Rate Adjustment. CESifo Group Munich, CESifo Working Paper Series: 4018. The European sovereign debt crisis revived the discussion concerning the pros and cons of exchange rate adjustment in the face of asymmetric shocks. Exit from the euro area is to regain rapidly international competitiveness. Exchange rate stability with structural reforms could be beneficial for long-run growth. We augment the literature by analyzing short- and long-term growth effects of exchange rate flexibility in a panel-cointegration framework. Countries with a high degree of exchange rate stability exhibit lower short-term and higher long-term

Year	DE	Title and Abstract
		growth. The degree of business cycle synchronization with the anchor country matters for the impact of exchange rate flexibility on growth.
2012	C58	Ibrahim, Mansor H. 2012. "Financial Market Risk and Gold Investment in an Emerging Market: The Case of Malaysia." <i>International Journal of Islamic and Middle Eastern Finance and Management</i> , 5(1): 25-34. Purpose--The purpose of this paper is to examine the relation between gold return and stock market return and whether its relation changes in times of consecutive negative market returns for an emerging market, Malaysia. Design/methodology/approach--The paper applies the autoregressive distributed model to link gold returns to stock returns with TGARCH/EGARCH error specification using daily data from August 1, 2001 to March 31, 2010, a total of 2,261 observations. Findings--A significant positive but low correlation is found between gold and once-lagged stock returns. Moreover, consecutive negative market returns do not seem to intensify the co-movement between the gold and stock markets as normally documented among national stock markets in times of financial turbulences. Indeed, there is some evidence that the gold market surges when faced with consecutive market declines.
2012	C78	Li, Yiting, Guillaume Rocheteau, and Pierre-Olivier Weill. 2012. "Liquidity and the Threat of Fraudulent Assets." <i>Journal of Political Economy</i> , 120(5): 815-46. We study an over-the-counter (OTC) market in which the usefulness of assets as a means of payment or collateral is limited by the threat of fraudulent practices. Agents can produce fraudulent assets at a positive cost, which generates upper bounds on the quantity of each asset that can be traded in the OTC market. Each of these endogenous, asset-specific, resalability constraints depends on the cost of fraud, on the frequency of trade, and on the asset price. In equilibrium, assets are partitioned into three liquidity tiers, which differ in their resalability, prices, haircuts, sensitivity to shocks, and responses to policies.
2012	C78	Saito, Tetsuya. 2012. "Rationality and Stability of Equilibrium in a Search-Theoretic Model of Money." <i>Theoretical Economics Letters</i> , 2(3): 283-86. In this short note, I examine the rationality of money-search equilibrium in a basic second-generation money search model, which is a perfectly divisible goods and indivisible money model. I then show that only an inflationary economy can generate a socially and individually rational stable equilibrium. On the basis of this finding, I demonstrate that there is no loss of generality in an analysis that assumes dictatorial buyers in an inflationary economy, since the properties of a dictatorial buyers model are identical to those of a general inflationary economy model. The result of this paper is especially useful for empirical applications since we are generally incapable of finding data showing bargaining power. This result also alerts us against employing the second-generation model to analyze a deflationary economy and commodity money.
2012	C81	Lahiri-Dutt, Kuntala. 2012. <i>How do the poor handle money? What do the financial diaries of char dwellers tell us about financial inclusion?</i> . The Australian National University, Australia South Asia Research Centre, ASARC Working Papers. Derived from livelihoods surveys and ethnographic material about people living on the chars, or river islands, in deltaic lower Bengal, this paper illustrates the complex, diverse and ingenious ways that the poor manage money. These islands constitute some of the most vulnerable locations housing some of the poorest communities; state services and facilities do not reach the chars because they are not listed as land in revenue records. It demonstrates that the poor live in a diverse economy where community spirit, family assistance and trust play roles equally important to markets. In doing so, it puts forth a grounded-in-the-field, evidence-based, critique of the slogan 'financial inclusion' that has gained prominence in recent years.
2012	D03	Gaffeo, Edoardo, Ivan Petrella, Damjan Pfajfar, and Emiliano Santoro. 2012. <i>Loss Aversion and the Asymmetric Transmission of Monetary Policy</i> . University of Copenhagen, Department of Economics, Discussion Papers: 12-21. There is widespread evidence that monetary policy exerts asymmetric effects on output over contractions and expansions in economic activity, while price responses display no sizeable asymmetry. To rationalize these facts we develop a dynamic general equilibrium model where households' utility depends on consumption deviations from a reference level below which loss aversion is displayed. In line with the prospect theory pioneered by Kahneman and Tversky (1979), losses in consumption loom larger than gains. State-dependent degrees of real rigidity and elasticity of intertemporal substitution in consumption generate competing effects on output and inflation. The resulting state-dependent trade-off between output and inflation stabilization recommends stronger policy activism towards inflation during expansions
2012	D61	Grubb, Farley. 2012. <i>Chronic Specie Scarcity and Efficient Barter: The Problem of Maintaining an Outside Money Supply in British Colonial America</i> . University of Delaware, Department of Economics, Working Papers: 12-08. Colonial Americans complained that gold and silver coins (specie) were chronically scarce. These coins could be acquired only through importation. Given unrestricted trade in specie, market arbitrage should have eliminated chronic scarcity. A model of efficient barter and local inside money is developed to show how chronic specie scarcity in colonial America could prevail despite unrestricted specie-market arbitrage, thus justifying colonial complaints. The creation of inside fiat paper monies by colonial governments was a welfare-enhancing response to preexisting chronic specie scarcity, not the cause of that scarcity.
2012	E01	Buiter, Willem H., and Ebrahim Rahbari. 2012. <i>Target2 Redux: The simple accountancy and slightly more complex economics of Bundesbank loss exposure through the Eurosystem</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 9211. This study shows that Target2 net claims are a poor measure of Bundesbank loss exposure, and even more so of German loss exposure to the rest of the Eurozone. This is true even under plausible assumptions about a comprehensive break-up scenario that leaves Germany as the only member of the euro area and the Bundesbank as the sole owner of the ECB. In this implausible scenario, the discrepancy between the Bundesbank's Target2 net credit balance and its likely loss exposure has two principal sources. First, the 16 national central banks (NCBs) that exit the Eurosystem (which will on balance be net Target2 debtors) and their sovereigns will not automatically walk away completely from their Target2 debts--defaulting on their debts with a zero recovery rate for the Bundesbank. Legally, the Target2 claims are not extinguished by exit from the Eurosystem by the debtor NCBs. Politically and realistically, many of the exiting NCBs would be able and willing to honour their obligations to Target2 in part or even in full. Second, in the comprehensive break-up scenario, future seigniorage revenues of the Bundesbank would likely go up, as it would be left with a larger share (in our example 100 percent) of the ownership of the ECB. Changes in German exposure to the rest of the euro area (or to the periphery) can differ in magnitude and in sign from Bundesbank exposure.
2012	F60	Fiorentini, Riccardo, and Guido Montani. 2012. <i>The New Global Political Economy: From Crisis to Supranational Integration</i> . New Directions in Modern Economics. Cheltenham, U.K. and Northampton, Mass.: Elgar. Explores the causes of the 2008 financial crisis and the measures of political economy required to build a safer and more stable international order, focusing on the role of supranational institutions. Discusses the invisible Leviathan; global imbalances and the dollar standard; globalization and income inequalities; multipolarity and regional integration; money as a supranational public good; and finance as a supranational public good.
2012	H12	Buiter, Willem H., and Ebrahim Rahbari. 2012. <i>The ECB as Lender of Last Resort for Sovereigns in the Euro Area</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 8974. The paper establishes that sovereigns, like banks, need a lender of last resort (LoLR). In the euro area the ECB, with its estimated 3.4 trillion euro non-inflationary loss absorption capacity, is the only credible

Year	DE	Title and Abstract
		sovereign LoLR. The ECB/Eurosystem has been acting as sovereign LoLR through its SMP purchases of periphery sovereign debt in the secondary markets. It has also contributed, through the deeply subsidised bank funding it provided through the 3-year LTROs, half of a mechanism to purchase periphery sovereign debt in the primary issue markets. The other half has been financial repression requiring banks in Italy and Spain to purchase more of their own government's debt than they would voluntarily and at below-market yields. We expect that, once Spain and Italy are under troika programmes, the Eurosystem will also lend to these sovereigns indirectly, through loans by the national central banks to the IMF which on-lends them to these sovereigns. We recommend that, to increase its effectiveness as LoLR, the ESM be given a banking license. To reduce the illegitimate and unaccountable abuse of the ECB/Eurosystem as a quasi-fiscal actor, we propose that all its credit risk-related losses be jointly and severally guaranteed/indemnified by the 17 euro area member states.
2012	H23	CV: Parguez, Alain. 2012. "A Monetary Theory of Public Finance." In <i>Theories of Money and Banking. Volume 1. Development of Heterodox Approaches to Money and Banking.</i> , ed. L. Randall Wray, 563-80. Elgar Research Collection. International Library of Critical Writings in Economics, vol. 268. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2012	H32	Madura, Jeff, and Thanh Ngo. 2012. "Determinants of the Medium of Payment Used to Acquire Privately-Held Targets." <i>Journal of Economics and Finance</i>, 36(2): 424-42. Since private firms have a unique ownership structure, the method of payment decision when acquiring private firms is influenced by a different set of factors than the method of payment decision when acquiring public firms. We find that bidders are more likely to pay for private targets with stock when the capital gain tax rate is relatively high. This relationship is attributed to greater tax benefits to private owners who receive stock in periods when the capital gains tax is high. Bidders are more likely to use stock in takeovers when the targets are high-tech firms, which we attribute to protection against overpayment by using a contingent pricing method. Bidders are more likely to use cash in takeovers since the Sarbanes-Oxley Act, which we attribute to the higher level of due diligence by bidder managers and board members, and therefore a reduced need for contingent pricing methods like stock. Overall, the results suggest the likelihood of using stock to acquire private targets is positively related to the information asymmetry between the parties, while the likelihood of using cash is greater when conditions (such as SOX) reduce the information asymmetry.
2012	J20	CV: Vernay, Vincent. 2012. "Labour Market and Monetary Macroeconomics." In <i>Employment, Growth and Development: A Post-Keynesian Approach</i> , ed. 2012	J65	Nakajima, Makoto. 2012. "A Quantitative Analysis of Unemployment Benefit Extensions." <i>Journal of Monetary Economics</i>, 59(7): 686-702. Extensions of unemployment insurance (UI) benefits have been implemented in response to the Great Recession. This paper measures the effect of these extensions on the unemployment rate using a calibrated structural model featuring job search and consumption-saving decisions, skill depreciation, and UI eligibility. The ongoing UI benefit extensions are found to have raised the unemployment rate by 1.4 percentage points, which is about 30% of the observed increase since 2007. Moreover, the contribution of the UI benefit extensions to the elevated unemployment rate increased during 2009-2011; while the number of vacancies recovered, the successive extensions kept search intensity down.
2012	K29	Grubb, Farley. 2012. <i>Is Paper Money Just Paper Money? Experimentation and Local Variation in the Fiat Paper Monies Issued by the Colonial Governments of British North America, 1690-1775: Part I.</i> National Bureau of Economic Research, Inc. NBER Working Papers: 17997. The British North American colonies were the first western economies to rely on legislative-issued fiat paper monies as their principal internal media of exchange. This system arose piecemeal. It was monetary experimentation on a grand scale. In the absence of banks and treasuries that exchanged local fiat monies at fixed rates for specie monies (outside monies) on demand, colonial governments experimented with other ways to anchor their fiat monies to real values in the economy. These mechanisms included tax-redemption, interest-bearing notes, land-backed mortgage loans, sinking funds, and legal tender laws. The structure and performance of these mechanisms are explained.
2012	N53	Edvinsson, Rodney. 2012. "The International Political Economy of Early Modern Copper Mercantilism: Rent Seeking and Copper Money in Sweden 1624-1776." <i>Explorations in Economic History</i>, 49(3): 303-15. In 1624-1776 Sweden minted intrinsic value copper coins, alongside silver coins. One purpose behind introducing the copper standard was to use its monopoly position at the European markets to manipulate the international copper prices, implementing a kind of copper mercantilism. This paper presents a model of an early modern copper monopolist that could price discriminate between two different uses for copper: copper for export and copper for minting. The paper concludes that authorities did not completely conform to this rent-seeking model, since there were also other considerations behind minting policy, such as providing a stable monetary system. The model shows that under profit-maximisation, minting should have been even higher and the price of copper money lower, but at periods minting and prices approached the optimal state. In the 17th century, the market for copper money was probably too small relative the huge copper production, but by the 1720s and 1730s, when copper production had declined, the copper standard functioned more smoothly.
2012	P13	Mainelli, Michael. 2012. "Short Monetary Systems: Take a Risk, Create Money." <i>Journal of Risk Finance</i>, 13(4): 280-84. Purpose--The purpose of this editorial is to examine fiat currencies and common tenders (trade-based money) from a risk perspective. The editorial encourages risk managers to consider the distributive benefits of a multiplicity of currencies and urges them to examine common tenders both old, such as the Swiss WIR, and novel, such as capacity exchange monies, as risk management tools. Design/methodology/approach--The editorial is based on research conducted for the City of London Corporation in 2011 into capacity, trade and credit which examined new architectures for commerce and money. Findings--The editorial links <i>Freiwirtschaft</i> movement ideas with some characteristics of common tenders. Further, it considers whether some simple regulatory approaches might make such common tenders more useful.

2013	B16 C43	von der Lippe, Peter. 2013. "Recurrent Price Index Problems and Some Early German Papers on Index Numbers: Notes." <i>Jahrbucher fur Nationalokonomie und Statistik</i>, 233(3): 336-66. With Laspeyres, Paasche and other authors such as Drobisch and Lehr, Germany made quite a promising start in index theory in the last decades of the 19th century. However, it soon lost ground after this period, which is described in this paper. The focus is not on biographies but on controversies where these persons acted as opponents and developed the views for which they are well known. The issues selected are primarily those which are still interesting and controversial today, e.g. the merits and demerits of certain index formulas, the definition and updating of weights, "pure" price comparison vs. chain indices, etc. However, in order to aid a better understanding of how Laspeyres et al arrived at their index formulas and views about the purposes index numbers should serve, some attention is also given to the typical disputes and prejudices of that time (e.g., regarding inflation under the regime of a gold currency).

Year	DE	Title and Abstract
2013	B30	de Boyer des Roches, Jerome. 2013. "Bank Liquidity Risk: From John Law (1705) to Walter Bagehot (1873)." <i>European Journal of the History of Economic Thought</i>, 20(4): 547-71. By granting credit and issuing money, banks take a liquidity risk--that is, the risk of being unable to reimburse its notes in coins. Five different explanations of a bank liquidity crisis have been provided by different authors, since John Law and up to Walter Bagehot. First, according to Law (1703) and Steuart ([1767] [1998]), the distinction between money of account (the pound sterling) and money of payment (the guinea) may induce a bank run. Second, according to Cantillon (1730), Hume ([1752] 1972), Ricardo (1810-1823) and the Currency School (1837-1858), the bank reserve becomes insufficient as a consequence of a diminishing value of money allied with over issues. Third, according to Thornton ([1802] 1939, 1991) and the Banking School (1840-1857), it can occur as a consequence of a falling exchange rate that is not linked with over issues. Fourth, according to Smith (1776) and the Banking School, discounting of fictitious bills, by decreasing the shareholders' funds, leads to bank illiquidity. Lastly, according to Thornton ([1802] 1939, 1991) and Bagehot (1873), the liquidity crisis is a consequence of bank panics: a "flight" to money for Thornton, a "flight" to credit for Bagehot. The analysis of these five different explanations sheds new light on classical monetary controversies.
2013	B30	de Boyer des Roches, Jerome, and Rebeca Gomez Betancourt. 2013. "American Quantity Theorists Prior to Irving Fisher's The Purchasing Power of Money." <i>Journal of the History of Economic Thought</i>, 35(2): 135-52. The aim of this paper is to analyze the state of the quantity theory in the United States prior to the publication of Irving Fisher's <i>The Purchasing Power of Money</i> in 1911. We start by presenting the participants in the monetary debate. Next, we analyze the controversies regarding prices, purchasing power of money, and credit, prior to the Gold Standard Act of 1900, in particular the opposing views of Francis Amasa Walker and James Laurence Laughlin. We then go on to study the restatement of the quantity theory at the beginning of the twentieth century, through the introduction of credit in the analysis and the statistical tests of the exchange equations. Finally, we study the problems and management of the gold standard, focusing on the elasticity of money supply, the characteristics of the gold exchange standard, and the contrast between the fixed price of gold and its fluctuating purchasing power. We show the improvement of the quantity theory and the new issues that emerged from the rich and original American monetary debate, prior to the publication in 1911 of Fisher's book.
2013	B59	Sobhani, Hasan, and Mansoor Maleki. 2013. "Endogeneity of Money in Islamic Monetary and Financial System: A Comparative Study with the Post-Keynesian Approach on Money. (In Farsi. With English summary)." <i>Biquarterly Journal of Economic Essays</i>, 10(20): 9-28. Money is one of the most challenging concepts in economics about which economists have always had serious disputes with each other. During the history of economics development, all different schools of thought have tried to explore the true meaning of money and its real origins. It seems that one of the most important causes of having different cognition about the true meaning of money refers to the concept of endogeneity of money. This issue is an important part of the post-Keynesian approach to money. Because of the necessity of studying the theoretical aspect of monetary economy in the cortex of Islamic monetary and financial system, in this paper we are going to analyze the concept of the endogeneity of money by a comparative study with other school of thoughts significantly, post-Keynesian and orthodox approach to money. Based on the result of this comparative study, although, money in the Islamic approach follows the endogenous process of creation, but this process and analyzing the Islamic endogenous money is fundamentally different from the post Keynesian view.
2013	C30	Leuwer, David, and Bernd Sussmuth. 2013. <i>The Exchange Rate Susceptibility of Some European Core Industries and the Currency Union</i>. CESifo Group Munich, CESifo Working Paper Series: 4253. This paper investigates the relationship between real exchange rate changes and the German, French and UK automobile and mechanical engineering sector. In stylized models, exports decline whenever the domestic currency appreciates and vice versa. Strategic firm behavior, however, can obscure the unambiguosness of this relationship, rendering the impact of a strengthening Euro on exports and on overall order volume unclear. To quantify the impact of the EUR/USD real exchange rate on German and French key exporting industries, we estimate a trivariate VAR based on monthly data from 1995 to 2010, respectively. We proceed analogously with the GBP/USD rate and the UK automobile and mechanical engineering sector series. Our findings indicate that an appreciating Euro hampers exports in the German and French core sectors, but does not cause these industries "pain" in the sense of an aggravated business climate. The latter does not apply to the respective time series for the UK. Time varying parameter VAR estimates confirm this immunization for members in the period after installation of the currency union.
2013	C43	THE SAME AS B16 von der Lippe, Peter. 2013. "Recurrent Price Index Problems and Some Early German Papers on Index Numbers: Notes." <i>Jahrbucher fur Nationalokonomie und Statistik</i>, 233(3): 336-66.
2013	C45	Gutierrez, Martha, Giovanni Franco, and Carlos Campuzano. 2013. "Gold Prices: Analyzing Its Cyclical Behavior." <i>Lecturas de Economia</i>, 0(79): 113-42. Gold is a commodity that is seen as a safe haven when a financial crisis strikes, but when stock markets are prosperous, these are more attractive investment alternatives, and so the gold cycle goes on and on. The DJIA/GF (Dow Jones Industrial Average and Gold Fix ratio) is chosen to establish the evolution of gold prices in relation to the NYSE. This paper has two goals: to prove that the DJIA/GF ratio is strongly cyclical by using Fourier analysis and to set a predictive neural networks model to forecast the behavior of this ratio during 2011-2020. To this end, business cycle events like the Great Depression along with the 1970s crisis, and the 1950s boom along with the world economic recovery of the 1990s are contrasted in light of the mentioned ratio. Gold prices are found to evolve cyclically with a dominant period of 37 years and are mainly affected by energy prices, financial markets and macroeconomic indicators.
2013	D22	Pisani, Michael J., and Thomas M. Fullerton Jr. 2013. "Microenterprise Peso Acceptance in El Paso, Texas." <i>Ensayos: Revista de Economia</i>, 32(2): 75-94. Utilizing a unique sample of 253 microenterprise border retailers from El Paso, Texas, this paper explores the possibility of cash payment from cross-border shoppers using Mexican pesos. We find that one-fifth of microenterprise retailers in El Paso accept payment in Mexican pesos. Increased peso acceptance rates are associated with retailer proximity to Mexico and business segment in which the retailers compete. El Paso microenterprises are also more likely than their medium-to large-business counterparts to allow payments to be made using Mexican pesos. The opportunity cost of currency substitution is examined for accepting and yet-to-accept firms.
2013	D47	van der Schaar, Mihaela, Jie Xu, and William Zame. 2013. "Efficient Online Exchange via Fiat Money." <i>Economic Theory</i>, 54(2): 211-48. In many online systems, individuals provide services for each other; the recipient of the service obtains a benefit but the provider of the service incurs a cost. If benefit exceeds cost, provision of the service increases social welfare and should therefore be encouraged--but the individuals providing the service gain no (immediate) benefit from providing the service and hence have an incentive to withhold service. Hence, there is scope for designing a protocol that improves welfare by encouraging exchange. To operate successfully within the confines of the online environment, such a protocol should be distributed, robust, and consistent with individual incentives. This paper proposes and analyzes protocols that rely solely on the exchange of fiat money or tokens. The analysis has much in common with work on search models of money but the requirements of the environment also lead to

Year	DE	Title and Abstract
		many differences from previous analyses--and some surprises; in particular, existence of equilibrium becomes a thorny problem and the optimal quantity of money is different.
2013	F35	CV: Vaughan, Pauline, Wolfgang Fengler, and Michael Joseph. 2013. "Scaling Up through Disruptive Business Models: The Inside Story of Mobile Money in Kenya." 2013	F35	Plassaras, Nicholas A. 2013. "Regulating Digital Currencies: Bringing Bitcoin within the Reach of the IMF." <i>Chicago Journal of International Law</i> , 14(1): 377-407. This Comment examines the potentially destabilising effects of emerging digital currencies on the international foreign currency exchange market. Specifically, it examines "Bitcoin," a decentralized, partially anonymous, and largely unregulated digital currency that has become particularly popular in the last few years. This Comment argues that the International Monetary Fund, the institution responsible for coordinating the stability of foreign exchange rates, is ill-equipped to handle the widespread use of digital currencies in the foreign currency exchange market. It highlights the inability of the Fund to intervene in the event of a speculative attack on a currency by Bitcoin users. This Comment concludes by suggesting two interpretations of the Fund's incorporating document, the Articles of Agreement, that would allow it to intervene in the event of such an attack.
2013	F62	Gouveia, Sofia, and Leonida Correia. 2013. "Labour Costs Dynamics in the Euro Area: Some Empirical Evidence." <i>International Economics and Economic Policy</i> , 10(3): 323-47. Little is known about how the introduction of a common currency and a single monetary policy has affected the labour cost dynamics in the Euro area. The literature has focused mainly on business cycle synchronisation. This paper analyses labour costs convergence in the Euro area since 1995, combining results from different data and two complementary approaches. First we present some relevant facts about wages and unit labour cost dynamics and, in a second phase, we investigate whether the physical introduction of the euro has changed the volatility and the synchronisation of labour costs cycles, in a context of globalisation. Overall, our results indicate that labour markets in the Euro area are very heterogeneous. However, some signs of labour cost convergence are beginning to emerge. After the circulation of the euro, it seems that a reduction in nominal unit labour costs differences and an increase on the degree of synchronisation has occurred, which has been strengthened in the economic and financial crisis period.

"Understanding the Role of Governments and Administrations in the Implementation of Community and Complementary Currencies." <i>Annals of Public and Cooperative Economics</i> , 84(1): 63-81. This text focuses on the role of governments and administrations in the emergence, spread, development, and differentiation of community and complementary currency schemes (CCs), highlighting their role as potential support for experimentation. This support can take various forms: technical, financial, fiscal, official, and/or legal recognition. We present first the role of governments, mostly local, in the emergence and development of four generations of CCs. We distinguish then a series of modes of action of governments at central and local levels. This leads to identify the interest of being supported (greater professionalism, greater complexity, and possibly greater impact) while emphasizing the risks linked to public support as well.

2013	K00 M40	Peacock, Mark S. 2013. "Accounting for Money: The Legal Presuppositions of Money and Accounting in Ancient Greece." <i>Business History</i> , 55(1-2): 280-301. This paper aims to extend the purview of Business History to the ancient world by exploring the hypothesis that the development of money was stimulated by legal institutions which regulated payment of compensation for torts. The hypothesis was propounded by Philip Grierson who argued that the Germanic institution of wergeld established the earliest concept of value which underlies money's function as a unit of account. It considers Grierson's thesis in the context of archaic Greece. Although archaic Greek law developed differently from the Germanic wergeld, the legal-political sphere in Greece provides decisive impetus to the development of money and accounting. The article examines the role of commerce in archaic Greece and its relationship to monetisation.
2013	L21	Loke, Yijing Jia, Siew Hwa Yen, Andrew K. G. Tan, and Yew Wah Lai. 2013. "Do Businesses Exhibit Payment Preferences as Payors? Evidence from Malaysia." <i>Malaysian Journal of Economic Studies</i> , 50(1): 37-52. This paper examines the factors that affect business to business payment preferences. The payment methods have been classified into three categories, namely cash only, paper based and electronic-paper. A multinomial logistic model was used to determine the effect of the factors on the odds and probability of businesses selecting these three payment methods. The factors were broadly divided into two groups: (i) firm's characteristics and (ii) business payment perceptions and priorities. The findings indicate that characteristics of the firm such as location, business sector, scale of operation, age of the firm, the average total value and volume of monthly payments, and priority of payment attributes have significant effects on business payment preferences. The significance of business priorities in determining the range of payment methods used indicate that businesses that prioritise cost prefer to use electronic-paper based payment methods while those which emphasise convenience and security tend to use paper based payment methods.

This paper explains the process by which the Bank of Spain became a national bank, first by obtaining the monopoly of note issue in 1874 and then by extending its sphere of financial action by creating the country's only network of bank branches before 1900. The implementation of a "unified or national banknote" in 1884 and the creation of a system of free transfers for its clients were also decisive steps towards the Bank's transformation from a local Madrid-based institution into a Spanish national institution. The paper also argues that the transformation of the Bank of Spain into a genuine national financial institution contributed to the modernization of the Spanish administrative structure.

Year	DE	Title and Abstract
2013	N95	Kaminishi, Miriam. 2013. "The Seasonal Demand for Multiple Monies in Manchuria: Re-examining Zhang Zuolin's Government's Economic Policy during the 1920s." <i>Financial History Review</i>, 20(3): 335-59. This article reviews the political economy of Manchuria under the rule of Zhang Zuolin, which resulted in the economic instability that occurred during the winter of 1928. One can conjecture that the economic instability did not occur only because of the arbitrariness of the political and military regional government. The instability appears to be related to an ongoing seasonal demand for monies, which was relatively high between the months of September and March, since it corresponded to the period of commerce in soybeans--the region's main economic activity--the migration of seasonal workers, and also the festive period of the Chinese New Year. The analysis was conducted based on primary materials published by the South Manchuria Railway Company, such as currency issuance and the variation of the exchange rate of the major currencies in circulation among foreign and Chinese currencies.
2013	P11	Lanzarini Casa, Carlos Alberto. 2013. "Teoria da Realocacao da Poupanca Interna: Uma Integracao Metodologica a Partir de Abba Lerner Haavelmo e Kaldor. (With English summary)." <i>Economia (University of Brazil)</i>, 14(1): 267-330. The term reallocation of domestic saving refers to the fact that the instruments of economic policy and economic planning that begin to allow the self-financing for the State from its own currency by the mechanism of monetary issues will be only materialized in the real economy because of the restructuring of the process of formation of domestic saving. Reallocation in this case comes to be synonymous with "reuse" and "leverage" therefore training tools of Public Finance are determined by a mechanism for automatic creation and destruction of currency, and subsequent reuse of the same coin issued earlier. In this system, the State determines the amount of public resources at their disposal through monetary emission by the fact that this coin has "real ballast trust", based on their respective "automatic destruction" at the exact moment of its creation.

Table E43.F Examples of Publications according to New Links in 2006—2013

Year	DE	Title and Abstract
2006		
2006	C83	Shih, Ruby, and David E. A. Giles. 2006. <i>Modelling the Duration of Interest Rate Spells Under Inflation Targeting in Canada</i>. Department of Economics, University of Victoria, Econometrics Working Papers: 0605. We use survival models to analyze the duration of the spells associated with the interest rate used by the Bank of Canada as its monetary policy instrument. Both non-parametric and parametric models are estimated, allowing for right-censoring of the data, and time-varying covariates. We find that the data are explained well by an accelerated failure time Weibull model, with the annual rate of inflation and the quarterly rate of growth in GDP as covariates. The model indicates that there is positive duration dependence in the interest rate spells, and that unemployment and exchange rate effects are insignificant.
2006	D53	Stracca, Livio. 2006. "A Note on Liquidity and Real Equilibrium Interest Rates." <i>Macroeconomic Dynamics</i>, 10(3): 426-38. This note proposes a general equilibrium model with heterogeneous households and a financial market where each financial instrument provides liquidity services in addition to enabling a transfer of purchasing power over time. Importantly, liquidity services may be asymmetric according to whether the financial instrument is held as an asset or as a liability, and are also agent-specific. The main purpose of the study is to develop an analytical framework and a language for evaluating the effect of (broadly defined) liquidity factors on equilibrium rates of return.
2006	D58	Benassy, Jean-Pascal. 2006. "Liquidity Effects in Non-Ricardian Economies." <i>Scandinavian Journal of Economics</i>, 108(1): 65-79. It has often been found difficult to generate a liquidity effect (i.e., a negative effect of monetary injections on the nominal interest rate) in the traditional "Ricardian" stochastic dynamic model with a single infinitely lived household. We show that moving to a non-Ricardian environment where new agents enter the economy in each period allows such a liquidity effect to be generated.
2006	D58	Dubey, Pradeep, and John Geanakoplos. 2006. <i>Money and Production, and Liquidity Trap</i>. Cowles Foundation, Yale University, Cowles Foundation Discussion Papers: 1574. We prove the existence of monetary equilibrium in a finite horizon economy with production. We also show that if agents expect the monetary authority to significantly decrease the supply of bank money available for short term loans in the future, then the economy will fall into a liquidity trap today.

2006	E26	Lovrinec, Zeljko, Zdravko Maric, and Davor Mikulic. 2006. "Maastricht Criteria and the Inclusion of the Underground Economy--The Case of Croatia." <i>Privredna Kretanja i Ekonomska Politika</i>, 16(106): 28-65. The European Union has introduced an explicit obligation for all member countries that the official GDP data needs to include the estimation of the underground economy, resulting from statistical or economic reasons. For this purpose, the so-called Eurostat Exhaustiveness programme has been developed for the group of candidate countries, of which ten have become full members as of the 1st of May 2004. In line with the results of this programme, the new EU members include the correction for the value of the underground economy into their official GDP figure. With the inclusion of the underground economy, the consequent value of Croatian per capita GDP, measured according to the purchasing power parity, reduces the gap in comparison to the EU-25. Furthermore, the proportion of total expenditures in GDP of the general government sector is reduced as well, which places Croatia below the NMS-8 country average. In terms of the Maastricht convergence criteria, the underground economy inclusion procedure does not affect the fact that the criteria are not met. The inclusion of the underground economy influences two indicators: the proportion of the state sector

Year	DE	Title and Abstract
		deficit in the GDP and the proportion of the public debt in the GDP. The inclusion of the underground economy does not help fulfilling the criteria concerning the state sector deficit. The criteria concerning the size of public debt is fulfilled by Croatia even without the inclusion of the underground economy. The inflation criteria and the size of the long-term interest rates criteria are not directly linked to the GDP value.
2006	F20	Ahrend, Rudiger, Pietro Catte, and Robert Price. 2006. <i>Factors Behind Low Long-Term Interest Rates</i>. OECD Economics Department, OECD Economics Department Working Papers: 490. Long-term bond yields have been low in recent years both in nominal and real terms, and . especially in the United States - they have reacted differently to shifts in monetary and fiscal stances relative to previous cycles. This article examines various possible explanations for this behaviour, such as the effects of changes in monetary policy frameworks on inflation and interest rate expectations; developments in ex ante saving-investment balances, and shifts in investors' portfolio preferences (including official reserve accumulation, .petro-dollar. recycling and pension fund demand for longer maturities). The paper finds that it is unlikely that any individual explanation can account for the level and profile of bond yields in recent years, but that an important element has been a compression in term premia, together with shifts in expected short rates. Even though bond yields have started to rise in the early part of 2006, they are unlikely to go back to the levels that prevailed in the 1980s or the early 1990s, as several of the factors that drove them lower are set to persist.
2006	H25	Kehoe, Patrick, and Varadarajan V. Chari. 2006. <i>Modern Macroeconomics in Practice: How Theory is Shaping Policy</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 12476. Theoretical advances in macroeconomics made in the last three decades have had a major influence on macroeconomic policy analysis. Moreover, over the last several decades, the United States and other countries have undertaken a variety of policy changes that are precisely what macroeconomic theory of the last 30 years suggests. The three key developments that have shaped macroeconomic policy analysis are the Lucas critique of policy evaluation due to Robert Lucas, the time inconsistency critique of discretionary policy due to Finn Kydland and Edward Prescott, and the development of quantitative dynamic stochastic general equilibrium models following Finn Kydland and Edward Prescott.
2006	H42	Bichsel, Robert. 2006. "State-Owned Banks as Competition Enhancers, or the Grand Illusion." <i>Journal of Financial Services Research</i>, 30(2): 117-50. We analyze the role of state ownership in the banking sector from the perspective of competition. That is, do state-owned banks play a special role as competition enhancers? Focusing on the market for mortgage loans in Switzerland, we test four hypotheses which are consistent with this view. First, are state-owned banks' interest rates relatively cost sensitive? Second, are state-owned banks charging relatively low mark-ups? Third, are the state-owned banks' interest rates particularly borrower friendly? And fourth, do state-owned banks exert a disciplinary effect on competitors' prices? Based on a comprehensive database containing information at the individual bank level over the 1996-2002 period, our answer is 'No.'

2006	I38	van der Ploeg, Frederick. 2006. "Rolling Back the Public Sector: Differential Effects on Employment, Investment, and Growth." <i>Oxford Economic Papers</i>, 58(1): 103-22. The macroeconomic effects of different ways of rolling back the welfare state are analysed. Cutting public spending on market goods induces a lower interest rate, a higher wage, a lower capital stock, and a fall in employment. Cutting public employment or the labour income tax rate leads, in contrast, to a lower wage, a higher interest rate and a higher capital stock. Employment rises on impact. If the extra revenues of rolling back the welfare state are handed back via a lower tax rate rather than a lump-sum subsidy, both cutting public employment and cutting public spending on market goods induce an investment boom. Making the tax system less progressive by cutting tax credits and the labour income tax rate induces an investment boom as well. The effects of endogenous growth, adjustment costs for investment, and non-Walrasian labour markets on these results are considered as well.
2006	J61 L74	Honohan, Patrick, and Anthony J. Leddin. 2006. "Ireland in EMU: More Shocks, Less Insulation?" <i>Economic and Social Review</i>, 37(2): 263-94. Despite anchoring the Irish monetary system to a common zone-wide exchange rate and interest rate, EMU has triggered sizeable exchange rate and especially interest rate shocks to the Irish economy (albeit not appreciably greater than those experienced under previous exchange rate regimes). Interest rate movements have deviated widely from what a standard Taylor monetary policy rule would have counselled--though here again the deviations have been no worse in this regard than those of the previous regime. The most important shock has been associated with the large and sustained initial fall in nominal interest rates as EMU began. Through mechanisms which we formally model, the interest rate fall has had a lasting effect on property prices, construction activity and the capacity of the labour market to absorb sizeable net immigration, despite a sharp deterioration in wage competitiveness since 2002. As the long drawn-out impact of this shock subsides, the failure of the wage-bargaining system promptly to claw back the loss of competitiveness resulting from exogenous exchange rate movements is increasingly likely to show up in weaker aggregate employment performance.

2006	L68	Marquez de la Cruz, Elena. 2006. "Consumo duradero, hábitos y mercado de valores. (Durable Consumption, Habits and the Stock Market. With English summary.)" <i>Revista de Economía Aplicada</i>, 14(42): 5-33. The Consumption based Capital Asset Pricing Model (CCAPM) has been the subject of various empirical studies for different economies, giving rise to the so-called risk equity premium puzzle. This puzzle is the result of the inability of the model to explain the observed risk premiums except in cases where implausible values are used for one of the agents' preference parameters, namely, the relative risk aversion parameter. On the other hand, the high values for this parameter necessary for the model to fit with empirical data result in interest rates that are higher than those observed empirically. This gives rise to a second empirical puzzle, the interest rate puzzle. In this work, we examine the CCAPM model, considering the possibility of the development of external habits in consumption and including the service flow that the consumption of durable goods generates in the consumption variable, with the aim of analyzing the effect these factors have on the aforementioned empirical puzzles.

2006	L74	THE SAME AS J61 Honohan, Patrick, and Anthony J. Leddin. 2006. "Ireland in EMU: More Shocks, Less Insulation?" <i>Economic and Social Review</i>, 37(2): 263-94.
2006	M12 M52	Ortiz-Molina, Hernan. 2006. "Top Management Incentives and the Pricing of Corporate Public Debt." <i>Journal of Financial and Quantitative Analysis</i>, 41(2): 317-40. This article examines managerial ownership structure and at-issue yield spreads on corporate bonds. There is a positive relation between managerial ownership and borrowing costs, and this relation is weaker at higher levels of ownership. In addition, managerial stock options have a larger effect on yield spreads than stock ownership. These effects exist after controlling for firm and bond characteristics, and are robust to endogeneity and sample selection concerns. The evidence suggests that rational bondholders price new debt issues using the information about a firm's future risk choices contained in managerial incentive structures, and that lenders anticipate higher risk-taking incentives from managerial stock options than from equity ownership.
2006	N50	Perez, Stephen J., and Mark V. Siegler. 2006. "Agricultural and Monetary Shocks before the Great Depression: A Graph-Theoretic Causal Investigation." <i>Journal of Macroeconomics</i>, 28(4): 720-36. This paper uses graph-theoretic methods to investigate the causal relationships between agriculture, money, interest rates, prices, and real GDP in 12 countries during the years 1869-1929. We find that agricultural production directly and indirectly causes real GDP in two-thirds of the cases. Monetary shocks also play an important causal role in about half the cases, but unlike agriculture, the causal links are usually indirect through other variables to real GDP. The direct causal link between money and prices is also particularly strong. Between 1869 and 1929, money causes prices in nearly all of the countries in the sample.
2006	O34	Amable, Bruno, Jean-Bernard Chatelain, and Kirsten Ralf. 2006. "Nantissement des brevets et croissance des innovations. (Patents as Collateral and the Growth of Innovations. With English summary.)." <i>Revue d'Economie Politique</i>, 116(4): 523-40. The effect of the imperfection of collateral assignments of patents on the growth of innovations and the equilibrium interest rate is studied in this paper. It leads to the following results: security interests in patents leverage the growth of innovations and the effect of a reduction of the imperfection of collateral assignments has a marked effect on the growth of innovations only for relatively high growth rate with a relatively large gap between the equilibrium interest rate and the marginal rent on innovation. Negative side effects of the collateral assignments of patents are then discussed.

2006	P20	Poghosyan, Tigran, and Evzen Kocenda. 2006. <i>Foreign Exchange Risk Premium Determinants: Case of Armenia</i>. William Davidson Institute at the University of Michigan Stephen M. Ross Business School, William Davidson Institute Working Papers Series: wp811 This paper studies foreign exchange risk premium using the uncovered interest rate parity framework in a single country context. The analysis is performed using weekly data on foreign and domestic currency deposits in Armenian banking system. The paper provides the results of the simple tests of uncovered interest parity condition, which indicate that contrary to established view dominating in empirical literature there is a positive correspondence between exchange rate depreciation and interest rate differentials in Armenian deposit market. Furthermore, the paper presents and discusses a systematic positive risk premium required by the economic agents for foreign exchange transactions, which increases over the investment horizon. The two currency affine term structure framework is applied to identify the factors driving the systematic exchange rate risk premium in Armenia. At the end, possible directions for further research are outlined.
2006	P23	Lu, Lan, and Ian M. McDonald. 2006. "Does China Save Too Much?" <i>Singapore Economic Review</i>, 51(3): 283-301. This paper, through simulating an open economy model of China, investigates whether the current rate of saving in China is excessive. The model incorporates the major factors that influence optimal saving, namely demographic change, the catch-up of total factor productivity in China to the level of high-income OECD countries, and an endogenous world rate of interest. The paper finds that the rate of time preference that would imply the current rate of saving is optimal is very low; in fact, it is negative. Thus, to justify China's current rate of saving, the social planner would have to put a higher weight on the economic welfare of future generations relative to the current generation, indeed up to 19 times the weight. This suggests that the current rate of saving in China is excessive.
2006	Q53 Q58	Roma, Antonio. 2006. "Energy, Money, and Pollution." <i>Ecological Economics</i>, 56(4): 534-45. This paper explores general equilibrium consumption choices and interest rate determination in a deterministic two-period model in which the production side explicitly describes the thermodynamic process unavoidably connected with production, as argued by Georgescu Roegen. A simple energy based production process is modeled, which is not in a stationary state. The resulting production function is time dependent. In neoclassical general equilibrium the thermodynamic implication of the production process, i.e., the production of waste, will not be taken into account by decision making agents. For welfare optimality, the resulting externality needs to be corrected by a social planner, or through the use of environmental related taxation. However, it is shown that imposing energy as a medium of exchange (money) in the same economy makes agents "energy conscious" and decreases the externality associated with entropic waste through a market mechanism, without the need for intervention. In the limit case in which production occurs in thermodynamic equilibrium, no entropic waste is produced, and the model collapses to the nested neoclassical model. A contribution of the proposed approach is the determination of energy (money) prices in general equilibrium. Despite the fact that energy does not enter the agents' utility function, and therefore has no direct value, money prices and interest rate can be fully characterized in the model due precisely to the production technology adopted. In this competitive equilibrium the market interest rate will be greater than the real interest rate. The change in the numeraire and medium of exchange used affects the economy due to the non stationarity of the production process, but has no effect in the limit case in which the productive process reaches a steady state.
2006	R21	Le Bayon, Sabine, and Herve Peleraux. 2006. "L'exuberance rationnelle de l'immobilier. (The Rational Exuberance of Housing With English summary.)." <i>Revue de L'OFCE</i>, 0(96): 83-114. House prices have risen strongly since 1997 in France, like in many other developed countries. Indeed, housing supply has not been strong enough to answer a buoyant demand. Demand for housing has been mainly boosted by falling interest rates and a lengthening of loan duration, but also by demographic factors and foreign investment. The increase in house prices seems therefore justified and not the sign of a speculative bubble, like in Paris at the beginning of the 1990s. This is confirmed by the analysis of housing yields: due to the inertia of rent prices, rates of return on housing have decreased but not as much as long-term interest rates, thus remaining slightly higher than bonds yields.

2006	R30	McAllister, Patrick, and Colin Lizieri. 2006. "Monetary Integration and Real Estate Markets: The Impact of Euro on European Real Estate Equities." <i>Journal of Property Research</i>, 23(4): 281-303. This paper assesses the impact of the monetary integration project on different types of stock returns in Europe. In order to isolate European monetary factors, the impact of global equity integration is investigated. European countries are sub-divided according to the differences in the timing and degree of monetary integration. Analysis shows that national equity indices are strongly influenced by global market movements, with a European stock factor providing additional explanatory power. The global and European factors explain small cap and real estate stocks much less well--suggesting an increased importance of local and national drivers. However, there is little evidence to suggest that monetary integration is causing the phenomenon. For all sectors investigated, the European factor affects non-Eurozone members and non-EU members in the same way as Eurozone members. Further, the importance of global and European factors has almost invariably increased over time. For real estate equities, the largest increase in correlation was for non-Eurozone and non-European Union markets. One possible interpretation is that broader regional economic integration rather than more narrow monetary integration is driving the European factor.

2007	D70	Farvaque, Etienne, Norimichi Matsueda, and Pierre-Guillaume Meon. 2007. <i>How committees reduce the volatility of policy rates.</i> Universite libre de Bruxelles, Department of Applied Economics (DULBEA), Working Papers DULBEA: 07-11.RS. This paper relates the volatility of interest rates to the collective nature of monetary policymaking in monetary unions. Several decision rules are modelled, including hegemonic and democratic procedures, and also committees headed by a chairman. A ranking of decision rules in terms of the volatility of policy rates is obtained, showing that the presence of a chairman has a cooling effect. However, members of a monetary union are better off under symmetric rules (voting, consensus, bargaining), unless they themselves chair the union. The results are robust to the inclusion of heterogeneities among members of the monetary union.
2007	F47	de Pooter, Michiel D., Francesco Ravazzolo, and Dick van Dijk. 2007. <i>Predicting the Term Structure of Interest Rates: Incorporating Parameter Uncertainty, Model Uncertainty and Macroeconomic Information.</i> Tinbergen Institute, Tinbergen Institute Discussion Papers: 07-028/4. We forecast the term structure of U.S. Treasury zero-coupon bond yields by analyzing a range of models that have been used in the literature. We assess the relevance of parameter uncertainty by examining the added value of using Bayesian inference compared to frequentist estimation techniques, and model uncertainty by combining forecasts from individual models. Following current literature we also investigate the benefits of incorporating macroeconomic information in yield curve models. Our results show that adding macroeconomic factors is very beneficial for improving the out-of-sample forecasting performance of individual models. Despite this, the predictive accuracy of models varies over time considerably, irrespective of using the Bayesian or frequentist approach. We show that mitigating model uncertainty by combining forecasts leads to substantial gains in forecasting performance, especially when applying Bayesian model averaging.
2007	F49	Natal, Jean-Marc, and Nicolas Stoffels. 2007. <i>Globalization, markups and the natural rate of interest.</i> Swiss National Bank, Working Papers: 2007-14. In this paper, we investigate how, in a stylised theoretical framework, an increase in the degree of globalization--modelled as a decline in trade costs--affects the real natural rate of interest by impacting firms markups. Outlining a two-country dynamic general equilibrium model with endogenous elasticity of substitution between goods, we suggest two main propositions: 1) Globalization--via the implied variation in markups--has a potentially significant impact on the natural rate of interest. 2) Simple, plausible markup dynamics may have contributed to explain the recent "conundrum" of world interest rates.
2007	F65	Majid, Muhd-Zulhibri Abdul. 2007. "The Dynamic Interaction between Interest Rate and Exchange Rate in Asian Crisis Countries: Further Empirical Evidence." <i>Global Journal of Finance and Economics</i>, 4(2): 93-105. This paper aims at contributing to this key policy debate by providing new empirical evidence on the dynamic interaction of the exchange rate and interest rate in countries affected by Asian currency crisis. Our empirical results are consistent with the conventional view in the sense that monetary policy tightening leads to a nominal exchange rate appreciation during tranquil periods. However, they also provide support to the revisionist view in that tightening of monetary policy that occurred during the Asian financial crisis was excessive. By going beyond what was required to offset increasing risk premia, tighter monetary policy appears to have contributed to the collapse of the exchange rates when they came under speculative attack.
2007	H68	Aristovnik, Aleksander, and Bostjan Bercic. 2007. "Fiscal Sustainability in Selected Transition Countries." <i>Ekonomicky Casopis/Journal of Economics</i>, 55(7): 659-75. In the article, we review recent literature on fiscal sustainability with particular reference to problems that are specific to transition countries. While the original literature on fiscal sustainability is chiefly focused on industrial countries there are by now few works that have focused on fiscal sustainability in transition countries. Consequently, the article's purpose is to assess the short-, medium- and long-term sustainability of fiscal policy (under set assumptions) on the national level in the great majority of transition countries which we divide into three main groups, i.e., Central and Eastern Europe (CEE), Southern and Eastern Europe (SEE) and the Commonwealth of Independent States (CIS). Based on the mainstream theory measures of fiscal sustainability, the results indicate that fiscal sustainability seems to be a problem in many transition countries, particularly in the Visegrad group countries (in CEE region) and in Albania and Croatia (in SEE region).
2007	I31	Welsch, Heinz. 2007. "Macroeconomics and Life Satisfaction: Revisiting the 'Misery Index.'" <i>Journal of Applied Economics</i>, 10(2): 237-51. Using data from surveys of life satisfaction, evidence has been presented that European citizens' subjective well-being is inversely related to inflation and unemployment. Motivated by the "Barro Misery Index", this paper reconsiders the relationship between macroeconomics and subjective well-being by including the growth rate and the long-term interest rate as additional variables in life satisfaction regressions. The paper finds that people care about growth and employment on the one hand and stability on the other, where stability may alternatively be captured by the inflation rate or the long-term interest rate.

Year	DE	Title and Abstract
		Stability, measured in whichever of these ways, does not seem to be less important to European citizens than growth and employment.
2007	I32	de Mendonca, Helder Ferreira, and Jose Simao Filho. 2007. "Economic Transparency and Poverty." <i>Banca Nazionale del Lavoro Quarterly Review</i>, 60(240): 33-48. Nowadays, with the diffusion of inflation targeting, the main instrument that central banks use to achieve final objectives in the implementation of monetary policy (concerning inflation and unemployment) is the interest rate. Furthermore, recent studies point out that central bank transparency contributes to reducing asymmetric information and price stability. As inflation, unemployment and interest rates are determinants of the level of poverty, the central bank's behaviour is relevant to its reduction. Accordingly, the present paper highlights the connection between economic transparency and poverty. The theoretical and empirical results denote that central bank transparency is a useful strategy in reducing income inequality and poverty.

2007	J15	Avery, Robert B., Kenneth P. Brevoort, and Glenn B. Canner. 2007. "Opportunities and Issues in Using HMDA Data." <i>Journal of Real Estate Research</i>, 29(4): 351-79. Since 1975, the Home Mortgage Disclosure Act (HMDA) has required most mortgage lending institutions to disclose to the public information about the home loans they originate or purchase during a calendar year. In using these data, however, researchers need to be aware of a number of issues and potential problems that characterize HMDA. This article provides a comprehensive enumeration of these issues, focusing on practical problems that can potentially influence choices researchers make in using the data or in interpreting the findings. The article also includes an illustrative example of how the data that is reported in HMDA can be used to gain a better understanding of trends and practices in the home mortgage market.
2007	J15 J16	McCoy, Patricia A. 2007. "The Home Mortgage Disclosure Act: A Synopsis and Recent Legislative History." <i>Journal of Real Estate Research</i>, 29(4): 381-97. This article describes the provisions of the federal Home Mortgage Disclosure Act (HMDA), tracing its legal evolution since 1989, when Congress expanded HMDA to require reporting of home mortgage lending by ethnicity and race. HMDA requires most lenders to report the demographic makeup and geographic distribution of home mortgages to the federal government. The 1989 amendments and later developments transformed HMDA from a law exclusively concerned with geographic disinvestment to one concerned with lending disparities by ethnicity and race. In the process, HMDA evolved from an obscure reporting statute to a flashpoint for debates over lending discrimination and subprime lending.
2007	J15	Courchane, Marsha J. 2007. "The Pricing of Home Mortgage Loans to Minority Borrowers: How Much of the APR Differential Can We Explain?" <i>Journal of Real Estate Research</i>, 29(4): 399-439. The public releases of the 2004 and 2005 HMDA data have engendered a lively debate over the pricing of mortgage credit and its implications regarding the treatment of minority mortgage borrowers. This research uses aggregated proprietary data provided by lenders and an endogenous switching regression model to estimate the probability of taking out a subprime mortgage, and annual percentage rate (APR) conditional on getting either a subprime or prime mortgage. The findings reveal that up to 90% of the African American APR gap, and 85% of the Hispanic APR gap, is attributable to observable differences in underwriting, costing, and market factors that appropriately explain mortgage pricing differentials. Although any potential discrimination is problematic and should be addressed, the analysis suggests that little of the aggregate differences in APRs paid by minority and non-minority borrowers are appropriately attributed to differential treatment.

2007	K21 L40	Rosen, Richard J. 2007. "Banking Market Conditions and Deposit Interest Rates." <i>Journal of Banking and Finance</i>, 31(12): 3862-84. This paper shows that the impact of market structure on bank deposit interest rates is complex. Both market size structure and multimarket bank presence have independent effects on rates. There is evidence that mid-size banks were more aggressive competitors than other banks, but that the effect of market structure on deposit rates has evolved over time, with mega-banks recently becoming more aggressive competitors. This may be related to the growth of mega-banks in many markets. These findings have implications for existing theories of deposit pricing and, by extension, antitrust policy in banking.
2007	L52	Botnari, Nadeja. 2007. "Investments--The Premises of the Economic Development and Expansion." <i>Petroleum-Gas University of Ploiesti Bulletin: Economic Sciences Series</i>, 59(3): 7-12. This paper emphasizes the importance of investments in economic growth both on the company level and on the national level. An analysis is carried out regarding the factors which affect investments (interest rate, economic level, companies' profitability, evolution of demand, trust in the future, etc.), with focus on Republic of Moldova. Likewise, the improvement of the banking system activity, step up of legal persons' incomes taxing, upgrading of equities taxing, development encouragement and innovations implementations, and using the fiscal investments credits are analysed.

2007	L70	Karim, Shahnawaz, Minsoo Lee, and Christopher Gan. 2007. "Real Effects of Monetary Policy in New Zealand." <i>Australian Economic Review</i>, 40(4): 385-401. This article analyses the dynamic effects of unexpected domestic and foreign monetary policy shocks on industrial output in New Zealand based on a new open economy macroeconomic model. Empirical analyses are performed using unrestricted recursive open economy vector autoregressive models involving policy and non-policy variables for New Zealand and four of its most important trading partners (that is, Australia, Japan, the United Kingdom and the United States).

Year	DE	Title and Abstract
		The empirical findings are in accord with the qualitative predictions of the conventional monetary transmission mechanism applicable to a small open economy. Consequently, no empirical anomalies are observed in the dynamic behaviour of New Zealand industrial output in response to restrictive monetary innovations of domestic and foreign origin.

2007	M51	Kaufmann, Sylvia. 2007. "Capturing the Link between M3 Growth and Inflation in the Euro Area--An Econometric Model to Produce Conditional Inflation Forecasts." <i>Monetary Policy and the Economy</i> , 0(0): 93-108. In this paper, we capture the link between M3 growth and inflation with a vector error correction model. The analysis also includes the 10-year government bond yield, the three-month EURIBOR interest rate and GDP. The long-run link between M3 growth and inflation is observable in the raw data. Over the years 1980-2006, we find that M3 growth and inflation are cointegrated, which means that deviations from long-term average real money growth lead to mean-reverting adjustment processes to restore the average level of real money growth. The full effect of an unexpected monetary shock thus materializes over time in the level of inflation, after a transitory period during which GDP and interest rates have been affected as well. Out-of-sample yearly conditional inflation forecasts are produced from 2001 to 2006 which are compared to Eurosystem staff projections. Qualitatively, the monetary model predicts future inflation rates which are consistent with the ECB's assessment of future inflation prospects.
2007	N15	Burdekin, Richard C. K. 2007. "Nontraditional Monetary Policy Options and Commodity-Based Stabilization Policy." <i>International Economics and Finance Journal</i> , 2(1-2): 1-18. Despite renewed interest in alternative "nontraditional" monetary policy options in a world of low interest rates and inflation rates, relatively little attention has been focused on central bank commodity purchases. Commodity-based stabilization policy was widely advocated during the deflationary environment prior to World War II and could be a valid option for commodity-dependent nations today. Major commodity-market intervention was undertaken by China in the past, while other examples include the US government's silver purchase programs of 1890 and 1934. This paper reviews these and other experiences and considers whether there is any useful scope for commodity-based monetary stabilization policy today.
2007	N25	Ohnuki, Mari. 2007. "The Bank of Japan Network and Financial Market Integration: From the Establishment of the Bank of Japan to the Early 20th Century." <i>Monetary and Economic Studies</i> , 25(1): 95-127. One of the purposes cited for establishing the Bank of Japan (BOJ) was to "facilitate finance" by promoting the nationwide integration of the regional financial markets, which until that point had been divided and functioned independently. Nonetheless, much remains unknown about Japanese financial transactions and the operations of the BOJ during the Meiji Period, and the role the BOJ played in the process of domestic financial market integration is still not sufficiently clear. The purpose of this paper is to examine, using interest rate data and documentary evidence of financial transactions, the role played by the BOJ in the process of financial market integration in Meiji Period Japan. The analysis finds that, from the perspective of reducing inter-regional interest rate differences, there was indeed significant progress toward financial market integration in the latter half of the 1890s. It also finds that the BOJ may have played a role in promoting financial market integration because the expansion of its networks (a correspondent network with private-sector banks and a branch office network) served to facilitate the movement of funds between regions through the funds transfer services it provided.
2007	N25	Mitchener, Kris James, and Mari Ohnuki. 2007. "Capital Market Integration in Japan." <i>Monetary and Economic Studies</i> , 25(2): 129-53. We construct new quarterly estimates of lending rates for the 47 Japanese prefectures for the period 1886-1922, and test the extent to which regional capital markets integrated during this period. We analyze whether the Japanese capital market was efficient, estimate the speed of convergence among the rates, and assess the degree to which different regions were integrated with the main financial centers of Japan. Interest rate differentials between the financial centers of Japan and other regions do not follow a random walk, and hence are suggestive of market efficiency-in the sense that arbitrage opportunities did not persist. Results from cointegration tests suggest that the integration in Japan is characterized by multiple stochastic elements. We find the existence of four long-run cointegrating relationships. We also find evidence that shocks occurring in a financial center, such as the Kanto region in which Tokyo is located, were transmitted to outlying regions and had permanent but small effects on their rates.

2007	N91 N92	Landon-Lane, John, and Hugh Rockoff. 2007. "The Origin and Diffusion of Shocks to Regional Interest Rates in the United States, 1880-2002." <i>Explorations in Economic History</i> , 44(3): 487-500. This paper is about the behavior of regional interest rates in the United States from 1880 to 2002. The main concern is with the shocks to regional rates. Where did they originate? How did they diffuse? How did the pattern change over time? We show that in the late nineteenth century the main source of shocks to rates on the periphery were shocks originating on the periphery itself. This pattern continued through World War I and the Great Depression. After World War II, however, the importance of disturbances on the periphery diminished and shocks to rates in the Eastern financial centers became the main source of fluctuations in all regions.
2007	P25	Egert, Balazs, and Dubravko Mihajlek. 2007. "Determinants of House Prices in Central and Eastern Europe." <i>Comparative Economic Studies</i> , 49(3): 367-88. This paper studies the determinants of house prices in eight transition economies of central and eastern Europe (CEE) and 19 OECD countries. The main question addressed is whether the conventional fundamental determinants of house prices, such as GDP per capita, real interest rates, housing credit and demographic factors, have driven the observed house prices in CEE. We show that house prices in CEE can be explained well by the underlying conventional fundamentals and some transition specific factors, in particular institutional development of housing markets and housing finance and quality effects.

2007	Q33	Frankel, Jeffrey. 2007. "On the Rand: Determinants of the South African Exchange Rate." <i>South African Journal of Economics</i> , 75(3): 425-41. This paper is an econometric investigation of the determinants of the real value of the South African rand over the period 1984-2007. The results show a relatively good fit. As always with exchange rate equations, there is substantial weight on the lagged exchange rate, which can be attributed to a momentum component. Nevertheless, economic fundamentals are significant and important. This is especially true of an index of the real prices of South African mineral commodities, which even drives out real income as a significant determinant. An implication is that the 2003-2006 real appreciation of the rand can be

Year	DE	Title and Abstract
		attributed to the Dutch Disease. In other respects, the rand behaves like currencies of industrialised countries with well-developed financial markets. In particular, high South African interest rates raise international demand for the rand and lead to real appreciation, controlling also for a forward-looking measure of expected inflation and a measure of default risk or country risk.
2007	Q54	Groom, Ben, Phoebe Koundouri, Ekaterini Panopoulou, and Theologos Pantelidis. 2007. "Discounting the Distant Future: How Much Does Model Selection Affect the Certainty Equivalent Rate?" <i>Journal of Applied Econometrics</i> , 22(3): 641-56. Recent work in evaluating investments with long-term consequences has turned towards establishing a schedule of Declining Discount Rates (DDRs). Using US data we show that the employment of models that account for changes in the interest rate generating mechanism has important implications for operationalising a theory of DDRs that depends upon uncertainty. The policy implications of DDRs are then analysed in the context of climate change for the USA, where the use of a state space model can increase valuations by 150% compared to conventional constant discounting.

2007	R20	Koijen, Ralph S. J. Otto Van Hemert, and Stijn Van Nieuwerburgh. 2007. <i>Mortgage Timing</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 13361. The fraction of newly-originated mortgages that are of the adjustable-rate (ARM) versus the fixed-rate (FRM) type exhibits a surprising amount of time variation. A simple utility framework of mortgage choice points to the bond risk premium as theoretical determinant: when the bond risk premium is high, FRM payments are high, making ARMs more attractive. We confirm empirically that the bulk of the time variation in household mortgage choice can be explained by time variation in the bond risk premium. This is true regardless of whether bond risk premia are measured using forecasters' data, a VAR term structure model, or a simple rule-of-thumb based on adaptive expectations. This simple rule-of-thumb moves in lock-step with mortgage choice, thereby lending further credibility to a theory of strategic mortgage timing by households.

2007	R23	Dow, Sheila C., and Alberto Montagnoli. 2007. "The Regional Transmission of UK Monetary Policy." <i>Regional Studies</i> , 41(6): 797-808. Concerns have been raised in the media about a 'one-size-fits-all' monetary policy for the UK. If there are diverse economic conditions in different regions, then a unitary monetary policy cannot suit all. The purpose of this paper is to explore this issue further by breaking it down into two separate issues. First there is the more conventional way of considering the question, in terms of the effect of a particular interest rate change on regions experiencing different economic conditions. This requires a consideration of the nature and causes of regional economic disparities in the UK, and how these might be affected by particular interest rate changes. But there is further the question of how monetary policy is transmitted to the different regions. The possibility is considered that there may be regional differences in how a particular monetary policy is translated into different financial conditions in different regions. In other words there may be a regional dimension to the transmission process itself. The focus here will be on the regional structure of the financial sector and financial behaviour, and in particular the credit market. The argument is explored further with a comparison of Scottish and UK data.

2008	D40	Buchholz, Wolfgang, and Jan Schumacher. 2008. <i>Discounting the Long-Distant Future: A Simple Explanation for the Weitzman-Gollier-Puzzle</i> . CESifo GmbH, CESifo Working Paper Series: CESifo Working Paper No. 2357. In this paper, we reconsider the debate on Weitzman's (1998) suggestion to discount the long-run future at the lowest possible rate, referring to Gollier (2004) and Hepburn & Groom (2007). We show that, while Weitzman's use of the present value approach may indeed seem questionable, its outcome, i.e. a discount rate that is declining over time, is nevertheless reasonable, since it can be justified by assuming a plausible degree of risk aversion.
2008	D61	Gollier, Christian, Phoebe Koundouri, and Theologos Pantelidis. 2008. "Declining Discount Rates: Economic Justifications and Implications for Long-Run Policy." <i>Economic Policy</i> , 0(56): 757-85, 790-95. Should economic policy target immediate problems like malaria and AIDS? Or should it target climate change, which may have even more dramatic life-threatening effects in the very long term? We discuss how the pattern of discount rates over the planning horizon bears on this important issue. A declining pattern of discount rates is theoretically justified by uncertainty about future economic conditions, and its shape and relevance can be estimated from historical data. We analyse empirically long-term interest rate data from nine countries, construct a weighted average representing a possible global discount rate pattern for a very long range of future dates, and assess its implications for the valuation of carbon mitigation policies.

2008	D78	De Haan, Jakob. 2008. "The Effect of ECB Communication on Interest Rates: An Assessment." <i>Review of International Organizations</i> , 3(4): 375-98. This paper reviews the literature on the communication policy of the European Central Bank (ECB) addressing two questions. First, to what extent has ECB communication affected interest rates? Second, to what extent has ECB communication affected the predictability of the ECB's interest rate decisions? On the basis of a survey of empirical studies, it is concluded that various forms of ECB communication lead to more volatility. However, studies focusing on volatility cannot assess

Year	DE	Title and Abstract
		whether markets moved in the intended direction. To analyze whether this is the case, researchers have coded ECB communications. Studies using this approach yield evidence that communications generally move financial markets in the intended direction. There is also substantive evidence that ECB communications increase the predictability of interest decisions by the ECB Governing Council. Finally, the consequences of the fact that ECB officials often gave contrasting signals to market participants are analyzed. New evidence suggests that inconsistent communication causes agents to make less accurate predictions. The policy implication is that central bankers should take care that their statements are consistent.
2008	G17	Almeida, Caio, and Jose Vicente. 2008. "The Role of No-Arbitrage on Forecasting: Lessons from a Parametric Term Structure Model." <i>Journal of Banking and Finance</i> , 32(12): 2695-2705. Parametric term structure models have been successfully applied to numerous problems in fixed income markets, including pricing, hedging, managing risk, as well as to the study of monetary policy implications. In turn, dynamic term structure models, equipped with stronger economic structure, have been mainly adopted to price derivatives and explain empirical stylized facts. In this paper, we combine flavors of those two classes of models to test whether no-arbitrage affects forecasting. We construct cross-sectional (allowing arbitrages) and arbitrage-free versions of a parametric polynomial model to analyze how well they predict out-of-sample interest rates. Based on US Treasury yield data, we find that no-arbitrage restrictions significantly improve forecasts. Arbitrage-free versions achieve overall smaller biases and root mean square errors for most maturities and forecasting horizons. Furthermore, a decomposition of forecasts into forward-rates and holding return premia indicates that the superior performance of no-arbitrage versions is due to a better identification of bond risk premium.
2008	G17	Bowsher, Clive G., and Roland Meeks. 2008. "The Dynamics of Economic Functions: Modeling and Forecasting the Yield Curve." <i>Journal of the American Statistical Association</i> , 103(484): 1419-37. The class of functional signal plus noise (FSN) models is introduced that provides a new, general method for modeling and forecasting time series of economic functions. The underlying, continuous economic function (or "signal") is a natural cubic spline whose dynamic evolution is driven by a cointegrated vector autoregression for the ordinates (or "y-values") at the knots of the spline. The natural cubic spline provides flexible cross-sectional fit and results in a linear state-space model. This FSN model achieves dimension reduction, provides a coherent description of the observed yield curve and its dynamics as the cross-sectional dimension N becomes large, and can be feasibly estimated and used for forecasting when N is large. The integration and cointegration properties of the model are derived. The FSN models are then applied to forecasting 36-dimensional yield curves for U.S. Treasury bonds at the 1-month-ahead horizon. The method consistently outperforms the dynamic Nelson-Siegel and random walk forecasts on the basis of both mean squared forecast error criteria and economically relevant loss functions derived from the realized profits of pairs trading algorithms. The analysis also highlights in a concrete setting the dangers of attempting to infer the relative economic value of model forecasts on the basis of their associated mean squared forecast errors.

The growing need for infrastructure funding by central and regional governments, on both sides of the Tasman, can be utilised to complete long-term debt markets. One possible structure is a sovereign infrastructure vehicle that invests in long-term primary debt securities written by state and local government to fund infrastructure projects and repackage these into asset-backed securities issued to the public. Synergistic enhancements include lifecycle derivatives and retirement funding.
2008	H81	Brock, William A., and Charles F. Manski. 2008. <i>Competitive Lending with Partial Knowledge of Loan Repayment</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 14378. We study a competitive credit market in which lenders, having partial knowledge of loan repayment, use a Bayesian, maximin, or minimax-regret criterion to make lending decisions. Lenders allocate endowments between loans and a safe investment, while borrowers demand loans to undertake investments. Borrowers may incompletely repay their loans when investment productivity turns out to be low ex post. We characterize market equilibrium, the contracted repayment rate being the price variable that equilibrates loan supply and demand. We explore market dynamics when a credit market that is initially in steady state experiences an unanticipated shock that temporarily lowers the productivity of borrower investments. The shock reduces loan repayment and lenders, not knowing whether the shock is temporary, then reduce loan supply. We study two forms of government intervention to restore the steady state. One policy manipulates the return on the safe investment and the other guarantee a minimum loan return to lenders. We conclude that the minimum-return guarantee is preferable. This policy directly reduces lender ambiguity in a transparent manner.
2008	H83	Bernoth, Kerstin, and Guntram B. Wolff. 2008. "Fool the Markets? Creative Accounting, Fiscal Transparency and Sovereign Risk Premia." <i>Scottish Journal of Political Economy</i> , 55(4): 465-87. We investigate the effects of official fiscal data and creative accounting signals on interest rate spreads between bond yields in the European Union. We find that two different measures of creative accounting indeed both increase the spread. The increase of the risk premium is stronger, if financial markets are unsure about the true extent of creative accounting. Moreover, fiscal transparency reduces risk premia. Instrumental variable regressions confirm these results by addressing potential reverse causality problems and measurement bias.

2008	K22	Dalla Pellegrina, Lucia. 2008. "Illegal Finance, Interest Rates and Bank Lending: The Missing Supply Side of Usury." <i>Global Business and Economics Review</i> , 10(3): 265-83. This paper aims at identifying a causal relationship going from bank interest rates and credit rationing to usury. We manage the endogeneity issues by exploiting the variables that are related to bankruptcy proceedings as exogenous factors that affect bank variables, but not the other nonmeasurable determinants of usury. The estimates carried out in Italian provinces during the period of 1999-2002 provide evidence that a higher bank credit availability reduces illegal lending, while interest rates respond ambiguously. We explain these results with the presence of contrasting forces that drive usury demand and supply. We test the robustness of our estimates using controls that capture economic and financial conditions, social standards, government intervention, the severity of punishments and the presence of organised crime.

2008	L72	Swaray, Raymond. 2008. "Macroeconomic Determinants of Non-fuel Primary Commodity Price Movements." <i>Journal of Applied Business Research</i> , 24(1): 11-16. This paper uses cointegration and error correction modelling techniques to examine the relationship between non-fuel commodity prices and world macroeconomic and monetary variables. The results show that fluctuations in industrial production of OECD countries, real effective exchange rate of the U.S. dollar and oil prices have significant short- and long- run impact on non-fuel commodity prices. In addition, there is evidence of highly significant positive correlation between the index of non-fuel commodity prices and crude oil price. This implies non-fuel commodity-dependent developing countries that are net importers of oil can derive little benefit from upward movements in commodity prices.

2008	O18	Oner Bodurlar, Ilkay. 2008. "Turkiye'de Konut Fiyatları İle Makro Ekonomik Değişkenler Arasındaki İlişkinin Arastırılması. (Investigation of Relationship between House Prices and Macroeconomic Variables in Turkey. With English summary)." <i>Anadolu University Journal of Social Sciences</i> , 8(1): 223-38. This study analyses the dynamic effects of macroeconomic variables (i.e., gross domestic product (GDP), money supply, short-run interest rates and exchange rates) on the house prices in Turkey for the period 2000-2006. Estimates of the long run relationship between house prices and macroeconomic variables are obtained using the Johansen cointegration test. The results of cointegration analysis suggest that there exists a long run relationship between house prices and macroeconomic variables. Vector error correction model (VECM) is used to investigate of the short-run dynamic relationship between house prices and macroeconomic variables. The results of VEC Granger causality/block exogeneity Wald test show that there is bi-directional causality between house prices and interest rates and exchange rates. It is observed that one-directional causality exists from gross domestic product and money supply to house prices.
2008	O18	Hudon, Marek. 2008. "Norms and Values of the Various Microfinance Institutions." <i>International Journal of Social Economics</i> , 35(1-2): 35-48. The paper aims to study the role of norms and values in the microfinance sector. The paper provides a combination of narrative with argument and analysis. A classification of the sector is proposed, mapping the institutions along two axes: the profit motive (profit vs not-for-profit) and the decision-making style (centralized vs un-centralized). Some microfinance institutions base their interactions on rigid norms or rules; while others are based on values. It is argued that the private sector will tend to produce the operating rules of the microfinance system while the not-for-profit institutions that are using an inclusive decision-making process are more likely to influence the ethical norms in the sector. Nevertheless, this classification is not static as recent events in South-India shows that norms, such as the interest rates, can be politically and emotionally invested to the point that they are about to become values in the sector. The conclusions drawn help in understanding the interactions between the various actions in microfinance. Exploiting the full range of the possibilities of those different structures may be valuable for a fully successful development in India.
2008	P11	Stesevic, Ivana. 2008. "Econometric Model of Interest Rates on Deposits in Montenegro." <i>Panoeconomicus</i> , 55(3): 383-98. Last years econometric models had become very important toll in planning, analyses and prognoses. This paper presents the process and methodology that is used in econometric modeling, with a particular focus on the modeling performed by the Eviews 3.0 software package. The interest rates on deposits in Montenegro will be presented to demonstrate the process of econometric modelling. Interest rates as macroeconomic phenomena determine and harmonize relations between demand and supply for credits; they aid in directing savings into investments, as well as provide adequate returns to participants in the financial market. Given the great importance of interest rates, this paper will define and analyze the factors which determine Montenegrin interest rates on deposits, and also formulates a model to predict these numbers.
2008	P52	CV: Pruski, Jerzy, and Piotr Szpunar. 2008. "The Monetary Transmission Mechanism in Poland." In <i>Transmission Mechanisms for Monetary Policy in Emerging Market Economies</i> . Bank for International Settlements, 427-37. BIS Papers, no. 35. Basel: Bank for International Settlements.
2008	Q12	Zhao, Jianmei, Peter J. Barry, and Gary D. Schnitkey. 2008. "Financing Strategies under Combined Capital Structure Theories: A Farm-Level Simulation Analysis." <i>Agricultural Finance Review</i> , 68(2): 321-38. A stochastic, multi-period simulation model is developed based on the prevalent capital structure theories, in searching for and identifying an optimal combination of related financing strategies. The model reflects both conceptual and empirical implications of the pecking order, trade-off, and signaling theories on farm business financing, investment, and expansion process. The comparisons of simulation output indicate that farm businesses could expand at a moderate speed accompanied by financial health when they concurrently adopt these financing tactics. Pecking order financing benefits short-term financial management, trade-off strategy effectively adjusts farm capital structure, and the signaling theory enables the adoption of risk-adjusted interest rate policies between the farm borrower and the lender.

2009	C58	Chib, Siddhartha, and Bakhodir Ergashev. 2009. "Analysis of Multifactor Affine Yield Curve Models." <i>Journal of the American Statistical Association</i>, 104(488): 1324-37. In finance and economics, there is a great deal of work on the theoretical modeling and statistical estimation of the yield curve (defined as the relation between $(-1/\tau) \log p[\text{subscript } t](\tau)$ and τ , where $p[\text{subscript } t](\tau)$ is the time t price of the zero-coupon bond with payoff 1 at maturity date $t + \tau$. Of considerable current interest are models of the yield curve in which a collection of observed and latent factors determine the market price of factor risks, the stochastic discount factor, and the arbitrage-free bond prices. The model is particularly interesting from a statistical perspective, because the yields are complicated nonlinear functions of the underlying parameters (e.g., those appearing in the evolution dynamics of the factors and those appearing in the model of the factor risks). This nonlinearity tends to produce a likelihood function that is multimodal. In this article, we revisit the question of how such models should be fit from the Bayesian viewpoint. Key aspects of the inferential framework include (a) a prior on the parameters of the model that is motivated by economic considerations, in particular, those involving the slope of the implied yield curve; (b) posterior simulation of the parameters in ways to improve the efficiency of the MCMC output, for example, through sampling of the parameters marginalized over the factors and tailoring of the proposal densities in the Metropolis-Hastings steps using information about the mode and curvature of the current target based on the output of a simulating annealing algorithm; and (c) measures to mitigate numerical instabilities in the fitting through reparameterizations and square root filtering recursions. We apply the techniques to explain the monthly yields on nine U.S. Treasury Bills (with maturities ranging from 1 month to 120 months) over the period January 1986-December 2005. The model contains three factors, one latent and two observed. We also consider the problem of predicting the nine yields for each month of 2006. We show that the (multi-step-ahead) prediction regions properly bracket the actual yields in those months, thus highlighting the practical value of the fitted model.
2009	C58	Christensen, Jens H. E., Francis X. Diebold, and Glenn D. Rudebusch. 2009. "An Arbitrage-Free Generalized Nelson-Siegel Term Structure Model." <i>Econometrics Journal</i>, 12(3): C33-64. The Svensson generalization of the popular Nelson-Siegel term structure model is widely used by practitioners and central banks. Unfortunately, like the original Nelson-Siegel specification, this generalization, in its dynamic form, does not enforce arbitrage-free consistency over time. Indeed, we show that the factor loadings of the Svensson generalization cannot be obtained in a standard finance arbitrage-free affine term structure representation. Therefore, we introduce a closely related generalized Nelson-Siegel model on which the no-arbitrage condition can be imposed. We estimate this new AFGNS model and demonstrate its tractability and good in-sample fit.
2009	D02	Farkas, Istvan. 2009. "The Growing Responsibility of Financial Supervisory Authorities." <i>Development and Finance/Fejlesztés és Finanszírozás: Quarterly Hungarian Economic Review</i>, 0(1): . Supervision based on monitoring must be replaced by forward-looking activities. In addition, the main purpose of coexistence with the market must be seen as being for the supervisory authorities to gain an understanding of the institutions' business models. These are the essential steps required if the supervisory authorities are to succeed in imposing a longer-term view instead of short-term market solutions. Durable legislation is important, but in a rapidly changing situation durable rules can only be drawn up once the most important qualitative elements are fixed. This, however, still leaves an area which, in the spirit of the rules, and in a transparent and accountable manner, has to be filled by the regulatory role of the supervisory authorities. The most significant change required is that longer-term interests must take precedence over short-term interests. One aspect of this is a change in the way issues of interest are handled, but greater controls must also be introduced for institutions which are critical to the system, such as auditors and rating agencies. One way of reducing chauvinism in the sector would be to have more integrated rules and supervision, whilst a solution to the issue of the self-interest of national supervisors could be a uniform European system with limits on legislative exceptions and European level supervision.
2009	F17	Campbell, Sean D., and Steven A. Sharpe. 2009. "Anchoring Bias in Consensus Forecasts and Its Effect on Market Prices." <i>Journal of Financial and Quantitative Analysis</i>, 44(2): 369-90. Previous empirical studies on the "rationality" of economic and financial forecasts generally test for generic properties such as bias or autocorrelated errors but provide only limited insight into the behavior behind inefficient forecasts. This paper tests for a specific form of forecast bias. In particular, we examine whether expert consensus forecasts of monthly economic releases are systematically biased toward the value of previous months' releases. Such a bias would be consistent with the anchoring and adjustment heuristic described by Tversky and Kahneman (1974) or could arise from professional forecasters' strategic incentives. We find broad-based and significant evidence for this form of bias, which in some cases results in sizable predictable forecast errors. To investigate whether market participants' expectations are influenced by this bias, we examine interest rate reactions to economic news. We find that bond yields react only to the residual, or unpredictable, component of the forecast error and not to the component induced by anchoring, suggesting that expectations of market participants anticipate this bias embedded in expert forecasts.

2009	L82 Z11	Ulibarri, Carlos A. 2009. "Perpetual Options: Revisiting Historical Returns on Paintings." <i>Journal of Cultural Economics</i>, 33(2): 135-49. This paper applies a perpetual option-pricing model in examining historical returns on paintings. A key development of the paper is formalizing a structural relationship between rational investment decisions and historical returns to art ownership. In this regard the options' framework yields choice-theoretic implications on the relationship among risk, convenience yields from art ownership, and investor 'hurdle prices'--prices triggering the purchase and sale of artworks at auction. The methodology offers testable implications concerning the adjustment dynamics in the relationship between historical art returns and risk-free yields. The implications are examined in a case study of paintings of major art schools using error correction methodology. We find evidence of a long-run equilibrium relationship between painting types and risk-free bond yields, and some indication of buyers and sellers preferring exchange environments not prone to "speculative resales."

2009	M13	Liu, Jia. 2009. "Business Failures and Macroeconomic Factors in the UK." <i>Bulletin of Economic Research</i>, 61(1): 47-72. We examine the interactions between business failures and macroeconomic aggregates, and specifically the accounts of policy-induced changes in the macroeconomy for the observed fluctuations of UK business failures in the period 1966-2003 using the vector error-correction model (VECM). The results demonstrate that macroeconomic aggregates, i.e., interest rate, credit, profits, inflation and business births, exert differential impacts on business failures both in the short run and in the long run. The study reveals that structural changes in the financial and real sectors during the examined period have made an impact on the way in

Year	DE	Title and Abstract
		which the macroeconomy affects business failures. In particular, business failures are increasingly reacting to monetary policy changes in the post-1980 period. Furthermore, the shocks to business failures can generate large fluctuations in macroeconomic aggregates, suggesting the importance of corporate balance sheets in financial stability and economic growth. The paper's findings carry policy implications that are related to the survival of firms in distress and finance-driven business cycles.

2009	P28	Ito, Katsuya. 2009. "The Russian Economy and the Oil Price: A Co-integrated VAR Approach." <i>Transition Studies Review</i> , 16(1): 220-27. Using a co-integrated VAR model, this paper analyzes the dynamic effects of oil price and interest rate shocks on the Russian economy for the period 1995:Q1-2008:Q2. The co-integration analysis leads to the finding that a 1% increase in oil prices contributes to real GDP growth by 0.8%, suggesting an increase four times that reported by Rautava (2002), in the long run. Furthermore, the impulse response analysis suggests that the impacts of the shock on inflation and real GDP are positive over the next eight quarters (short run), whereas the tightening of monetary policy through interest rate channel is immediately associated with a decline in inflation as predicted by theory, but with an increase in real GDP over the preceding quarters.
2009	R41	Astley, Mark, Julia Giese, Michael Hume, and Chris Kubelec. 2009. "Global Imbalances and the Financial Crisis." <i>Bank of England Quarterly Bulletin</i> , 49(3): 178-90. The recent financial crisis has put the spotlight on the rapid rise in credit which preceded it and the macroeconomic context in which it developed. This article examines the contribution of international savings and investment imbalances to the crisis and how these imbalances have evolved since its onset, focusing on the UK experience as a deficit country over the past decade. It also briefly discusses some implications of the crisis for global imbalances over the medium term.

2010	C31 C34 D71 D85	Bhattacharjee, Arnab, and Sean Holly. 2010. <i>Understanding Interactions in Social Networks and Committees.</i> Faculty of Economics, University of Cambridge, Cambridge Working Papers in Economics. While much of the literature on cross section dependence has focused mainly on estimation of the regression coefficients in the underlying model, estimation and inferences on the magnitude and strength of spill-overs and interactions has been largely ignored. At the same time, such inferences are important in many applications, not least because they have structural interpretations and provide useful interpretation and structural explanation for the strength of any interactions. In this paper we propose GMM methods designed to uncover underlying (hidden) interactions in social networks and committees. Special attention is paid to the interval censored regression model. Our methods are applied to a study of committee decision making within the Bank of England's monetary policy committee.
2010	C36	Enders, Walter, Kyung So Im, Junsoo Lee, and Mark C. Strazlicich. 2010. "IV Threshold Cointegration Tests and the Taylor Rule." <i>Economic Modelling</i> , 27(6): 1463-72. The usual cointegration tests often entail nuisance parameters that hinder precise inference. This problem is even more pronounced in a nonlinear threshold framework when stationary covariates are included. In this paper, we propose new threshold cointegration tests based on instrumental variables estimation. The newly suggested IV threshold cointegration tests have standard distributions that do not depend on any stationary covariates. These desirable properties allow us to formally test for threshold cointegration in a nonlinear Taylor rule. We perform this analysis using real-time U.S. data for several sample periods from 1970 to 2005. In contrast to the linear model, we find strong evidence of cointegration in a nonlinear Taylor rule with threshold effects. Overall, we find that the Federal Reserve is far more policy active when inflation is high than when inflation is low. In addition, we reaffirm the notion that the response to counteract high inflation was weakest in the 1970s and strongest in the Greenspan era.

2010	D73	Ehrmann, Michael, and Marcel Fratzscher. 2010. <i>Politics and Monetary Policy.</i> C.E.P.R. Discussion Papers, CEPR Discussion Papers: 8143. How and why do politicians' preferences about monetary policy differ from the interest rates set by independent central banks? Looking at the European Central Bank, the paper shows that politicians, on average, favor significantly lower interest rates. Three factors explain the different preferences. First, politicians put relatively less weight on inflation (and more on output) in their preferred monetary policy reaction function. Second, politicians' preferences are affected by political economy motives. Third, different preferences are also, and largely, due to different constituencies, as politicians primarily focus on national economic objectives rather than the euro area as a whole.

2010	F24	Diss: Coronado, Roberto A.. 2010. Essays on the Mexican Economy: Business Cycles and Remittances, Monetary Policy and Taylor-Rules, and Offshoring and Volatility. PhD diss. University of Houston. This dissertation is comprised of three essays on Mexico. The first essay examines business cycles and remittances. The second essay examines whether Mexico's monetary policy follows the Taylor rule. The third essay examines volatility in Mexico's maquiladora industry. The first essay analyzes business cycle properties of remittances and output for the United States and Mexico. Using an unobserved components state-space model, I decompose remittances and output into stochastic permanent and cyclical components. I then use the resulting stationary cyclical components to estimate co-movements between remittances and output. Empirical results indicate that remittances are counter-cyclical with Mexico. With respect to the source country, remittances to Mexico are counter-cyclical with the United States business cycle. As a robustness check, I incorporate two other pairs of countries into the analysis: the United States-El Salvador and Germany-Turkey. The second essay examines whether Mexico's central bank follows the Taylor rule when setting monetary policy. Taylor argues that the same type of Taylor rule that has been widely used for developed economies could be employed for emerging markets but modifications might be needed to accommodate for differences in market conditions. For developed economies, real-time data has become the norm; however, the existing literature on Taylor rule and emerging market economies

Year	DE	Title and Abstract
		uses only revised data. I use real-time data to estimate Taylor rules for Mexico. In the spirit of Taylor's suggestion for modifications, I incorporate the real exchange rate into the analysis. Results indicate that both inflation and the output gap play a key role for Banco de Mexico when deciding monetary policy actions. The empirical evidence for the exchange rate is mixed. The third chapter analyzes the impact that offshoring has in employment and output volatility in Mexico's maquiladora industry. I expand Bergin, Feenstra and Hanson's (BFH) seminal work in different directions. Empirical results suggest that the volatility in employment and output in Mexico's maquiladoras is greater than the one originally estimated by BFH. These results imply that offshoring via the maquiladora industry in Mexico can act as a greater cushion for business cycle fluctuations in the United States.

2010	F44	Bogoev, Jane. 2010. "Comparative Analysis of Credit Growth and Bank Lending Channel among the South Eastern European Economies during the Periods of Economic Growth and Economic Recession." <i>CEA Journal of Economics</i> , 5(1): 59-72. The main aims of this analysis are to assess the credit growth and whether the bank lending channel is operational among the economies from South Eastern Europe during the two periods: a) period of relatively stable macroeconomic environment and economic growth: 2004-2008 and b) period of economic recession: 2009Q1 and 2010Q1. In order to investigate these issues, we aim to provide a brief assessment of the key central bank interest rate movements, the major developments on the deposit market as a major source of financing of banks' lending activities and the credit growth. The data presented, indicate that in all almost all SEE economies there have been an episode of "credit boom" during the period of economic growth (2004-2008). An exception from this is Croatia that had two episodes of "credit boom" that occurred much earlier. Regarding the existence of the bank lending channel, the data presented and the results from the correlation coefficient imply that probably in all SEE economies, apart from Croatia, the bank lending channel is not operational. 2010	F44	Jimenez-Rodriguez, Rebeca, Amalia Morales-Zumaquero, and Balazs Egert. 2010. "The Effect of Foreign Shocks in Central and Eastern Europe." <i>Journal of Policy Modeling</i> , 32(4): 461-77. This paper investigates the impact of international shocks--interest rate, commodity price and industrial production shocks--on key macroeconomic variables in ten Central and Eastern European (CEE) countries by using near-VAR models and monthly data from the early 1990s to 2009. In contrast to previous work, the empirical analysis takes explicit account of the possibility of (multiple) structural breaks in the underlying time series. We establish strong evidence of structural breaks, particularly along the years 2007 and 2008, suggesting the very relevant impact of the recent global crisis on CEE economies. Moreover, our results suggest that the way how countries react to world commodity price shocks is related to the underlying economic structure and the credibility of the monetary policy. We also find that some countries like Slovakia and Slovenia--already euro area members--react stronger to foreign industrial production shocks than other countries and that the responses to such shocks are strongly correlated for selected CEE countries. Nevertheless, our results also shed light on substantial differences in responses to foreign interest rate shocks that originate from the US or the euro area.
2010	H41	CV: Spiro, Peter S. 2010. "The Social Discount Rate for Provincial Government Investment Projects." In <i>Discount Rates for the Evaluation of Public Private Partnerships</i> , ed. David F. Burgess and Glenn P. Jenkins, 299-313. Montreal and Kingston: McGill-Queen's University Press.

2010	I18	Jha, Raghendra. 2010. <i>Inflation, Macroeconomic Policy and Hunger: A Variation on a Theme by C. Rangarajan</i> . Australian National University, Australia South Asia Research Centre, ASARC Working Papers. This paper re-emphasizes the importance of price stability as a tool for macroeconomic policy and make it more specific by considering a typically (unanticipated) advantage of stabilizing the Consumer Price Index (CPI). I briefly review the recent economic growth performance of the Indian economy and recount the sluggish response of poverty to high economic growth. Further, hunger (calorie deficiency) has actually increased during the post-reform period. Using household level National Sample Survey (NSS) data for 1993-94 and 2004-05 the paper shows that calorie intakes in both rural and urban areas are sensitive to commodity (in particular foodgrain) prices. Hence, reducing consumer price inflation is likely to yield a rich dividend by reducing hunger. Indeed rising per capita incomes are not likely to be sufficient to reduce hunger. The paper also reviews some policy challenges to stabilizing consumer prices.
2010	J65	Nakajima, Tomoyuki. 2010. "Optimal Monetary Policy with Imperfect Unemployment Insurance." <i>Journal of Economic Dynamics and Control</i> , 34(3): 365-87. We consider an efficiency-wage model with the Calvo-type sticky prices and analyze the optimal monetary policy when the unemployment insurance is not perfect. With imperfect risk sharing, the strict zero-inflation policy is no longer optimal even when the zero-inflation steady-state equilibrium is made (conditionally) efficient. Quantitative results depend on how the idiosyncratic earning loss due to unemployment varies over business cycles. If the idiosyncratic income loss is acyclical, the optimal policy differs very little from the zero-inflation policy. However, if it varies countercyclically, as evidence suggests, the deviation of the optimal policy from the complete price-level stabilization becomes quantitatively significant. Furthermore, the optimal policy in such a case involves stabilization of output to a much larger extent.
2010	K34	Mignarri, Enzo. 2010. "Il trattamento fiscale dei Btp indicizzati all'inflazione europea. (The Tax Treatment of Italian Treasury Bonds Linked to Eurozone Inflation. With English summary.)." <i>Bancaaria</i> , 0(7-8): 50-55. The taxation rules on capital gains from various types of securities and bonds issued in Italy and abroad have introduced a clear distinction between gross and net taxpayers as revenues collectors. This fiscal regime is applied also to the Italian Treasury Bonds linked to Eurozone inflation; however, with some peculiarities for net taxpayers: for them a distinction must be drawn between the principal redeemed at maturity and coupon interest.

It is common to assume in business cycle analysis that the capital stock is homogenous and constant in aggregate value. We explore the alternative concept that capital is heterogeneous, and whether it exhibits cyclical changes. A multiperiod model of investment

Year	DE	Title and Abstract
		implies that acquisition of specific components of capital responds to changes in relative interest rates, and we further show that the structure of rates is cyclical. If cyclical changes in the composition of capital are substantial, that is another mechanism to propagate the business cycle. Detailed data of specific capital types are available for U.S. passenger airlines, a cyclical industry. We find that there are regular patterns by which airlines adjust the mix of capital. Results suggest a capacity constraint influence in determining movements of aggregate income.
2010	N46	Pecquet, Gary M., and Clifford F. Thies. 2010. "Texas Treasury Notes and the Mexican-American War: Market Responses to Diplomatic and Battlefield Events." <i>Eastern Economic Journal</i>, 36(1): 88-106. Studies have demonstrated the impact of battlefield outcomes on financial markets in the case of the US Civil War and other existential struggles. But many wars (such as Vietnam and Iraq) have been wars of choice. In these wars, military victories have not necessarily led to peace. Investigation of the market impact of battlefield and diplomatic events in the context of a war of choice offers the opportunity to distinguish the market's interest in peace as distinct from victory; and, the usefulness of identifying events from the study of history as an adjunct to the empirical identification of break-points.
2010	Q02	Gal, Peter, Csaba Moldicz, Tamas Novak, and Zsolt Szabo. 2010. "Shaky Growth Outlook, Domestic and International Risks Remain Substantial." <i>Development and Finance/Feltesztes es Finanszirozas: Quarterly Hungarian Economic Review</i>, 0(1): . The world economic outlook will remain uncertain throughout 2010 as well. Looking at the factors supporting growth, the fiscal incentives implemented by the largest countries continue to dominate, while the other two components of (corporate) investments and external demand are still making no contribution to growth. The lasting upswing may be hampered by instability in international financial and money market trends, the expected rise in commodity and energy prices along with the burgeoning protectionism. The global economy is still characterised by a paucity of funding, in spite of the fact that key rates of interest followed by interbank interest rates fell sharply in the course of 2009. Lending problems are rearing their head particularly in Central and Eastern European countries.

2011	B20 B52	Wray, L. Randall. 2011. "Is There Room for Bulls, Bears, and States in the Circuit?." Levy Economics Institute, The, Economics Working Paper Archive. This paper takes off from Jan Kregel's paper "Shylock and Hamlet, or Are There Bulls and Bears in the Circuit?" (1986), which aimed to remedy shortcomings in most expositions of the "circuit approach." While some "circuitistes" have rejected John Maynard Keynes's liquidity preference theory, Kregel argued that such rejection leaves the relation between money and capital asset prices, and thus investment theory, hanging. This paper extends Kregel's analysis to an examination of the role that banks play in the circuit, and argues that banks should be modeled as active rather than passive players. This also requires an extension of the circuit theory of money, along the lines of the credit and state money approaches of modern Chartalists who follow A. Mitchell Innes. Further, we need to take Charles Goodhart's argument about default seriously: agents in the circuit are heterogeneous credit risks. The paper concludes with links to the work of French circuitist Alain Parguez.

A duration analysis is adopted in this study to investigate the determinants of the "interest rate spells" across ten countries (or area). Both parametric and nonparametric methods are employed for the analysis. It is found that the length of "interest rate spells" is affected by both the rate of inflation and the rate of economic growth. In contrast, the influence of exchange and unemployment rates proved to be insignificant and the lagged interest rate is significant only for Denmark. The empirical results support the contention that central banks usually design their interest rate policies based on the Taylor Rule.

The paper establishes that sovereigns, like banks, need a lender of last resort (LoLR). In the euro area the ECB, with its estimated 3.4 trillion euro non-inflationary loss absorption capacity, is the only credible sovereign LoLR. The ECB/Eurosystem has been acting as sovereign LoLR through its SMP purchases of periphery sovereign debt in the secondary markets. It has also contributed, through the deeply subsidised bank funding it provided through the 3-year LTROs, half of a mechanism to purchase periphery sovereign debt in the primary issue markets. The other half has been financial repression requiring banks in Italy and Spain to purchase more of their own government's debt than they would voluntarily and at below-market yields. We expect that, once Spain and Italy are under troika programmes, the Eurosystem will also lend to these sovereigns indirectly, through loans by the national central banks to the IMF which on-lends them to these sovereigns. We recommend that, to increase its effectiveness as LoLR, the ESM be given a banking license. To reduce the illegitimate and unaccountable abuse of the ECB/Eurosystem as a quasi-fiscal actor, we propose that all its credit risk-related losses be jointly and severally guaranteed/indemnified by the 17 euro area member states.

2013	B40	van Arkel, Roder, and Koen Vermeylen. 2013. <i>The Interest Rate and Capital Durability, and the Importance of Methodological Pluralism</i>. Tinbergen Institute, Tinbergen Institute Discussion Papers: 2013-202/V1. Champions of sustainable growth often call for more durable production technologies with less capital depreciation. As investment in more durable capital is encouraged by lower interest rates, we investigate whether policy makers can steer the economy towards a path with low interest rates in order to stimulate more durable capital formation. We study this question from the viewpoint of two different macroeconomic paradigms, with three different modeling strategies, and get three fundamentally different and even contradicting answers. As none of these paradigms can claim to be superior to the other one, we argue that all modeling strategies may yield valuable insights, which leads to nuanced and careful policy advice. The paper is therefore an illustration of the importance of methodological pluralism in addressing macro-environmental questions where the interest rate takes center stage.
2013	C24	Dueker, Michael J., Zacharias Psaradakis, Martin Sola, and Fabio Spagnolo. 2013. "State-Dependent Threshold Smooth Transition Autoregressive Models." <i>Oxford Bulletin of Economics and Statistics</i>, 75(6): 835-54. In this article, we consider extensions of smooth transition autoregressive (STAR) models to situations where the threshold is a function of variables that affect the separation of regimes of the time series under consideration. Our specification is motivated by the observation that unusually high/low values for an economic variable may sometimes be best thought of in relative terms. State-dependent contemporaneous-threshold STAR and logistic STAR models are introduced and discussed. These models are also used to investigate the dynamics of US short-term interest rates, where the threshold is allowed to be a function of past output growth and inflation.
2013	C65	Wang, Tianxiao, and Yufeng Shi. 2013. "A Class of Time Inconsistent Risk Measures and Backward Stochastic Volterra Integral Equations." <i>Risk and Decision Analysis</i>, 4(1): 17-24. In this paper we derive a new class of time inconsistent dynamic coherent risk measures, allowing the interest rates involved to be random, which extends and modifies the results on risk measures in Appl. Anal. 86 (2007), 1429-1442. Since in this procedure one important mathematical tool is a kind of backward stochastic Volterra integral equations (BSVIEs in short) with stochastic Lipschitz coefficients, this paper firstly is devoted to develop the existence and uniqueness theory for the corresponding BSVIEs, which not only generalizes the results in Stoch. Proc. Appl. 116 (2006), 779-795; Appl. Anal. 86 (2007), 1429-1442; Probab. Theory Related Fields 142 (2008), 21-77; but also simplifies considerably the related arguments there.
2013	D22	Halac, Umut, and Mustafa Gurol Durak. 2013. "IMKB'de Islem Goren Isletmeler icin Para Politikasi ve Sermaye Yapisi Iliskisi. (The Relationship between Monetary Policy and Capital Structure for Companies Traded in Istanbul Stock Exchange. With

Year	DE	Title and Abstract
		English summary.)" <i>Ege Akademik Bakis/Ege Academic Review</i> , 13(4): 497-504. For the companies not quoted into the stock exchange the only way to finance their investments other than using auto-financing is to borrow with lower interest rates under expansionary monetary policy. On the other hand, for the quoted companies, there is one more option; issuing new common stocks. These companies can direct the funds to investments either by issuing new stocks or enjoying lower interest rate opportunities. This situation is explained as Tobin's q theory. Tobin's q theory defines the mechanism that monetary policy affects the economy throughout the stock exchange. Tobin's q is calculated as market value of firms divided by replacement cost of their assets. If q is high, the relative market value of the company is higher than its replacement cost. Companies can get relatively higher returns on their stocks compared to the cost of new investment by issuing new stocks. They can make more investment by issuing lower numbers of stocks; therefore total investment probably increases. The aim of this study is to investigate the preferences of companies that are quoted to Istanbul Stock Exchange (ISE) for the years 2003-2010, in financing their investments considering the monetary policies. In the context of investigation, Arellano-Bond dynamic panel data methodology is applied in order to consider the lagged values of capital structures, as well. On the base of the constructed model, Tobin q and lagged value of debt/equity variables don't have any significant effect on the financing decision of the firm, whereas interest rate on Turkish Lira, Producer Price Index, exposure risk of Euro are significant in model.
2013	D22	Zarate, Hector, Norberto Rodriguez, and Margarita Marin. 2013. "El tamaño de las empresas y la transmisión de la política monetaria en Colombia: Una aplicación con la encuesta mensual de expectativas económicas. (Firm Size and Monetary Policy Transmission in Colombia. With English summary.)" <i>Revista de Economía del Rosario</i>, 16(1): 61-87. We use information from surveys of economic expectations to see if the effect of monetary policy differs between large and small companies. The methodology used is vector autoregressions with regime change, MS-BVAR. According to the impulse response functions, to a shock in interest rates, the business climate both large and small companies regime responds positively during expansions, while during contraction responses are negative and more pronounced. The results suggest that larger firms are more sensitive to interest rate shocks. This is probably due to the low level of financial deepening.
2013	D22	Malik, Muhammad Farhan, and Amir Rafique. 2013. "Commercial Banks Liquidity in Pakistan: Firm Specific and Macroeconomic Factors." <i>Romanian Economic Journal</i>, 0(48): 139-54. Achieving the optimum level of liquidity is crucial for every bank. A lot of factors have been examined by number of researchers in this area. This study examines the bank specific and macroeconomic determinants of commercial bank's liquidity in Pakistan. The sample of the study consists of 26 Pakistani commercial banks. The study period consists of 5 years [2007 to 2011] which also covers the period of the Asian financial crisis 2008. Bank's liquidity is measured in two ways; one is cash and cash equivalents to total assets (L1) and second is advances net of provisions to total assets (L2). Two models are estimated based on these measures of liquidity. The results of model 1 (L1) indicate that the bank specific fundamentals (NPL and TOA) and monetary policy interest rate positively determine the bank liquidity whereas inflation has a negative impact. Bank liquidity measured by L1 is negatively and significantly affected by the financial crisis. The results of model 2 (L2) indicate that the bank size and monetary policy interest rate positively and significantly determine the bank liquidity. Additionally there is a positive and significant impact of financial crisis on the liquidity of commercial banks measured by L2.
2013	D57	Steedman, Ian. 2013. "Sraffian Thoughts in Full Marginalist Dress." <i>Metroeconomica</i>, 64(4): 598-606. 2013	D62	Feiock, Richard C. 2013. "The Institutional Collective Action Framework." <i>Policy Studies Journal</i>, 41(3): 397-425. Institutional collective action (ICA) dilemmas arise from the division or partitioning of authority in which decisions by one government in one or more specific functional area impacts other governments and/or other functions. The focus on externalities of choice in fragmented systems integrates multiple research traditions into a conceptual system to understand and investigate collective dilemmas ubiquitous in contemporary governance arrangements. The mechanisms for mitigating ICA dilemmas are classified according to their scope and enforcement. Incentives to participate in a mechanism are hypothesized to favor mechanisms that provide the greatest gain for the least cost under different conditions of collaboration risk as determined by the nature of the underlying ICA problem, the compositions of affected jurisdictions, and institutional contexts. After reviewing empirical applications of the framework, an agenda to advance the theoretical and empirical development of the ICA approach is advanced.

2013	I13	Url, Thomas. 2013. "Lebensversicherung leidet weiterhin unter niedrigem Zinsniveau. (Life Insurance Business Continues to Suffer from Low Interest Rates. With English summary.)" <i>WIFO-Monatsberichte</i>, 86(9): 769-79. The western European private insurance market continued to suffer during 2012 from the repercussions of the financial market and sovereign debt crisis. The life insurance branch saw premium volumes decline, while non-life insurance business contracted in the EU periphery countries. Even in countries less affected by the sovereign debt crisis, higher premium revenues were mainly driven by price increases. The Austrian market exhibited by and large the same pattern. Life insurers lost 6.5 percent in premium revenues from the previous year, against an increase of 2.1 percent in the property and accident insurance. With a 3.4 percent plus in premium receipts, private health insurance was the only branch to stay resilient and even raised the number of insured risks by 1.5 percent. Premium revenues overall edged down by 0.9 percent year-on-year, further lowering insurance penetration to 5.3 percent of GDP. Premium revenues in 2013 are expected to stagnate (+0.2 percent). In 2012 Austria's internationally operating insurance companies were able to compensate losses on the domestic market by further expanding in central, eastern, and south-eastern Europe.
2013	J63	Khalifa, Sherif. 2013. "Cyclical Job Upgrading, Wage Inequality, and Unemployment Dynamics." <i>International Economic Journal</i>, 27(4): 549-85. This paper studies the implications of a monetary policy shock on the skill premium and the unemployment persistence. A VAR demonstrates that a contractionary policy induces a lagged decline in the skill premium and a larger and more persistent increase in the unemployment ratio of the unskilled relative to that of the skilled. A new Keynesian framework characterized by labor search frictions is developed. The labor force is divided into high and low educated. Firms post two types of vacancies: the complex that can be matched with the high educated, and the simple that can be matched with both the high and the low educated. A positive shock to the nominal interest rate induces the high educated unemployed to compete with the low educated, as they increase their search intensity for simple vacancies. As the high educated occupy simple vacancies, they crowd

Year	DE	Title and Abstract
		out the low educated into unemployment. This downgrading of jobs, and the subsequent crowding out of the low educated into unemployment, provide a possible explanation to unemployment persistence and the response of the skill premium.
2013	K23	Di Lorenzo, Emilia, Albina Orlando, and Marilena Sibillo. 2013. "A Stochastic Model for Loan Interest Rates." <i>Banks and Bank Systems</i>, 8(4): 94-99. The topic of interest rate restrictions and their legal implications represents a delicate subject about which a recent inventory of EU authorities was developed. This is aimed to inspection of the so called principle of "good morals" against usury for the Member States. The most recent Italian law regulating legal rates of interest applied in loans, sets a threshold under which loan interest rates have to remain for being nonusurious, in the sense that if the loan rate lies outside the threshold, it becomes a usury rate and has to be prosecuted. The threshold is stated by Bank of Italy precisely each three-month period. In the paper the authors propose a stochastic process modelling the non-usurious interest rates applied in loans, in order to control its quarterly behavior. It is studied in the form of a modification of the Cox, Ingersoll and Ross model moving between two bands and closed expressions for its expected value and variance are given both conditional and unconditional. The model parameters are estimated by the Indirect Inference Method; the behavior of the expected value and variance functions are illustrated with graphs.
2013	L22	CV: Galindo, Arturo J., Alejandro Izquierdo, and Liliana Rojas-Suarez. 2013. (Estimation of the Profit at Risk in an Electric Energy Transmission Company Considering Economic Variables. With English summary)." <i>Cuadernos de Economia (National University of Colombia)</i>, 32(59): 103-36. This paper presents a methodological approach to quantification of potential economic losses caused by the macroeconomic variables following: money exchange rate (TRM for its initials in Spanish), consumer price index (CPI), producer price index (PPI), fixed term deposits (DTF for its initials in Spanish), and London Interbank Basic Operational Rate (Libor), on a power transmission company. Exposure is measured calculating the earning at risk (EaR) over the probability distribution of the company profits. The Probability distribution functions and the stochastic processes of each risk factor were identified and integrated into the financial statement, then, using Monte Carlo simulation the potential losses of each risk factor over the company financial statements were identified in order to take management decisions or hedge risks.

In the actual worldwide context the exposure of companies to various financial risks increased and the consequences are much worst than 10 years ago. That's why hedging accounting has become a necessity. Derivative operations can be used to hedge: interest rate risks, foreign currency exchange rate risks, credit risks. Derivatives used to hedge these risks can be handled to cover fair value exposure, cash flow exposure and exposure to changes in the value of a net investment in a foreign operation. This paper proposes two models for fair value risk hedging using derivatives. Both examples are based on IAS 39, some of the most controversial accounting standards of the day. The proposed solutions can be used by the experts interested in applying hedging accounting in order to manage this particular type of risk and to limit the negative consequences of companies' performances.
2013	N17	Romain, Houssa, Jolan Mohimont, and Chris Otrok. 2013. <i>Credit Shocks and Macroeconomic Fluctuations in Emerging Markets</i>. CESifo Group Munich, CESifo Working Paper Series: 4281. In this paper, we examine the role of global and domestic credit supply shocks in macroeconomic fluctuations for Emerging Markets. For this purpose, we impose a set of zero and sign restrictions within a medium-scale Bayesian Vector Auto-Regressive model. Quarterly data from South Africa and G-7 countries in 1985-2010 show that credit supply shocks impact significantly on macroeconomic aggregates in these economies. However, credit supply shocks have played, on average, a less important role than credit demand shocks. Moreover, shocks originating from G7-countries are the main drivers of real activity in South Africa, although they played a marginal role in the 1996-1999 South African recession.
2013	O43	Sharpe, Timothy P. 2013. "Institutional Arrangements and Public Debt Threshold Limits." <i>International Review of Applied Economics</i>, 27(6): 707-28. Inter-governmental Organisations, such as the IMF and OECD, advocate a medium-term reduction in deficit spending and public debt accumulation among advanced economies to satisfy conditions of fiscal sustainability. Buttressing the need for fiscal austerity, Reinhart and Rogoff claim to have identified a so-called tipping point, beyond which public debt accumulation negatively affects economic growth. While recent data seem to indicate that some Eurozone (non-sovereign) economies have reached a tipping point, for other advanced (sovereign) economies, such as the US, UK and Japan, this is not clear. The mainstream tipping point literature however does not recognise the importance of institutional arrangements for the conduct of fiscal and monetary policy. Furthermore, the literature sheds little light on the transmission mechanism between high public debt and low economic growth. This article draws on the principles of Modern Monetary Theory to discuss institutional arrangements and to justify the theoretical and empirical focus on Eurozone economies. The empirical analysis unpacks the transmission mechanism(s) to reveal that Eurozone economies have reached a public debt threshold limit with respect to long-term interest rates.

2013	P32	Yuan, Yan, and Lihe Xu. 2013. "What Determine the Interest Rates in China's Informal Market?" <i>Journal of Chinese Economic and Business Studies</i> , 11(3): 179-96. The interest rate is one of the most important factors in farmers' decision-making of borrowing and lending in the informal financial market in China. This paper explores the determinants of the interest rate with microfinance data. Results show that the income disparity, the relationship between borrowers and lenders, the usage of borrowing, and formal credit constraints are important factors affecting interest rates. More importantly, to borrow from those in the higher income hierarchy, farmers have to bear higher interest rates. We attribute this to different social capitals across income groups and higher default risks for the poor. This paper contributes to a better understanding of the informal financial market in rural China and sheds light on the mechanism of higher informal interest rate formation.

Year	DE	Title and Abstract
2006		
2006	C24	Huizinga, Harry, and Dantao Zhu. 2006. <i>Financial Structure and Macroeconomic Volatility: Theory and Evidence</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 5697. This paper presents a simple model capturing differences between debt and equity finance to examine how financial structure matters for macroeconomic volatility. Debt finance is relatively cheap in the sense that debt holders need to verify relatively few profitability states, but debt finance may lead to costly bankruptcy. At the aggregate level, a more debt-based financial structure leads to a higher bankruptcy rate. Therefore, aggregate output is more variable in case of a heavy reliance on debt finance. This paper provides empirical evidence that countries with more equity finance have a lower variance of GDP and a lower probability of episodes of negative economic growth.
2006	C25	Peltonen, Tuomas A. 2006. <i>Are emerging market currency crises predictable? A test</i>. European Central Bank, Working Paper Series: 571. This paper analyzes the predictability of emerging market currency crises by comparing the often used probit model to a new method, namely a multi-layer perceptron artificial neural network (ANN) model. According to the results, both models were able to signal currency crises reasonably well in-sample, but the forecasting power of these models out-of-sample was found to be rather poor. Only in the case of Russian (1998) crisis were both models able to signal the crisis well in advance. The results reinforced the view that developing a stable model that can predict or even explain currency crises is a challenging task.

2006	C31	Egert, Balazs, Peter Backe, and Tina Zumer. 2006. <i>Credit growth in Central and Eastern Europe - new (over)shooting stars?</i> European Central Bank, Working Paper Series: 687. This paper analyzes the equilibrium level of private credit to GDP in 11 Central and Eastern European countries in order to see whether the high credit growth recently observed in some of these countries led to above equilibrium private credit-to-GDP levels. We use estimation results obtained for a panel of small open OECD economies (out-of-sample panel) to derive the equilibrium credit level for a panel of transition economies (in-sample panel). We opt for this (out-of-sample) approach because the coefficient estimates for transition economies are fairly unstable. We show that there is a large amount of uncertainty to determine the equilibrium level of private credit. Yet our results indicate that a number of countries are very close or even above the estimated equilibrium levels, whereas others are still well below the equilibrium level.
2006	C58 G17	Boucher, Christophe. 2006. "Stock Prices, Inflation and Stock Returns Predictability." <i>Finance</i>, 27(2): 71-101. This paper considers a new perspective on the relationship between stock prices and inflation, by estimating the common long-term trend in real stock prices, as reflected in the earning-price ratio, and both expected and realized inflation. We study the role of the transitory deviations from the common trend in the earning-price ratio and realized inflation for predicting stock market fluctuations. In particular, we find that these deviations exhibit substantial out-of-sample forecasting abilities for real stock returns. Moreover, we find that this variable provides information about future stock returns at short and intermediate horizons that is not captured by other popular forecasting variables.
2006	D53	Stracca, Livio. 2006. "A Note on Liquidity and Real Equilibrium Interest Rates." <i>Macroeconomic Dynamics</i>, 10(3): 426-38. This note proposes a general equilibrium model with heterogeneous households and a financial market where each financial instrument provides liquidity services in addition to enabling a transfer of purchasing power over time. Importantly, liquidity services may be asymmetric according to whether the financial instrument is held as an asset or as a liability, and are also agent-specific. The main purpose of the study is to develop an analytical framework and a language for evaluating the effect of (broadly defined) liquidity factors on equilibrium rates of return.
2006	E01	Blancas, Andres. 2006. "Interinstitutional Linkage Analysis: A Social Accounting Matrix Multiplier Approach for the Mexican Economy." <i>Economic Systems Research</i>, 18(1): 29-59. By analogy to inter-industry analysis, this paper addresses the Inter-institutional linkage analysis through an accounting multiplier approach and a social accounting matrix framework that has a flow of funds. Such an analysis provides a useful tool to identify and quantify structural features of an economy in terms of productive and financial backward and forward linkage indices, which are estimated from the accounting multipliers. As an empirical application of this analysis, we identify and measure the accounting multipliers and the respective linkage indices for the Mexican economy. The results may help to improve the quality of policy decisions by detecting key linkage and partial linkage accounts (production sectors or institutions) and by providing a better understanding of how an impact of an initial exogenous injection runs within a complex economic structure.
2006	E01	Darne, Olivier, and Claude Diebolt. 2006. "Chocs temporaires et permanents dans le PIB de la France, du Royaume-Uni et des Etats-Unis. (Temporary and Permanent Shocks in GDP for France, the United Kingdom and the United States. With English summary.)" <i>Revue d'Economie Politique</i>, 116(1): 65-78. In this paper, infrequent large temporary and permanent shocks that have affected the quarterly GDP series for France, the United Kingdom and the United States are analyzed in the post-World War II period using the outlier method. Strong proof of permanent and/or transitory shocks are found, resulting from (national and international) economic, political and monetary events. We show that the persistence in GDP for France and the United States is associated to infrequent large shocks as well as permanent shocks that are assumed to be randomly generated every observation period as in the case of a random walk.
2006	E64	Brounen, Dirk, Peter Neuteboom, and Arjen van Dijkhuizen. 2006. <i>House Prices and Affordability--A First and Second Look Across Countries</i>. Netherlands Central Bank, Research Department, DNB Working Papers. In this paper we analyze the development of house prices for eight different countries over the period 1970-2003. First we look at real house price dynamics of the United States, the United Kingdom, Germany, France, Italy, the Netherlands, Sweden, and Belgium. After discussing the observable similarities and variations in national house prices, we continue by analyzing structural differences in legislation and mortgage markets, which might help us to understand the cross-sectional variation in prices levels and price developments. Next, we construct a comprehensive first-buyer affordability model in which nominal house prices are corrected for household income changes and the net financing costs of mortgage payments. This model grants us a second look on the cross-section of international house price dynamics. We finish our study with first-buyer elasticity tests, which give a first glance on the stability of each price level on the basis of affordability.

"Balance Issues in the Monetary System of the Macro-economy." <i>Development and Finance/Fejlesztés és Finanszirozas: Quarterly Hungarian Economic Review</i>, 0(4): 12-21. In the monetary system of the Hungarian economy in the last three decades economic growth has been accompanied by a cyclically recurring international current account and general government deficit. This is the true growth theory dilemma of the country.
2006	H71	Vartia, Laura. 2006. <i>Finland's housing market: reducing risks and improving policies</i>. OECD Economics Department, OECD Economics Department Working Papers: 514. While pronounced cycles in house prices have been a major cause of macroeconomic instability in the past, current house price developments do not yet suggest an overheating of the housing market. However, several important concerns are related to both direct effects of housing markets on overall activity and to more structural and regional issues. A factor making housing markets and the macro economy vulnerable to interest rate shocks is the high share of mortgage loans linked to variable interest rates. Tax subsidies to housing may largely be capitalised in higher land prices rather than increasing housing availability to the extent that slow planning procedures and municipalities' unwillingness to provide building land have limited the growth of the housing stock in growth regions. This would argue for improving municipalities' incentives to provide building land, speeding up planning procedures and a phased removal of the tax advantage associated with housing. Furthermore, the provision of social housing and the housing allowance system should be better targeted on those most in need of affordable housing.

Year	DE	Title and Abstract
		Economic Policy Research Institute Working Papers: 20066 . Personal bankruptcies in the United States have increased dramatically, rising from 1.4 per thousand working age population in 1970 to 8.5 in 2002. We use a heterogeneous agent life-cycle model with competitive financial intermediaries who can observe households' earnings, age and current asset holdings to evaluate several commonly offered explanations. We find that increased uncertainty (income shocks, expense uncertainty) cannot quantitatively account for the rise in bankruptcies. Instead, stories related to a change in the credit market environment are more plausible. In particular, we find that a combination of a decrease in the transactions cost of lending and a decline in the cost of bankruptcy does a good job in accounting for the rise in consumer bankruptcy. We also argue that the abolition of usury laws and other legal changes are unimportant.
2006	L10	Becker, Bo, and Jagadeesh Sivadasan. 2006. <i>The effect of financial development on the investment-cash flow relationship - cross country evidence from Europe</i>. European Central Bank, Working Paper Series: 689 . We investigate financing constraints in a large cross-country data set covering most of the European economy. Firm level investment sensitivity to cash flow is used to identify financing constraints. We find that the sensitivities are significantly positive on average, controlling for country and industry fixed effects, as well as firm level controls. Most importantly, the cash flow sensitivity of investment is lower in countries with better-developed financial markets. This suggests that financial development may mitigate financial constraints. This effect is weaker in conglomerate subsidiaries, which are likely to have access to internal capital markets and depend less on the outside financial environment, and possibly for firms in industries with highly liquid assets as well. This result sheds light on the link between financial and economic development.
2006	L26	CV: Mooslechner, Peter. 2006. "Finance and Growth: The Legacy of Schumpeter to Be Rediscovered?." In <i>Financial Development, Integration and Stability: Evidence from Central, Eastern and South-Eastern Europe</i>, ed. 2006	L26 L43	Kerr, William, and Ramana Nanda. 2006. <i>Democratizing Entry: Banking Deregulations, Financing Constraints, and Entrepreneurship</i>. Harvard Business School, Working Papers: 07-033 We study how US branch-banking deregulations affected the entry and exit of firms in the non-financial sector using establishment-level data from the US Census Bureau's Longitudinal Business Database. The comprehensive micro-data allow us to study how the entry rate, the distribution of entry sizes, and survival rates for firms responded to changes in banking competition. We also distinguish the relative effect of the policy reforms on the entry of startups versus facility expansions by existing firms. We find that the deregulations reduced financing constraints, particularly among small startups, and improved ex ante allocative efficiency across the entire firm-size distribution. However, the US deregulations also led to a dramatic increase in 'churning' at the lower end of the size distribution, where new startups fail within the first three years following entry. This churning emphasizes a new mechanism through which financial sector reforms impact product markets. It is not exclusively better ex ante allocation of capital to qualified projects that causes creative destruction; rather banking deregulations can also 'democratize' entry by allowing many more startups to be founded. The vast majority of these new entrants fail along the way, but a few survive ex post to displace incumbents.
2006	L26	Meyer, Thomas. 2006. "Private Equity, Spice for European Economies." <i>Journal of Financial Transformation</i>, 0(18): 61-69 . Private equity has become a substantial force in the European financial system. This paper describes some of the recent developments and looks at the structural relationship between private equity investments and economic growth. The econometric analysis of a set of panel data from 20 European countries for the period between 1994 and 2004 fails to reject the hypothesis that private equity investments are associated with economic growth. According to this analysis, an increase in private equity investments of 0.1% of GDP is associated with an increase in real economic growth of between 0.2 pp (buyouts) and 0.8 pp (early-stage investments)--other things being equal.
2006	L26	Smith, Anthony A., Jr., and Cheng Wang. 2006. "Dynamic Credit Relationships in General Equilibrium." <i>Journal of Monetary Economics</i>, 53(4): 847-77 . We construct a general equilibrium model with private information in which borrowers and lenders enter into long-term dynamic credit relationships. Each new generation of ex ante identical individuals is divided in equilibrium into workers and entrepreneurs. Workers save through financial intermediaries in the form of interest-bearing deposits and supply labor to entrepreneurs in a competitive labor market. Entrepreneurs borrow from financial intermediaries to finance projects which produce privately observed sequences of random returns. Each financial intermediary holds deposits from a large number of workers and operates a portfolio of dynamic contracts with different credit positions. We calibrate the model to the U.S. economy and find that dynamic contracting is very effective at mitigating the effects of private information. Moreover, restricting borrowers and lenders to use static (one-period) contracts with a costly monitoring technology has adverse effects both on the level of aggregate economic activity and on individual welfare unless monitoring costs are very small. Finally, the optimal provision of intertemporal incentives leads to increasing consumption inequality over time within generational cohorts as in U.S. data.

2006	L68	Marquez de la Cruz, Elena. 2006. "Consumo duradero, hábitos y mercado de valores. (Durable Consumption, Habits and the Stock Market. With English summary)." <i>Revista de Economía Aplicada</i>, 14(42): 5-33 . The Consumption based Capital Asset Pricing Model (CCAPM) has been the subject of various empirical studies for different economies, giving rise to the so-called risk equity premium puzzle. This puzzle is the result of the inability of the model to explain the observed risk premiums except in cases where implausible values are used for one of the agents' preference parameters, namely, the relative risk aversion parameter. On the other hand, the high values for this parameter necessary for the model to fit with empirical data result in interest rates that are higher than those observed empirically. This gives rise to a second empirical puzzle, the interest rate puzzle. In this work, we examine the CCAPM model, considering the possibility of the development of external habits in consumption and including the service flow that the consumption of durable goods generates in the consumption variable, with the aim of analyzing the effect these factors have on the aforementioned empirical puzzles.
2006	L80	Maudos, Joaquin, and Juan Fernandez de Guevara. 2006. "Desarrollo financiero, dependencia financiera y crecimiento económico sectorial: Nueva evidencia internacional. (With English summary)." <i>Papeles de Economía Española</i>, 0(110): 35-48 . This paper offers new empirical evidence of the effect of the financial development on economic growth for a sample of 21 countries and 53 sectors in the period 1993-2003. As novelties, the paper calculates sectorial indicators of financial dependency for a much more recent period than the habitually used in other studies. Furthermore, it widens the sectorial scope including the services sector in addition to the manufacturing one. Results confirm the evidence of other papers that state the importance of the financial development to explain the differences of rates of growth among countries.

2006	N01	Richardson, Gary. 2006. <i>Bank Distress during the Great Depression: The Illiquidity-Insolvency Debate Revisited</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 12717. During the contraction from 1929 through 1933, the Federal Reserve System tracked changes in the status of all banks operating in the United States and determined the cause of each bank suspension. This essay analyzes chronological patterns in aggregate series constructed from that data. The analysis demonstrates both illiquidity and insolvency were substantial sources of bank distress. Periods of heightened distress were correlated with periods of increased illiquidity. Contagion via correspondent networks and bank runs propagated the initial banking panics. As the depression deepened and asset values declined, insolvency loomed as the principal threat to depository institutions.
2006	N26	von Mettenheim, Kurt. 2006. "Still the Century of Government Savings Banks? The Caixa Economica Federal." <i>Revista de Economia Política/Brazilian Journal of Political Economy</i> , 26(1): 39-57. This article explores general concerns about government banking, social inclusion, and democracy through case study of the Brazilian federal government savings bank (Caixa Economica Federal). Review of government savings banks in Brazilian history suggests that these institutions have been at the center of domestic political economy, expanding and contracting under a variety of political regimes and economic conditions. Since capitalization to meet central bank and Basel Accord guidelines in 2001, the Caixa has attempted to modernize, continue to serve as agent for government policies, and expand both popular credit and savings and investment banking activities.
2006	N40	Bordo, Michael D., and Peter L. Rousseau. 2006. "Legal-Political Factors and the Historical Evolution of the Finance-Growth Link." <i>European Review of Economic History</i> , 10(3): 421-44. Recent cross-country investigations of the role of institutional fundamentals, such as the protection of property rights, in promoting financial development have extended a literature that has for decades maintained that financial factors can affect real outcomes. In this article we pursue this new direction by considering relationships between finance, growth, legal origin, and the political environment in a historical cross-section of 17 countries covering the period from 1880 to 1997. We find that relationships between a country's legal origin (such as English, French, German, or Scandinavian) and financial development are for the most part consistent with earlier findings but are not persistent. At the same time, political variables such as proportional representation election systems, frequent elections, universal female suffrage, and infrequent revolutions or coups seem linked to larger financial sectors and higher conditional rates of economic growth. Despite the explanatory power of some of our measures of the deeper fundamentals, however, a significant part of the growth-enhancing role of financial development remains unexplained by them.
2006	O43	Law, Siong Hook, and Muzafar Shah Habibullah. 2006. "Financial Development, Institutional Quality and Economic Performance in East Asian Economies." <i>Review of Applied Economics</i> , 2(2): 201-16. This paper examines the effects of financial development and institutional quality on economic performance in the East Asian economies using the panel cointegration and panel group mean fully modified OLS estimations. The empirical results based on the Solow growth model indicate that well developed institutional quality and financial market lead to the improved output per capita in East Asian economies. The effect of financial development on economic performance is larger when the financial system is embedded within a sound institutional framework. Thus, institutional improvements in these economies are important, not only in promoting economic development but also to deliver the benefits of financial development.

2007	C63	Oreiro, Jose Luis, and Fabio Hideki Ono. 2007. "Um modelo macrodinamico pos-keynesiano de simulacao. (A Post-Keynesian Macro-dynamic Model of Simulation. With English summary)." <i>Revista de Economia Política/Brazilian Journal of Political Economy</i> , 27(1): 82-107. The objective of this article is to present the structure and the simulation results of a one-sector macro-dynamic model that embeds some elements of the post-Keynesian theory. The computational simulation of the model replicates some important features of capitalist dynamics as the phenomenon of cyclical growth, the long-run stability of the profit rate and functional distribution of income, the maintenance of idle-capacity in the long-run and the occurrence of a single episode of deep fall in real economic activity, which is in accordance with the rarity character of great crashes in the history of capitalism. Moreover, the simulation results show that a great reduction in inflation rate will be followed by an increase of financial fragility, increasing the likelihood of a great depression. As a policy advice derived from the simulation results, we can state that the Central Bank should never promote big reductions in inflation rate.
2007	D74 F51	Corallo, Elena. 2007. "The Effect of the War Risk: A Comparison of the Consequences of the Two Iraq Wars." <i>International Review of Economics</i> , 54(3): 371-82. This paper measures the effect of the two Iraq wars on some Italian and US financial variables using the heteroskedasticity-based estimation technique (Rigobon and Sack, NBER WP No. 9640, 2003). Our results show that it is not possible to trace a general pattern in the behaviour of the international markets following a period of political and economic instability such as a war. The risk of war caused significant effects on financial markets in 2003; no effect appeared in 1990. The results underline a similar response between the different countries we analyse. Both Italian and American markets reacted in a similar way to both wars.
2007	I38	Daly, Kevin J., and Selim Akhter. 2007. "Finance and Poverty: Evidence from Panel Study." <i>Asia Pacific Journal of Economics and Business</i> , 11(2): 39-57. This paper presents empirical evidence of a direct relationship between financial development and poverty. A poverty determination model that integrates financial development and financial instability is considered. Using panel data for sixty-eight developing countries over the period 1980-2004, the study finds that, on average, financial development is conducive for poverty reduction but that the instability accompanying financial development is detrimental to the poor. This outcome only holds when financial development is measured by the ratio of money to GDP (M3-GDP) and not by the credit-GDP ratio.
2007	I38	Muthulakshmi, C. 2007. "Effectiveness of PMRY Scheme in India." <i>Indian Journal of Finance</i> , 1(4): 15-21. The financial system is the lifeline of the economy. Banks are the backbone of the financial sector. They are the most dominant segment of the country's

Year	DE	Title and Abstract
		financial system. Banks plays a pivotal role in the development of a sound economy and form the core of the money market. It facilitates payment mechanism, mobilized insured deposits, act as credit intermediaries, and serve as the principal channel for transmission of monetary policy actions to the economy at large. The banks provided financial assistance only to the industries which had already established as financially sound, with a capacity to repay the loan, favourable credit guarantee, etc. After the Independence in 1947, the Government of India, as well as the state governments, was trying to show concern for the rural poor. The rural scenario in India was quite disturbing and needs much attention to eradicate poverty through employment opportunities. Therefore, the government had come up with different schemes to eradicate poverty. The PMRY scheme was announced and implemented in the VIIIth Five-Year Plan till now.
2007	K12	Galindo, Arturo Jose, and Alejandro Micco. 2007. "Creditor Protection and Credit Response to Shocks." <i>World Bank Economic Review</i>, 21(3): 413-38. This article studies the relationship between creditor protection and credit responses to macroeconomic shocks. Using a data set on legal determinants of finance in a panel of data on aggregate credit growth for 79 countries during 1990-2004, it is shown that credit is more responsive to external shocks in countries with weak legal creditor protection and weak enforcement. The results are statistically and economically significant and robust to alternative measures of creditor protection, to the inclusion of variables that reflect different stages of economic development, to the restriction of the sample to only developing economies, to the controls for systemic crises, to alternative shock measures, and to vector autoregressive specifications.
2007	K12	Kharroubi, Enisse. 2007. "Crises, Volatility, and Growth." <i>World Bank Economic Review</i>, 21(3): 439-60. How do volatility and liquidity crises affect growth? When credit is constrained, a bias toward short-term debt can arise in financing long-term investments, generating maturity mismatches and leading potentially to liquidity crises. The frequency of liquidity crises ("abnormal" volatility) and the volatility of growth ("normal" volatility) are found to have independent negative effects on growth. Financial development however dampens the growth cost of volatility, but only in the case of normal volatility. The growth cost of volatility therefore depends critically on the composition of normal and abnormal volatility, the latter being more costly for growth.

2007	M14	Tennant, David, and Claremont Kirton. 2007. "The Impact of Foreign Direct Investment, Financial Crises and Organizational Culture on Managers' Views as to the Finance-Growth Nexus." <i>Journal of Economic Issues</i>, 41(3): 625-60. This paper suggests that an important flaw of many theoretical models and empirical tests of the finance-growth relationship is the insufficient attention given to institutional and historical factors that impact on decision-making within financial intermediaries. The paper examines the relationship between financial sector intermediation and economic growth in Jamaica, by analyzing the views of financial institutions' managers as to the practicality of the theorized channels through which the sector is expected to foster economic growth, and the constraints faced in fulfilling these roles. Views expressed varied widely, with important distinctions between indigenous and foreign-owned financial intermediaries, intermediaries that were positively and adversely impacted by financial crisis, and different types of financial intermediaries. Information has been provided that will be useful in fostering improved performance of the Jamaican financial sector, facilitating economic growth and enhancing understanding of practical aspects of the finance-growth debate. The paper concludes that any plans made for development and reform of the financial sector must be based on institutional, historical and other factors unique to the country in which they are implemented.
2007	O13 Q32	Nili, Masoud, and Mahdi Rastad. 2007. "Addressing the Growth Failure of the Oil Economies: The Role of Financial Development." <i>Quarterly Review of Economics and Finance</i>, 46(5): 726-40. The oil exporting countries have experienced a relatively continuous fall in GDP per capita over the last 30 years. This is in spite of benefiting from a more than average of the rest of the world investment rate. The findings of this paper, report a lower level of financial development for the oil economies when compared with the rest of the world. We will show in this paper that the higher rate of investment of the oil economies can be explained mainly by the oil revenues and surprisingly, financial development has a net dampening effect on investment for these economies. The paper also shows that the weakness of financial institutions, contributes to the poor performance of economic growth of the oil economies and the weakness of financial institutions might be associated with the dominant role of government in total investment and the weakness of private sector.
2007	Z12	Mirakhor, Abbas. 2007. "Islamic Finance and Globalization: A Convergence?" <i>Journal of Islamic Economics, Banking and Finance</i>, 3(2): 11-71. Islamic finance--understood as achieving maximum risk sharing--diversifies risk and allows it to be shared widely. Implications that follow are: (i) a close relationship between finance and real economic activities and (ii) the rate of return to finance determined by the rate of return to real economic activities rather than the reverse. This system's full operation leads to financial stability, growth of income and employment, and, as a result, reduction in poverty. To obtain these results, preconditions must exist, including a developed financial system; rule of law; legal institutions that protect investors, creditors, and property rights; good governance; policy discipline to ensure macroeconomic stability; and trust in government and institutions. The network of rules and norms mandated by Islam, if implemented, satisfy these preconditions. A vast potential for financial engineering effort in Islamic finance could span each of its basic transaction modes into a menu of instruments for risk-sharing opportunity. The period since 1990 has witnessed dramatic and rapid change in the structure of financial markets and institutions around the globe. It is believed that the benefits of financial globalization would grow as economies are liberalized; legal, institutional, and financial development in countries reach and surpass threshold levels; and greater variety of financial instruments of risk sharing are designed and developed. The paper explores the potential convergence of Islamic and conventional finance as these systems continue their progress in designing and developing better risk-sharing structure and much expanded menu of financial instruments. It discusses the legal, institutional, governance, and financial preconditions that should exist for equity finance to dominate debt financing. Finally, it suggests that most of the preconditions for Islamic finance to achieve its potential could be realized with operationalization of behavioral rules and norms mandated by Islam.

2008	C00	Hansen, Lars Peter. 2008. <i>Modeling the Long Run: Valuation in Dynamic Stochastic Economies</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 14243. I explore the equilibrium value implications of economic models that incorporate reactions to a stochastic environment. I propose a dynamic value decomposition (DVD) designed to distinguish components of an underlying economic model that influence values over long horizons from components that impact only the short run. To quantify the role of parameter sensitivity and to impute long-term risk prices, I develop an associated perturbation technique. Finally, I use DVD methods to study formally some example economies and to speculate about others. A DVD is enabled by constructing operators indexed by the elapsed time between the date of pricing and the date of the future payoff (i.e. the future realization of a consumption claim). Thus formulated, methods from applied mathematics permit me to characterize valuation behavior as the time between price determination and payoff realization becomes large. An outcome of this analysis is the construction of a multiplicative martingale component of a process that is used to represent valuation in a dynamic economy with stochastic growth. I contrast the differences in the applicability between this multiplicative martingale method and an additive martingale method familiar from time series analysis that is used to identify shocks with long-run economic consequences.
2008	C14	Bos, Charles S. 2008. <i>Model-based Estimation of High Frequency Jump Diffusions with Microstructure Noise and Stochastic Volatility</i>. Tinbergen Institute, Tinbergen Institute Discussion Papers: 08-011/4. When analysing the volatility related to high frequency financial data, mostly non-parametric approaches based on realised or bipower variation are applied. This article instead starts from a continuous time diffusion model and derives a parametric analog at high frequency for it, allowing simultaneously for microstructure effects, jumps, missing observations and stochastic volatility. Estimation of the model delivers measures of daily variation outperforming their non-parametric counterparts. Both with simulated and actual exchange rate data, the feasibility of this novel approach is shown. The parametric setting is used to estimate the intra-day trend in the Euro/U.S. Dollar exchange rate.
2008	C15	van den End, Jan Willem. 2008. <i>Liquidity Stress-Tester: A macro model for stress-testing banks' liquidity risk</i>. Netherlands Central Bank, Research Department, DNB Working Papers. This paper presents a macro stress-testing model for market and funding liquidity risks of banks, which have been main drivers of the recent financial crisis. The model takes into account the first and second round (feedback) effects of shocks, induced by behavioural reactions of heterogeneous banks, and idiosyncratic reputation effects. The impact on liquidity risk is simulated by a Monte Carlo approach. This generates distributions of liquidity buffers for each scenario round, including the probability of a liquidity shortfall. An application to Dutch banks illustrates that the second round effects have more impact than the first round effects and hit all types of banks, indicative of systemic risk. This lends support policy initiatives to enhance banks' liquidity buffers and liquidity risk management, which could also contribute to prevent financial stability risks.
2008	C35	Jacobson, Tor, Rikard Kindell, Jesper Linde, and Kasper F. Roszbach. 2008. <i>Firm Default and Aggregate Fluctuations</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 7083. This paper studies the relation between macroeconomic fluctuations and corporate defaults while conditioning on industry affiliation and an extensive set of firm-specific factors. Using a multiperiod logit approach on a panel data set for all incorporated Swedish businesses over 1990-2002, we find strong evidence for a substantial and stable impact of aggregate fluctuations. Macroeffects differ across industries in an economically intuitive way. Out-of-sample evaluations show our approach is superior to both models that exclude macro information and best fitting naive forecasting models. While firm-specific factors are useful in ranking firms' relative riskiness, macroeconomic factors capture fluctuations in the absolute risk level.

2008	F12	Herrero, Alicia Garcia, and Juan M. Ruiz. 2008. <i>Do trade and financial linkages foster business cycle synchronization in a small economy?</i>. BBVA Bank, Economic Research Department, Working Papers: 0801. We estimate a system of equations to analyze whether bilateral trade and financial linkages influence business cycle synchronization directly and/or indirectly. Our paper builds upon the existing literature by using bilateral trade and financial flows for a small, open economy (Spain) as benchmark for the results, instead of the US as generally done in the literature. We find that both the similarity of productive structure and trade links promote the synchronization of cycles. However, bilateral financial links are inversely related to the co movement of output. This might point to financial integration allowing an easier transfer of resources between two economies, which could enable their decoupling, as predicted by a standard model of international business cycles. Both the effects of trade and financial links on output synchronization are statistically significant and economically relevant.
2008	F24	Saavedra Garcia, Maria Luisa. 2008. "La crisis financiera estadounidense y su impacto en la economia mexicana. (American Financial Crisis and Its Impact on Mexican Economy. With English summary)." <i>Economia (Universidad de Los Andes): Nueva Etapa</i>, 33(26): 11-41. This paper aims to conduct a study to determine how the U.S. financial crisis will affect the Mexican economy. From Minsky's theory view, it begins with a background of the crisis today and a brief description of the current economic situation in Mexico. Finally, it will consider the economic impact that it will have, given their high dependence on the economy with this country. The main conclusion is that we believe that it will damage the Mexican economy, although Mexican financial authorities has been taking measures to mitigate the impact, given that the three most important components of economy are tied to the U.S. economy: manufacturing exports, remittances, and oil.
2008	F38	Ferreira Gabriel, Luciano, and Jose Luis da Costa Oreiro. 2008. "Fluxos de capitais, fragilidade externa e regimes cambiais--Uma revisao teorica. (Capital Flows, External Fragility and Currency Regimes: A Theoretical Review. With English summary)." <i>Revista de Economia Politica/Brazilian Journal of Political Economy</i>, 28(2): 331-57. The major integration and deregulation of the international financial markets increased the degree of interdependence and risk of incompatibility between the financial and monetary policy adopted by different countries. The consequences of these facts are the financial instability and the currency crisis. In this article we develop arguments advocating that independent of the currency regime adopted the national policy makers should take into account, between other factors, the major capital mobility and the integrations of markets. One of the corollaries of our analyses is that countries should pursue policies that reduces the degree of short-term capital volatile by the adoption of capital controls or though measures of prudential supervision.

2008	F62	Carneiro, Ricardo. 2008. "Globalizacao e Inconvertibilidade Monetaria. (Globalization and Monetary Inconvertibility. With English summary.)." <i>Revista de Economia Politica/Brazilian Journal of Political Economy</i> , 28(4): 539-56. The central hypothesis of this article is that in the context of globalization, monetary inconvertibility is a crucial problem of peripheral countries. It begins with a brief review of the debate from a historical point of view and then stresses the contemporary opposite's views on the fragility of financial system of emerging countries: the original sin and the debt intolerance hypothesis. Despite of supporting the first one, the article goes further and explores the domestic implication of inconvertibility. It criticizes the jurisdictional uncertainty proposition showing that an inherent flaw in the store of value of emerging market currencies, derived from original sin, is the main reason for de facto inconvertibility and underdevelopment of domestic financial system of these countries.
2008	F63	Kliass, Paulo, and Pierre Salama. 2008. "A globalizacao no Brasil: Responsavel ou bode expiatorio? (Globalization in Brazil: Guilty or Scapegoat? With English summary.)." <i>Revista de Economia Politica/Brazilian Journal of Political Economy</i> , 28(3): 371-91. After the sequence of structural adjustments decisions suggested by the IMF, Brazilian economy became wider opened, as the consequences from financial globalization were stronger than those from commercial globalization. Nevertheless, social and economical reality didn't show much improvement. On the contrary, figures on economic increase and inequalities show Brazil behind the average of developing countries. Even if the effects caused by "mondialisation" on weakened economies are well known, globalization can not be taken as the only guilty of weak economic increase, for maintaining the high level of inequalities or for the increase of precariousness. Responsibility must be searched on high inequalities in where operates "mondialisation", on weakness of public policies, on irresponsible way of opening of the economy and in fiscal policy in favor of financial sector. Other countries have reached quite different results, once the have adopted different public policies, which goal was to establish control and reduction upon the negatives effects of globalization.

2008	F65 M40	Platt, Harlan D., and Marjorie B. Platt. 2008. "Financial Distress Comparison across Three Global Regions." <i>Journal of Risk and Financial Management</i> , 1(1): 129-62. Globalization has precipitated movement of output and employment between regions. We examine factors related to corporate financial distress across three continents. Using a multidimensional definition of financial distress we test three hypotheses to explain financial distress using historical financial data. A null hypothesis of a single global model was rejected in favor of a fully relaxed model which created individual financial distress models for each region. This result suggests that despite other indications of worldwide convergence, international differences in accounting rules, lending practices, managements skill levels, and legal requirements among others has kept corporate decline from becoming commoditized.
2008	H74	Schulz, Alexander, and Guntram B. Wolff. 2008. <i>The German sub-national government bond market: evolution, yields and liquidity</i> . Deutsche Bundesbank, Research Centre, Discussion Paper Series 1: Economic Studies: 2008,06. The paper presents a comprehensive data set of all bonds issued by the sixteen German states (Lander) since 1992. It thus provides a complete picture of a capital market comparable in size to funds raised in the German fixed income market for corporations. The quantitative analysis reveals that Lander follow different issuing strategies: while some concentrate to a greater extend on large issues or issue joint bonds with other Lander (Jumbos), others rely more on comparatively small but frequent issues. Moreover, some Lander issue a significant volume-share of their bonds in foreign currencies. Suitable bonds are used to compute yields for the respective Lander at a daily frequency. In addition, we construct a measure of liquidity based on the standard deviation of yields of those bonds that are used to compute the average yield.
2008	J44	Belhocine, Nazim. 2008. <i>The Embodiment of Intangible Investment Goods: a Q-Theory Approach</i> . Queen's University, Department of Economics, Working Papers: 1217. Recent empirical findings on firms' expenditure towards the creation and acquisition of knowledge goods, otherwise known as intangibles, suggest that their share in overall investment has grown considerably. Still, intangible investment is rarely present in investment models. In this paper, I extend the q-theory of investment to model explicitly the decision of firms to invest in intangibles. I then use the model to measure the contribution of intangible goods to the overall capital stock in the U.S. The model highlights the embodiment of intangible goods in tangibles and the role of relative price movements in the measurement of the contribution of each type of investment to the overall capital stock. In particular, given that the relative cost of the main input to intangible production, skilled labor, rose substantially in the 80s and 90s, the price of intangibles inherits this rise. As a result, the downward trend in the aggregate investment deflator series reported by national accounts, which accounts only for the presence of tangible investment goods, is found to have a significant downward bias in the 90s. The model also shows that the growth in the overall capital stock from the late-80s until 2000 was driven mainly by an increase in the contribution of intangibles. However, the contribution of intangibles fell consistently after 2000. These results underscore the importance of accounting for the movements in the price of intangibles rather than focusing only on their rising share in overall investment.
2008	L85	Mian, Atif, and Amir Sufi. 2008. <i>The Consequences of Mortgage Credit Expansion: Evidence from the 2007 Mortgage Default Crisis</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 13936. We demonstrate that a rapid expansion in the supply of mortgages driven by disintermediation explains a large fraction of recent U.S. house price appreciation and subsequent mortgage defaults. We identify the effect of shifts in the supply of mortgage credit by exploiting within-county variation across zip codes that differed in latent demand for mortgages in the mid 1990s. From 2001 to 2005, high latent demand zip codes experienced large relative decreases in denial rates, increases in mortgages originated, and increases in house price appreciation, despite the fact that these zip codes experienced significantly negative relative income and employment growth over this time period. These patterns for high latent demand zip codes were driven by a sharp relative increase in the fraction of loans sold by originators shortly after origination, a process which we refer to as "disintermediation." The increase in disintermediation-driven mortgage supply to high latent demand zip codes from 2001 to 2005 led to subsequent large increases in mortgage defaults from 2005 to 2007. Our results suggest that moral hazard on behalf of originators selling mortgages is a main culprit for the U.S. mortgage default crisis.

2008	M16	Juan Pineiro Chousa, Krishna Chaitanya, and Artur Tamazian. 2008. <i>Does Growth & Quality of Capital Markets drive Foreign Capital? The case of Cross-border Mergers & Acquisitions from leading Emerging Economies.</i> William Davidson Institute at the University of Michigan Stephen M. Ross Business School, William Davidson Institute Working Papers Series: wp911. Is there any interrelationship between firm level FDI in the form of cross border Mergers & Acquisitions and capital markets growth and quality? We addressed this question using panel data of cross border M&A for nine emerging economies. Our study period goes from 1987 to 2006. We find that the stock market variables, viz., capitalization and value addition encourage the number of deals and value of cross border Mergers & Acquisitions. However, the association with regulatory and financial reforms is much stronger and robust.

2008	O57	Krishna Chaitanya, and Emilia Vazquez Rozas. 2008. <i>ARE EMERGING ECONOMIES FDI INFLOWS COINTEGRATED WITH FDI INFLOWS OF CHINA?--AN EMPIRICAL INVESTIGATION.</i> William Davidson Institute at the University of Michigan Stephen M. Ross Business School, William Davidson Institute Working Papers Series: wp904. Emerging economies viz., Brazil, China, India, Mexico and South Africa have seen a tremendous increase in the FDI inflows in the last one decade. Amongst all, the FDI inflows of China witnessed sharp rise from 1992. As on 2006, China stood as the world's second largest recipient of FDI inflows (AT Kearney Report, 2006), leaving behind many emerging economies in the race of attracting FDI inflows.
2008	P13	Cabaleiro Casal, M. Jose, and Sonia M. Rodriguez Parada. 2008. "Sociedades cooperativas de banca alternativa. (Cooperatives of Alternative Banking. With English summary.)." <i>Revista de Estudios Cooperativos</i>, 0(95): 44-64. Currently in Spain we are witnessing an ethical reorientation of a part of the offer of financial services which gives priority to the social commitment without losing economic viability. This banking model known as alternative banking also known as ethical, social or sustainable banking is distinct from traditional banking. This work wishes to highlight the ideal conditions of cooperatives for the development of alternative banking. Its legal nature and its functional regulations enhance the social utility of the banking activity. The double condition of the partners eliminates intermediaries and allocates directly equity towards financing socially responsible projects, in a way that the financial economy and the real economy advance together.
2008	P23	Yuriy, Serhiy, and Yevhen Savelyev. 2008. "H-Hour: Extreme Economic Reforms in Ukraine at Surmounting the Crisis." <i>Journal of European Economy</i>, 7(4): 369-84. The main dominant thing of present economic crisis in Ukraine is mistakes of state and corporative management of long-term strategic nature. Crisis is enhanced by world financial crisis and became of dangerous nature generally for national safety. This cannot be removed only by fragmentary changes. Conducting of radical economic reforms with probably not popular measures are necessary for surmounting the crisis. Any economic crisis (especially the present one) destroys not only economic status quo. Under its conditions arises new economic conjuncture and interest to new directions of investments is forming. Due to all these anti-crisis measures should be based on forecasting of such tendencies. Specialties of crisis surmounting of Ukrainian industry are of finding resources and mechanisms of changes of structure of industrial production with orientation on decrease of amount and part of energy consumption, mostly of raw material branch and reduce its production to the level which gives possibility of avoiding of crucial state dependence from external sources of supply of energy. Ukraine should take an active position in solving of problems of new financial order and forming of new financial civilization on the basis of philosophy of trust.
2008	R58	Vaona, Andrea, and Roberto Patuelli. 2008. "New Empirical Evidence on Local Financial Development and Growth." <i>Letters in Spatial and Resource Sciences</i>, 1(2-3): 147-57. In this paper, we show that the regional finance-growth nexus in Italy is robust to a series of innovations with respect to the existing literature on the topic. We use finer measures of economic and financial development, as well as instruments with a deeper economic content. We rely on state-of-the-art cross-sectional and panel estimation methods, and we offer a thorough investigation of the nonlinearities in the relation between finance and growth. Our results show that, while local financial development is a key factor for economic growth, in regions with inefficient courts more credit might translate into reduced growth due to opportunistic behaviour and the consequent misallocation of funds.

2009	A11	Schneider, Friedrich, and Gebhard Kirchgassner. 2009. "Financial and World Economic Crisis: What Did Economists Contribute?" <i>Public Choice</i>, 140(3-4): 319-27. In this paper, we deal with two questions, (1) what are the origins of the current financial crisis, and (2) what did economists contribute, or why did economists fail to provide a convincing answer for the origins of the crisis, and possible solutions to overcome it? The economics profession apparently was unaware of the looming worldwide financial and economic crisis, and significantly underestimated its global dimensions and consequences. A first and preliminary analysis is undertaken to explore reasons for these failures. We conclude by pointing to some consequences for economics as well as for economic policy.
2009	A11	CV: Gabel, Ilene. 2009. "Neo-liberal Finance and Third World (Mal)development." In <i>Heterodox Macroeconomics: Keynes, Marx and Globalization</i> , ed. Jonathan P. Goldstein and Michael G. Hillard, 250-60. Routledge Advances in Heterodox Economics. London and New York: Taylor and Francis, Routledge.
2009	A11 A13	Colander, David. 2009. "The Financial Crisis and the Systemic Failure of the Economics Profession." <i>Critical Review</i>, 21(2-3): 249-67. Economists not only failed to anticipate the financial crisis; they may have contributed to it--with risk and derivatives models that, through spurious precision and untested theoretical assumptions, encouraged policy makers, and market participants to see more stability and risk sharing than was actually present. Moreover, once the crisis occurred, it was met with incomprehension by most economists because of models that, on the one hand, downplay the possibility that economic actors may exhibit highly interactive behavior; and, on the other, assume that any homogeneity will involve economic actors sharing the economist's own putatively correct model of the economy, so that error can stem only from an exogenous shock. The financial

Year	DE	Title and Abstract
		crisis presents both an ethical and an intellectual challenge to economics, and an opportunity to reform its study by grounding it more solidly in reality.
2009	A11	Jora, Octavian-Dragomir. 2009. "Expansiunea creditului si "economia in trei timpi". Despre boom-crisis-bust in cazul subprime. (With English summary)." <i>Romanian Economic Journal</i> , 31(1): 43-74. A proven fact though is that an "economic crisis" is also an "intellectual crisis" in the economists tribe. For almost a century economists didn't manage to reach a consensus on the final cause and perfect answer to such economic troubles. Mainstreamers say there is neither bubble nor boom-bust cycles, just complex states of the economy, due to atypical evolutions in factor structure, such as new technologies, that the government cannot ever systematically control. The ones grounded in Keynes' work oppose with "market psychology" and anti-cyclic policies that can calm the boom and fight the bust. Finally, a third set blames all these problems on the fundamental model on which modern banking systems work, with a fractional reserve and the back-up of a central bank. The latter belong to the Austrian School of Economics, whose theory of business cycle the author of this article is going to briefly apply to the subprime crisis, as well as to its further developments.

2009	A22	Fontana, Giuseppe, and Mark Setterfield. 2009. "Macroeconomics, Endogenous Money and the Contemporary Financial Crisis: A Teaching Model." <i>International Journal of Pluralism and Economics Education</i> , 1(1-2): 130-47. This paper develops an undergraduate macroeconomics teaching model that features endogenous money and an explicit account of commercial bank behaviour. It therefore transcends common shortcomings of existing teaching models based on either IS-LM or its successor, the New Consensus. The model is used to explain the recent financial crisis and its macroeconomic impact, and to analyse the effects and potential shortcomings of monetary and fiscal policy responses to the crisis.
2009	A22 A23	Burton, Maureen, and Bruce Brown. 2009. <i>The Financial System and the Economy: Principles of Money and Banking, Fifth edition</i> . Armonk, N.Y. and London: Sharpe. Expanded fifth edition textbook for introductory undergraduate and graduate students explores the financial system, recent changes to the financial system due to the current economic crisis, and an analytical framework for understanding these changes. Discusses money and its role in the economy; the overseer--the Federal Reserve System; financial markets, instruments, and market makers; interest rates and bond prices; the structure of interest rates; market efficiency and the flow of funds among sectors; an introduction to financial intermediaries and risk; commercial banking structure, regulation, and performance; financial innovation; financial instability and strains on the financial system; regulation of the banking system and the financial services industry; the debt markets; the stock market; securities firms, mutual funds, and financial conglomerates; how exchange rates are determined; forward, futures, and options agreements; the international financial system; the Fed, depository institutions, and the money supply process; the demand for real money balances and market equilibrium; financial aspects of the household, business, government, and rest-of-the-world sectors; aggregate demand and aggregate supply; the challenges of monetary policy; the process of monetary policy formulation; policy implementation; and monetary policy in a globalized financial system.
2009	B30	Ponsot, Jean-Francois, and Sergio Rossi, eds. 2009. <i>The Political Economy of Monetary Circuits: Tradition and Change in Post-Keynesian Economics</i> , New York: St. Martin's Press, Palgrave Macmillan. Ten papers offer a modern approach to monetary macroeconomics that is deeply rooted in the post-Keynesian tradition outside mainstream economics. Papers discuss circuit theory supplementing John Maynard Keynes's genuine analysis of the monetary economy of production (Claude Gnos); bridging the gap between monetary circuit theory and post-Keynesian monetary theory (Jesper Jespersen); monetary circuit theory and money emissions (Sergio Rossi); the existence of profits within the monetary circuit--some unanswered questions revisited (Louis-Philippe Rochon); saving, firms' self-financing, and fixed capital formation in the monetary circuit (Jean-Luc Bailly); finance and the realization problem in Rosa Luxemburg--a "circuitist" reappraisal (Riccardo Bellofiore and Marco Passarella); money, capital turnover, and the leisure class--Thorstein Veblen's tips for a monetary theory of production (Guglielmo Forges Davanzati and Riccardo Realfonzo); from Wicksell to Keynes--some thoughts on the role of a central bank in the tradition of monetary circuit theory (Stefano Figuera); the dynamics of the monetary circuit (Steve Keen); and the financialization of modern economies in monetary circuit theory (Marc Pilkington).
2009	C01	Malkiel, Burton, Atanu Saha, and Alex Grecu. 2009. <i>The Clustering of Extreme Movements: Stock Prices and the Weather</i> . Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 186malkiel.pdf. A striking feature of the United States stock market is the tendency of days with very large movements of stock prices to be clustered together. We define an extreme movement in stock prices as one that can be characterized as a three sigma event; that is, a daily movement in the broad stock-market index that is three or more standard deviations away from the average movement. We find that such extreme movements are typically preceded by, but not necessarily followed by, unusually large stock-price movements. Interestingly, a similar clustering of extreme observations of temperature in New York City can be observed. A particularly robust finding in this paper is that extreme movements in stock prices are usually preceded by larger than average daily movements during the preceding three-day period. This suggests that investors might fashion a market timing strategy, switching from stocks to cash in advance of predicted extreme negative stock returns. In fact, we have been able to simulate market timing strategies that are successful in avoiding nearly eighty percent of the negative extreme move days, yielding a significantly lower volatility of returns. We find, however, that a variety of alternative strategies do not improve an investor's long-run average return over the return that would be earned by the buy-and-hold investor who simply stayed fully-invested in the stock market.

The Significance of the Relaxation of the Assumption of Perfect Competition." <i>International Journal of Business and Economics</i> , 8(2): 91-114. Under the usual assumption of perfect competition, we have money being neutral and changes in nominal aggregate demand cannot affect the real economic variables. If so, a financial

Year	DE	Title and Abstract
		crisis cannot be very important. However, the real world is characterized more by non-perfect competition when changes in nominal demand can affect real variables. This paper shows the important differences and explains the crux of these differences from both the demand and cost sides. It also provides a simplified general-equilibrium analysis of the economy and shows that, by concentrating on a representative firm and on how this firm is affected by macro variables and simplified interaction with other firms, macro analysis of the economy without assuming perfect competition is manageable with more realistic and richer results.
2009	E02	CV: Pedersen, Lasse Heje. 2009. <i>When Everyone Runs for the Exit</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 15297. The dangers of shouting "fire" in a crowded theater are well understood, but the dangers of rushing to the exit in the financial markets are more complex. Yet, the two events share several features, and I analyze why people crowd into theaters and trades, why they run, what determines the risk, whether to return to the theater or trade when the dust settles, and how much to pay for assets (or tickets) in light of this risk. These theoretical considerations shed light on the recent global liquidity crisis and, in particular, the quant event of 2007.

2009	F18	Garcia Andres, Gonzalo. 2009. "Apuntes para una teoria post-crisis de la intervencion publica en el sistema financiero. (With English summary)." <i>Papeles de Economia Espanola</i> , 0(122): 180-92. The financial crisis has established the beginning of a new trend of change and intensification of public intervention in the financial system. It has become necessary to work towards ensuring the success of the major current reform considering the difficult challenge of making the most of the potential welfare generation of an open market-based financial system. Thoughts concerning the financial system and its relation with real economy in this article commence with the proposal of a new theoretical framework, as an alternative to that of financial markets' efficiency. At the same time, the fundamental issues to be applied by the new regulatory system are stated, considering the market failures that should be dealt with. We end, finally, in some of the challenges of the correct application of the regulation and treatment of systemic entities.
2009	F50	CV: Altman, Roger C. 2009. "Globalization in Retreat: Further Geopolitical Consequences of the Financial Crisis." <i>Foreign Affairs</i> , 88(4): 2-7. The popularity of the U.S. economic model is waning. To put globalization back on track, President Barack Obama must articulate the benefits of open markets and free trade.
2009	F50	CV: Yeldan, Erinc. 2009. <i>On the Nature and Causes of the Collapse of the Wealth of Nations, 2007-2008: The End of a Facade Called Globalization</i> . Political Economy Research Institute, University of Massachusetts at Amherst, Working Papers. In this working paper, Erinc Yeldan investigates the 2007-2008 financial crisis, hailed as the most devastating (and complex) crisis of capitalism since the great depression of 1929. He suggests that the 2007-2008 crisis was not the end result of a series of technical errors or ad hoc developments that occurred on their own, but was instead the result of the systemic imbalances of capitalism over the last three decades. In order to evaluate the conditions of the global crisis more clearly, Yeldan considers it critical that its underlying structural causes are understood. The paper reflects the Marxian literature on crises, prominently that of Rosa Luxemburg, pointing out to the necessity of a 'corrective war' in order to break with old institutions, old technologies, and old methods of accumulation.
2009	H41	CV: Costi, Bruno. 2009. "Italy Holds Its Own in the Global Crisis: The Annual Report of Censis on 2009." <i>Review of Economic Conditions in Italy</i> , 0(3): 475-91.
2009	H50	Stiglitz, Joseph E. 2009. "The Anatomy of a Murder: Who Killed America's Economy?" <i>Critical Review</i> , 21(2-3): 329-39. The main cause of the crisis was the behavior of the banks--largely a result of misguided incentives unrestrained by good regulation. Conservative ideology, along with unrealistic economic models of perfect information, perfect competition, and perfect markets, fostered lax regulation, and campaign contributions helped the political process along. The banks misjudged risk, wildly overleveraged, and paid their executives handsomely for being short-sighted; lax regulation let them get away with it--putting at risk the entire economy. The mortgage brokers neglected due diligence, since they would not bear the risk of default once their mortgages had been securitized and sold to others. Others can be blamed: the ratings agencies that judged subprime securities as investment grade; the Fed, which contributed low interest rates; the Bush administration, whose Iraq war and tax cuts for the rich made low interest rates necessary. But low interest rates can be a boon; it was the financial institutions that turned them into a bust.
2009	H50	Hsing, Yu. 2009. "Impacts of Changing Crude Oil Prices and Macroeconomic Conditions on Short-Term Output Fluctuations in Japan." <i>Japanese Economy</i> , 36(2): 103-14. Applying the monetary policy function (Romer 2000, 2006; Taylor 2001), this article reveals that a 10 percent rise in the real crude oil price is expected to reduce Japan's real gross domestic product (GDP) by 0.19 percent and that increased government spending as a percent of the GDP, a higher real stock price, real appreciation of the yen, a lower world real interest rate, and a lower expected inflation rate would raise real output for Japan.
2009	H50	Bertola, Giuseppe, and Anna Lo Prete. 2009. "Openness, Financial Markets and Policies: Cross-Country and Dynamic Patterns." <i>Annales d'Economie et de Statistique</i> , 0(95-96): 167-82. We document significant and robust empirical relationships in cross-country panel data between government size or social expenditure on the one hand, and trade and financial development indicators on the other. Across countries, deeper economic integration is associated with more intense government redistribution, but more developed financial markets weaken that relationship. Over time, controlling for country-specific effects, public social expenditure appears to be eroded by globalization trends where financial market development can more easily substitute for it.

2009	J16	Jefferson, Therese, and Alison Preston. 2009. "Women's Earnings Security in a Context of Economic Crisis." <i>Journal of Australian Political Economy</i> , 0(64): 117-40. There are likely to be important gender differences in both the short and long term effects of economic downturns (ILO, 2009; Tutnjevic, 2002). Typically the differences are attributable to three contrasts between the working lives of men and women. Firstly, women are traditionally over represented in casualised workforce sectors that are relatively less regulated and susceptible to changes in working hours and employment conditions. Secondly, men and women are concentrated in different industries and occupations and therefore the gender effects of a change in economic conditions differ according to the effects on specific sectors of the economy. Thirdly, women in Australia and many other societies undertake a disproportionately large amount of unpaid household work. Economic conditions which result in reduced public expenditure on service provision can increase the demands on household unpaid labour to make up the shortfall. These contrasts mean that government policies aimed at stimulating the economy can have different implications for men's and women's employment, depending on which sectors are targeted for government expenditure and support. Policies focused on physical infrastructure such as buildings may have a more positive effect in traditionally male industries (Richardson, 2009). The conventional wisdom, backed by a large and growing research literature suggests that part-time workers in low paid industries are likely to be among the first casualties in an economic downturn (Seguino, 2009). Not only are they likely to lack negotiating power; they are also likely to have relatively low levels of accumulated assets to draw upon if they lose their jobs. These general patterns can differ, however, depending on specific combinations of social, industry, occupational, and government policy responses to an economic downturn. The sudden and steep economic crisis in Australia since September 2008 is a good example of the way in which actual developments in women's employment and official data may differ from the experiences of past recessions. In this article, we review official Australian data on women's employment, earnings and wealth immediately preceding and after September 2008. The data show that, while patterns of employment and earnings appear, superficially, to demonstrate that women are faring comparatively well there are also indications that there are serious short- and long-term challenges for women in the Australian labour market. This has serious implications for policy and for the growing number of men who are facing patterns of employment that were once more strongly associated with feminised workforces.
2009	K21 L40	Fingleton, John. 2009. "La politica della concorrenza in tempo di crisi. (Competition Policy in Troubled Times. With English summary)." <i>Mercato Concorrenza Regole</i> , 11(1): 7-22. The article analyses the link between competition policy and credit crunch. In particular, the public confidence in the ability of competitive markets to deliver positive outcomes is scrutinised by underlining the risks that the financial crisis and the economic downturn can facilitate. In this respect, it is also discussed the role of competition agencies, which need to be able to respond quickly to changing priorities, display a degree of pragmatism in recognising times when other policy interests may over-ride competition policy and support governments in tackling powerful private vested interests.
2009	L74	Mocanu, Florina. 2009. "Financial Crisis Impact on Construction and Real Estate Sectors in Romania." <i>Romanian Economic and Business Review</i> , 4(3): 127-35. This paper presents the evolution of construction and real estate sectors in Romania in the context of current financial crisis, highlighting the internal and international economic climate. The evolutions of the main macroeconomic indicators and sectoral factors of influence on them are presented. Construction and real estate sectors are particularly affected by the worsening perception of the risk, of financing difficulties, doubling the risk of liquidity with the solvency one.
2009	M10	Dolgopiatova, T. 2009. "Corporate Governance in Russian Companies: The Role of Globalization and the Crisis." <i>Problems of Economic Transition</i> , 52(6): 76-92. The article studies the development of corporate governance in Russian companies in the contexts of both economic growth and world crisis. The interests of domestic or foreign shareholders and top managers work as incentives for improving corporate governance tools. These interests are determined by a number of economic and institutional conditions. In the 2000s, Russian businesses entered world financial markets (including stock exchanges) and mergers and acquisitions markets. The participation of foreign shareholders in equity and control of domestic companies has been growing. These trends have resulted in intense use of corporate governance standards under the impact of stock market regulations and the disciplined influence of foreign shareholders, managers, and nonexecutive (independent) directors. The crisis has dramatically reduced the decision-making horizon, discredited IPOs, violated minor shareholders' rights, and increased management opportunism and stockholders' return to executive management.
2009	M42	Farkas, Istvan. 2009. "The Growing Responsibility of Financial Supervisory Authorities." <i>Development and Finance/Fejlesztés és Finaszírozás: Quarterly Hungarian Economic Review</i> , 0(1). Supervision based on monitoring must be replaced by forward-looking activities. In addition, the main purpose of coexistence with the market must be seen as being for the supervisory authorities to gain an understanding of the institutions' business models. These are the essential steps required if the supervisory authorities are to succeed in imposing a longer-term view instead of short-term market solutions. Durable legislation is important, but in a rapidly changing situation durable rules can only be drawn up once the most important qualitative elements are fixed. This, however, still leaves an area which, in the spirit of the rules, and in a transparent and accountable manner, has to be filled by the regulatory role of the supervisory authorities. The most significant change required is that longer-term interests must take precedence over short-term interests. One aspect of this is a change in the way issues of interest are handled, but greater controls must also be introduced for institutions which are critical to the system, such as auditors and rating agencies. One way of reducing chauvinism in the sector would be to have more integrated rules and supervision, whilst a solution to the issue of the self-interest of national supervisors could be a uniform European system with limits on legislative exceptions and European level supervision.
2009	N16	Gerchunoff, Pablo, and Lucas Llach. 2009. "Equality or Growth: A Twentieth Century Argentine Dilemma." <i>Revista de Historia Económica</i> , 27(3): 397-426. Argentina's long term economic performance between 1880 and 2000 (convergence with the rich followed by divergence) can be understood in terms of the economic and political consequences of its peculiar factor endowments. Skewed endowments meant huge gains from trade during the first globalization boom; but, conversely, disintegration of world commerce in the Depression was a heavier blow for such a naturally specialized economy. The extreme protectionism, characteristic of the post-war period, was related to the country's peculiar economic structure: comparative advantages in food production and disadvantages in (labor-intensive) manufacturing implied that closing the economy was a political winner, though it eventually hampered growth. The road to openness followed in the last quarter of the 20th century would have meant, correspondingly, an increase in inequality. Attempts to moderate it through debt accumulation and exchange rate appreciation destabilized the economy and contributed further to Argentina's comparative decline.
2009	N26 N46	Musacchio, Aldo. 2009. <i>Experiments in Financial Democracy: Corporate Governance and Financial Development in Brazil, 1882-1950</i> . Studies in Macroeconomic History. Cambridge and New York: Cambridge University Press. 2009	N30	Mishkin, Frederic S. 2009. "Why We Shouldn't Turn Our Backs on Financial Globalization." <i>IMF Staff Papers</i> , 56(1): 139-70. This essay argues that financial globalization can be a powerful force in promoting economic growth and the reduction of poverty in emerging market countries. Financial development enables the financial system to allocate capital to its most productive uses and is crucial to the success of an economy. Financial globalization encourages financial development by weakening the power of groups such as government and entrenched private special interests, which have much to lose from an efficient financial system, and by encouraging support for institutional reforms to make the financial system work better. On the other hand, financial globalization, if it is not managed properly, has a dark side and can lead to financial crises that cause much economic hardship. Getting financial globalization to work well is no easy task and requires policies that promote property rights and good-quality financial information that encourage effective prudential supervision, and that promote a stable macroeconomic environment. Although these policies need to be home-grown, international financial institutions like the International Monetary Fund and the World Bank can create incentives to promote these policies in emerging market countries. Citizens in advanced countries can also help by supporting the opening up of their markets to goods and services from poorer countries, and thereby encourage expansion of their export sectors, which creates increased support for financial development and less vulnerability to financial crises.

2009	Q31 Q54	van der Ploeg, Frederick. 2009. "Global Crises and Developing Countries: Financial, Environmental, Resource and Food Perspectives." <i>International Review of Environmental and Resource Economics</i> , 3(2): 119-60. The global financial crisis has potentially many adverse effects on the developing world: falls in exports of goods and services to the OECD, dramatic falls in commodity prices and resource exports, and falls in remittances. Many of the poorer countries are heavily specialized and dependent on natural resources, often landlocked, ethnically polarized, and financially underdeveloped. They therefore suffer especially from the notorious volatility of natural resource prices. Volatile oil prices harm not only producers and consumers in the developing world, but also harm environmental quality if they hold back irreversible investments in costly energy-saving technology and hydrocarbon substitutes. In the aftermath of the crisis, political leaders should seek for a global deal whereby resource-rich developing countries are helped to cope with managing very volatile streams of resource revenues while cutting back pollution of the energy industries. The global crisis facing the world today is thus not only a financial crisis, but also a fuel and commodity crisis. In addition, the world also faces a food, water, and climate change crisis, all of which undermine the ability to sustain prosperity and eradicate poverty in the developing world. Hence, the contours of a Global Green New Deal will be sketched.
2009	Q50	Gleeson, Brendan. 2009. "A Twin Crisis of Capital in an Urban Age." <i>Journal of Australian Political Economy</i> , 0(64): 165-77. The world faces a twin threat from simultaneous economic and environmental crises. Human society, now heavily urbanised, will mostly encounter these threats in cities and large human settlements. The crisis of financial capital is a crisis of financial capitals, the urban hubs of neoliberal global order. In an era of globalised interdependency, the pain of the wealthy metropolitan centres will likely be the agonies of the world's poorer peripheries. David Harvey (2009) writes: "My guess is that half of the financial crises over the last 30 years are urban property based. The origins of this crisis in the United States came from something called the sub prime mortgage crises. I call this not a sub prime mortgage crisis but an urban crisis." Australia and its cities remain on the margins of the crisis. We don't yet feel the searing pain that is so apparent in global pivots, like New York, or aspiring tigers like Dublin, where unemployment soars as public finances plummet. And yet our cities are already on the edge of social and environmental defaults that widened during the era of neoliberal rule (McManus, 2004). Australian author and social commentator, John Birmingham (2009) depicts 'The Coming Storm' whose advance clouds are already engulfing those in vulnerable employment sectors, like mining, business services, and manufacturing, where retrenchment and reduced hours are the norm. The tempests of

Year	DE	Title and Abstract
		global warming and resource (especially oil) volatility threaten the fundamental circulation and health of an urban process that produced ever higher velocities. This process pushed continuously against the constraints of time. Time is the agent of delay, decay, and debility which reminds us that we exist in nature not outside it. In doing so, as Harvey (1982) reminds us, the urban process in capitalism seeks ways of overcoming barriers to the realisation of value and profit. The city is a means for overcoming 'the limits to capital' presented by the time-space dimensions of nature. As capitalism has evolved--and suffered and survived crises--it has sought new pathways to the realisation of value in city processes. A key instance of this in the twentieth-century was the motorisation of urban mobility to reduce spatial frictions of the labour process.
2009	Q54	United Nations Conference on Trade and Development. 2009. <i>Trade and Development Report, 2009, Report by the UNCTAD Secretariat</i> . Sales No. E.09.II.D.16. New York and Geneva: United Nations Publications. Assesses recent trends and prospects in the world economy, focusing on responding to the global crisis and climate change mitigation and development. Discusses the impact of the global crisis and the short-term policy response; the financialization of commodity markets; learning from the crisis--policies for safer and sounder financial systems; reform of the international monetary and financial system; and climate change mitigation and development.

2009	R41	Astley, Mark, Julia Giese, Michael Hume, and Chris Kubelec. 2009. "Global Imbalances and the Financial Crisis." <i>Bank of England Quarterly Bulletin</i> , 49(3): 178-90. The recent financial crisis has put the spotlight on the rapid rise in credit which preceded it and the macroeconomic context in which it developed. This article examines the contribution of international savings and investment imbalances to the crisis and how these imbalances have evolved since its onset, focusing on the UK experience as a deficit country over the past decade. It also briefly discusses some implications of the crisis for global imbalances over the medium term.
2010		
2010	A10 A12	Underhill, Geoffrey R. D. 2010. <i>Theory and the Market after the Crisis: the Endogeneity of Financial Governance</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 8164. The inheritance of contemporary financial economics invites us to consider financial stability as integral to a liberal market setting. The crisis however demonstrated that financial markets may prove highly dysfunctional in the absence of adequate mechanisms of regulation and governance. This implies that economic theory requires an enhanced understanding of the intersection of economic rationality with the rationality of governance. This article extends the insights of institutional economics to demonstrate that the emergence of the institutions of financial governance is endogenous to the utility-maximising behaviour of competing economic agents. Utility-maximising behaviour and conflict over the terms of competition in the market generate both the formal and informal institutions and processes of governance such as regulation and dispute settlement. The model is illustrated by the case of international finance, predicting forms of policy rent seeking in a market environment: private interests embedded in public policy processes simultaneously reshaped both market and governance in line with their own perceived utility functions. The model predicts that similar policy rent seeking will dominate the reform process. Successful reform will require a conceptual understanding of this link between governance and market competition, and appropriate changes in the nature of the policy process so as to reshape markets to avoid financial instability in the future.
2010	B11	Basevi, Giorgio. 2010. "La crisi finanziaria internazionale: Da Erodoto a Plutarco, passando per Goldfinger. (The International Financial Crisis: An Excursus from Herodotus to Plutarch, with a Stop at Goldfinger. With English summary)." <i>Politica Economica</i> , 26(3): 325-37. This article is not a traditional scientific work in economics. It was written following the oral discussion of a book--Dionigi I. (ed.), "Il dio denaro", BUR Rizzoli 2010--that the author made on the occasion of its publication. The author suggests adding a couple of classical writings taken from Herodotus and from Plutarch, to the collection of classical pieces that are discussed in the book by various experts on the classics. The first quotation that the author presents is taken from "The Histories" of Herodotus, and seems particularly interesting for the regulation of financial markets, and the role that its insufficiency played in building up the international financial crisis of 2007-2010. The second quotation is taken from "The Life of Lycurgus", by Plutarch, and is particularly illuminating for another aspect of the current crisis, i.e., the fear that exit from it may need to bring about inflation in order to reduce the burden of recently accumulated stocks of public debt. As for the reference to Goldfinger, the author hopes that it will make the potential reader curious enough to become an actual reader of his paper.
2010	B26	Corsi, Marcella, and Giulio Guarini. 2010. "Le cause reali delle crisi finanziarie: L'approccio di Paolo Sylos Labini. (With English summary)." <i>Studi e Note di Economia</i> , 15(3): 389-412. In his "Le prospettive dell'economia mondiale" ("Prospects for the world economy") of 2003 Paolo Sylos Labini analyses the real and financial factors of the American economy and expresses pessimistic forebodings on the future economic trends in the USA and other parts of the world which, in the light of the events occurring as from 2007, can now be seen to have been justified. The aim of this paper is to provide his ideas with a place in the present debate on the American financial crisis and, to this end, the paper is divided into three parts. At first, we delineate the approach taken by Paolo Sylos Labini in examining the links between the financial system and economic system, highlighting the Classical, Schumpeterian, and Keynesian elements contained in it. We then turn the focus on the four key elements of financial crisis according to Sylos Labini: income distribution, innovation, market forms, and debt sustainability. Finally, we recall some considerations by Sylos Labini on the three themes central to the present debate on the American crisis, namely the rate of interest in monetary policy, the role of the managers, and expectations.
2010	B41	Colander, David. 2010. "The Economic Profession, the Financial Crisis, and Method." <i>Journal of Economic Methodology</i> , 17(4): 419-27. In 2007-2008, the world economy came perilously close to a systemic failure in which a financial system collapse almost undermined the entire world economy as we know it. These events have led some to fault the economics profession for its failure to predict the crisis, and to ask whether the crisis will lead the economics profession to change its ways. In this paper, I will discuss these two issues, and then turn to some suggestions for institutional changes in the economics profession that might lead to better outcomes in the future.
2010	B41	du Plessis, Stan. 2010. "Implications for Models in Monetary Policy." <i>Journal of Economic Methodology</i> , 17(4): 429-44. Monetary authorities have been implicated in the financial crisis of 2007-2008. John Muellbauer, for example, has blamed what he thought was initially inadequate policy responses by central banks to the crisis on their models, which are, in his words, 'overdue for the scrap heap'. This paper investigates the role of monetary policy models in the crisis and finds that (i) it is likely that monetary policy contributed to the financial crisis; and (ii) that an inappropriately narrow suite of models made this mistake easier. The core models currently used at prominent central banks were not designed to discover emergent financial fragility. In that respect John Muellbauer is right. But the implications drawn here are less dramatic than his: while the representative agent approach to micro-foundations now seems indefensible, other aspects of modern macroeconomics are not similarly suspect. The case made here is rather for expanding the suite of models used in the regular deliberations of monetary authorities, with new

Year	DE	Title and Abstract
		models that give explicit roles to the financial sector, to money and to the process of exchange. Recommending a suite of models for policy making entails no methodological innovation. That is what central banks do; though, of course, how they do it is open to improvement. The methodological innovation is the inclusion of a model that would be sensitive to financial fragility, a sensitivity that was absent in the run-up to the current financial crisis.
2010	B41	Ross, Don. 2010. "Should the Financial Crisis Inspire Normative Revision?" <i>Journal of Economic Methodology</i>, 17(4): 399-418. The paper evaluates the claim, made by a range of commentators but most prominently by Akerlof and Shiller in <i>Animal Spirits</i> , that the recent financial crisis illustrates gaps in the normative picture incorporated into standard macroeconomics that are plugged by insights due to behavioral economics. It is argued that Akerlof and Shiller's contention that we cannot understand what happened unless we supplement macroeconomic theory with social-psychological theory is convincing only after being so heavily qualified that most of the surface excitement drains out of it. However, this is argued to be compatible with the idea that each recession or depression is a unique historical episode from which specific lessons can be learned; rejection of calls for paradigm shifts does not imply that each business cycle merely offers another observation to confirm a settled and stable understanding of macroeconomic dynamics. Discussion of factors that made the recent crisis unusually dangerous--the extreme global savings imbalance and the very rapid shifts occurring in the composition of the global labor force - leads to identification of a quite specific normative recommendation. This recommendation, that wealthy and middle-income people who care about efficiency, growth and prosperity should be willing to be taxed at higher levels to fund investments in human capital development, is certainly far from novel. However, I contend that the recent events have provided a new and newly specific reason to urge it. The reasoning in question owes nothing to behavioral economics or to any new advances in empirical psychology, which are indeed argued to obscure the most important implications of the recent crisis, and of recessions in general.
2010	B41	CV; Vercelli, Alessandro. 2010. "Minsky Moments, Russell Chickens and Grey Swans: The Methodological Puzzles of Financial Instability Analysis." In <i>Minsky, Crisis and Development</i>, ed. Daniela Tavasci and Jan Toporowski, 15-31. New York: St. Martin's Press, Palgrave Macmillan.
2010	C38	Badarau-Semenescu, Cristina, and Gregory Leveuge. 2010. "Assessing the Potential Strength of a Bank Capital Channel in Europe: A Principal Component Analysis." <i>Review of Finance and Banking</i>, 2(1): 5-16. The asymmetric impact of the recent financial crisis on the European countries' real activity raised the question of the heterogeneity of the transmission channels of shocks in the euro area. In this article, we suggest an assessment of this heterogeneity based on the banks' capital channel (BCC). To this end, we follow an original and global perspective, studying the combination of several key indicators through a principal component analysis (PCA). Based on data collected before the beginning of the crisis, the analysis identifies Germany and Italy as the European economies a priori the most exposed to a financial shock passing through the BCC, while Finland, France, or Spain would be the least exposed. The comparison of these a priori results to the post-crisis economic performance of the largest European countries supports the idea of a heterogeneous bank capital channel inside the union.
2010	C81	Gauthier, Celine, Alfred Lehar, and Moez Souissi. 2010. <i>Macprudential Regulation and Systemic Capital Requirements</i>. Bank of Canada, Working Papers. In the aftermath of the financial crisis, there is interest in reforming bank regulation such that capital requirements are more closely linked to a bank's contribution to the overall risk of the financial system. In our paper we compare alternative mechanisms for allocating the overall risk of a banking system to its member banks. Overall risk is estimated using a model that explicitly incorporates contagion externalities present in the financial system. We have access to a unique data set of the Canadian banking system, which includes individual banks' risk exposures as well as detailed information on interbank linkages including OTC derivatives. We find that systemic capital allocations can differ by as much as 50% from 2008Q2 capital levels and are not related in a simple way to bank size or individual bank default probability. Systemic capital allocation mechanisms reduce default probabilities of individual banks as well as the probability of a systemic crisis by about 25%. Our results suggest that financial stability can be enhanced substantially by implementing a systemic perspective on bank regulation.
2010	C81	Gauthier, Celine, Zhongfang He, and Moez Souissi. 2010. <i>Understanding Systemic Risk: The Trade-Offs between Capital, Short-Term Funding and Liquid Asset Holdings</i>. Bank of Canada, Working Papers. We offer a multi-period systemic risk assessment framework with which to assess recent liquidity and capital regulatory requirement proposals in a holistic way. Following Morris and Shin (2009), we introduce funding liquidity risk as an endogenous outcome of the interaction between market liquidity risk, solvency risk, and the funding structure of banks. To assess the overall impact of different mix of capital and liquidity, we simulate the framework under a severe but plausible macro scenario for different balance-sheet structures. Of particular interest, we find that (1) capital has a decreasing marginal effect on systemic risk, (2) increasing capital alone is much less effective in reducing liquidity risk than solvency risk, (3) high liquid asset holdings reduce the marginal effect of increasing short term liability on systemic risk, and (4) changing liquid asset holdings has little effect on systemic risk when short term liability is sufficiently low.
2010	C82	de Margerie, Gilles. 2010. "Le poids du secteur financier: Sa mesure et son impact sur la croissance: Quelques leçons de la crise. (The Financial Sector's Size and Impact on Growth: Some Lessons of the Crisis. With English summary)." <i>Revue d'Economie Financière</i>, 0(98-99): 55-74. The financial crisis has triggered intense debates on the financial sector's excessive role in the economy, and on its role in the economic and financial crisis. Recent studies realised in the framework of France's National Council on Statistical Information (CNIS) have shown that, until the crisis, there was a growing gap between banks' contribution to the GDP, which was very stable in recent times, and the rapid growth of their net banking income (NBI). This evolution mainly results from the growing proportion of dividends received and fair value adjustments in banks' results, which can be interpreted as particularly linked to the growing impact of their internationalisation and of their capital markets activities. The crisis has resulted in a decline of the gap between these data that largely stems from the reduction of the market value of some financial instruments. Nevertheless this does not enable to give a well-argued answer to the critical question of the mechanisms through which the financial crisis impacted the economy, an issue on which very substantial research is still to be done.
2010	D22	Jain, Ravi, and Dev Prasad. 2010. "Cash--A Corporate Umbrella." <i>Global Journal of Finance and Economics</i>, 7(2): 85-95. Our study is motivated by a recent Wall Street Journal article which suggests that firms with higher cash holdings fared better in their stocks' returns relative to the stock market returns during the current economic and financial crisis. We examine the relation between stock market returns and firms' cash holdings surrounding the crisis caused by the September 11, 2001 terrorist attacks. We find evidence that firms with higher cash holdings had a relatively smaller negative market returns following the attack. This suggests that cash acts as an 'umbrella' for corporations. In addition, we find evidence that firms increased their cash holdings after the crisis. This increase is much larger than an annual increase of 0.46 per cent found by Bates, Kahle, and Stulz (2009) for US industrial firms.
2010	D62	Bianchi, Javier, and Enrique G. Mendoza. 2010. <i>Overborrowing, Financial Crises and 'Macro-prudential' Taxes</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 16091. We study overborrowing and financial crises in an equilibrium model of business cycles and asset prices with collateral constraints. Private agents in a decentralized competitive equilibrium do not

Year	DE	Title and Abstract
		internalize the effects of their individual borrowing plans on the market price of assets at which collateral is valued and on the wage costs relevant for working capital financing. Compared with a constrained social planner who internalizes these effects, they undervalue the benefits of an increase in net worth when the constraint binds and hence they borrow "too much" ex ante. Quantitatively, average debt and leverage ratios are only slightly larger in the competitive equilibrium, but the incidence and magnitude of financial crises is much larger. Excess asset returns, Sharpe ratios and the market price of risk are also much larger. A state-contingent tax on debt of about 1 percent on average supports the planner's allocations as a competitive equilibrium and increases social welfare.
2010	D62	Philippon, Thomas, and Vasiliki Skreta. 2010. <i>Optimal Interventions in Markets with Adverse Selection</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 15785 We study interventions to restore efficient lending and investment when financial markets fail because of adverse selection. We solve a design problem where the decision to participate in a program offered by the government can be a signal for private information. We characterize optimal mechanisms and analyze specific programs often used during banking crises. We show that programs attracting all banks dominate those attracting only troubled banks, and that simple guarantees for new debt issuances implement the optimal mechanism, while equity injections and asset buyback do not. We also discuss the consequences of moral hazard.
2010	D64	Snyder Belousek, Darrin W. 2010. "Market Exchange, Self-Interest, and the Common Good: Financial Crisis and Moral Economy." <i>Journal of Markets and Morality</i>, 13(1): 83-100. The financial crisis of 2008-2009 presents us with the opportunity to not only understand what has happened in the markets but also to reflect on the purpose of the marketplace. Drawing from expert economic analyses, we first assess the central lesson of the crisis--the failure of self-regulation by rational self-interest to moderate externalized risk in financial markets. Second, we ask the philosophical question occasioned by the crisis concerning the moral meaning of economic activity: Is market exchange solely for the sake of self-interest? Reflecting on the poetry of Kahlil Gibran and engaging with the recent encyclical of Pope Benedict XVI, we turn our attention from political economy to moral economy: the relationships among market exchange, self-interest, and the common good--and, in particular, the prior conditions of market exchange and their moral significance for the present crisis.
2010	D73	Ahmad, Naved, and Shahid Ali. 2010. "Corruption and Financial Sector Performance: A Cross-Country Analysis." <i>Economics Bulletin</i>, 30(1): 303-08. In this paper we explore the effects of corruption on financial sector performance for a sample of 38 developed and developing economies for the period 1995-2005. Using system GMM technique our results demonstrate that corruption undermines the efficacy of a developed financial sector. Governments, therefore, should control corruption to improve financial sector performance in order to increase the likelihood of economic growth and prosperity.
2010	D85	Delli Gatti, Domenico, Mauro Gallegati, Bruce Greenwald, Alberto Russo, and Joseph E. Stiglitz. 2010. "The Financial Accelerator in an Evolving Credit Network." <i>Journal of Economic Dynamics and Control</i>, 34(9): 1627-50. We model a credit network characterized by credit relationships connecting (i) downstream (D) and upstream (U) firms and (ii) firms and banks. The net worth of D firms is the driver of fluctuations. The production of D firms and of their suppliers (U firms) in fact, is constrained by the availability of internal finance--proxied by net worth--to the D firms. The structure of credit interlinkages changes over time due to an endogenous process of partner selection, which leads to the polarization of the network. At the aggregate level, the distribution of growth rates exhibits negative skewness and excess kurtosis. When a shock hits the macroeconomy or a significant group of agents in the credit network a bankruptcy avalanche can follow if agents' leverage is critically high. In a nutshell, we want to explore the properties of a network-based financial accelerator.
2010	D85	Kirman, Alan. 2010. "The Economic Crisis Is a Crisis for Economic Theory." <i>CESifo Economic Studies</i>, 56(4): 498-535. This article examines, in the light of recent events, the origins of the difficulties that current macroeconomic models have in encompassing the sort of sudden crisis which we are currently observing. The reasons for this are partly due to fundamental problems with the underlying General Equilibrium theory and partly to the unrealistic assumptions on which most financial models are based. What is common to the two is that systematic warnings over more than a century in the case of finance and over 30 years in the case of equilibrium theory have been ignored and we have persisted with models which are both unsound theoretically and incompatible with the data. It is suggested that we drop the unrealistic individual basis for aggregate behaviour and the even more unreasonable assumption that the aggregate behaves like such a 'rational' individual. We should rather analyse the economy as a complex adaptive system, and take the network structure that governs interaction into account. Models that do this, of which two examples are given, unlike standard macroeconomic models, may at least enable us to envisage major 'phase transitions' in the economy even if we are unlikely to be able to forecast the timing of their onset.
2010	F59	Stockhammer, Engelbert. 2010. <i>Financialization and the Global Economy</i>. Political Economy Research Institute, University of Massachusetts at Amherst, Working Papers. In this chapter from the forthcoming book, <i>The Political Economy of Financial Crises</i> , edited by Gerald Epstein and Martin H. Wolfson, (Oxford University Press, 2012) Engelbert Stockhammer discusses 'financialization', i.e. changes in the role of the financial sector. This will highlight (1) changes in household behavior, in particular with regards to household debt, (2) changes in the behaviour of non-financial businesses, such as shareholder value orientation and increased financial activity and (3) changes in the financial sector, in particular the emergence of the (hardly regulated) shadow banking sector, a shift towards household credit (rather than business credit) and a shift to investment banking/fee generating business. Second, the chapter discusses the international dimension of financialization. Here the liberalization of capital flows and its consequences, the determination of exchange rates by capital flows (rather than by current account disequilibria), will be discussed. International financial liberalization has not fulfilled the neoliberal promise of generating investment-based growth, but rather has given rise to a series of financial crises that were typically driven by a swing of capital inflows ('capital flow bonanza') followed by capital flow reversals. Third, the chapter offers an interpretation of the finance-dominated accumulation regime as having given rise to two distinct growth models (based on Stockhammer 2010): a credit-financed consumption-driven growth model (mostly in Anglo-Saxon countries) and an export-driven growth model (in Germany, Japan, and, possibly, China). Both growth models suffer from a structural demand deficiency, which is due to wage suppression, but each try to overcome this by different means (credit-financed consumption or export orientation). The chapter thus highlights how financialization with its domestic and international effects have interacted with a polarization of income distribution to generate the structural imbalances that led to the crisis 2007-09.
2010	F60	Szego, Giorgio. 2010. "The US Political Brawl over the Causes of the Crisis: Comments and Additions." <i>Rivista di Politica Economica</i>, 100(7-9): 229-52. The Final Report of the National Commission on the Causes of the Financial and Economic Crisis in the United States was released on January 27th, 2011. The strong political differences within the commission prevented the draft of a shared report. In addition to the majority report, two dissenting ones have been produced. I shall criticize some of their conclusions and point out some unreported facts.

Year	DE	Title and Abstract
2010	H21	Diss: Severo, Tiago Pedroso. 2010. Essays in Macroeconomics. PhD diss. Harvard University. The present dissertation covers three topics in Macroeconomics. In its first chapter, we analyze how technological evolution in developed nations contributes to a relative shortage of high-yield financial assets in world capital markets, which stimulates the emergence of asset price bubbles. In our model, as intangible capital becomes more important relative to physical capital in production, interest rates decline, and equilibrium featuring rational bubbles can be sustained. The economy, however, still satisfies the existing criteria for dynamic efficiency. The second chapter addresses how financial shocks, represented by increases in the overall cost of funds, affect aggregate TFP. We present a theoretical model that posits that aggregate TFP shall decline in the aftermath of financial shocks if heterogeneity in financial frictions increases with the overall cost of funds. Moreover, the effect should be more pronounced the higher the dependence of firms on borrowed funds. We then estimate TFP growth for the manufacturing industries in the U.S. and Canada between 1991 and 2007 and show that, as interest rates or the cost of issuing equity goes up, TFP declines, the more so the higher an industry's dependence on external finance. The third and last chapter studies the topic of optimal taxation in the presence of multidimensional heterogeneity across agents and asymmetric information. Optimal income tax prescriptions are hardly possible in this context. Notwithstanding, we are able to prescribe which combinations of tax policies are consistent with Pareto optimality.
2010	H21	Philippon, Thomas. 2010. "Financiers versus Engineers: Should the Financial Sector Be Taxed or Subsidized?" <i>American Economic Journal: Macroeconomics</i> , 2(3): 158-82. I study the allocation of human capital in an economy with production externalities, financial constraints, and career choices. Agents choose to become entrepreneurs, workers, or financiers. Entrepreneurship has positive externalities but requires the services of financiers. In the second best solution, the financial sector should be taxed in exactly the same way as the nonfinancial sector. When direct subsidies to investment and scientific education are not feasible, subsidizing the financial sector increases growth if externalities are driven by physical capital as in Paul M. Romer (1986), and decreases growth if externalities are driven by human capital as in Robert E. Lucas, Jr. (1988).
2010	H72	Mendoza Velazquez, Alfonso. 2010. "Indicadores de desempeño, presión y vulnerabilidad de las finanzas públicas estatales en México. (With English summary)." <i>El Trimestre Económico</i> , 77(3): 605-49. The vulnerability and financial pressure of financial systems is a critical subject in light of the economic crisis we are currently facing. This paper defines financial pressure of local governments as the extreme situation characterized by financial imbalances, increasing current expenditure, lack of investment, excessive public debt and debt service. Using multivariate methods this paper develops six indexes that jointly measure the pressure on the states public finances in Mexico for the period 2001-2007. These indexes--which by construction are not correlated with each other--capture more than 80% of the variation of public finance variables and show the ranking of each state in relation to other states in Mexico. Among the results we find a trade-off between public investment and balance surpluses and between savings and current expenditure. The hence-obtained set of indexes can be used by local officials to assess the relative condition of his state public finances in relation to others and by the supervisors or regulatory bodies to assess the financial pressure experienced by state governments in Mexico.
2010	J08	Kim-Ming, Lee, and Law Kam-Yee. 2010. "The Financial Tsunami: Economic Insecurity and Social Protection in Hong Kong." <i>Development</i> , 53(1): 83-90. The authors examine the consequences of the financial crisis and the social-measures package adopted by the Hong Kong government. They illustrate how the government lacked long-term strategies and commitments for protecting the people of Hong Kong against increasingly risky globalization and economic insecurity. They suggest that active labour market policies are the social policy tools the government can use to reform the social protection system.
2010	J53	CV: Bellofiore, Riccardo, and Joseph Halevi. 2010. "Magdoff-Sweezy, Minsky and the Real Subsumption of Labour to Finance." In <i>Minsky, Crisis and Development</i> , ed. Daniela Tavasci and Jan Toporowski, 77-89. New York: St. Martin's Press, Palgrave Macmillan.
2010	J68	Buhociu, Florin Marian, Raducan Oprea, and Valentin Marian Antohi. 2010. "Analysis of Main Social Indicators Developments Regarding Labour Market in 2007-2009 in Romania." <i>Annals of "Dunarea de Jos" University of Galati: Fascicle I: Economics and Applied Informatics</i> , 16(1): 109-16. Labor markets at the international level--in Europe and equally in Romania--registered in terms of globalization, European integration, and the global financial crisis have had many transformations while maintaining sustainable competitiveness, new challenges, and major risks for the viability of social protection systems. Thus, must be considered: the dynamics of employment rates, occurrence or loss of paid employment, more flexible occupational system, motivational payment, development of new skills for new jobs, and promote a professional and geographical mobility. All having major implications for social protection functionality now, and especially in the future. Employment and human capital management in Romania extends far beyond the actual policies of the labor market, because the employment policy of Romania must be formed in a component of national growth and development strategy, adapted to employment policies of the European Union, globalization of economies, and in the context of the current financial crisis.

Davis, 155-202. Elgar Reference Collection. International Library of Critical Writings in Economics, vol. 243. Northampton, Mass. and Cheltenham, U.K.: Elgar.
2010	K10	Supiot, Alain. 2010. "A Legal Perspective on the Economic Crisis of 2008." <i>International Labour Review</i> , 149(2): 151-62. The 2008 global financial meltdown was the symptom of an underlying crisis in law and institutions caused by the neoliberal utopia of Total Market--"scientific" depoliticization of the economy, full commodification of labour, land and money, and all-out competition, with even legal systems subject to "law shopping". Financial markets were so successfully deregulated, they were the first to collapse: taxpayers are now paying the bills. But the markets for natural and "human resources" are also at risk. In the spirit of the 1944 Declaration of Philadelphia, Supiot argues, the rule of law must be reinstated to end human subordination to economic efficiency.
2010	K40	Cavalcanti, Marco Antonio F. H. 2010. "Credit Market Imperfections and the Power of the Financial Accelerator: A Theoretical and Empirical Investigation." <i>Journal of Macroeconomics</i> , 32(1): 118-44. We investigate, both theoretically and empirically, the relationship between credit market imperfections and the degree of shock amplification arising from the so-called financial accelerator. We begin by simulating a dynamic stochastic general equilibrium model with two types of financial frictions--costly contract enforcement and anti-creditor bias in the judicial system. Our model builds on the standard financial accelerator framework of Bernanke et al. (1999), to which we add imperfect judicial enforcement in the line of Krasa and Villamil (2000). According to our simulations, the power of the financial accelerator may either increase or decrease with financial frictions, depending on the source and initial level of such frictions. We then turn to the empirical investigation, based on panel data for 62 countries over 1981-1999. We rely on Djankov et al. (2005) and the World Bank's Doing Business Database for proxies of credit market imperfections. According to our results, which are consistent with the theoretical model's main predictions, macroeconomic

Year	DE	Title and Abstract
		volatility and the power of the financial accelerator seem to increase with contract enforcement costs, but vary non-monotonically with the degree of anti-creditor bias in the judicial and legal system.
2010	L22	CV: Cerutti, Eugenio, Anna Ilyina, Yulia Makarova, and Christian Schmieder. 2010. "Bankers without Borders? Implications of Ring-Fencing for European Cross-Border Banks." 2010	L93	Benmelech, Efraim, and Nittai K. Bergman. 2010. <i>Bankruptcy and the Collateral Channel</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 15708. Do bankrupt firms impose negative externalities on their non-bankrupt competitors? We propose and analyze a collateral channel in which a firm's bankruptcy reduces collateral values of other industry participants, thereby increasing the cost of external debt finance industry wide. To identify this collateral channel, we use a novel dataset of secured debt tranches issued by U.S. airlines which includes a detailed description of the underlying assets serving as collateral. Our estimates suggest that industry bankruptcies have a sizeable impact on the cost of debt financing of other industry participants. We discuss how the collateral channel may lead to contagion effects which amplify the business cycle during industry downturns.
2010	L93	Benmelech, Efraim, and Nittai K. Bergman. 2010. <i>Vintage Capital and Creditor Protection</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 15735. We provide novel evidence linking the level of creditor protection provided by law to the degree of usage of technologically older, vintage capital in the airline industry. Using a panel of aircraft-level data around the world, we find that better creditor rights are associated with both aircraft of a younger vintage and newer technology as well as firms with larger aircraft fleets. We propose that by mitigating financial shortfalls, enhanced legal protection of creditors facilitates the ability of firms to make large capital investments, adapt advanced technologies and foster productivity.

2010	N00	Shachmurove, Yochanan. 2010. <i>The Next Financial Crisis</i>. Penn Institute for Economic Research, Department of Economics, University of Pennsylvania. PIER Working Paper Archive. The examination of U.S. crises reveals that the current financial crisis follows past patterns. An investment bubble creates excess demand for new financing instruments. During the railroad bubbles of the nineteenth century loans were issued at a pace higher than many companies could pay back. The current housing bubble originated from issuing sub-prime mortgages that assume that housing prices would only rise. The increased demand for credit induces financial innovations and instruments that circumvent existing regulations. Inevitably, the bubble bursts. The history of financial crises teaches that policy reforms and new regulations cannot prevent future financial crises.
2010	N31 N32	CV: Iacoviello, Matteo. 2010. "Housing in DSGE Models: Findings and New Directions." In <i>Housing Markets in Europe: A Macroeconomic Perspective</i> , ed. Olivier de Bandt, Thomas Knetsch, Juan Penalosa and Francesco Zollino, 3-16. New York and Heidelberg: Springer.
2010	N62	Courtemanche, Charles, and Kenneth A. Snowden. 2010. <i>Repairing a Mortgage Crisis: HOLC Lending and its Impact on Local Housing Markets</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 16245. The Home Owners' Loan Corporation purchased more than a million delinquent mortgages from private lenders between 1933 and 1936 and refinanced the loans for the borrowers. Its primary goal was to break the cycle of foreclosure, forced property sales and decreases in home values that was affecting local housing markets throughout the nation. We find that HOLC loans were targeted at local (county-level) housing markets that had experienced severe distress and that the intervention increased 1940 median home values and homeownership rates, but not new home building.
2010	O22	McKenzie, David. 2010. "Impact Assessments in Finance and Private Sector Development: What Have We Learned and What Should We Learn?" <i>World Bank Research Observer</i>, 25(2): 209-33. Until recently rigorous impact evaluations have been rare in the area of finance and private sector development. One reason for this is the perception that many policies and projects in this area lend themselves less to formal evaluations. However, a vanguard of new impact evaluations on areas as diverse as fostering microenterprise growth, microfinance, rainfall insurance, and regulatory reform demonstrates that in many circumstances serious evaluation is possible. The purpose of this paper is to synthesize and distill the policy and implementation lessons emerging from these studies, use them to demonstrate the feasibility of impact evaluations in a broader array of topics, and thereby help prompt new impact evaluations for projects going forward.
2010	P12	Demele, Uwe. 2010. "Kritische Finanzethik. (Critical Financial Ethics. With English summary.)" <i>Zeitschrift für Wirtschafts- und Unternehmensethik</i>, 11(2): 139-59. The approach of critical financial ethics claims to illuminate the genesis and characteristics of these ethical problems. Arguments offered are based on revealing the profound connections between financial theory, acts, and impacts. It can be demonstrated that the financial sciences which nowadays dominate practical market action is not free of bias, ignores spill-over effects and follows its own myopic ideological argumentation in many ways. To momentous effects, financial theory not only tries to model human behaviour, it also conditions it. In combination with a mindset disconnected from responsibility for financial actions, there is little chance to avoid ethical problems except by exploring capitalism's more subtle workings. In conclusion. critical financial ethics professes that our personal financial actions must never exceed our capacity to oversee our money's whereabouts or its effects. This would be a fundamental step to-wards reducing the harm to people and environments from finance, whether it be in crisis or in ascension.)
2010	P28	Grigor'ev, L., and V. Kriukov. 2010. "The International Energy Industry at a Crossroads: Which Way Should Russia Choose?" <i>Problems of Economic Transition</i>, 53(6): 23-44. The article presents the main problems of the Russian oil and gas complex. The authors argue that the global economic and financial crisis has already led not only to a certain reduction in energy consumption but also to serious changes in the global energy sector. In the medium, term the authors expect more efforts in energy savings, climate change prevention, and a deeper impact of innovation. This may require a serious adaptation of the Russian energy sector to new tendencies.
2010	P42	Choudhury, Masudul Alam. 2010. "Islamic Perspective of Socioeconomic Development." <i>Journal of Islamic Economics, Banking and Finance</i>, 6(3): 37-54. The mainstream approaches to economic growth and development are examined critically against the understanding of sustainability in socioeconomic development in alternative paradigms of socioeconomic development. The ethical approaches to socioeconomic development in the literature are presented. Against the backdrop of such criticism to the mainstream theories of socioeconomic development and in cognizance of the ethical view of development sustainability, the Tawhidi epistemological methodology of unity of knowledge is presented to set the basis of the criticism revolving around the development sustainability concept. Finally, to exemplify the applications of the Islamic worldview and the model of development

Year	DE	Title and Abstract
		sustainability, some actual case studies are presented. These comprise examples of grassroots microenterprise development in a Bangladesh village, which is financed by the Zakat Fund, and the interactive, integrative, and evolutionary Tawhidi model used to evaluate the experience of Islamic banks in community and enterprise relationships in Indonesia. The development approach of Islamic Development Bank is critically evaluated against the reference to the essentially sustainable development experience of the learning model of unity of knowledge in the Islamic framework of socioeconomic development. Several Figures are used to bring out the technical nature of the socioeconomic development approaches according to the Islamic methodological worldview.
2010	Q11	Balaz, Peter, and Stanislav Zabožnik. 2010. "Contemporary Development of the Commodity Markets--Consequences and Challenges for the Revitalization of the World Economy." <i>Ekonomicky Casopis/Journal of Economics</i>, 58(9): 938-57. The paper analyzes selected examples of the impact that the economic crisis has had on the development of commodity markets and global economy. Authors focus mainly on the segment of energy resources, in which plays a dominant role crude oil and its condensates; it accentuates the highness of dependence between financial markets development (USD), and oil markets. This paper describes consequences of the energy markets development on strategic development plans of the EU. The revitalization of the global economy can only be successful if the result of coordinated strategic cooperation-oriented or even most affected national economies to international and supranational bodies, and without that they are not taken into account and target the interests of the various parts of the world economy.
2010	Q48	Sadorsky, Perry. 2010. "The Impact of Financial Development on Energy Consumption in Emerging Economies." <i>Energy Policy</i>, 38(5): 2528-35. Financial development is often cited as a very important driver of economic growth in emerging economies and it is thus likely that financial development affects energy demand. This study uses generalized method of moments estimation techniques to examine the impact of financial development on energy consumption in a sample of emerging countries. Several different measures of financial development are examined. Using a panel data set on 22 emerging countries covering the period 1990-2006, the empirical results show a positive and statistically significant relationship between financial development and energy consumption when financial development is measured using stock market variables like stock market capitalization to GDP, stock market value traded to GDP, and stock market turnover. The implications of these results for energy policy are discussed.
2010	Q56 Q57	Glemin, Pascal. 2010. "En quoi les finances responsables participent-elles a un autre mode de financement du developpement durable local? (How Responsible Finances Would Be in Charge with a New Financial Way for Local Sustainable Development? With English summary.)" <i>Economies et Societes</i>, 44(11): 1745-70. This research paper would like to try to qualify the optimal structure of financial systems, for going towards a local sustainable development. In that way, and even if we are in front of "a lack of surveys about this monetary economics topic" [Lopez, F. and Villanova, L. (2006), 306], we want to understand the all challenges that responsible finance has to consider, in order to diversify the local financial ecosystems.

2011	B13	Boianovsky, Mauro. 2011. "Wicksell on the American Crisis of 1907." <i>Journal of the History of Economic Thought</i>, 33(2): 173-85. The article discusses Knut Wicksell's interpretation of the American crisis of 1907, which he presented in a piece published in Swedish in 1908. Wicksell advanced, probably for the first time in the literature, a clear distinction between the "solvency" and "liquidity" of banks, and discussed its implications for the interpretation of crises. Moreover, he called attention to a third desirable attribute of a bank: "flexibility"; that is, the ability to satisfy credit demand at an adequate rate of interest. Wicksell linked that with his better known concept of the cumulative process and the stabilization policy associated with it.
2011	B13	CV: Winnett, Catherine P., and Adrian B. Winnett. 2011. "Innovation, Growth and Finance: Three (or Four or More) Stories from the 1930s and Their Lessons." 2011	B29	Leeson, Robert. 2011. "The MONIAC Updated for the Era of Permanent Financial Crises." <i>Economia Politica</i>, 28(0): 103-30. This paper updates the Phillips Machine (or "MONIAC") by including a malfunctioning financial sector. An augmented Phillips model is outlined which can provide a solution to the problem of unfunded retirement income liabilities (via James Meade's Consumed Income Tax Structure) whilst providing an uninterrupted flow of savings into the capital goods sector (thus insulating the macroeconomy from crises originating in the financial sector).
2011	C44	Osamwonyi, Ifuero Osad, Sunday Osaretin Igbino, and Joseph Efosa Aigboduwa. 2011. "Operations Research Models and Market Microstructure." <i>Asian-African Journal of Economics and Econometrics</i>, 11(2): 511-31. The interactions that occur in the securities market have been posited as being among the fastest, most information-intensive, and most highly strategic of all economic phenomena. In the last few years, both the theoretical and empirical researches on financial markets have grown; however, literature on market microstructure in emerging economies is still thin. This paper attempts to contribute to the needed literature. The paper reviews various structures and design of capital markets including the Nigerian Stock Exchange, and examines major microstructure theories. The relevance and implications for the Nigerian capital market are then identified, with a conclusion and suggestions on methods to improve the fortunes of investors especially during economic recession.
2011	C46	Barro, Robert J., and Tao Jin. 2011. "On the Size Distribution of Macroeconomic Disasters." <i>Econometrica</i>, 79(5): 1567-89. The coefficient of relative risk aversion is a key parameter for analyses of behavior toward risk, but good estimates of this parameter do not exist. A promising place for reliable estimation is rare macroeconomic disasters, which have a major influence on the equity premium. The premium depends on the probability and size distribution of disasters, gauged by proportionate declines in per capita consumption or gross domestic product. Long-term national-accounts data for 36 countries provide a large sample of disasters of magnitude 10% or more. A power-law density provides a good fit to the size distribution, and the upper-tail exponent, alpha, is estimated to be around 4. A higher alpha signifies a thinner tail and, therefore, a lower equity premium, whereas a higher coefficient

Year	DE	Title and Abstract
		of relative risk aversion, γ , implies a higher premium. The premium is finite if $\alpha > \gamma$. The observed premium of 5% generates an estimated γ close to 3, with a 95% confidence interval of 2 to 4. The results are robust to uncertainty about the values of the disaster probability and the equity premium, and can accommodate seemingly paradoxical situations in which the equity premium may appear to be infinite.
2011	E16	Touati, Karima, and Hamid Kherbachi. 2011. "Impact du secteur financier sur l'activite economique en Algerie par une MCSRF. (Impact of the Financial Sector on Economic Activity in Algeria by a Real Financial Social Accounting Matrix. With English summary.)" <i>Les Cahiers du CREAD</i>, 0(95): 5-26. This article tries to construct a real financial social accounting matrix for the Algerian economy for 2003 and we describe a number of multipliers in order to evaluate the impact of the financial sector on the real economy. We have simulated the effect of an increase in credits to the economy as well as a decrease in banking activities. The results show the weakness of the multiplier effect in Algeria and are basically identical to those of research works on developing countries.
2011	F00	Shachmurove, Tomer, and Yochanan Shachmurove. 2011. <i>Boom and Bust of the Spanish Economy</i>. Penn Institute for Economic Research, Department of Economics, University of Pennsylvania. PIER Working Paper Archive. Spain has experienced many financial crises through its history. These financial crises have varied origins. However, they do have common threads. The current recession and subsequent debt crisis follow the same pattern. The fiscal and monetary policies of the Spanish government have played a role in creating and prolonging the boom and bust cycles. Government spending, government regulation, credit institutions, budget deficits, the political climate, and international trade are discussed to illuminate the causes and effects of these business cycles. The Spanish government can take action to improve the economy and to lessen the effects of its financial crises.
2011	F52	Luparelli Mathieu, Miguel S., and Andres Montero Gomez. 2011. "Inteligencia prospectiva de seguridad economica. (With English summary.)" <i>Ekonomiaz</i>, 0(76): 38-63. World economic crisis has caused instability and insecurity in a way that Human Security was seriously challenged. Information failures as well as the incapacity to estimate an instable future has proved the needs for tools to estimate the future. Complexity within the international system makes unavoidable the existence of some unmeasurable uncertainty. Fortuitous events, or accidents, are one of the main future threats to world economic stability and security. The States are competing within the market against business companies for the benefits of strategic resources. Business intelligence and prospective (as a complementary discipline) are both necessary tools to compete in such a complex system.
2011	F53	Roe, Mark J., and Jordan I. Siegel. 2011. "Political Instability: Effects on Financial Development, Roots in the Severity of Economic Inequality." <i>Journal of Comparative Economics</i>, 39(3): 279-309. We here bring forward strong evidence that political instability impedes financial development, with its variation a primary determinant of differences in financial development around the world. As such, it needs to be added to the short list of major determinants of financial development. First, structural conditions first postulated by Engerman and Sokoloff (2002) as generating long-term inequality are shown here to have strong empirical support as exogenous determinants of political instability. Second, that exogenously-determined political instability in turn holds back financial development, even when we control for factors prominent in the last decade's cross-country studies of financial development. The findings indicate that inequality-perpetuating conditions that result in political instability and weak democracy are fundamental roadblocks for international organizations like the World Bank that seek to promote financial development. The evidence here includes country fixed effect regressions and an instrumental model inspired by Engerman and Sokoloff's (2002) work, which to our knowledge has not yet been used in finance and which is consistent with current tests as valid instruments. Four conventional measures of national political instability--Alesina and Perotti's (1996) well-known index of instability, a subsequent index derived from Banks' (2005) work, and two indices of managerial perceptions of nation-by-nation political instability--persistently predict a wide range of national financial development outcomes. Political instability's significance is time consistent in cross-sectional regressions back to the 1960s, the period when the key data becomes available, robust in both country fixed effects and instrumental variable regressions, and consistent across multiple measures of instability and of financial development. Overall, the results indicate the existence of an important channel running from structural inequality to political instability, principally in nondemocratic settings, and then to financial backwardness. The robust significance of that channel extends existing work demonstrating the importance of political economy explanations for financial development and financial backwardness. It should help to better understand which policies will work for financial development, because political instability has causes, cures, and effects quite distinct from those of many of the key institutions most studied in the past decade as explaining financial backwardness.
2011	G02	Lozano, Carmen, and Federico Fuentes. 2011. "The Overrating of Financial Expectations at the Origin of the Crisis: An Evaluation Using the Dempster-Shafer Credibility Function." <i>International Research Journal of Applied Finance</i>, 2(3): 251-69. This article is contextualized within the phenomenon of new financial instruments surfacing on the international economic scene, which has led to the emergence of speculative practices, credit expansion and the so-called stock market boom, which in turn has led to instability and the crisis that we are currently experiencing. An analysis of the possible causes that have prompted the emergence of the "illusion" that speculative financial transactions could generate profits without any risk is the starting point for this study, in which the Dempster-Shafer Theory is applied in order to establish a theoretical framework that might enable us to analyze the making of decisions with incomplete information and to quantify the credibility that investors give to information sources when it comes to the decision to buy sub-prime mortgage-backed securities.
2011	H12	Sazedj, Sharmin, and Jose Tavares. 2011. <i>Hope, Change, and Financial Markets: Can Obama's Words Drive the Market?</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 8713. Barack Obama's victory in the 2009 presidential elections in the United States is widely credited to his personal charisma and his extraordinary rhetorical powers, as revealed throughout the campaign. President Obama was inaugurated in the midst of the worst economic crisis in the country, when individuals and organizations yearned for leadership and signs of change. We code an array of rhetorical features in Obama's main speeches and press conferences and assess their impact on stock returns of the Dow Jones, S&P 500, and NASDAQ indices, at 3 and 7 day time horizons. We find that words matter. Paragraphs matter, too. We also uncover how some of Obama's rhetorical abilities that are politically effective seem to be perceived negatively by economic agents, and have a significant negative impact on stock returns.

		Epstein); financial services, the World Trade Organization, and initiatives for global financial reform (Chakravarthi Raghavan); cross-border tax evasion and Bretton Woods II (David Spencer); learning from the crisis--whether there is a model for global banking (Chandrasekhar); the Report of the Commission of Experts on Reform of the International Monetary and Financial System and its economic rationale (Jan Kregel); and special drawing rights and the reform of the global reserve system (Jose Antonio Ocampo).
2011	H68	Galati, Gabriele, John Lewis, Steven Poelhelke, and Chen Zhou. 2011. <i>Have market views on the sustainability of fiscal burdens influenced monetary authorities' credibility?</i>. Netherlands Central Bank, Research Department, DNB Working Papers. During the Great Crisis, most governments in industrial countries supported their domestic financial sector under stress and responded to strong declines in output growth with fiscal stimulus packages. Starting in 2010, attention focused on the sustainability of the resulting debt burdens. We conduct an empirical study to test whether in the United States, the euro area and the United Kingdom, views on the sustainability of fiscal burdens have influenced markets' assessment of central banks' commitment to price stability. Using a daily measure of inflation expectations extracted from nominal and indexed-linked government bonds, or inflation swaps, we test whether these react to alternative measures of fiscal burdens. These include rescue package announcements, credit default swap (CDS) spreads and changes in either the outlook or the credit rating of governments. We find no evidence of a significant effect of market participants' perceptions of fiscal burdens on long-term inflation expectations in the United States, the euro area and the United Kingdom. These results are broadly consistent with the view that long term inflation expectations have remained well anchored.
2011	H81 K23	Herd, Richard, Vincent Koen, Ila Patnaik, and Ajay Shah. 2011. <i>Financial Sector Reform in India: Time for a Second Wave?</i>. OECD Publishing, OECD Economics Department Working Papers: 879. The Indian financial system has changed considerably since the 1990s. Interest rates have been deregulated and new entrants allowed in the banking and the securities business. The Indian equity market has become world-class. New private banks have emerged that are more customer-oriented than the older state-owned banks. Meanwhile, the scale of saving within the economy has expanded considerably, much as in East Asian economies during their high-growth period. This adds to the need for further financial-sector reform. In particular, banks need much greater freedom in asset allocation. While public-sector banks did appear sounder to the public during the 2007/08 crisis due to implicit government backing, they ought to be privatised to improve their governance and minimise the recurrent need for recapitalisation. The remaining obstacles to new entry have to be reduced. Financial inclusion is an important priority and restrictions on microfinance should be avoided. The regulatory and legal framework also needs to be overhauled, consolidating the diverse legislation. While such reforms would improve financial sector efficiency they would also likely have positive spillover effects on the rest of the economy and help sustain rapid growth. This Working Paper relates to the 2011 OECD Economic Survey of India (www.oecd.org/eco/surveys/india)
2011	I31	Bano, Sayeeda, Sriya Kumarasinghe, and Yih Pin Tang. 2011. "Comparative Economic Performance and Stock Market Performance: Some Evidence from the Asia-Pacific Region." <i>Asian Journal of Finance and Accounting</i>, 3(1): 103-24. This study looks at interdisciplinary research in the fields of economics, finance and socioeconomic relations addressing the question whether the ranking of countries by major economic, social, and financial performance indicators provide any guide to the rate and pattern of growth and development in the Asia-Pacific region. The paper also examines the extent of balanced and sustained growth in 14 selected Asia-Pacific countries. It analyses data on MSCI returns, GDP growth, and HDI to rank and correlate the overall performance of each country during the 1993-2009 period. The Gini Index and CPI are also included to provide added insights. The results show that developing countries like India, Indonesia, Pakistan, and Sri Lanka are at the top on most of the financial and economic indicators, while Japan is the lowest except on HDI, where the bottom rankings goes to India, Indonesia and Pakistan. Overall, the results indicate no significant relationships between a country's stock market returns and its GDP growth. Nonetheless, the results suggest that for balanced and sustainable well-being, economic growth in the less-developed countries needs to be matched by concomitant improvements in social welfare, income distribution, transparency and accountability.
2011	J15 J71	Charles, Aurelie. 2011. "The Great Recession and Ethnic Inequality in the US Labour Force." <i>History of Economic Ideas</i>, 19(2): 163-76. Financial and managerial occupations are essentially characterised by a white labour force. Looking at the Current Population Survey (2009), the financial crisis has reinforced existing patterns of the us labour force in favour of the dominant identity: white. Using an identity model (Akerlof and Kranton 2010), this paper argues that the decision of principal (employers) to hire an agent (employee) is influenced by the identity to which they belong, and especially to the related social norms attached to their identity. As a result of the financial crisis, in increasing uncertain times, principals have adopted a survival strategy of their dominant identity rather than following the rationale behaviour of hiring the traditional agent i.e., the cheaper and more flexible part of the labour force: the young, female, non-white workforce.

2011	J60	Zhang, Yahong. 2011. <i>Financial Factors and Labour Market Fluctuations</i>. Bank of Canada, Working Papers. What are the effects of financial market imperfections on unemployment and vacancies? Since standard DSGE models do not typically model unemployment, they abstract from this issue. In this paper I augment a standard monetary DSGE model with explicit financial and labour market frictions and estimate the model using US data for the period 1964:Q1-2010:Q3. I find that the estimated degree of financial frictions is higher when financial data and shocks are included. The model matches the aggregate volatility in the data reasonably well. In particular, for the labour market, the model is able to generate highly volatile unemployment and vacancies, and a relatively rigid real wage. Further, I find that the financial accelerator mechanism plays an important role in amplifying the effects of financial shocks on unemployment and vacancies. Overall, financial shocks explain about 37 per cent of the fluctuations in unemployment and vacancies.

2011	K11 L52	Andrianova, Svetlana, Panicos Demetriades, and Chenggang Xu. 2011. "Political Economy Origins of Financial Markets in Europe and Asia." <i>World Development</i>, 39(5): 686-99. We provide historical evidence from London, Amsterdam and Hong Kong which highlights the essential role played by governments in kick-starting financial development. In the cases of London and Amsterdam, the emergence of financial markets was a by-product of the rise of large trading monopolies. These monopolies, partly created to improve public finances, were responsible for major financial innovations and helped to strengthen investors' property rights. In Hong Kong, where the financial development model was bank-based, a large banking monopoly with close links to both the British and Chinese governments, set up to finance international trade, played a similar role.

Year	DE	Title and Abstract
2011	L31	2011. "Gli interventi di: Giuseppe Guzzetti. (With English summary.)." <i>Risparmio</i>, 59(4): 7-24. The mission of those working in credit is in essence to transform savings into a factor of economic and social development. When the purpose of community service is not the driving force behind action, then there is something fundamentally flawed in the economy. The willingness of Italian banks to follow this line of thinking is confirmed by recent experience. Foundations have always done their part, seeking the right balance between the protection of their assets and the soundness of their investee banks. Holding their investments in Italian banks--and increasing them as far as possible--is in the interest of the country and of the Foundations themselves, because stronger and more competitive banks can better support the real economy, adequately protect investors and give more dividends! As regards donations by Foundations, although in the last two years they stopped growing, they have increased by about 10% since 2000, adjusted for inflation, while the value of the Foundations' net assets have even grown: in fact, since 1992 net assets adjusted for inflation have grown by 45%, with an average annual compound rate of 2.2%.

2011	L61	Morales, Lucia, and Bernadette Andreosso-O'Callaghan. 2011. "Comparative Analysis on the Effects of the Asian and Global Financial Crises on Precious Metal Markets." <i>Research in International Business and Finance</i>, 25(2): 203-27. The global financial crisis has vigorously struck major financial markets around the world, in particular in the developed economies since they have suffered the most. However, some commodity markets, and in particular the precious metal markets, seem to be unscathed by this financial downturn. This paper investigates therefore the nature of volatility spillovers between precious metal returns over fifteen years (1995-2010 period) with the attention being focused on these markets' behavior during the Asian and the global financial crises. Daily closing values for precious metals are analyzed. In particular, the variables under study are the US\$/Troy ounce for gold, the London Free Market Platinum price in US\$/Troy ounce, the London Free Market Palladium price in US\$/Troy ounce, and the Zurich silver price in US\$/kg. The main sample is divided into a number of sub periods, prior to, during and after the Asian crisis. The aim of this division is to provide a wide and deep analysis of the behavior of precious metal markets during this financial event and of how these markets have reacted during times of market instability. In addition, this paper also looks at the effects of the global financial crisis from August 2007 to November 2010 using GARCH and EGARCH modeling. The main results show that there is clear evidence of volatility persistence between precious metal returns, a characteristic that is shared with financial market behavior as it has been demonstrated extensively by the existing literature in the area. In terms of volatility spillover effects, the main findings evidence volatility spillovers running in a bidirectional way during the periods; markets are not affected by the crises, with the exception of gold, that tends to generate effects in all other metal markets. However, there is little evidence in the case of the other precious metals generating any kind of influence on the gold market. On the other hand, there is little evidence of spillover effects during the two crisis episodes. Finally, the results from asymmetric spillover effects show that negative news/information have a stronger impact in these markets than positive news, again a characteristic that has been also exhibited by financial markets.

2011	L92	Haralambides, Hercules, and Girish Gujar. 2011. "The Indian Dry Ports Sector, Pricing Policies and Opportunities for Public-Private Partnerships." <i>Research in Transportation Economics</i>, 33(1): 51-58. At the time of writing (2010), the world is witnessing the aftermath of the most severe financial sector meltdown in modern economic history caused by the real estate bubble in the United States. Its consequences on the real economy, especially in Europe, are yet to be fathomed, and this of course includes the longer-term impacts on international ocean transportation, ports, and the distribution of global production. The economic recession has left the international shipping and port sectors with substantial overcapacity. This has resulted in drastic cost cutting measures on the one hand, and voluntary, often consensual, and coordinated reduction of supply on the other. These measures, together with a noticeable recovery in demand, are gradually leading again to improvement in prices charged by carriers and other transport service providers. In view of the country's expanse; size of population; and regional inequalities, India's dry ports (inland cargo consolidation and distribution centres) are seen by the government as a pivot of export-led growth and economic development (Haralambides and Gujar, 2011). Moreover, public and private sectors alike see the coordinated development of dry ports as the only way forward in terms of easing pressures at congested coastal ports, thus improving supply chain efficiency. In spite of this, dry port development and operations are still dominated by the public sector, under prices, capacity, land acquisition policies, and other conditions that make private sector participation risky and comparatively unattractive. In order to rationalize dry port capacity and prices, this paper argues in favour of greater devolution through competition-enhancing public-private partnerships (PPPs). The paper puts forward recommendations for the necessary legal, regulatory and general economic policy interventions based on international best practice, while keeping Indian specificities in the right perspective.

2011	O44	Jalil, Abdul, and Mete Feridun. 2011. "The Impact of Growth, Energy and Financial Development on the Environment in China: A Cointegration Analysis." <i>Energy Economics</i> , 33(2): 284-91. This article aims to investigate the impact of financial development, economic growth and energy consumption on environmental pollution in China from 1953 to 2006 using the Autoregressive Distributed Lag (ARDL) bounds testing procedure. The main objective is to examine the long run equilibrium relationship between financial development and environmental pollution. The results of the analysis reveal a negative sign for the coefficient of financial development, suggesting that financial development in China has not taken place at the expense of environmental pollution. On the contrary, it is found that financial development has led to a decrease in environmental pollution. It is concluded that carbon emissions are mainly determined by income, energy consumption and trade openness in the long run. Moreover, the findings confirm the existence of an Environmental Kuznets Curve in the case of China.
2011	P32	China's Financial Policy Research Center of Renmin University of China, ed. 2011. <i>Growth without Crisis: China's Modern Financial System</i>, Translated by Mifen Yang and Xiaoqiao Xing. Honolulu and Hong Kong: Enrich Professional Publishing. English translation of 2009 Chinese text. Thirteen papers examine the financial system governing financial growth in China, the fiscal policies that influence the institutional structure and reform, and the theory of the formation of equilibrium exchange rate of the renminbi and the political-economic mechanism of exchange rate reform. Papers discuss fiscal decentralization, local government behavior, and economic growth (Qingwang Guo and Junxue Jian); high-speed growth of taxation in China--tax capacity and tax effort (Guo and Bingyang Lu); tax burden in China--a multiperspective analysis (Guo and Lu); a reinterpretation of the modern financial system--theory and choices based on the reality of China's endowment (Yulu Chen and Yong Ma); the effects and transmission mechanism of China's monetary policy--an analysis based on the structural vector autoregression model (Qiang Qu); China's high monetization (Jie Zhang); the capital fund of China's state-owned banks (Zhang); China's agricultural credit system (Zhang); the renminbi equilibrium exchange rate--theoretical origin and the political economy of the exchange rate (Chen); whether Chinese peasants are credible (Chen and Ma); the abnormal relations between stock market and economic growth--theoretical and empirical evidence based on China (Changyun Wang and Zhiwen Wu); the preference of Chinese listed companies for equity financing--evidence and analysis (Wang and Tong Sun); and backward development of the Chinese bond market--an analysis based on corporate bonds (Haixiao Wang and Qiang Qu).
2011	P40	Asari, Abbas, Mohsen Khezri, and Ahmad Rasooli. 2011. "Capital Market Equilibrium in the Islamic Economy. (In Farsi. With English summary.)" <i>Biquarterly Journal of Economic Essays</i> , 7(14): This paper investigates the capital market equilibrium in an Islamic Economy by modeling the behavior of economic agents in an Islamic economy and developing a general equilibrium mode. Accordingly, the authors have tried to determine the capital market regulator variable by determining the affecting factors on supply and demand of capital in an economy without interest. According to the result, compared with an economy with interest that determined exogenous interest rates in the money market is a regulator for the capital market. The variable profit sharing ratio of families in the productive partnership is earned as a capital market endogenous regulator variable in an economy without interest. Also in this article, capital market equilibrium point and maximum production point of producers is obtained, which means more investment in an economy interest-free to the economy with interest.
2011	P52	Konzelmann, S., and M. Fovargue-Davies. 2011. <i>Anglo-Saxon Capitalism in Crisis? Models of Liberal Capitalism and the Preconditions for Financial Stability</i>, ESRC Centre for Business Research, ESRC Centre for Business Research - Working Papers. The return to economic liberalism in the Anglo-Saxon world was motivated by the apparent failure of Keynesian economic management to control the stagflation of the 1970s and early 1980s. In this context, the theories of economic liberalism, championed by Friederich von Hayek, Milton Friedman and the Chicago School economists, provided an alternative. However, the divergent experience of the US, UK, Canada and Australia reveals two distinct 'varieties' of economic liberalism: the 'neo-classical' incarnation, which describes American and British liberal capitalism, and the more 'balanced' economic liberalism that evolved in Canada and Australia. In large part, these were a product of the way that liberal economic theory was understood and translated into policy, which in turn shaped the evolving relationship between the state and the private sector and the relative position of the financial sector within the broader economic system. Together, these determined the nature and extent of financial market regulation and the system's relative stability during the 2008 crisis.
2011	Q21	Fumagalli, Andrea, and Stefano Lucarelli. 2011. "Penser la crise et la sortie de crise. Les apports de Andre Orlean, et au-dela. (Thinking about the Crisis and Its End: The Contribution of Andre Orlean, and Beyond. With English summary.)" <i>European Journal of Economic and Social Systems</i> , 24(1-2): 195-210. Orlean's research has its first references in the notions of uncertainty, mimetism, convention and self-referentiality of markets. We will discuss the theoretical categories that Orlean used. Secondly, we will present his analysis of the current financial and economic crisis. Finally we will discuss the possible scenarios to overcome the crisis and the emergence of new "financial conventions" based on the predation of the Common. It is strong the need of a democratic process that could lead to new institutional mechanisms towards a collective evaluation that is alternative to the financial logic. We have a close questioning of the political problems posed by scholars from the theoretical tradition of the Italian Workerism when they focus on the "Institution of the Common".
2011	Q37	Ntsosa, Mogale. 2011. "The Impact of 2007 Global Financial Crisis on Botswana Economy." <i>Asian-African Journal of Economics and Econometrics</i> , 11(1): 45-63. The purpose of this paper is to investigate the impact of the global financial crisis of 2007-2009 on Botswana economy. The impact on the economy was through second round effects. The country depends heavily on mineral exports to developed countries. Since the financial crisis significantly reduced the purchasing power in developed countries, the result has been a significant fall in export revenues for the country. Overall balance of payments, GDP and FDI fell significantly. The stock market was also affected while employment was relatively stable. The government responded with aggressive stimulus that was meant to maintain aggregate demand and minimize job losses. The stimulus worked although there are threats of excessive debt in the future. The paper suggests, among others, that the country should work on developing domestic demand and expanding into Africa since the continent is relatively delinked from the rest of the world.

2012	A14 H10	Wray, L. Randall. 2012. "A Meme for Money". Levy Economics Institute, The. Economics Working Paper Archive This paper argues that the usual framing of discussions of money, monetary policy, and fiscal policy plays into the hands of conservatives. That framing is also largely consistent with the conventional view of the economy and of society more generally. To put it the way that economists usually do, money "lubricates" the market mechanism-a good thing, because the conventional view of the market itself is overwhelmingly positive. Acknowledging the work of George Lakoff, this paper takes the position that we need an alternative meme, one that provides a frame that is consistent with a progressive social view if we are to be more successful in policy debates. In most cases, the progressives adopt the conservative framing and so have no chance. The paper advances an alternative framing for money and shows how it can be used to reshape discussion. The paper shows that the Modern Money Theory approach is particularly useful as a starting point for framing that emphasizes use of the monetary system as a tool to accomplish the public purpose. It is not so much the accuracy of the conventional view of money that we need to question, but rather the framing. We need a new meme for money, one that would emphasize the social, not the individual. It would focus on the positive role played by the state, not only in the creation and evolution of money, but also in ensuring social control over money. It would explain how money helps to promote a positive relation between citizens and the state, simultaneously promoting shared values such as liberty, democracy, and responsibility. It would explain why social control over money can promote nurturing activities over the destructive impulses of our "undertakers" (Smith's evocative term for capitalists).
2012	B40	Dow, Sheila C. 2012. "Different Approaches to the Financial Crisis." <i>Economic Thought: History, Philosophy, and Methodology</i>. 1(1): 80-93. The economic crisis has exposed shortcomings in standard economic theory and provided an impetus for new economic thinking. But the theoretical debate in the wake of the crisis has been unduly constrained by the terms of the mainstream approach to economic theory. Like any approach, it is characterised by a way of framing reality, giving meaning to terms and setting criteria for good argument. It also determines how any economic theory is understood, whether from the history of economic thought or from the contemporary literature. But there are other approaches to economics which would open up the field to a much wider range of possibilities for new economic thinking. Addressing the challenge that any reader bases her understanding on her own approach, the purpose of this paper is to attempt to explain what it means to consider different approaches and why it matters for policy. This is done by discussing two features of the financial crisis which pose particular problems for economic theory. These are the role of changing market sentiment in driving asset prices on the one hand and the breakdown of trust relationships in banking on the other (the moral hazard issue). We will see how these are addressed by mainstream theory and by alternative approaches. First, market sentiment is discussed within the mainstream rational-optimising framework, where risk is quantifiable, and compared with the Keynesian approach based on the general uncertainty of knowledge, where reason, evidence and sentiment are integrated. The moral hazard issue is then discussed in its mainstream form in terms of rational opportunism and in its institutionalist form in terms of the foundation of social relations (including relations between institutions) in trust. It is shown that different ways of approaching theorising in each case imply different policy measures. It is argued further that an exclusively deductive mathematical approach to analysis of market sentiment and trust is unduly limiting and that a more pluralist approach would more fully address the issues.
2012	C73	Shubik, Martin. 2012. <i>Mathematical Institutional Economics</i>. Cowles Foundation for Research in Economics, Yale University, Cowles Foundation Discussion Papers: 1882. An overview is given of the utilization of strategic market games in the development of a game theory based theory of money and financial institutions.
2012	C83	Entorf, Horst, Christian Knoll, and Liliya Sattarova. 2012. "Measuring Confidence and Uncertainty during the Financial Crisis: Evidence from the CFS Survey." <i>OECD Journal: Journal of Business Cycle Measurement and Analysis</i>, 0(0): 61-75. The CFS survey covers individual situations of banks and other companies of the financial sector. This provides a rare opportunity to analyse appraisals, expectations and forecast errors of the core sector of the recent financial crisis. Following standard ways of aggregating individual survey data, we first present and introduce the CFS survey by comparing CFS indicators of confidence and predicted confidence to Ifo and ZEW indicators. The major contribution is the analysis of several indicators of uncertainty. In addition to well-established concepts, we introduce innovative measures based on the skewness of forecast errors and on the share of "no response" replies. Results show that uncertainty indicators fit quite well with patterns of real and financial time series of the time period 2007 to 2010.
2012	D44	Diss: Huang, Pidong. 2012. Essays in Monetary and Banking Theory. PhD diss. Pennsylvania State University. The thesis consists of the following three essays. The first essay, "A comment on: 'Efficient propagation of shocks and the optimal return on money'" (joint work with Yoske Igarashi), shows that introducing lotteries into Cavalcanti-Erosa (2008) eliminates two prominent features of their optima: over-production and history-dependence. Cavalcanti-Erosa (2008) study optima in a version of Trejos-Wright (1995). They introduce into it i.i.d. aggregate shocks to preferences, shocks with a two-point support. They show that for an interval of intermediate magnitudes for the discount factor, the ex ante optimum over all individually rational (IR) and deterministic trades displays two properties: output is higher than the first-best when the shock is such that the first-best output is low and there is history dependence--that is, promised utilities play a role. We show that if lotteries are allowed, then higher ex ante utility is achieved and neither property holds at an optimum. Moreover, the optimum can be supported by buyer take-it-or-leave-it offers. The second essay, "Suspension in a global-games version of the Diamond-Dybvig model", builds on the model in Goldstein and Pauzner (GP) (2005), a global-games version of the Diamond-Dybvig (DD) (1983) model in which there is uncertainty about the long-run return and in which agents observe noisy signals about that return. GP limited their investigation to a banking contract that makes a noncontingent promised payoff to those who withdraw early until the bank's resources are exhausted. We amend the contract and permit suspension. There are two reasons to do this. First, suspension works perfectly in the no-aggregate-risk version of the DD model. (It uniquely implements the first-best outcome.) Because versions of GP are close to that model, it is plausible that suspension would also work well in such versions. Second, as I show, there is a class of suspension policies that gives rise to uniqueness without requiring the new assumption introduced in a proof in GP; namely, that the short-term return is also random. In general, both the GP policy and my generalization of it to allow suspension seem not to be best banking contracts in a model with return uncertainty and signals about it. Viewed as mechanisms, there is no attempt to elicit information about the signals that agents receive and to make payoffs to at least some depositors contingent on that information.

Year	DE	Title and Abstract
		However, if the return uncertainty is sufficiently small, then there are policies in the class I study that imply ex ante welfare close to the first-best outcome in DD, which, itself, is an upper bound on welfare in the model with return uncertainty. Moreover, for one such policy, noisy signals are not necessary for uniqueness. In other words, the properties of the DD suspension policy are robust to the kind of uncertainty introduced by GP, provided it is small. The virtue of that uncertainty is that in a long sequence of i.i.d. realizations of the model, all of the following four outcomes occur with positive probability: good long-run return, poor long-run return, suspension not invoked and suspension invoked. Put differently, the model with a small amount of GP uncertainty combined with a banking contract that permits suspension does well in terms of ex ante welfare and is able to account for a rich history of banking-system outcomes, including ones with banking-system difficulties. Essay 3, "Why ten \$1s are not treated as a \$10?", (joint work with Yoske Igarashi) explores, as Zhu (2003) shows, the existence of his full-support steady state implies the existence of non-full-support steady states constructed as follows. Consider the full-support steady state in a given economy. Then consider a different economy where both the bound and the total stock of money are some integer L times as much, relative to the original economy. In this new economy, there is a non-full-support steady state where all the owned/traded units of money are also L times as much, but the quantity of production of goods remains unchanged. In other words, the difference between the original full-support steady state and the induced non-full-support steady state is nominal, although the difference between the two economic environments is not. Since the new economy has its own full-support steady state, there is multiplicity of steady states. We show that the non-full-support steady states of the above kind are unstable. Specifically, it is shown that there is no equilibrium path with a constant payment rule that converges to these steady states if the initial distribution has a different support.

2012	I14 I15	Lopez i Casanovas, Guillem, and Marina Soley Bori. 2012. "The Economic Crisis and Its Effects on the Social Determinants of Health." Hacienda Publica Espanola/Revista de Economia Publica, 0(201): 113-32. With the economic crisis, the fight against unemployment in most countries is coetaneous to the need to restrain public expenditure in closing budget deficits. As a consequence, spending cuts have started to affect a large number of decisions that directly or indirectly may be expected to have an impact on health. These effects are likely to be unevenly distributed among different groups within the population. Therefore, not just health levels but also their distribution may be at risk with the financial consequences of the crisis. The main message of this paper is to first show social concern on the nature of the trade-offs in redefining expenditure priorities. On the prescriptive side of our work we argue that in the present situation we should not focus so much on health expenditure as we should on the social protection system as a whole. In addition, fighting against poverty (and not focusing so much on income inequality in itself) should be the most important consideration for health policy design. Thus, more selective, tailored made combinations of integrated policies should be addressed. Fragile groups need to be prioritized at this stage in battling toward poverty alleviation (poverty induces health losses) and for a sound job creation economy (workfare strategies require health at the same time that they produce health). Universal old-style welfare policies commonly lack focus, are not financially sustainable, and, overall, they have lower redistributive impacts. Random, poorly understood effects in welfare may result from these policies due to side effects from economic crisis, unemployment and changes in life style. Results may also depend on the type of groups benefiting from sustained social spending in practice. A welfare function is required in order to compare "losers" and "winners." This is a part of the second welfare theorem where non-superior Pareto agreements are achievable, and lack of consensus may easily emerge in designing health strategies since politics may not build the necessary consensus for policies.
2012	I15 J20	CV : Stockhammer, Engelbert. 2012. "Still Unemployed, after All These Wage Cuts: Labor in Europe." In <i>Employment, Growth and Development: A Post-Keynesian Approach</i> , ed. 2012	J22	Kanellopoulos, Costas N. 2012. "The Size and Structure of Uninsured Employment." Bank of Greece Economic Bulletin, 0(37): 23-41. The paper challenges the accuracy of the high rates of uninsured employment i.e., one in three, that emerge from the investigations of the Inspectorate of Labour, because they are based on biased samples. Comparing those insured with the Social Security Foundation (IKA) with those estimated from the Labour Force Survey, generates a rate of uninsured employment of 11.7%. When employment of illegal immigrants is added, the uninsured employment rate is estimated at around 17% of those employed and insured with IKA or 9% of total employment. While uninsured employment initially increased with the economic crisis, subsequently, like insured employment, it declined remarkably. The usual categories of uninsured employment are those insured for the minimum work days necessary to claim various benefits, those with a second job, working pensioners, as well as those declaring the minimum insurable pay.
2012	J51	Gatti, Donatella, Christophe Rault, and Anne-Gael Vaubourg. 2012. "Unemployment and Finance: How Do Financial and Labour Market Factors Interact?" Oxford Economic Papers, 64(3): 464-89. Using annual data for 18 OECD countries over the period 1980-2004, we investigate how labour and financial factors interact to determine unemployment. We estimate a dynamic panel model using the system Generalized Method of Moments (GMM). It is shown that the impact of financial variables depends strongly on the labour market context. Increased market capitalization as well as decreased banking concentration reduce unemployment if the level of labour market regulation, union density, and coordination in wage bargaining is low. Increasing intermediated credit and banking concentration is beneficial for employment when the degree of labour market regulation, union density, and wage coordination is high. These results suggest that the respective virtues of intermediated and market-based finance are crucially tied to the labour market context
2012	J51	Kus, Basak. 2012. "Financialisation and Income Inequality in OECD Nations: 1995-2007." Economic and Social Review, 43(4): 477-95. This paper attempts to examine the link between financialisation and income inequality in advanced countries from a comparative perspective using data from 20 OECD countries over a period of 13 years (1995-2007). The initial regression results show an overall strong correlation between several of the financialisation indicators and income inequality net of conventional explanations including economic growth rate, unemployment, globalisation, left party power, social spending, union density, female participation in the labour market, and wage bargaining centralisation. The results also show that although financialisation

Nevertheless, Italian banks are an element of strength and a vital resource for the recovery and, as the country, are facing a great opportunity for carrying out the restructuring processes already launched.
2012	L62	Hiraide, Norikatsu, and Kalyan Chakraborty. 2012. "Surviving the Global Recession and the Demand for Auto Industry in the U.S.--A Case for Ford Motor Company." <i>International Journal of Economics and Finance</i> , 4(5): 85-93. The world economy has been severely affected by the global recession which started in the second quarter of 2007, triggered by the financial crisis. The auto industry in the U.S. faced the most severe difficulties which threatened its survival after the recession. In the U.S., the "Big 3"--General Motors, Ford, and Chrysler, struggled to stay in business. This paper analyzes the impact of the recent downturn on the U.S. auto industry in general, and the demand of Ford vehicles in particular. The study also discusses the past and present performance of Ford Motor Company in the light of changing economic conditions at home and abroad. The empirical study uses twenty years of sales data to estimate a time-series demand model for Ford vehicles. The study found that the demand for automobiles in the U.S is positively related to non-farm employment and single family housing and negatively related to gas price and vehicle price.
2012	L65	Jasra, Javed Mahmood, Rauf I-Azam, and Muhammad Asif Khan. 2012. "Impact of Macroeconomic Variables on Stock Prices: Industry Level Analysis." <i>Actual Problems of Economics</i> , 134(8): 403-12. This study examines the relationship between stock prices and interest rate, exchange rate and consumer price index (CPI). Four different industries were selected for this study on the basis of data availability, these industries included oil and gas, chemical, cement and insurance industry. The data for the selected industries and economic variables were obtained for the period of six years (24 quarters). Regression analysis was used to analyze the impact of exchange rate, interest rate and consumer price index on stock returns. Stock index is used as a dependent variable and the macroeconomic variables are used as independent variables. Results of the study show that the impact of interest rate on oil and gas, chemical and cement industry are insignificant, while it has significant effect on insurance industry. When the impact of consumer price index is determined it shows significant effect on oil and gas, chemical, cement industry and insurance industry respectively. The exchange rate showed significant negative effect on all four industries.

With English summary.)." <i>Actual Problems of Economics</i> , 129(3): 86-94. The article generalizes the theoretical approaches to the essence of credit process and creation of mechanism for the financial-credit interaction between banks and enterprises. The conceptual model of the mechanism for the financial-credit interaction between banks and national economy based on the principles of marketing is constructed, and the analysis of its elements and functional relations is carried out.
2012	N81	Frydman, Carola, Eric Hilt, and Lily Y. Zhou. 2012. <i>Economic Effects of Runs on Early 'Shadow Banks': Trust Companies and the Impact of the Panic of 1907</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 18264. We use the unique circumstances that led to the Panic of 1907 to analyze its consequences for non-financial corporations. The onset of the panic occurred following a series of scandalous revelations about the investments of prominent financiers, which triggered widespread runs on trust companies associated with those men. Using newly collected data, we find that corporations with close ties to the trust companies that faced severe runs experienced an immediate decline in their stock price, and performed worse in the years following the panic: they earned fewer profits and paid fewer dividends, and faced higher interest rates on their debt. Consistent with the notion that information asymmetries aggravated the consequences of the contraction of credit intermediation, these effects were largest for smaller firms and for industrials, whose collateral was more difficult to value than that of railroads.
2012	P50	Clift, Ben. 2012. "Comparative Capitalisms, Ideational Political Economy and French Post-Dirigiste Responses to the Global Financial Crisis." <i>New Political Economy</i> , 17(5): 565-90. This article advances the case for the more systematic incorporation of ideational factors into comparative capitalisms analysis as a corrective to the rational choice proclivities of the Varieties of Capitalism approach. It demonstrates the pay-off of such an ideationally attuned approach through analysis of French capitalist restructuring over the last 25 years, placing it in comparative context. A modus operandi for such ideational explanation is elaborated through delineating different national conceptions of the market, and setting out their impacts on practices of market-making. The claim made in this article is that understanding the evolution of French capitalism requires recognition of the ongoing market-making role of the French State, in combination with the French conception of the market and its embedding within a social context characterised by the inter-penetration of public and private elitist networks of France's 'financial network economy' which remains substantially intact. The ideational dimension is crucial because French understandings of the market and competition, the ideational building blocks of market-making, inform French state interventions and leave footprints on French institutions and market structures, and the evolutionary trajectory of French capitalism. In charting this trajectory, this article deploys the concept of post-dirigisme. We map out the parameters and causes of the post-dirigiste condition in France through examination of French bond market development, privatisation, the shift from a government- to a market-dominated financial system, and French capitalism's internationalisation. It then uses post-dirigisme to explain French state responses to the financial crisis and the banking bailout, noting how state actors, in concert with the banking elites, actively facilitated dominant market positions of French international champions.
2012	Q02	Tang, Ke, and Wei Xiong. 2012. "Index Investment and the Financialization of Commodities." <i>Financial Analysts Journal</i> , 68(6): 54-74. The authors found that, concurrent with the rapidly growing index investment in commodity markets since the early 2000s, prices of non-energy commodity futures in the United States have become increasingly correlated with oil prices; this trend has been significantly more pronounced for commodities in two popular commodity indices. This finding reflects the financialization of the commodity markets and helps explain the large increase in the price volatility of non-energy commodities around 2008.
2012	Q17	Goswami, Bhaskar, and Ranjanendra Narayan Nag. 2012. "Macroeconomics of Agricultural Trade Liberalization." <i>Global Economic Review</i> , 41(3): 233-42. In this article a macroeconomic model is built to examine interactions between the agricultural sector and the industrial sector in an emerging market economy. This article examines how monetary shock and real shocks produce agricultural price fluctuations and change in employment through multiple cross effects. Monetary shocks result in overshooting of primary commodity price while real shock in terms of rise in the production of primary commodity mitigates the volatility of primary price.

2012	R20	Geanakoplos, John, Robert Axtell, Doyne J. Farmer, Peter Howitt, Benjamin Conlee, Jonathan Goldstein, Matthew Hendrey, Nathan M. Palmer, and Chun-Yi Yang. 2012. <i>Getting at Systemic Risk via an Agent-Based Model of the Housing Market</i>. Cowles Foundation for Research in Economics, Yale University, Cowles Foundation Discussion Papers: 1852. Systemic risk must include the housing market, though economists have not generally focused on it. We begin construction of an agent-based model of the housing market with individual data from Washington, DC. Twenty years of success with agent-based models of mortgage prepayments give us hope that such a model could be useful. Preliminary analysis suggests that the housing boom and bust of 1997-2007 was due in large part to changes in leverage rather than interest rates.
2013		
2013	A20	Diss; Benner, Mats, ed. 2013. <i>Before and Beyond the Global Economic Crisis: Economics, Politics and Settlement</i> , Cheltenham, U.K. and Northampton, Mass.: Elgar. Twelve papers explore the long-term impact of the 2007-08 financial crisis and consider whether we are about to enter a new era in state-society-market interaction that will transform the finance-led economic growth model. Papers discuss crisis, structural change, and new conditions for growth (Lennart Schon); responding to economic crisis--macroeconomic revolutions in the 1930s and 1970s (Roger E. Backhouse); the efficient-markets hypothesis after the crisis--a methodological analysis of the evidence (Fredrik Hansen); macroeconomics after the crisis--bringing finance back in (Robert Boyer); discursive strategies in economic texts (Jan Svensson); regulating the family in times of economic crisis--Sweden in the 1930s and the 1990s (Asa Lundqvist); economic crises as political opportunities (Johannes Lindvall); the "new new deal" as a response to the eurocrisis (Bengt-Ake Lundvall); a cultural political economy of crisis responses--the turn to the "BRIC" countries and the case of China (Ngai-Ling Sum); the metaphor challenge of future economics--growth and sustainable development in Swedish media discourse (Anna W. Gustafsson); macroprudential supervision and regulation--lessons for the next crisis (Lars Jonung); and recovered imaginaries, imagined recoveries--a cultural political economy of crisis construals and crisis management in the North Atlantic financial crisis (Bob Jessop).
2013	A20	Lo Prete, Anna. 2013. "Economic Literacy, Inequality, and Financial Development." <i>Economics Letters</i>, 118(1): 74-76. Empirical studies of the link between finance and inequality document that across countries financial development is associated with lower and decreasing income inequality. This article uses an indicator of economic literacy as a proxy for the ability to reap the benefits of financial investment opportunities, and documents that such specific competences matter for the relationship between changes in inequality and financial development. As financial markets become more sophisticated, the ability to take advantage of new investment opportunities may help reduce inequality, and the empirical association between financial development and lower income inequality indeed appears to be driven by economic literacy.
2013	B54	Fukuda-Parr, Sakiko, James Heintz, and Stephanie Seguino. 2013. "Critical Perspectives on Financial and Economic Crises: Heterodox Macroeconomics Meets Feminist Economics." <i>Feminist Economics</i>, 19(3): 4-31. This contribution brings together various strands of analysis about the causes, consequences, and policy ramifications of economic crises, with a specific focus on distributional dynamics. It aims to facilitate a conversation between macroeconomic theorists of crises and instability and feminist economists and scholars of intergroup inequality. Macroeconomic analyses of the Great Recession have centered on the causal role of financial deregulation, capital flow imbalances, and growth of income and wealth inequality. That work tends to be divorced from research that analyzes broader distributional impacts, prior to the crisis and subsequently, transmitted through economic channels and government responses. This study's framework emphasizes the role of stratification along multiple trajectories--race, class, and gender--in contributing to economic crises and in shaping their distributional dynamics. The study underscores the long-run effects of the 2008 crisis on well-being, highlighted in feminist economists' research on social reproduction and often missed in the macroeconomics literature.
2013	B54	McKay, Ailsa, Jim Campbell, Emily Thomson, and Susanne Ross. 2013. "Economic Recession and Recovery in the UK: What's Gender Got to Do with It?" <i>Feminist Economics</i>, 19(3): 108-23. This study argues that a feminist economics perspective is essential in order to fully understand the gender consequences of the recent recession and the ongoing economic crisis in the United Kingdom. Unemployment and redundancy rates have been used to highlight the fact that male workers suffered the greatest impact in terms of job losses in the initial phases of the recession. However, this situation appears to have reversed with an associated program of spending cuts in public sector employment and welfare that will likely be borne by women. While accurate data are crucial in the analytical process, the exclusive use of statistics relating to paid work only gives a partial analysis. A more inclusive understanding of the range of impacts on both men and women is more useful in the formulation of gender-aware, as opposed to gender-blind, policy responses to recession and recovery.
2013	B59	Va'aez, Mohammad, and Shahram Moeeni. 2013. "Short-Run Speculation in Economic and Financial Markets: Juridical and Economic Analysis. (In Farsi. With English summary.)" <i>Biquarterly Journal of Economic Essays</i>, 10(20): 29-56. Uncertainty about the legitimacy of speculative transaction in economic and financial markets has created widespread controversial discussions among Islamic scholars. To recognize the nature of short-run speculative financial transactions from an Islamic viewpoint, through this paper, first, the relationship of these discussions with Keynes in one hand and Gharar, Gambling and Wager in the other hand were examined. Then, this research studied the nature of Keynesianism. At last, it was tried to understand the nature of short-run speculative transactions from an Islamic point of view conceptually and analytically. The results showed that all short-run financial transactions that strongly have the nature of zero or negative sum games are not illegal. These transactions have a betting nature via unusual normal risk. We have frequently experienced them in exchange markets. It also revealed that it is not obligatory for entering the betting activities based only on chance according to jurisprudential principles. Entering such activities with prediction and estimation does not make them eligible. It was finally concluded that disregarding the doubt about being Keynesian concerning the short-run speculative transactions, these transactions can be considered as the instances of Gharar and betting.
2013	B59	Sobhani, Hasan, and Mansoor Maleki. 2013. "Endogeneity of Money in Islamic Monetary and Financial System: A Comparative Study with the Post-Keynesian Approach on Money. (In Farsi. With English summary.)" <i>Biquarterly Journal of Economic Essays</i>, 10(20): 9-28. Money is one of the most challenging concepts in economics about which economists have always had serious disputes with each other. During the history of economics development, all different schools of thought have tried to explore the true meaning of money and its real origins. It seems that one of the most important causes of having different cognition about the true meaning of money refers to the concept of endogeneity of money. This issue is an important part of the post-Keynesian approach to money. Because of the necessity of studying the theoretical aspect of monetary economy in the cortex of Islamic

Year	DE	Title and Abstract
		monetary and financial system, in this paper we are going to analyze the concept of the endogeneity of money by a comparative study with other school of thoughts significantly, post-Keynesian and orthodox approach to money. Based on the result of this comparative study, although, money in the Islamic approach follows the endogenous process of creation, but this process and analyzing the Islamic endogenous money is fundamentally different from the post Keynesian view.
2013	C49	Chang, Tsangyao, Xiao-lin Li, Stephen M. Miller, Mehmet Balcilar, and Rangan Gupta. 2013. <i>The Co-Movement and Causality between the U.S. Real Estate and Stock Markets in the Time and Frequency Domains</i>. University of Connecticut, Department of Economics, Working papers: 2013-34. This study applies wavelet analysis to examine the relationship between the U.S. real estate and stock markets over the period 1890-2012. Wavelet analysis allows the simultaneous examination of co-movement and causality between the two markets in both the time and frequency domains. Our findings provide robust evidence that co-movement and causality vary across frequencies and evolve with time. Examining market co-movement in the time domain, the two markets exhibit positive co-movement over recent past decades, exception for 1998-2002 when a high negative co-movement emerged. In the frequency domain, the two markets correlate with each other mainly at low frequencies (longer term), except in the second half of the 1900s as well as in 1998-2002, when the two markets correlate at high frequencies (shorter term). In addition, we find that the causal effects between the markets in the frequency domain occur generally at low frequencies (longer term). In the time-domain, the time-varying nature of long-run causalities implies structural changes in the two markets. These findings provide a more complete picture of the relationship between the U.S. real estate and stock markets over time and frequency, offering important implications for policymakers and practitioners.

2013	E69	Takamura, Tamon. 2013. <i>A General Equilibrium Model with Banks and Default on Loans</i>. Bank of Canada, Working Papers. During the recent financial crisis in the U.S., banks reduced new business lending amidst concerns about borrowers' ability to repay. At the same time, firms facing higher borrowing costs alongside a worsening economic outlook reduced investment. To explain these aggregate business cycle patterns, I develop a model with households, banks and firms. I assume that a bank's ability to raise deposits is constrained by a limited commitment problem and that, furthermore, loans to firms involve default risk. In this environment, changes in loan rates affect the size of the business sector. I explore how banks influence the behavior of households and firms and find that both productivity and financial shocks lead to counter-cyclical default and interest rate spreads. I examine the implications of a government capital injection designed to mitigate the effect of negative productivity and financial shocks in the spirit of the Troubled Asset Relief Program (TARP). I find that the stabilizing effect of such policy interventions hinges on the source of the shock. In particular, a capital injection is less effective against aggregate productivity shocks because easing banks' lending stance only weakly stimulates firms' demand for loans when aggregate productivity falls. In contrast, a capital injection can counteract the adverse effect of financial shocks on the supply of loans. Finally, I measure aggregate productivity and financial shocks to evaluate the role of each in the business cycle. I find that the contribution of aggregate productivity shocks in aggregate output and investment is large until mid-2008. Financial shocks explain 65% of the fall in investment and 55% of the fall in output in the first quarter of 2009.
2013	F39	Briere, Marie, Kim Oosterlinck, and Ariane Szafarz. 2013. <i>Virtual Currency, Tangible Return: Portfolio Diversification with Bitcoins</i>. ULB -- Universite Libre de Bruxelles, Working Papers CEB: 13-031. Bitcoin is a major virtual currency. Using weekly data over the 2010-2013 period, we analyze a Bitcoin investment from the standpoint of a U.S. investor with a diversified portfolio including both traditional assets (worldwide stocks, bonds, hard currencies) and alternative investments (commodities, hedge funds, real estate). Bitcoin investment has highly distinctive features, including exceptionally high average return and volatility. Its correlation with other assets is remarkably low. Spanning tests confirm that Bitcoin investment offers significant diversification benefits. We show that the inclusion of even a small proportion of Bitcoins, say 3%, may dramatically improve the risk-return trade-off of well-diversified portfolios.
2013	F64	Fukuda, Takashi. 2013. "Linkage between Financial Development, Financial Crisis and Globalization in India: VARX and ARDL Co-integration Assessments." <i>Journal of Applied Economics and Business Research</i>, 3(4): 232-48. In this paper, the long-run causality between financial development, financial crisis and globalization--trade and financial openness--in India is investigated through the co-integration techniques of the VARX and ARDL methods. The main finding is that although the single impact of either trade or financial openness is uncertain, the simultaneous opening of the two sectors contributes to financial development. Another finding is that the growing presence of international trade is relevant to the occurrence of financial crisis. Policymakers, especially those of developing countries, need to recognize these effects of trade and financial openness in designing development plans.
2013	G29	Carbo Valverde, Santiago, and Julia Garcia Cabello. 2013. "Transformaciones en la estructura financiera: Implicaciones para la financiación de la economía española. (With English summary.)." <i>Ekonomiaz</i>, 0(84): 93-109. This article examines the profound structural changes that have taken place in the Spanish banking market over the course of the financial crisis and their potential effects on the channels by which the Spanish economy is financed. In particular, it asks whether the generation of internal liquidity markets at Spanish financial institutions (comprising the presence of financial institutions on various regional markets) may have significant effects on lending. The article also considers whether increases in default rates and their detrimental effects on the supply of loans can be reduced by setting up such internal circuits for capital. The findings suggest that non-performing bank loans create spillover effects that result in a reduction in lending in all regions of Spain and not just in those hardest hit by loan defaults and unemployment. However, the restructuring of the banking system has managed to consolidate inter-regional internal capital circuits, which may help attenuate the curtailment of lending and have positive effects for the distribution of lending in the long term.
2013	H00	Mehra, Rajnish. 2013. <i>Asset Pricing Implications of Macroeconomic Interventions An Application to Climate Policy</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 19146. This paper illustrates that evaluating alternate abatement policies that affect the growth path of an economy on the basis of their effects on asset valuation may not be welfare enhancing. We show that the class of abatement policies considered in the integrated assessment literature are robust with respect to the choice of a discount factor if lifetime consumption equivalents are used as a metric. We argue against a global welfare function in the presence of significant global household heterogeneity. While economic analysis is a useful tool for evaluating different policies for a homogenous class of households, inter household comparisons are an ethical issue.

2013	H32	Lendvai, Julia, Rafal Raciborski, and Lukas Vogel. 2013. "Macroeconomic Effects of an Equity Transaction Tax in a General-Equilibrium Model." <i>Journal of Economic Dynamics and Control</i>, 37(2): 466-82. The paper studies the impact of an equity transaction tax (ETT) on financial and real variables in a DSGE model with two types of financial frictions: (1) financial intermediaries facing a leverage constraint; (2) noise shocks that lead to the emergence of non-fundamental equity trade. The ETT depresses the demand for equity and hence increases the cost of capital; this then affects firms' investment decisions. In the long run, the tax is found to be as distortive as a corporate income tax. The transaction tax also reduces volatility in financial markets, but the impact on real volatility is limited.
2013	H70	CV: Ramirez, Carlos D. 2013. "The Effect of Banking Crises on Deposit Growth: State-Level Evidence from 1900 to 1930." In <i>History and Financial Crisis: Lessons from the 20th Century</i>, ed. Christopher Kobrak and Mira Wilkins, 96-113. London and New York: Taylor and Francis, Routledge.
2013	H83	Baer, Werner, Daniel A. Dias, and Joao B. Duarte. 2013. "The Economy of Portugal and the European Union: From High Growth Prospects to the Debt Crisis." <i>Quarterly Review of Economics and Finance</i>, 53(4): 345-52. This paper documents some of the recent economic history of Portugal, since its accession to the EEC, to the adoption of the Euro and more recently to the financial and economic crisis. In the first part of the paper, we show the economic performance of Portugal during the last twenty-five years till now, from the fast growth of the late 1980s and early 1990s to the current recession. We point out some of the reasons for this trajectory--slow productivity growth, disconnection between productivity and wages, and continued external and public deficits--and choose three areas that must be improved in order to reverse the current downward spiral--justice needs to be more effective and faster, education needs to improve its quality and distribution across the population, and the public administration must become more efficient.
2013	J61	Uddin, Gazi Salah, and Bo Sjo. 2013. "Remittances, Financial Development and Economic Growth in Bangladesh." <i>South Asia Economic Journal</i>, 14(2): 261-73. In Bangladesh, remittances from migrant workers are an important component of national income and a source for financing consumption and investment. This article investigates the relationship between remittances, financial sector development and economic growth in Bangladesh over the period of 1976-2011. In the long run, the inflow of remittances and the expansion of the financial sector drive the growth in GDP, whereas in the short run, remittances act as a shock absorber to income changes.
2013	J88	Galasso, Vincenzo. 2013. "Getting Fitter." <i>CESifo Forum</i>, 14(3): 25-34.
2013	K33	Siskova, Nadezda. 2013. "The Impact of the Eurozone's Crisis on the Institutional Framework and National Law of Member States--Some Considerations." <i>Danube: Law and Economics Review</i>, 0(4): 293-300. This article focuses on the Treaty on Stability, Coordination and Governance in Economic and Monetary union (the so-called Fiscal Compact Treaty). It especially analyses the selected provisions of this international contract instrument and considers its impact on European primary law and the national law of Member States. In this respect, issues relating to reverse majority voting are examined, de facto the new kind of judicial control, the new obligations for Member States concerning the modification of their legal orders, which were not envisaged by the Foundation Treaties, etc. Other key problems addressed in the article are connected with the future "destiny" of the Fiscal Compact Treaty, including two different scenarios: a) the incorporation of its material scope into primary law or b) termination of the legal force of this act after the expiration of a certain period of time.
2013	L15	Kurlat, Pablo. 2013. "Lemons Markets and the Transmission of Aggregate Shocks." <i>American Economic Review</i>, 103(4): 1463-89. I study a dynamic economy featuring adverse selection in asset markets. Borrowing-constrained entrepreneurs sell past projects to finance new investment, but asymmetric information creates a lemons problem. I show that this friction is equivalent to a tax on financial transactions. The implicit tax rate responds to aggregate shocks, generating amplification in the response of investment and cyclical variation in liquidity.
2013	L41	Boncina, Suzana. 2013. "Merger Regulation in the Banking Sector during a Systemic Crisis." <i>Bančni Vestnik</i>, 62(1-2): 31-37. The article analyses the applicability of competition policy to the banking sector and focuses primarily on merger regulation and its relevance for the banking sector during a systemic crisis. Merger regulation prohibits mergers with an anticompetitive effect; in other words, there are mergers that are anticipated as likely to cause harm to competition. The article examines whether such mergers should be prohibited even in times of distress when other objectives of banking regulation such stability are at stake. The paper analyses whether merger regulation with its defences (such as failing firm defence and efficiency defence) is flexible enough to accommodate such objectives or whether in times of a systemic crisis competition rules, including merger regulation should be trumped in its entirety.
2013	L53	Stefaniak-Kopoboru, Joanna, and Joanna Kuczevska. 2013. "European Enterprises in Crisis Time." <i>Managerial Economics</i>, 0(14): 151-63. The economic crisis is a rapid economic downturn. National economies are increasingly intertwined through trade and capital which results in fast transmission of the crisis between countries. The crisis results mainly in the deteriorating financial situation of enterprises and in the increase of unemployment, the deterioration in consumer confidence and the reduction of purchases. Under such an unstable macroeconomic environment European companies were forced to review their strategies and maintain a high flexibility for their reactions to changes in the environment. The promotion of competitiveness of European enterprises has become the priority of public regional, national and supranational authorities. Any initiatives had, and still have, a great role in building a sustainable and permanent competitive position of the European companies. Companies operating in the European Union are in a unique situation, because they might receive a direct and indirect support to combat the negative effects of the crisis and to enhance their competitiveness on both the national and Community levels. The European companies are offered a wide range of support in the form of the pan-European networks and services, as well as the financial programmes. This results in new opportunities for the effective functioning of European companies and in the improvement of their competitiveness in a difficult period of economic crisis and beyond.
2013	L84	He, Jie, and Xuan Tian. 2013. "The Dark Side of Analyst Coverage: The Case of Innovation." <i>Journal of Financial Economics</i>, 109(3): 856-78. We examine the effects of financial analysts on the real economy in the case of innovation. Our baseline results show that firms covered by a larger number of analysts generate fewer patents and patents with lower impact. To establish causality, we use a difference-in-differences approach that relies on the variation generated by multiple exogenous shocks to analyst coverage, as well as an instrumental variable approach. Our identification strategies suggest a negative causal effect of analyst coverage on firm innovation. The evidence is consistent with the hypothesis that analysts exert too much pressure on managers to meet short-term goals, impeding firms' investment in long-term innovative projects. We further discuss possible underlying mechanisms through which analysts impede innovation and show that there is a residual effect of analysts on innovation even after controlling for these mechanisms. Our paper offers novel evidence on a previously under-explored adverse consequence of analyst coverage--its hindrance to firm innovation.

Year	DE	Title and Abstract
2013	L84	Lee, Chien-Chiang, Mei-Ping Chen, and Chi-Hung Chang. 2013. "Dynamic Relationships between Industry Returns and Stock Market Returns." <i>North American Journal of Economics and Finance</i> , 26(0): 119-44. Different from prior studies which concentrate on the unidirectional impact of industry leading, this study examines the bi-directional dynamical causal relation between industry returns and stock market returns by considering multiple structural breaks for ten major eastern and southern Asia countries. Our results show that finance and consumer service industry returns have significant power in explaining the movements of market returns. Further, we apply logit regressions to explore the determinants of the leading hypotheses and find exchange rate and interest rate are important in explaining the industry-market nexus. In a developed market, the industry and the market have feedback relations, but in a highly controlled economy the influence from the stock market dominates.
2013	L90	Greenwood, Robin, and Samuel Hanson. 2013. <i>Waves in Ship Prices and Investment</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 19246. We study the returns to owning dry bulk cargo ships. Ship earnings exhibit a high degree of mean reversion, driven by industry participants' competitive investment responses to shifts in demand. Ship prices are far too volatile given the mean reversion in earnings. We show that high current ship earnings are associated with high secondhand ship prices and heightened industry investment in fleet capacity, but forecast low future returns. We propose and estimate a behavioral model that can account for the evidence. In our model, firms over-extrapolate exogenous demand shocks and partially neglect the endogenous investment responses of their competitors. Formal estimation of the model confirms that both types of expectational errors are needed to account for our findings.
2013	N35	CV: Cizacka, Murat. 2013. "Finance and Development in Islam: A Historical Perspective and a Brief Look Forward." In <i>Economic Development and Islamic Finance</i> , ed. Zamir Iqbal and Abbas Mirakhor, 133-49. Directions in Development: Finance. Washington, D.C.: World Bank.
2013	N47	Islahi, Abdul Azim. 2013. "Economic and Financial Crises in Fifteenth-Century Egypt: Lessons from the History." <i>Islamic Economic Studies</i> , 21(2): 71-93. The present paper attempts to study the economic and financial crises of fifteenth-century Egypt, which was ruled by the Mamluk dynasty. During the fifteenth century, especially in its first half, Egypt faced horrible economic crisis caused sometimes by rulers' ill-governance and corruption and sometimes by natural catastrophe such as over flooding of Nile or its drying up, outbreak of epidemics, crop diseases, etc. In many cases two or more factors simultaneously existed. Financial crisis mainly emanated from monetary mismanagement. Two social thinkers of the time--al-Maqrizi at the beginning of the century and al-Asadi at the middle--addressed the situation. They analyzed the problem, pointed out the causes, and suggested remedies. For al-Maqrizi, the deterioration of Egypt's monetary system was the single most important cause of its economic and financial difficulties. As a panacea, he prescribed a return to gold and silver standard and restricting copper coinage to petty transactions. Al-Maqrizi did not realize that the reason for wide spread of copper money was Egypt's dependence on import of precious metals, especially silver, from Europe which was adversely affected in the fifteenth century known as "silver famine". Al-Asadi divided the factors responsible for economic and financial crises of his time into two main categories--socio-economic factors and monetary factors. In the former category he included neglect of agriculture, disturbances of bedouins, oppression of farmers, and sales of government positions. As far as the monetary factor is concerned, he dealt with it separately and held the bad currency system as the reason behind the high prices that disturbed the whole economy. Al-Asadi did not confine his analysis to monetary problem only. He advocated for an overall reform and strict management of the whole economy, the monetary aspect being one of them. He did not restrict money to gold and silver. To him precious metals and copper, all have their utility as money and all can be used at the same time. However, issue of money and minting of coins should be in such a way structured that the counterfeiting and debasement is checked. The main financial problem, in his opinion, was debasement of currency leading to unrestricted supply of money, not the dominance of copper coins. The paper concludes with an appraisal of their diagnosis of the problem, the solution suggested by them and the lessons learned from them.
2013	N56	Moreno Lazaro, Javier. 2013. "La Bolsa de La Habana, el mercado mundial de azucar y las fluctuaciones de la economia Cubana, 1910-1959. (The Havana Stock Exchange, Global Sugar Market and Fluctuations of the Cuban Economy, 1910-1959. With English summary)." <i>Revista de Historia Economica</i> , 31(1): 111-43. This paper presents the course taken by the Cuban economy from the early twentieth century until the outbreak of the Revolution, seen from the perspective of what happened in the stock market. I have therefore prepared an index of Havana Stock Exchange listings which shows strong dependence on what happened in the sugar market, particularly in sugar exports. However, my research highlights the weakness of this institution, conceived more as an instrument of speculative enrichment rather than one of financing, the evolution of which reveals the fragility of the Cuban economy and particularly the poor development of its capital markets.
2013	N83	Marin-Acena, Pablo, Elena Martinez-Ruiz, and Pilar Nogues-Marco. 2013. "The Bank of Spain: A National Financial Institution." <i>Journal of European Economic History</i> , 42(1): 11-45. This paper explains the process by which the Bank of Spain became a national bank, first by obtaining the monopoly of note issue in 1874 and then by extending its sphere of financial action by creating the country's only network of bank branches before 1900. The implementation of a "unified or national banknote" in 1884 and the creation of a system of free transfers for its clients were also decisive steps towards the Bank's transformation from a local Madrid-based institution into a Spanish national institution. The paper also argues that the transformation of the Bank of Spain into a genuine national financial institution contributed to the modernization of the Spanish administrative structure.
2013	N91	Young, Andrew T., and John A. Dove. 2013. "Policing the Chain Gang: Panel Cointegration Analysis of the Stability of the Suffolk System, 1825-1858." <i>Journal of Macroeconomics</i> , 37(0): 182-96. Conventional monetary theory suggests that a closed system banking regime may lead to in-concert overexpansions of circulation by its banks. However, Selgin (2001, 2010) argues that this is unlikely as long as there are enough banks to ensure (i) routine interbank settlement and (ii) no collusion amongst banks refraining from redeeming one another's notes. Banks effectively form a "chain gang" where in-concert expansion requires coordination that is prohibitively costly in a system with many banks. In order to test this conjecture, we examine state-level data on circulations and reserves from the Suffolk Banking System (1825-1858) in New England. In addition to narrative evidence on the stability of the Suffolk, panel cointegration tests provide evidence of a long-run relationship between state-level circulations and total reserves. The estimated error-correction mechanisms suggest a deviation half-life of about 2 years. We argue that a cointegrating relationship between circulations and reserves, along with rapid error-correction, supports the Selgin hypothesis.
2013	P22	Brown, M., R. de Haas, and V. Sokolov. 2013. <i>Regional Inflation and Financial Dollarization</i> . Tilburg University, Center for Economic Research, Discussion Paper: 2013-073. We exploit variation in consumer price inflation across 71 Russian regions to examine the relationship between the perceived stability of the local currency and financial dollarization. Our results show that regions with higher inflation experience an increase in the dollarization of household deposits and a decrease in the dollarization of (long-term) household credit. The negative impact of inflation on credit dollarization is weaker in regions with less-integrated banking markets, suggesting that the asset-liability management of banks constrains the currency-portfolio choices of households.

Year	DE	Title and Abstract
2013	Q15 Q24	Lanteri, Luis N. 2013. "Comportamiento de los precios reales de la tierra agrícola en la Argentina y en los Estados Unidos, 1960-2012. (With English summary)." <i>Atlantic Review of Economics/Revista Atlantica de Economia</i> , 2(0): . The recent international financial crisis has highlighted the role of real asset prices in the macroeconomic fluctuations of advanced economies. This paper analyzes the effects of some external and domestic shocks in the real prices of agricultural land in Argentina's economy and compared the results with the situation observed in the United States. To this end, we used VEC models (vector error correction) and annual data covering the period 1960-2012. The estimation results show that real GDP would be the most relevant factor to explain the volatility in the land prices in Argentina, in contrast with the United States where the real interest rate would be the main factor. The estimates also include other macroeconomic shocks (international real prices of agricultural commodities, general price index, real exchange rate) to explain the variability in the real prices of these assets.

2013	R53	Blagun, I. S., and M. Y. Zaets. 2013. "Modelling the Influence of Monetary Instruments upon Region's Economy. (In Ukrainian. With English summary)." <i>Actual Problems of Economics</i> , 140(2): 96-105. The article is based on the developed models of the monetary policy's influence upon a region's economy and confirms statistically the significant relationship between investment in fixed assets of a region, the required reserves, and the value added. Based on this, the dependence on interest rates is downward, and the one on aggregate demand is growing. It is also determined that changes within the monetary base are insensitive to changes in the refinancing rate, and the authors fail to find any time lag to obtain the meaningful relationship.
2013	Y10	World Bank. 2013. <i>The Little Data Book on Financial Development 2013</i> , Washington, D.C.: World Bank. Pocket edition of the Global Financial Development Database explores financial system characteristics for 203 economies. Presents measures of the size of financial institutions and markets; the degree to which individuals can and do use financial services; the efficiency of financial intermediaries and markets in intermediating resources and facilitating financial transactions; and the stability of financial institutions and markets.

Year	DE	Title and Abstract
2006		
2006	C33	Bowsher, Clive, and Roland Meeks. 2006. <i>High Dimensional Yield Curves: Models and Forecasting</i>. University of Oxford, Department of Economics, Economics Series Working Papers: 2006-FE-11. Functional Signal plus Noise (FSN) models are proposed for analysing the dynamics of a large cross-section of yields or asset prices in which contemporaneous observations are functionally related. The FSN models are used to forecast high dimensional yield curves for US Treasury bonds at the one month ahead horizon. The models achieve large reductions in mean square forecast errors relative to a random walk for yields and readily dominate both the Diebold and Li (2006) and random walk forecasts across all maturities studied. We show that the Expectations Theory (ET) of the term structure completely determines the conditional mean of any zero-coupon yield curve. This enables a novel evaluation of the ET in which its 1-step ahead forecasts are compared with those of rival methods such as the FSN models, with the results strongly supporting the growing body of empirical evidence against the ET. Yield spreads do provide important information for forecasting the yield curve, especially in the case of shorter maturities, but not in the manner prescribed by the Expectations Theory.
2006	C83	Engelberg, Joseph, Charles F. Manski, and Jared Williams. 2006. <i>Comparing the Point Predictions and Subjective Probability Distributions of Professional Forecasters</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 11978. We use data from the Survey of Professional Forecasters to compare point forecasts of GDP growth and inflation with the subjective probability distributions held by forecasters. We find that SPF forecasters summarize their underlying distributions in different ways and that their summaries tend to be favorable relative to the central tendency of the underlying distributions. We also find that those forecasters who report favorable point estimates in the current survey tend to do so in subsequent surveys. These findings, plus the inescapable fact that point forecasts reveal nothing about the uncertainty that forecasters feel, suggest that the SPF and similar surveys should not ask for point forecasts. It seems more reasonable to elicit probabilistic expectations and derive measures of central tendency and uncertainty, as we do here.
2006	G10	Diebold, Francis, Lei Ji, and Canlin Li. 2006. <i>A Three-Factor Yield Curve Model: Non-Affine Structure, Systematic Risk Sources, and Generalized Duration</i>. Penn Institute for Economic Research, Department of Economics, University of Pennsylvania, PIER Working Paper Archive. We assess and apply the term-structure model introduced by Nelson and Siegel (1987) and re-interpreted by Diebold and Li (2003) as a modern three-factor model of level, slope and curvature. First, we ask whether the model is a member of the affine class, and we find that it is not. Hence the poor forecasting performance recently documented for affine term structure models in no way implies that our model will forecast poorly, which is consistent with Diebold and Li's (2003) finding that it indeed forecasts quite well. Next, having clarified the relationship between our three-factor model and the affine class, we proceed to assess its adequacy directly, by testing whether its level, slope and curvature factors do indeed capture systematic risk. We find that they do, and that they are therefore priced. Finally, confident in the ability of our three-factor model to capture the pricing relations present in the data, we proceed to explore its efficacy in bond portfolio risk management. Traditional Macaulay duration is appropriate only in a one-factor (level) context; hence we move to a three-factor generalized duration, and we show the superior performance of hedges constructed using it.
2007		
2007	C52	Hall, Alastair, Atsushi Inoue, James Nason M, and Barbara Rossi. 2007. <i>Information Criteria for Impulse Response Function Matching Estimation of DSGE Models</i>. Duke University, Department of Economics, Working Papers: 07-04. We propose a new Information Criterion for Impulse Response Function Matching estimators of the structural parameters of macroeconomic models. The main advantage of our procedure is that it allows the researcher to select the impulse responses that are most informative about the deep parameters, therefore reducing the bias and improving the efficiency of the estimates of the model's parameters. We show that our method substantially changes key parameter estimates of representative Dynamic Stochastic General Equilibrium models, thus reconciling their empirical results with the existing literature. Our criterion is general enough to apply to impulse responses estimated by VARs, local projections, as well as simulation methods.
2007	C63	Karnizova, Lilia. 2007. <i>News versus Sunspot Shocks in Linear Rational Expectations Models</i>. University of Ottawa, Department of Economics, Working Papers: 0706E. This paper compares news and sunspot shocks as sources of exogenous changes in beliefs by

Year	DE	Title and Abstract
		analyzing equilibria of rational expectations models. The similarities and differences between the two shocks are illustrated in a New Keynesian monetary model.
2007	F00	Christiano, Lawrence, Roberto Motto, and Massimo Rostagno. 2007. <i>Shocks, Structures or Monetary Policies? The Euro Area and US After 2001</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 13521. The US Federal Reserve cut interest rates more vigorously in the recent recession than the European Central Bank did. By comparison with the Fed, the ECB followed a more measured course of action. We use an estimated dynamic general equilibrium model with financial frictions to show that comparisons based on such simple metrics as the variance of policy rates are misleading. We find that--because there is greater inertia in the ECB's policy rule--the ECB's policy actions actually had a greater stabilizing effect than did those of the Fed. As a consequence, a potentially severe recession turned out to be only a slowdown, and inflation never departed from levels consistent with the ECB's quantitative definition of price stability. Other factors that account for the different economic outcomes in the Euro Area and US include differences in shocks and differences in the degree of wage and price flexibility.
2007	F37	Panopoulou, Ekaterini. 2007. "Predictive Financial Models of the Euro Area: A New Evaluation Test." <i>International Journal of Forecasting</i>, 23(4): 695-705. This paper investigates the predictive ability of financial variables for euro area growth. Our forecasts are built from univariate autoregressive and single equation models. Euro area aggregate forecasts are constructed both by employing aggregate variables and by aggregating country-specific forecasts. The forecast evaluation is based on a recently developed test for equal predictive ability between nested models. Employing a monthly dataset from the period between January 1988 and May 2005 and setting the out-of-sample period to be from 2001 onwards, we find that the single most powerful predictor on a country basis is the stock market returns, followed by money supply growth. However, for the euro area aggregate, the set of most powerful predictors includes interest rate variables as well. The forecasts from pooling individual country models outperform those from the aggregate itself for short run forecasts, while for longer horizons this pattern is reversed. Additional benefits are obtained when combining information from a range of variables or combining model forecasts.
2007	F37	Mitchell, Karlyn, and Douglas K. Pearce. 2007. "Professional Forecasts of Interest Rates and Exchange Rates: Evidence from the Wall Street Journal's Panel of Economists." <i>Journal of Macroeconomics</i>, 29(4): 840-54. We analyze economists' forecasts of interest rates and exchange rates from the Wall Street Journal. We find that a majority of economists produced unbiased forecasts but that none predicted directions of changes more accurately than chance. Most economists' forecast accuracy is statistically indistinguishable from a random walk model in forecasting the Treasury bill rate, but many are significantly worse in forecasting the Treasury bond rate and the exchange rate. We also find systematic forecast heterogeneity, support for strategic models predicting the industry employing the economist matters, and evidence that economists deviate less from the consensus as they age.
2007	R21 R31	Iacoviello, Matteo, and Stefano Neri. 2007. <i>The Role of Housing Collateral in an Estimated Two-Sector Model of the U.S. Economy</i>. Boston College Department of Economics, Boston College Working Papers in Economics: 659. The ability of a two-sector model to quantify the contribution of the housing market to business fluctuations is investigated using U.S. data and Bayesian methods. The estimated model, which contains nominal and real rigidities and collateral constraints, displays the following features: First, a large fraction of the upward trend in real housing prices over the last 40 years can be accounted for by slow technological progress in the housing sector; second, residential investment and housing prices are very sensitive to monetary policy and housing demand shocks; third, the wealth effects from housing on consumption are positive and significant. The structural nature of the model allows identifying and quantifying the sources of fluctuations in house prices and residential investment and measuring the contribution of housing booms and busts to business cycles.
2008		
2008	F17	Blaskowitz, Oliver, and Helmut Herwartz. 2008. <i>Testing directional forecast value in the presence of serial correlation</i>. Sonderforschungsbereich 649, Humboldt University, Berlin, Germany, SFB 649 Discussion Papers: SFB649DP2008-073. Common approaches to test for the economic value of directional forecasts are based on the classical Chi-square test for independence, Fisher's exact test or the Pesaran and Timmerman (1992) test for market timing. These tests are asymptotically valid for serially independent observations. Yet, in the presence of serial correlation they are markedly oversized as confirmed in a simulation study. We summarize serial correlation robust test procedures and propose a bootstrap approach. By means of a Monte Carlo study we illustrate the relative merits of the latter. Two empirical applications demonstrate the relevance to account for serial correlation in economic time series when testing for the value of directional forecasts.
2008	G17	Almeida, Caio, and Jose Vicente. 2008. "The Role of No-Arbitrage on Forecasting: Lessons from a Parametric Term Structure Model." <i>Journal of Banking and Finance</i>, 32(12): 2695-2705. Parametric term structure models have been successfully applied to numerous problems in fixed income markets, including pricing, hedging, managing risk, as well as to the study of monetary policy implications. In turn, dynamic term structure models, equipped with stronger economic structure, have been mainly adopted to price derivatives and explain empirical stylized facts. In this paper, we combine flavors of those two classes of models to test whether no-arbitrage affects forecasting. We construct cross-sectional (allowing arbitrage) and arbitrage-free versions of a parametric polynomial model to analyze how well they predict out-of-sample interest rates. Based on US Treasury yield data, we find that no-arbitrage restrictions significantly improve forecasts. Arbitrage-free versions achieve overall smaller biases and root mean square errors for most maturities and forecasting horizons. Furthermore, a decomposition of forecasts into forward-rates and holding return premia indicates that the superior performance of no-arbitrage versions is due to a better identification of bond risk premium.
2008	G17	Bowsher, Clive G., and Roland Meeks. 2008. "The Dynamics of Economic Functions: Modeling and Forecasting the Yield Curve." <i>Journal of the American Statistical Association</i>, 103(484): 1419-37. The class of functional signal plus noise (FSN) models is introduced that provides a new, general method for modeling and forecasting time series of economic functions. The underlying, continuous economic function (or "signal") is a natural cubic spline whose dynamic evolution is driven by a cointegrated vector autoregression for the ordinates (or "y-values") at the knots of the spline. The natural cubic spline provides flexible cross-sectional fit and results in a linear state-space model. This FSN model achieves dimension reduction, provides a coherent description of the observed yield curve and its dynamics as the cross-sectional dimension N becomes large, and can be feasibly estimated and used for forecasting when N is large. The integration and cointegration properties of the model are derived. The FSN models are then applied to forecasting 36-dimensional yield curves for U.S. Treasury bonds at the 1-month-ahead horizon. The method consistently outperforms the dynamic Nelson-Siegel and random walk forecasts on the basis of both mean squared forecast error criteria and economically relevant loss functions derived from the realized profits of pairs trading algorithms. The analysis also highlights in a concrete setting the dangers of attempting to infer the relative economic value of model forecasts on the basis of their associated mean squared forecast errors.
2008	O19	Erus, Burcay, and Refik Erzan. 2008. "Interaction of Global Conditions with Domestic Developments in Generating Market Pressures and Crises: The Turkish Case." <i>Asian-African Journal of Economics and Econometrics</i>, 8(2): 165-75. This article explores

Year	DE	Title and Abstract
		the impact of global liquidity conditions--together with domestic economic developments--on market pressures for the currency in Turkey with the ultimate purpose of predicting economic crises. In our observation period of 168 months, there were 10 incidents when the index, which is a weighted average of the changes in the exchange rate and Central Bank reserves, exceeded its mean value by more than one standard deviation. The initial estimations covering all these incidents failed to provide any insightful results. To distinguish those incidents that affected the real economy, we studied the seasonally adjusted real GDP developments. There were two incidents when GDP persistently declined (except the one associated with the 1999 earthquake). These were the 1994 and 2001 crises. We have modified our dependent variable accordingly by only considering those incidents that we classified as economic crises. Our logit estimation results showed that economic crises follow deterioration in macroeconomic indicators and adverse global liquidity conditions. We found that primary balance, terms of trade, real exchange rate, domestic credit, ratio of foreign currency deposits to assets of foreigners, and the effective federal funds rate--as a proxy for international liquidity conditions--were significant variables in forecasting approaching crises.
2008	O23	Chumacero E., Romulo A., Claudio Pardo M., and David Valdes V. 2008. "Un Marco para la Elaboracion de los Programas de Impresion y Acunacion. (A Framework for Printing and Minting Plans. With English summary.)" <i>Economia Chilena</i>, 11(1): 29-59. This paper presents alternative models for forecasting the demand for bills and coins of different denominations. When compared to the models often used, the root mean squared forecasting error is substantially reduced. The paper also develops a new framework to formulate the printing and minting programs by using density forecasts along with information on technological constraints and preferences of the policy maker.
2008	O23	Tao, Guo, and Song Deyong. 2008. "Meanings of the Term Structure of Interest Rates for Monetary Policy in China. (In Chinese. With English summary.)" <i>Jingji Yanjiu/Economic Research Journal</i>, 43(3): 39-47. The paper uses the Nelson-Siegel model continuously estimates the curve of the term structure of interest rates in China. The paper tests the power of future interest rates forecasting spot interest rates after time. Based on analyzing the change in the curve of the term structure of interest rates, the paper analyzes the effect of monetary policy actions of the People's Bank of China, and researches the relation between the term structure of interest rates and future inflation. The research result of the paper shows that the term structure of interest rates can provide a lot of useful information for monetary policy in China.
2008	O23	Dua, Pami, Nishita Raje, and Satyananda Sahoo. 2008. "Forecasting Interest Rates in India." <i>Margin: The Journal of Applied Economic Research</i>, 2(1): 1-41. This paper develops univariate (ARIMA and ARCH/GARCH) and multivariate models (VAR, VECM and Bayesian VAR) to forecast short- and long-term rates, viz., call money rate, 15-91 days Treasury Bill rates and interest rates on Government securities with (residual) maturities of one year, five years, and 10 years. Multivariate models consider factors such as liquidity, repo rate, yield spread, inflation rate, foreign interest rates, and forward premium. The paper finds that multivariate models generally outperform univariate ones over longer forecast horizons. Overall, the paper concludes that the forecasting performance of Bayesian VAR models is satisfactory for most interest rates and their superiority in performance is marked at longer forecast horizons.
2009		
2009	D78	Rosa, Carlo. 2009. "Forecasting the Direction of Policy Rate Changes: The Importance of ECB Words." <i>Economic Notes</i>, 38(1-2): 39-66. This paper evaluates the predictive power of different information sets for the European Central Bank (ECB) interest-rate-setting behaviour. We employ an ordered probit model, i.e. a limited dependent variable framework, to take into account the discreteness displayed by policy rate changes. The results show that the forecasting ability of standard Taylor-type variables, such as inflation and output gap, is fairly low both in-sample and out-of-sample, and is comparable to the performance of the random walk model. Instead by using broader information sets that include measures of core inflation, exchange rates, monetary aggregates and financial conditions, the accuracy of the forecasts about ECB future actions substantially improves. Moreover, ECB rhetoric considerably contributes to a better understanding of its policy reaction function. Finally, we find that that the ECB has been fairly successful in educating the public to anticipate the overall future direction of its monetary policy, but has been less successful in signalling the exact timing of rate changes.
2009	E60 G18 R15 R28 R38	Khandani, Amir E., Andrew W. Lo, and Robert C. Merton. 2009. <i>Systemic Risk and the Refinancing Ratchet Effect</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 15362. The confluence of three trends in the U.S. residential housing market--rising home prices, declining interest rates, and near-frictionless refinancing opportunities--led to vastly increased systemic risk in the financial system. Individually, each of these trends is benign, but when they occur simultaneously, as they did over the past decade, they impose an unintentional synchronization of homeowner leverage. This synchronization, coupled with the indivisibility of residential real estate that prevents homeowners from deleveraging when property values decline and homeowner equity deteriorates, conspire to create a "ratchet" effect in which homeowner leverage is maintained or increased during good times without the ability to decrease leverage during bad times. If refinancing-facilitated homeowner-equity extraction is sufficiently widespread--as it was during the years leading up to the peak of the U.S. residential real-estate market--the inadvertent coordination of leverage during a market rise implies higher correlation of defaults during a market drop. To measure the systemic impact of this ratchet effect, we simulate the U.S. housing market with and without equity extractions, and estimate the losses absorbed by mortgage lenders by valuing the embedded put-option in non-recourse mortgages. Our simulations generate loss estimates of \$1.5 trillion from June 2006 to December 2008 under historical market conditions, compared to simulated losses of \$280 billion in the absence of equity extractions.
2009	N12	Ahmadi, Pooyan Amir, and Albrecht Ritschl. 2009. <i>Depression Econometrics: A FAVAR Model of Monetary Policy During the Great Depression</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 7546. The prominent role of monetary policy in the U.S. interwar depression has been conventional wisdom since Friedman and Schwartz [1963]. This paper presents evidence on both the surprise and the systematic components of monetary policy between 1929 and 1933. Doubts surrounding GDP estimates for the 1920s would call into question conventional VAR techniques. We therefore adopt the FAVAR methodology of Bernanke, Boivin, and Elias [2005], aggregating a large number of time series into a few factors and inserting these into a monetary policy VAR. We work in a Bayesian framework and apply MCMC methods to obtain the posteriors. Employing the generalized sign restriction approach toward identification of Amir Ahmadi and Uhlig [2008], we find the effects of monetary policy shocks to have been moderate. To analyze the systematic policy component, we back out the monetary policy reaction function and its response to aggregate supply and demand shocks. Results broadly confirm the Friedman/Schwartz view about restrictive monetary policy, but indicate only moderate effects. We further analyze systematic policy through conditional forecasts of key time series at critical junctures, taken with and without the policy instrument. Effects are again quite moderate. Our results caution against a predominantly monetary interpretation of the Great Depression.

2009	N12 N13	Ritschl, Albrecht, and Samad Sarferaz. 2009. <i>Crisis? What Crisis? Currency vs. Banking in the Financial Crisis of 1931</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 7610. This paper examines the role of currency and banking in the German financial crisis of 1931 for both Germany and the U.S. We specify a structural dynamic factor model to identify financial and monetary factors separately for each of the two economies. We find that monetary transmission through the Gold Standard played only a minor role in causing and propagating the crisis, while financial distress was important. We also find evidence of crisis propagation from Germany to the U.S. via the banking channel. Banking distress in both economies was apparently not endogenous to output or monetary policy. Results confirm Bernanke's (1983) conjecture that an independent, non-monetary financial channel of crisis propagation was operative in the Great Depression.

2010	C23	Schmidt, Sandra, and Dieter Nautz. 2010. <i>Why Do Financial Market Experts Misperceive Future Monetary Policy Decisions?</i> . Sonderforschungsbereich 649, Humboldt University, Berlin, Germany, SFB 649 Discussion Papers: SFB649DP2010-036. This paper investigates why financial market experts misperceive the interest rate policy of the European Central Bank (ECB). Assuming a Taylor-rule-type reaction function of the ECB, we use qualitative survey data on expectations about the future interest rate, inflation, and output to discover the sources of individual interest rate forecast errors. Based on a panel random coefficient model, we show that financial experts have systematically misperceived the ECB's interest rate rule. However, although experts tend to overestimate the impact of inflation on future interest rates, perceptions of monetary policy have become more accurate since clarification of the ECB's monetary policy strategy in May 2003. We find that this improved communication has reduced disagreement over the ECB's response to expected inflation during the financial crisis.
2010	C58	Racicot, Francois-Eric, and Raymond Theoret. 2010. "Forecasting Stochastic Volatility Using the Kalman Filter: An Application to Canadian Interest Rates and Price-Earnings Ratio." <i>Aestimatio: The IEB International Journal of Finance</i> , 0(1): 28-46. In this paper, we aim at forecasting the stochastic volatility of key financial market variables with the Kalman filter using stochastic models developed by Taylor (1986, 1994) and Nelson (1990). First, we compare a stochastic volatility model relying on the Kalman filter to the conditional volatility estimated with the GARCH model. We apply our models to Canadian short-term interest rates. When comparing the profile of the interest rate stochastic volatility to the conditional one, we find that the omission of a constant term in the stochastic volatility model might have a perverse effect leading to a scaling problem, a problem often overlooked in the literature. Stochastic volatility seems to be a better forecasting tool than GARCH(1,1) since it is less conditioned by autoregressive past information. Second, we filter the S&P500 price-earnings (P/E) ratio in order to forecast its value. To make this forecast, we postulate a rational expectations process but our method may accommodate other data generating processes. We find that our forecast is close to a GARCH(1,1) profile.
2010	C58	Caldeira, Joao F., Guilherme V. Moura, and Marcelo S. Portugal. 2010. "Efficient Yield Curve Estimation and Forecasting in Brazil." <i>Economia (University of Brazil)</i> , 11(1): 27-51. Modeling the term structure of interest rate is very important to macroeconomists and financial market practitioners in general. In this paper, we used the Diebold-Li interpretation to the Nelson Siegel model in order to fit and forecast the Brazilian yield curve. The data consisted of daily observations of the most liquid future ID yields traded in the BM&F from January 2006 to February 2009. Differently from the literature on the Brazilian yield curve, where the Diebold-Li model is estimated through the two-step method, the model herein is put in the state-space form, and the parameters are simultaneously and efficiently estimated using the Kalman filter. The results obtained for the fit and for the forecast showed that the Kalman filter is the most suitable method for the estimation of the model, generating better forecast for all maturities when we consider the forecasting horizons of one and three months.
2010	C58	Baghestani, Hamid. 2010. "Forecasting the 10-Year US Treasury Rate." <i>Journal of Forecasting</i> , 29(8): 673-88. This study compares the performance of two forecasting models of the 10-year Treasury rate: a random walk (RW) model and an augmented-autoregressive (A-A) model which utilizes the information in the expected inflation rate. For 1993-2008, the RW and A-A forecasts (with different lead times and forecast horizons) are generally unbiased and accurately predict directional change under symmetric loss. However, the A-A forecasts outperform the RW, suggesting that the expected inflation rate (as a leading indicator) helps improve forecast accuracy. This finding is important since bond market efficiency implies that the RW forecasts are optimal and cannot be improved.

2011	D53	Memmel, Christoph, Angelika Sachs, and Ingrid Stein. 2011. <i>Contagion at the interbank market with stochastic LGD</i> . Deutsche Bundesbank, Research Centre, Discussion Paper Series 2: Banking and Financial Studies: 2011,06. This paper investigates contagion at the German interbank market under the assumption of a stochastic loss given default (LGD). We combine a unique data set about the LGD of interbank loans with data about interbank exposures. We find that the frequency distribution of the LGD is u-shaped. Under the assumption of a stochastic LGD, simulation results show a more fragile banking system than under the assumption of a constant LGD. There are three types of banks concerning their tendency to trigger contagion: banks with strongly varying impact, banks whose impact is relatively constant, and banks with no direct impact.
2011	D53	Memmel, Christoph, and Angelika Sachs. 2011. <i>Contagion in the interbank market and its determinants</i> . Deutsche Bundesbank, Research Centre, Discussion Paper Series 2: Banking and Financial Studies: 2011,17. Carrying out interbank contagion simulations for the German banking sector for the period from the first quarter of 2008 to the second quarter of 2011, we obtain the following results: (i) The system becomes less vulnerable to direct interbank contagion over time. (ii) The loss distribution for each point in time can be condensed into one indicator, the expected number of failures, without much loss of information. (iii) Important determinants of this indicator are the banks' capital, their interbank lending in the system, the loss given default and how equal banks spread their claims among other banks.
2011	F34	Nakamura, Chikafumi. 2011. "Currency Mismatch, Balance-Sheet Effect and Monetary Policy." <i>Journal of International Economic Studies</i> , 0(25): 103-28. This paper analyzes the impact of the currency mismatch between assets and liabilities on monetary policy.

Year	DE	Title and Abstract
		The currency mismatch causes macroeconomic instability through balance-sheet effects. To analyze the problem, we apply a small open economy dynamic stochastic general equilibrium model with international credit-market imperfections. As a result, despite the currency mismatch and high trade openness, a targeting rule to address the terms of trade is not efficient. This result depends on the fact that the two balance sheet-based channels, a debt-side channel and an asset-side channel, exist. We indicate that stabilization on the asset side is more important for determining monetary policy than is stabilization on the debt side. Therefore, we suggest that authorities in emerging economies adopt a targeting rule to stabilize fluctuations on the asset side.
2011	G24	Monfort, Alain, and Jean-Paul Renne. 2011. <i>Credit and Liquidity Risks in Euro-area Sovereign Yield Curves</i>. Centre de Recherche en Economie et Statistique, Working Papers: 2011-26.
2011	G28	Meh, Cesaire. 2011. "Bank Balance Sheets, Deleveraging and the Transmission Mechanism." <i>Bank of Canada Review</i>, 0(0): 23-34. The author investigates the influence of bank capital on economic activity, using a macroeconomic model that incorporates an explicit role for financial intermediation. The analysis focuses on the role of a "bank-capital channel" in propagating and amplifying monetary policy actions and other shocks. The question of whether weaker bank balance sheets make the economy more vulnerable to adverse shocks is examined, together with the impact of initiatives, such as countercyclical capital buffers, on the transmission of monetary policy and other shocks to the real economy.
2011	P27	2011. "The Dobrescu Macromodel of the Romanian Market Economy--2005 Version--Yearly Forecast--Spring Forecast 2011, March Estimate." <i>Romanian Journal of Economic Forecasting</i>, 14(1): 277-81. The macromodel estimates the short and medium-term economic implications for internal policies and changes in the international context. This version of the Romanian macromodel incorporates the experience accumulated through the utilization of its previous forms--either experimental (tested during 1991-1995) or operational (developed during 1996-2003). At the same time, it introduces some methodological and information improvements. The most significant is the structural decomposition of the economy, associated with input-output techniques. Due to the relatively advanced stage of the transitional processes in Romania, the behavioral functions were accommodated --as much as possible--to the standard relationships. Unlike the versions that used the statistical series beginning in 1980, the present one is based exclusively on information concerning the period 1989--2004. Therefore, we have considered more adequately naming this variant the macromodel of the Romanian market (not transition, as before) economy. In this article we present the Spring forecast for 2011.

2012	C54	Lafourcade, Pierre, and Joris de Wind. 2012. <i>Taking Trends Seriously in DSGE Models: An Application to the Dutch Economy</i>. Netherlands Central Bank, Research Department, DNB Working Papers. We construct a new-Keynesian DSGE model tailored to the Netherlands and interpret it as a multivariate unobserved components model. We identify three major stochastic trends in the data--trends in general-purpose technology, investment-specific technology, and labor supply--and model them formally in our theoretical set-up. Our trend-cycle decomposition captures the data's co-integrating properties without which long-run analysis--whether scenario analysis or forecasting--would likely be misspecified. In particular, this approach appears to produce better-behaved posteriors for parameters along decision margins where traditional modeling imposes highly persistent but temporary shocks. The existence of permanent and temporary disturbances along the same margin broadens the scope for counterfactuals. Specifically, differences in short-run responses to the two types of shocks reflect smoothing motives and discounted valuation effects reminiscent of the Permanent Income Hypothesis.
2012	C61 C62	McCallum, Bennett T. 2012. <i>Determinacy, Learnability, Plausibility, and the Role of Money in New Keynesian Models</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 18215. Recent mainstream monetary policy analysis focuses on rational expectation solutions that are uniquely stable. A number of recent studies have examined the question of whether typical New Keynesian (NK) models, with policy rules that satisfy the Taylor principle, also exhibit solutions with explosive inflation that cannot be ruled out by any transversality condition or any other generally accepted economic principle. This paper contributes to that debate by supporting and developing previous arguments suggesting that such explosive solutions are informationally infeasible. It also critiques prevailing notions of "determinacy" and outlines two alternative approaches to solution selection.
2012	D81	Fukuda, Shin-Ichi. 2012. "Infrequent Changes of the Policy Target: Robust Optimal Monetary Policy under Ambiguity." <i>Global Journal of Economics</i>, 1(2): In many countries, the monetary policy instrument sometimes remains unchanged for a long period and shows infrequent responses to exogenous shocks. The purpose of this paper is to provide a new explanation on why the central bank's policy instrument remains unchanged. In the analysis, we explore how uncertainty on the private agents' expectations affects robust optimal monetary policy. We apply the Choquet expected decision theory to a new Keynesian model. A main result is that the policymaker may frequently keep the interest rate unchanged even when exogenous shocks change output gaps and inflation rates. This happens because a change of the interest rate increases additional uncertainty for the policymaker. To the extent that the policymaker has uncertainty aversion, it can therefore be optimal for the policymaker to maintain an unchanged policy stance for some significant periods and to make discontinuous changes of the target rate. Our analysis departs from previous studies in that we determine an optimal monetary policy rule that allows time-variant feedback parameters in a Taylor rule. We show that if the policymaker has small uncertainty aversion, the calibrated optimal stop-go policy rule can predict actual target rates of FRB and ECB reasonably well.

2013	D80 F21	Badarınza, Cristian, and Tarun Ramadorai. 2013. <i>Home Away From Home? Safe Haven Effects and London House Prices</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 9786. Historical time-series data is short relative to the frequency of political and economic crises. This makes it difficult to use pure time-series methods to identify the impacts of safe haven demand on asset prices, in the face of confounding effects from a wide range of alternative drivers. We present a new method to identify safe-haven effects which relies on combining the cross-section of asset prices with time-series measures of economic and political risk. We employ this strategy on large databases of historical housing transactions in London, and show that economic and political risk in Southern Europe, China, the Middle East, Russia, and South Asia is an important factor in explaining the dynamics of London house prices over the past two decades.
2013	E02	Drometer, Marcus, Thomas Siemsen, and Sebastian Watzka. 2013. <i>The Monetary Policy of the ECB: A Robin Hood Approach?</i>. CESifo Group Munich, CESifo Working Paper Series: 4178. We derive four sets of counterfactual national interest rate paths for the 17 Euro Area countries for the time period 1999 to 2012. They approximate desirable national interest rates countries would have liked to implement if they could still conduct independent monetary policy. We find that prior to the financial crisis the counterfactual interest rates for Germany trace the realized EONIA rate very closely, while monetary policy has been too loose

Year	DE	Title and Abstract
		especially for the southern European countries. This situation was inverted with the onset of the financial crisis. To shed light on the underlying decision rule of the ECB, we rank different rules according to their ability to aggregate the national counterfactual paths to the EONIA rate. In addition to previous literature we find that those mechanisms which care for countries who fare economically worse than the Euro Area average perform best.

Muhina, Irina K. — Мухина Ирина Константиновна — 0.2 AS;

Popov, Ilya Y. — Попов Илья Юрьевич — 0.2 AS;

Slepenkova, Juliya M. — Слепенкова Юлия Михайловна — 0.2 AS;

Suslov, Victor I. — Суслов Виктор Иванович — 0.25 AS.

The total volume of derivative works for E47 is equal to 2.5 AS.

Общий объем раздела E47 — 2,5 авторских (уч.-изд.) л.

² AS — Author's Sheet — unit of measuring the volume of a literary work; equal to 40,000 characters (including the spaces between words), or 3,000 sq cm of illustrations (maps) like the table E47.E.

Table E49.F Examples of Publications according to New Links in 2006—2013

Year	DE	Title and Abstract
2011		
2011	E21 G18 K35	Livshits, Igor, James MacGee, and Michele Tertilt. 2011. <i>Costly Contracts and Consumer Credit</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 17448. Financial innovations are a common explanation of the rise in consumer credit and bankruptcies. To evaluate this story, we develop a simple model that incorporates two key frictions: asymmetric information about borrowers' risk of default and a fixed cost to create each contract offered by lenders. Innovations which reduce the fixed cost or ameliorate asymmetric information have large extensive margin effects via the entry of new lending contracts targeted at riskier borrowers. This results in more defaults and borrowing, as well as increased dispersion of interest rates. Using the Survey of Consumer Finance and interest rate data collected by the Board of Governors, we find evidence supporting these predictions, as the dispersion of credit card interest rates nearly tripled, and the share of credit card debt of lower income households nearly doubled.

E49: Balance of Links

33	Links in 2005
3	New links in 2006-2013
786	Potential links at the end of 2013
822	Total

The date of final verification: November 22, 2017.

E49 — Contributors — Авторы

Lychagin, Anton M. — Лычагин Антон Михайлович — 0.12 AS²;
 Lychagin, Mikhail V. — Лычагин Михаил Васильевич — 0.14 AS;
 Slepikova, Juiya M. — Слепенкова Юлия Михайловна — 0.1 AS.

The total volume of derivative works for E49 is equal to 0.36 AS.
 Общий объем раздела E49 — 0,36 авторских (уч.-изд.) л.

² AS — Author's Sheet — unit of measuring the volume of a literary work; equal to 40,000 characters (including the spaces between words), or 3,000 sq cm of illustrations (maps) like the table E49.E.

E5 Monetary Policy, Central Banking, and the Supply of Money and Credit

Year	DE	Title and Abstract
2006		
2006	B50	Arestis, Philip, and Malcolm Sawyer, eds. 2006. <i>A Handbook of Alternative Monetary Economics</i> , Cheltenham, U.K. and Northampton, Mass.: Elgar. Twenty-nine papers explore topics of money and finance within heterodox economics. Papers discuss money--an alternative story; endogenous money--accommodationist; endogenous money--structuralist; the endogeneity of money--empirical evidence; chartalism and the tax-driven approach to money; French circuit theory; the Italian circuitist approach; the theory of money emissions; Keynes and money; Minsky on financial instability; Kalecki on money and finance; Karl Marx's theory of money and credit; the transmission mechanism of monetary policy--a critical review; monetary policy; monetary policy in an endogenous money economy; central bank and lender of last resort; the theory of interest rates; the role of banks in the context of economic development with reference to South Korea and India; credit rationing; liquidity preference theory; financial liberalization and the relationship between finance and growth; deregulation; banking and financial crises; a post-Keynesian analysis of financial crisis in the developing world and directions for reform; financial bubbles; Keynesian uncertainty and money; speculation, liquidity preference, and monetary circulation; money and inflation; and interest and money--the property explanation.
2006	D60	Butier, Willem H. 2006. <i>How Robust is the New Conventional Wisdom? The Surprising Fragility of the Theoretical Foundations of Inflation Targeting and Central Bank Independence</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 5772. Flexible inflation targeting cannot be rationalised using conventional welfare economic criteria, except in a single, practically uninteresting special case. New-Keynesian DSGE models imply that optimal monetary policy implements the Bailey-Friedman Optimal Quantity of Money rule and that actual inflation fully validates or accommodates core inflation. Flexible inflation targeting is also inconsistent with the mandates of leading inflation targeters like the Bank of England and the ECB. These mandates are lexicographic in price stability and therefore does not permit a trade-off between inflation volatility and output gap volatility in the monetary policy maker's objective function. Operational independence of the central bank is limited by the central bank's intertemporal budget constraint. Price stability, or an externally imposed inflation target, may not be independently financeable

Year	DE	Title and Abstract
		by the central bank. In that case, active budgetary support from the Treasury is necessary to make the inflation target financeable. Independent monetary policy is fully compatible with coordinated and cooperative monetary and fiscal policy. Central bank operational independence precludes substantive accountability; it is compatible only with a weak form of formal accountability: reporting obligations. Central bank independence will only survive if it is viewed as legitimate by the polity and its citizens. A necessary condition for this is that the central bank restricts its activities and public discourse to its natural core mandate: price stability and the capacity and willingness to act as lender of last resort. The Protocol on the Statute of the ESCB and the ECB has given the ECB a mandate that goes beyond this natural core mandate. Such behaviour represents a threat to its continued independence.
2006	D60	Dubey, Pradeep, and John Geanakoplos. 2006. <i>Money and Production, and Liquidity Trap</i>. Cowles Foundation, Yale University. Cowles Foundation Discussion Papers: 1574. We prove the existence of monetary equilibrium in a finite horizon economy with production. We also show that if agents expect the monetary authority to significantly decrease the supply of bank money available for short term loans in the future, then the economy will fall into a liquidity trap today.
2006	D62	Angeletos, George-Marios, and Alessandro Pavan. 2006. <i>Socially Optimal Coordination: Characterization and Policy Implications</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 12778. In recent years there has been a growing interest in macro models with heterogeneity in information and complementarity in actions. These models deliver promising positive properties, such as heightened inertia and volatility. But they also raise important normative questions, such as whether the heightened inertia and volatility are socially undesirable, whether there is room for policies that correct the way agents use information in equilibrium, and what are the welfare effects of the information disseminated by the media or policy makers. We argue that a key to answering all these questions is the relation between the equilibrium and the socially optimal degrees of coordination. The former summarizes the private value from aligning individual decisions, whereas the latter summarizes the value that society assigns to such an alignment once all externalities are internalized.
2006	F35	Prati, Alessandro, and Thierry Tresselt. 2006. <i>What is the Most Effective Monetary Policy for Aid-Receiving Countries?.</i> United Nations, Department of Economics and Social Affairs, Working Papers. This paper analyses how monetary policy can enhance the effectiveness of volatile aid flows. We find that monetary policy is effective in reducing trade balance volatility. We propose the following taxonomy, excluding the case of emergency assistance. Monetary policy should slow down consumption growth and build up international reserves when aid is abundant and deplete them to finance imports and support consumption when aid is scarce. If foreign aid also affects productivity growth, monetary policy should take this productivity effect into account in responding to aid flows.
2006	H25	Kehoe, Patrick, and Varadarajan V. Chari. 2006. <i>Modern Macroeconomics in Practice: How Theory is Shaping Policy</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 12476. Theoretical advances in macroeconomics made in the last three decades have had a major influence on macroeconomic policy analysis. Moreover, over the last several decades, the United States and other countries have undertaken a variety of policy changes that are precisely what macroeconomic theory of the last 30 years suggests. The three key developments that have shaped macroeconomic policy analysis are the Lucas critique of policy evaluation due to Robert Lucas, the time inconsistency critique of discretionary policy due to Finn Kydland and Edward Prescott, and the development of quantitative dynamic stochastic general equilibrium models following Finn Kydland and Edward Prescott.
2006	O14	von Furstenberg, George M., and Ulf von Kalckreuth. 2006. <i>Dependence on external finance: an inherent industry characteristic?.</i> Deutsche Bundesbank, Research Centre, Discussion Paper Series 1: Economic Studies: 2006,30. Rajan and Zingales (1998) use U.S. Compustat firm data for the 1980s to obtain measures of manufacturing sectors' Dependence on External Finance (DEF). They take any differences in these measures to be structural/technological and thus applicable to other countries. Their joint assumptions about how to obtain representative values of DEF by sector and about why these values differ fundamentally between sectors have been adopted in additional studies seeking to show that sectors benefit unequally from a country's level of financial development. However, the assumptions as such have not been examined. The present study, conducted with cyclically adjusted annual measures of DEF derived from U.S. industry data for 1977-1997, attempts to do so using data that are aggregated by sector. We find that those variables that may be regarded as structural/ technological have very low explanatory power, and that the DEF figures calculated from micro data do not correspond closely to what is obtained from aggregate figures. Hence key assumptions on which RZ's argumentation is based could not be validated.
2006	Q00	Frankel, Jeffrey A. 2006. <i>The Effect of Monetary Policy on Real Commodity Prices</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 12713. Commodity prices are back. This paper looks at connections between monetary policy, and agricultural and mineral commodities. We begin with the monetary influences on commodity prices, first for a large country such as the United States, then smaller countries. The claim is that low real interest rates lead to high real commodity prices. The theory is an analogy with Dornbusch overshooting. The relationship between real interest rates and real commodity prices is also supported empirically. One channel through which this effect is accomplished is a negative effect of interest rates on the desire to carry commodity inventories. The paper concludes with a consideration of implications for monetary policy.
2007		
2007	F59	Conesa, Juan Carlos, Timothy J. Kehoe, and Kim J. Ruhl. 2007. <i>Modeling Great Depressions: The Depression in Finland in the 1990s</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 13591. This paper is a primer on the great depressions methodology developed by Cole and Ohanian (1999, 2007) and Kehoe and Prescott (2002, 2007). We use growth accounting and simple dynamic general equilibrium models to study the depression that occurred in Finland in the early 1990s. We find that the sharp drop in real GDP over the period 1990-93 was driven by a combination of a drop in total factor productivity (TFP) during 1990-92 and of increases in taxes on labor and consumption and increases in government consumption during 1989-94, which drove down hours worked in Finland. We attempt to endogenize the drop in TFP in variants of the model with an investment sector and with terms-of-trade shocks but are unsuccessful.
2007	G22	Caballero, Ricardo J., and Arvind Krishnamurthy. 2007. <i>Collective Risk Management in a Flight to Quality Episode</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 12896. We present a model of optimal intervention in a flight to quality episode. The reason for intervention stems from a collective bias in agents' expectations. Agents in the model make risk management decisions with incomplete knowledge. They understand their own shocks, but are uncertain of how correlated their shocks are with systemwide shocks, treating the latter uncertainty as Knightian. We show that when aggregate liquidity is low, an increase in uncertainty leads agents to a series of protective actions--decreasing risk exposures, hoarding liquidity, locking-up capital--that reflect a flight to quality. However, the conservative actions of agents leave the aggregate economy over-exposed to negative shocks. Each agent covers himself against his own worst-case scenario, but the scenario that the collective of agents are guarding against is impossible. A lender of last resort, even if less knowledgeable than private agents about individual shocks,

Year	DE	Title and Abstract
		does not suffer from this collective bias and finds that pledging intervention in extreme events is valuable. The intervention unlocks private capital markets.
2007	H21	Jonker, Nicole, and Thijs Kettenis. 2007. <i>Explaining cash usage in the Netherlands: the effect of electronic payment instruments</i>. Netherlands Central Bank, Research Department, DNB Working Papers. Since the mid-nineties, usage of the debit card by Dutch consumers has increased considerably. While accounting for three quarters of the total value of retail sales in the early nineties, in 2004 the value share of cash payments had fallen to about two quarters. If the cash to payment card ratio in 2004 had been the same as in 1990, the social costs of retail payments would have come out almost EUR 200 million higher. Consumers will have benefited from these savings through lower consumer prices and bank fees. Estimates indicate that the share of cash (in value terms) will decline further from 46% to about 20% in 2015. Changes in the payment infrastructure can yield even higher cost savings. This appears from the outcomes of fictitious scenarios in which the use of electronic means of payment is promoted by increasing the growth rate of the number of EFTPOS terminals and keeping the number of ATMs at their end-2004 level. The outcome in question is indicative of the effectiveness of any efficiency-enhancing measures that may be taken within the scope of the November 2005 Payment Covenant between banks and retailers. An increase in the number of EFTPOS terminals turns out to be especially effective.
2007	J31	Diss: Zhang, Yahong. 2007. Essays on the Role of Search in Determining Wage Differentials and Monetary Equilibria. PhD diss. University of Western Ontario.
2007	O13	Jumah, Adusei, and Georg Pastuszyn. 2007. <i>Oil Price Shocks, Monetary Policy and Aggregate Demand in Ghana</i>. Institute for Advanced Studies, Economics Series: 212. The current study examines the relationship between the world oil price and aggregate demand in a developing country, Ghana, via the interest rate channel by means of cointegration analysis. Results of the study indicate that oil price--by impacting the price level positively--negatively impacts real output. The results also indicate that monetary policy is initially eased in response to a surge in the price of oil in order to lessen any growth consequences, but at the cost of higher inflation. The ensuing higher inflation, however, prompts a subsequent tightening of monetary policy leading to a further decline in output. In addition, output does not revert quickly to its initial level after an oil price shock, but declines over an extended period.
2008		
2008	C01	Koujianou Goldberg, Pinelopi, and Rebecca Hellerstein. 2008. <i>A Framework for Identifying the Sources of Local-Currency Price Stability with an Empirical Application</i>. Princeton University, Department of Economics, Center for Economic Policy Studies, Working Papers: 185goldberg.pdf. The inertia of the local-currency prices of traded goods in the face of exchange-rate changes is a well-documented phenomenon in International Economics. This paper develops a framework for identifying the sources of local-currency price stability. The empirical approach exploits manufacturers' and retailers' first-order conditions in conjunction with detailed information on the frequency of price adjustments in response to exchange-rate changes, in order to quantify the relative importance of markup adjustment by manufacturers and retailers, local-cost non-traded components, and nominal price rigidities, in the incomplete transmission of exchange-rate changes to prices. The approach is applied to micro data from the beer market. We find that on average, 54.1% of the incomplete exchange rate pass-through is due to local non-traded costs; 33.7% to markup adjustment; and 12.2% to the existence of price adjustment costs.
2008	C61	Newby, Elisa. 2008. <i>The Suspension of the Gold Standard as Sustainable Monetary Policy</i>. Faculty of Economics, University of Cambridge, Cambridge Working Papers in Economics. This paper models the gold standard as a state contingent commitment rule that is only feasible during peace. It shows that monetary policy during war, when the gold convertibility rule is suspended, can still be credible, if the policy maker's plan is to resume the gold standard at the old par value in the future. The DGE model developed in this paper suggests that the resumption of the gold standard was a sustainable plan, which replaced the gold standard as a commitment rule and made monetary policy time consistent. The equilibrium is supported by trigger strategies, where private agents retaliate if a policy maker defaults its policy plan to resume the gold standard rule.
2008	F37	Binyamini, Alon, and Assaf Razin. 2008. <i>Inflation-Output Tradeoff as Equilibrium Outcome of Globalization</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 14379. The paper provides an integrated analysis of globalization effects on the inflation-output tradeoff and monetary policy in the New-Keynesian framework. The prediction of the analysis is threefold. First, labor, goods, and capital mobility flatten the Phillips curve, the tradeoff between inflation and activity. Second, the same globalization forces lead the welfare-based monetary policy to be more aggressive with regard to inflation fluctuations, and at the same time, more benign with respect to the output-gap fluctuations. Third, the equilibrium response of inflation to supply and demand shocks is more moderate, and the response of the output gap to these shocks is more pronounced, when the economy opens up; under such welfare-based monetary policy.
2009		
2009	B30	Buiter, Willem H. 2009. <i>Negative Nominal Interest Rates: Three ways to overcome the zero lower bound</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 7346. The paper considers three methods for eliminating the zero lower bound on nominal interest rates and thus for restoring symmetry to domain over which the central bank can vary its policy rate. They are: (1) abolishing currency (which would also be a useful crime-fighting measure); (2) paying negative interest on currency by taxing currency; and (3) decoupling the numeraire from the currency/medium of exchange/means of payment and introducing an exchange rate between the numeraire and the currency which can be set to achieve a forward discount (expected depreciation) of the currency vis-a-vis the numeraire when the nominal interest rate in terms of the numeraire is set at a negative level for monetary policy purposes.
2009	D14	CV: Pilkington, Marc. 2009. "The Financialization of Modern Economies in Monetary Circuit Theory." In <i>The Political Economy of Monetary Circuits: Tradition and Change in Post-Keynesian Economics</i>, ed. Jean-Francois Ponsot and Sergio Rossi, 188-216. New York: St. Martin's Press, Palgrave Macmillan.
2009	D53 G01	Cassola, Nuno, Ali Hortacsu, and Jakub Kastl. 2009. <i>The 2007 Subprime Market Crisis Through the Lens of European Central Bank Auctions for Short-Term Funds</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 15158. In this paper we study European banks' demand for short-term funds (liquidity) during the summer 2007 subprime market crisis. We use bidding data from the European Central Bank's auctions for one-week loans, their main channel of monetary policy implementation. Through a model of bidding, we show that banks' behavior reflects their cost of obtaining short-term funds elsewhere (i.e., in the interbank market) as well as a strategic response to other bidders. We find considerable heterogeneity across

Year	DE	Title and Abstract
		banks in their willingness to pay for short-term funds supplied in these auctions. Accounting for the strategic component is important: while a naive interpretation of the raw bidding data may suggest that virtually all banks suffered a dramatic increase in the cost of obtaining funds in the interbank market, we find that for about one third of the banks, the change in bidding behavior was simply a strategic response. Using a complementary data set, we also find that banks' pre-turmoil liquidity costs, as estimated by our model, are predictive of their post-turmoil liquidity costs, and that there is considerable heterogeneity in these costs with respect to the country-of-origin. Finally, among the publicly traded banks, the willingness to pay for short-term funds in the second half of 2007 are predictive of stock prices in late 2008.
2009	D53 D61	Geanakoplos, John, and Pradeep Dubey. 2009. <i>Credit Cards and Inflation</i> . Cowles Foundation, Yale University, Cowles Foundation Discussion Papers: 1709. The introduction and widespread use of credit cards increases trading efficiency but, by also increasing the velocity of money, it causes inflation, in the absence of monetary intervention. If the monetary authority attempts to restore pre-credit card price levels by reducing the money supply, it might have to sacrifice the efficiency gains. When there is default on credit cards, there is even more inflation, and less efficiency gains. The monetary authority might then have to accept less than pre-credit card efficiency in order to restore pre-credit card price levels, or else it will have to accept inflation if it is unwilling to cut efficiency below pre-credit card levels. This could be a source of stagflation.
2009	D86 G01	Tambovtsev, V. 2009. "The Financial Crisis and Economic Theory." <i>Problems of Economic Transition</i> , 52(4): 42-48. Treating money as contracts in the process of execution, or "under-executed contracts," the article describes its properties as an economic good. It is shown that money is a private good with valuable externalities, that is, a legitimate good. Based on this, the article concludes the need for state regulation of financial markets oriented toward minimizing negative externalities by restricting the use of the riskiest contracts.
2009	E27 O51 R20 R21	Baker, Dean. 2009. <i>The Housing Crash Recession and the Case for a Third Stimulus</i> . Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This paper makes the case for a third stimulus package to in the face of economic indicators signaling that the economy is in a deeper downturn than was expected based on previous projections. Specifically, the report calls for an employer tax-credit for extending health care coverage and another per worker employer tax credit for increasing paid time off from work. The author also makes the case for a housing policy centered on the stabilization of prices in non-bubble and deflated markets rather than applying the same efforts on markets that remain at bubble inflated levels. Finally, the paper argues that the dollar must be allowed to fall in order to adjust trade imbalances that are compounding the U.S. economic crisis caused by the collapse of the housing market.
2009	F54	Robertson, James. 2009. "The Twenty-First Century Crisis of World Development--The Central Role of Money Values: A Metaproblem." <i>Development</i> , 52(3): 317-22. The prospect for the world development today contrasts with the optimistic outlook for post-imperial development 50 years ago. The author argues that we need to deal with the metaproblems underlying almost all the particular threats we face. One is that our present money system motivates us to accelerate the onset of combined system collapse.
2009	G01	Goodhart, Charles A. E., Carolina Osorio, and Dimitrios P. Tsomocos. 2009. <i>Analysis of Monetary Policy and Financial Stability: A New Paradigm</i> . CESifo Group Munich, CESifo Working Paper Series: CESifo Working Paper No. 2885. This paper introduces agent heterogeneity, liquidity, and endogenous default to a DSGE framework. Our model allows for a comprehensive assessment of regulatory and monetary policy, as well as welfare analysis in the different sectors of the economy. Due to liquidity and endogenous default, the transmission mechanism of shocks is well defined, and their short to medium run effects on financial stability are properly captured.
2009	G01	THE SAME AS D86 Tambovtsev, V. 2009. "The Financial Crisis and Economic Theory." <i>Problems of Economic Transition</i> , 52(4): 42-48.
2009	G01	White, Eugene N. 2009. <i>Lessons from the Great American Real Estate Boom and Bust of the 1920s</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 15573. Although long obscured by the Great Depression, the nationwide "bubble" that appeared in the early 1920s and burst in 1926 was similar in magnitude to the recent real estate boom and bust. Fundamentals, including a post-war construction catch-up, low interest rates and a "Greenspan put," helped to ignite the boom in the twenties, but alternative monetary policies would have only dampened not eliminated it. Both booms were accompanied by securitization, a reduction in lending standards, and weaker supervision. Yet, the bust in the twenties, which drove up foreclosures, did not induce a collapse of the banking system. The elements absent in the 1920s were federal deposit insurance, the "Too Big To Fail" doctrine, and federal policies to increase mortgages to higher risk homeowners. This comparison suggests that these factors combined to induce increased risk-taking that was crucial to the eruption of the recent and worst financial crisis since the Great Depression.
2009	G01 G38	Diamond, Douglas W., and Raghuram G. Rajan. 2009. <i>Illiquidity and Interest Rate Policy</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 15197. The cheapest way for banks to finance long term illiquid projects is typically to borrow short term from households. But when household needs for funds are high, interest rates will rise sharply, debtors will have to shut down illiquid projects, and in extremis, will face more damaging runs. Authorities may want to push down interest rates to maintain economic activity in the face of such illiquidity, but intervention may not always be feasible, and when feasible, could encourage banks to increase leverage or fund even more illiquid projects up front. This could make all parties worse off. Authorities may want to commit to a specific policy of interest rate intervention to restore appropriate incentives. For instance, to offset incentives for banks to make more illiquid loans, authorities may have to commit to raising rates when low, to counter the distortions created by lowering them when high. We draw implications for interest rate policy to combat illiquidity.
2009	G01 G33	Mian, Atif R., and Amir Sufi. 2009. <i>House Prices, Home Equity-Based Borrowing, and the U.S. Household Leverage Crisis</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 15283. Using individual-level data on homeowner debt and defaults from 1997 to 2008, we show that borrowing against the increase in home equity by existing homeowners is responsible for a significant fraction of both the sharp rise in U.S. household leverage from 2002 to 2006 and the increase in defaults from 2006 to 2008. Employing land topology-based housing supply elasticity as an instrument for house price growth, we estimate that the average homeowner extracts 25 to 30 cents for every dollar increase in home equity. Money extracted from increased home equity is not used to purchase new real estate or pay down high credit card balances, which suggests that borrowed funds may be used for real outlays (i.e., consumption or home improvement). Home equity-based borrowing is stronger for younger households, households with low credit scores, and households with high initial credit card utilization rates. Homeowners in high house price appreciation areas experience a relative decline in default rates from 2002 to 2006 as they borrow heavily against their home equity, but experience very high default rates from 2006 to 2008. Our estimates suggest that home equity-based borrowing is equal to 2.8% of GDP every year from 2002 to 2006, and accounts for at least 34% of new defaults from 2006 to 2008.

The Implicit Bank Subsidies in the Primary Dealer Credit Facility (PDCF) and the Term Securities Lending Facility (TSLF) Created by the Federal Reserve Board.</i> Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This study produces calculations of the amount of money being dispersed by the government to the 16 primary dealers and investment banks who qualify to borrow through the special lending facilities created in the last year by the Federal Reserve Board under the assumption that each borrows in proportion to its assets. The study then uses Fed data on the interest rate charged for loans from these lending facilities to calculate the potential subsidy in this lending. The report calls attention to the fact that few details have been given about the specific loan amounts, recipients, or collateral posted.
2009	G24	Sherman, Matthew. 2009. <i>The Alphabet Soup Explained: An Analysis of the Special Lending Facilities at the Federal Reserve.</i> Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This paper looks at the trends in activity at the Federal Reserve's newly-created special lending facilities, hoping to provide a better understanding of their operation and significance within financial markets. These facilities were created in response to the financial crisis and have expanded the Fed's balance sheet by over \$1 trillion in terms of total assets. This sum is larger than the total price tag of the recent federal stimulus as well as the bank bailout authorized by the TARP. Yet both of these government responses have received enormously more public scrutiny than any of the actions taken by the Federal Reserve.
2009	G24	Baker, Dean, and Travis McArthur. 2009. <i>The Value of the "Too Big to Fail" Big Bank Subsidy.</i> Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. One outcome of the TARP and other bank rescue efforts following the collapse of Lehman Brothers in September of 2008 is that the United States has essentially formalized a commitment to a "too big to fail" (TBTF) policy for major banks. This paper uses data from the FDIC on the relative cost of funds for TBTF banks and other banks, before and after the crisis, to quantify the value of the government protection provided by the TBTF policy.

2010	B59 E02	Bibow, Jorg. 2010. <i>A Post Keynesian Perspective on the Rise of Central Bank Independence: A Dubious Success Story in Monetary Economics.</i> Levy Economics Institute, The, Economics Working Paper Archive. This paper critically assesses the rise of central bank independence (CBI) as an apparent success story in modern monetary economics. As to the observed rise in CBI since the late 1980s, we single out the role of peculiar German traditions in spreading CBI across continental Europe, while its global spread may be largely attributable to the rise of neoliberalism. As to the empirical evidence alleged to support CBI, we are struck by the nonexistence of any compelling evidence for such a case. The theoretical support for CBI ostensibly provided by modeling exercises on the so-called time-inconsistency problem in monetary policy is found equally wanting. Ironically, New Classical modelers promoting the idea of maximum CBI unwittingly reinstalled a (New Classical) "benevolent dictator" fiction in disguise. Post Keynesian critiques of CBI focus on the money neutrality postulate as well as potential conflicts between CBI and fundamental democratic values. John Maynard Keynes's own contributions on the issue of CBI are found worth revisiting.
2010	E02	Christiano, Lawrence J., Mathias Trabandt, and Karl Walentin. 2010. <i>Involuntary Unemployment and the Business Cycle.</i> National Bureau of Economic Research, Inc. NBER Working Papers: 15801. We propose a monetary model in which the unemployed satisfy the official US definition of unemployment: they are people without jobs who are (i) currently making concrete efforts to find work and (ii) willing and able to work. In addition, our model has the property that people searching for jobs are better off if they find a job than if they do not (i.e., unemployment is 'involuntary'). We integrate our model of involuntary unemployment into the simple New Keynesian framework with no capital and use the resulting model to discuss the concept of the 'non-accelerating inflation rate of unemployment'. We then integrate the model into a medium sized DSGE model with capital and show that the resulting model does as well as existing models at accounting for the response of standard macroeconomic variables to monetary policy shocks and two technology shocks. In addition, the model does well at accounting for the response of the labor force and unemployment rate to the three shocks.
2010	E02	Blinder, Alan. 2010. <i>How Central Should the Central Bank Be?</i> Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 1202. About six years ago, I published a small book entitled <i>The Quiet Revolution</i> (Blinder 2004). Though its subtitle was <i>Central Banking Goes Modern</i> , I never imagined the half of it. Since March 2008, the Federal Reserve has gone post-modern with a bewildering variety of unprecedented actions that have either changed the nature and scope of the central bank's role or stretched it beyond the breaking point, depending on your point of view. And that leads straight to the central question of this essay: What should--and shouldn't--the Federal Reserve do?

2010	E02	Sims, Christopher. 2010. <i>Commentary on Policy at the Zero Lower Bound</i>. Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 1205. Several aspects of the difficulties of policy at the zero lower bound are discussed: The difficulty of credible commitment to higher future inflation, as most New Keynesian models imply is necessary; the need for fiscal and monetary policy coordination; the pitfalls in the taking of quasi-fiscal actions by the central bank.
2010	F50	Wolf, Nikolaus. 2010. <i>Europe's Great Depression: Coordination Failure after the First World War</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 7957. The purpose of this paper is to survey and re-interpret the extensive literature that tried to explain both the depth of the great depression in Europe and the delay of recovery as a failure to coordinate economic policies. Europe could not exploit her vast economic potential after 1918, because the war had not yet come to an end--indeed it did not end before 1945. Both, domestic and international institutions suffered from a lack of reciprocal trust and commitment, which can be clearly illustrated in the realm of monetary policy, but affected many other areas of policymaking, such as energy or migration policies. These institutions in turn affected expectations and thereby the extent to which for example expansionary policies could be effective.
2010	F50	Weisbrot, Mark, and Juan Antonio Montecino. 2010. <i>Alternatives to Fiscal Austerity in Spain</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. 2010	G13	Hamilton, James D., and Tatsuyoshi Okimoto. 2010. <i>Sources of Variation in Holding Returns for Fed Funds Futures Contracts</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 15736. This paper relates predictable gains from positions in fed funds futures contracts to violations of the expectations hypothesis of the term structure of interest rates. Although evidence for predictable gains from positions in short-horizon contracts is mixed, we find that gains in longer horizon contracts can be well described using Markov-switching models, with predictability associated with particular episodes in which economic activity was weak and variability in the returns to these contracts was quite high.
2010	N00	Shachmurove, Yochanan. 2010. <i>The Next Financial Crisis</i>. Penn Institute for Economic Research, Department of Economics, University of Pennsylvania, PIER Working Paper Archive. The examination of U.S. crises reveals that the current financial crisis follows past patterns. An investment bubble creates excess demand for new financing instruments. During the railroad bubbles of the nineteenth century loans were issued at a pace higher than many companies could pay back. The current housing bubble originated from issuing sub-prime mortgages that assume that housing prices would only rise. The increased demand for credit induces financial innovations and instruments that circumvent existing regulations. Inevitably, the bubble bursts. The history of financial crises teaches that policy reforms and new regulations cannot prevent future financial crises.
2010	N42 N62	Gordon, Robert J., and Robert Krenn. 2010. <i>The End of the Great Depression 1939-41: Policy Contributions and Fiscal Multipliers</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 16380. This paper is about the size of fiscal multipliers and the sources of recovery from the Great Depression. Its baseline result is that 89.1 percent of the 1939:Q1-1941:Q4 recovery can be attributed to fiscal policy innovations, 34.1 percent to monetary policy innovations and the remaining -23.2 percent to the combined effect of the basic VAR dynamic forecast and innovations in non-government components of GDP. Traditional Keynesian multipliers assume that there are no capacity constraints to impede a fiscal-driven expansion in aggregate demand. On the contrary, we find ample evidence of capacity constraints in 1941, particularly in the second half of that year. As a result our preferred government spending multiplier is 1.80 when the time period ends in 1941:Q2 but only 0.88 when the time period ends in supply-constrained 1941:Q4. Only the 1.80 multiplier is relevant to situations like 2009-10 when capacity constraints are absent across the economy. Two sets of new insights emerge from a review of contemporary print media. We document that the American economy went to war starting in June 1940, fully 18 months before Pearl Harbor. We also detail the bifurcated nature of the 1941 economy, with excess capacity in its labor market but capacity constraints in many of the key manufacturing industries. By July 1941, the American economy was in a state of perceived national emergency.
2010	N92	Fishback, Price V. 2010. <i>U.S. Monetary and Fiscal Policy in the 1930s</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 16477. The paper provides a survey of fiscal and monetary policies during the 1930s under the Hoover and Roosevelt Administrations and how they influenced the policies during the recent Great Recession. The discussion of the causal impacts of monetary policy focuses on papers written in the last decade and the findings of scholars using dynamic structural general equilibrium modeling. The discussion of fiscal policy shows why economists do not see the New Deal as a Keynesian stimulus, describes the significant shift toward excise taxation during the 1930s, and surveys estimates of the impact of federal spending on local economies. The paper concludes with discussion of the lessons for the present from 1930s monetary and fiscal policy.

2011	H44	Wray, L. Randall. 2011. "Keynes after 75 Years: Rethinking Money as a Public Monopoly". Levy Economics Institute, The Economics Working Paper Archive. In this paper I first provide an overview of alternative approaches to money, contrasting the orthodox approach, in which money is neutral, at least in the long run; and the Marx-Veblen-Keynes approach, or the monetary theory of production. I then focus in more detail on two main categories: the orthodox approach that views money as an efficiency-enhancing innovation of markets, and the Chartalist approach that defines money as a creature of the state. As the state's "creature," money should be seen as a public monopoly. I then move on to the implications of viewing money as a public monopoly and link that view back to Keynes, arguing that extending Keynes along these lines would bring his theory up to date.
2011	I12 I18 O47 O57	Weisbrot, Mark, Rebecca Ray, Juan Montecino, and Sara Kozameh. 2011. <i>The Argentine Success Story and its Implications</i> . Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. The Argentine economy has grown 94 percent for the years 2002-2011, using International Monetary Fund projections for the end of this year. This is the fastest growth in the Western Hemisphere for this period, and among the highest growth rates in the world. It also compares favorably to neighboring economies that are commonly seen as quite successful, such as Brazil, which has had less than half as much growth over the same period.
2011	J61 J63 J65 J68	Schmitt, John, and Kris Warner. 2011. <i>Deconstructing Structural Unemployment</i> . Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. Some economic observers argue "structural unemployment" has increased in the wake of the Great Recession, but in this paper we find little support for either of two arguments that suggest that structural unemployment has been on the rise. The first argument focuses on the large increase in unemployment among construction workers. The second argument is that falling house prices have reduced the mobility of unemployed workers--creating a "housing lock" in which unemployed workers, who would otherwise relocate to regions with jobs, are stuck in high unemployment areas.

2011	O47	Brixiova, Zuzana, and Leonce Ndikumana. 2011. <i>Supporting Africa's Post-Crisis Growth: The Role of Macroeconomic Policies</i> . Political Economy Research Institute, University of Massachusetts at Amherst, Working Papers. The objective of this paper is to discuss macroeconomic policies that would help African countries, especially the low income countries, reach strong, sustained and shared growth in the post-crisis world. The paper first reviews, with a special focus on LICs, macroeconomic policies in Africa prior to the crisis. It then discusses factors behind 'the Africa surprise' that is the continent's overall good performance during the crisis and relatively fast recovery. It underscores that in the aftermath of the crisis, the emphasis of the macroeconomic policy needs to shift from the objective of very low inflation that predominated prior to the crisis towards growth. Fiscal policy is key in this regard, through public outlays on infrastructure anchored in the medium term expenditure frameworks that would also have a counter-cyclical role. Where conditions allow, frontier market LICs may want to consider adopting flexible inflation targeting frameworks that would provide sufficient room for expansion of credit to the private sector.

2012		
2012	A14	Wray, L. Randall. 2012. "A Meme for Money". Levy Economics Institute, The Economics Working Paper Archive. This paper argues that the usual framing of discussions of money, monetary policy, and fiscal policy plays into the hands of conservatives. That framing is also largely consistent with the conventional view of the economy and of society more generally. To put it the way that economists usually do, money "lubricates" the market mechanism-a good thing, because the conventional view of the market itself is overwhelmingly positive. Acknowledging the work of George Lakoff, this paper takes the position that we need an alternative meme, one that provides a frame that is consistent with a progressive social view if we are to be more successful in policy debates. In most cases, the progressives adopt the conservative framing and so have no chance. The paper advances an alternative framing for money and shows how it can be used to reshape discussion. The paper shows that the Modern Money Theory approach is particularly useful as a starting point for framing that emphasizes use of the monetary system as a tool to accomplish the public purpose. It is not so much the accuracy of the conventional view of money that we need to question, but rather the framing. We need a new meme for money, one that would emphasize the social, not the individual. It would focus on the positive role played by the state, not only in the creation and evolution of money, but also in ensuring social control over

Year	DE	Title and Abstract
		money. It would explain how money helps to promote a positive relation between citizens and the state, simultaneously promoting shared values such as liberty, democracy, and responsibility. It would explain why social control over money can promote nurturing activities over the destructive impulses of our "undertakers" (Smith's evocative term for capitalists).
2012	B51	Wray, L. Randall, ed. 2012. <i>Theories of Money and Banking. Volume 1. Development of Heterodox Approaches to Money and Banking. Volume 2. Alternative Approaches to Money, Financial Institutions and Policy</i>. Elgar Research Collection. International Library of Critical Writings in Economics, vol. 268. Cheltenham, U.K. and Northampton, Mass.: Elgar. Sixty-five previously published papers present heterodox approaches to money, banks, the broader financial system, and monetary policy. Papers focus on historical debates on theories of money; historical, sociological, and anthropological approaches to money; Keynesian and institutionalist approaches to money; endogenous money; money and the circuit; Karl Marx's approach to money; the modern money or neochartalst approach; monetarist and "Keynesian" approaches to money and banks; money and general equilibrium models; the new monetary consensus; interest rate theory and policy; money, inflation, and exchange rates; money and finance; and financial instability and the Great Crash.
2012	C36	Zhang, Nellie. 2012. <i>Estimating the Demand for Settlement Balances in the Canadian Large Value Transfer System</i>. Bank of Canada, Working Papers. This paper applies a static model of an interest rate corridor to the Canadian data, and estimates the aggregate demand for central-bank settlement balances in the Large Value Transfer System (LVTS). The empirical specification controls for various calendar effects that have been shown to cause fluctuations in LVTS payment flows. The analysis takes into account the downward divergence of the overnight interest rate from the target rate, which has been persistent since 2005. The results suggest that a target of \$3 billion for LVTS settlement balances does not seem excessive during the time period when Canadian monetary policy was operating at the effective lower bound (ELB). Specifically, the model projects that, if the consistent downward divergence of overnight interest rate is taken into account, then on average \$2.405 billion of LVTS settlement balances would probably have been sufficient to achieve the goal of keeping the overnight interest rate at or very close to the lower bound of the corridor. However, by targeting a slightly higher level, the Bank of Canada could be 95% certain that the overnight interest rate would on average not exceed its policy rate at the lower bound of the corridor. In addition, the estimation shows that the point elasticity of overnight interest rate is around 0.17 when the daily level of settlement balances is targeted at \$3 billion under the ELB framework.
2012	C63	Ashraf, Quamrul, Boris Gershman, and Peter Howitt. 2012. <i>How Inflation Affects Macroeconomic Performance: An Agent-Based Computational Investigation</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 18225. We use an agent-based computational approach to show how inflation can worsen macroeconomic performance by disrupting the mechanism of exchange in a decentralized market economy. We find that increasing the trend rate of inflation above 3 percent has a substantial deleterious effect, but lowering it below 3 percent has no significant macroeconomic consequences. Our finding remains qualitatively robust to changes in parameter values and to modifications to our model that partly address the Lucas critique. Finally, we contribute a novel explanation for why cross-country regressions may fail to detect a significant negative effect of trend inflation on output even when such an effect exists in reality.
2012	F14	Weisbrot, Mark, and Juan Antonio Montecino. 2012. <i>More Pain, No Gain for Greece: Is the Euro Worth the Costs of Pro-Cyclical Fiscal Policy and Internal Devaluation?</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This week the Greek government reached agreement with the European authorities and the IMF for 130 billion euros in lending, as part of a new adjustment package to replace the current IMF program that began in May of 2010. Although the agreement should allow the government to avoid default in March, there are grave doubts as to whether the agreed upon program will lead the country to a point where it returns to growth, has a sustainable debt burden, and can borrow from private markets. The most important problem with the commitments that Greece has made in the past two years is that its fiscal policy is pro-cyclical—that is, the government has been, and is committed to, tightening its budget while the economy is in recession.
2012	K29	Grubb, Farley. 2012. <i>Is Paper Money Just Paper Money? Experimentation and Local Variation in the Fiat Paper Monies Issued by the Colonial Governments of British North America, 1690-1775: Part I</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 17997. The British North American colonies were the first western economies to rely on legislative-issued fiat paper monies as their principal internal media of exchange. This system arose piecemeal. It was monetary experimentation on a grand scale. In the absence of banks and treasuries that exchanged local fiat monies at fixed rates for specie monies (outside monies) on demand, colonial governments experimented with other ways to anchor their fiat monies to real values in the economy. These mechanisms included tax-redemption, interest-bearing notes, land-backed mortgage loans, sinking funds, and legal tender laws. The structure and performance of these mechanisms are explained.
2012	L60 R10	Shachmurove, Yochanan, and Reuel Shinnar. 2012. <i>Do Chemical Reactors Hold the Solution for Global Economic Crises?</i>. Penn Institute for Economic Research, Department of Economics, University of Pennsylvania, PIER Working Paper Archive. What can economists learn from dynamic partial control of chemical reactors? Both chemical reactors and the economy involve many variables that are difficult to fully predict or control. Thus, this paper suggests the use of partial control, which involves identifying only the key variables that monitor the system. This idea of observing relatively few variables and enabling policy makers to better control the economy is in line with the contributions of Sargent and Sims, who use a limited number of variables to study monetary and fiscal policies. This approach enables a better distinction between cause and effect in the macroeconomy.

		sovereign debt crises. It reviews the typical patterns prior to crises, considers lessons on their antecedents, and analyzes their evolution and aftermath. It also provides valuable policy lessons on how to prevent, contain and manage financial crises.
2013	F44 H12	Claessens, Stijn, and Ayhan Kose. 2013. <i>Financial Crises: Explanations, Types, and Implications</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 9329. This paper reviews the literature on financial crises focusing on three specific aspects. First, what are the main factors explaining financial crises? Since many theories on the sources of financial crises highlight the importance of sharp fluctuations in asset and credit markets, the paper briefly reviews theoretical and empirical studies on developments in these markets around financial crises. Second, what are the major types of financial crises? The paper focuses on the main theoretical and empirical explanations of four types of financial crises--currency crises, sudden stops, debt crises, and banking crises--and presents a survey of the literature that attempts to identify these episodes. Third, what are the real and financial sector implications of crises? The paper briefly reviews the short- and medium-run implications of crises for the real economy and financial sector. It concludes with a summary of the main lessons from the literature and future research directions.
2013	F62	Milani, Fabio, and Sung Ho Park. 2013. <i>The Effects of Globalization on Macroeconomic Dynamics in a Trade-Dependent Economy: the Case of Korea</i>. University of California-Irvine, Department of Economics, Working Papers: 141502. This paper studies the implications of globalization for the dynamics of macroeconomic variables over the business cycle for a small open trade-dependent economy, such as South Korea. We study the impact of globalization through the lens of a structural model. Globalization is modeled as a time-varying degree of openness in the economy. We estimate the model allowing for non-fully rational expectations, learning by economic agents, and incomplete international financial markets. The empirical results show that globalization led to important changes in the macroeconomic environment. Domestic variables have become much more sensitive toward global measures over the 1991-2012 sample. In particular, domestic output and inflation are significantly affected by global output. Fluctuations in Korean output, inflation, and interest rates, which were driven for the most part by domestic shocks in the early 1990s are, by the end of the sample, due in large part (roughly 70%) to global shocks (and shocks that are open-economy in nature).
2013	H12	THE SAME AS F44 Claessens, Stijn, Ayhan Kose, Luc Laeven, and Fabian Valencia. 2013. <i>Understanding Financial Crises: Causes, Consequences, and Policy Responses</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 9310.
2013	H12	Bouis, Romain, Lukasz Rawdanowicz, Jean-Paul Renne, Shingo Watanabe, and Ane Kathrine Christensen. 2013. <i>The Effectiveness of Monetary Policy since the Onset of the Financial Crisis</i>. OECD Publishing, OECD Economics Department Working Papers: 1081. In the wake of the Great Recession, a massive monetary policy stimulus was provided in the main OECD economies. It helped to stabilise financial markets and avoid deflation. Nonetheless, GDP growth has been sluggish and in some countries lower than expected given the measures taken, and estimated economic slack remains large. In this context, this paper assesses the effectiveness of monetary policy in recent years. It finds that notwithstanding an almost full transmission of policy interest rate cuts and unconventional policy measures to higher asset prices and lower cost of credit in and outside the banking sector in most countries, with the exception of vulnerable euro area economies, monetary policy stimulus did not show up in stronger growth due to a combination of three factors. First, lower policy interest rates may not have provided as much stimulus as expected given the evidence of a decrease in natural interest rates, resulting from the estimated decline in potential GDP growth in the wake of the crisis. Second, balance sheet adjustments of non-financial companies and households, large uncertainty as well as simultaneous and considerable fiscal consolidation in many OECD countries constituted important headwinds. Third, the bank lending channel of monetary policy transmission appears to have been impaired, mainly due to considerable balance sheet adjustments and prevailing uncertainty, which together limited banks' capacity and willingness to supply credit. The paper also stresses that the monetary accommodation risks having unintended negative consequences which are likely to increase with its duration.
2013	H12	THE SAME AS F44 Claessens, Stijn, and Ayhan Kose. 2013. <i>Financial Crises: Explanations, Types, and Implications</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 9329.

2013	O53	Seliger, Bernhard. 2013. <i>The Shrimp that Became a Tiger: Transformation Theory and Korea's Rise after the Asian Crisis</i>, Emerging Markets Studies, vol. 3. Frankfurt am Main and Bern: Peter Lang, PL Academic Research. Presents the theory that the economic crisis and the subsequent changes in the Republic of Korea (South Korea) can be understood by applying the theory of economic transformation. Discusses the economic crisis in South Korea as a transformation crisis of its political and economic culture; the move toward a more general theory of transformation; institutional competition and external constraints to transformation; area studies and the theory of economic transformation--the possibility of moving from uneasy coexistence to integration; a review of five years of DJ-nomics--understanding the economic crisis in South Korea as a transformation crisis of its political and economic culture; the interdependence of economic and political systems--comparing the cases of Malaysia, Indonesia, and South Korea; competition policy as an answer for the Korean crisis; South Korea's economic development between the Asian crisis and the international financial crisis 2008-10; central bank independence and monetary policy after the Asian crisis--the case of South Korea; central bank independence in South Korea before and after the crisis; cognitive models and self-perceptions and the role of South Korea's history; foreign direct investment policy and the perception of South Korea's economic model before and after the financial and economic crisis; the transition from ethnocentrism and cultural nationalism to globalization and hallyu (Korean wave); trajectories of economic integration in East Asia during the Kim Dae-Jung government; the option of bilateral free trade agreements; economic integration in the Kim Dae-Jung and Roh Moo-Hyun era--whether South Korea is the "hub of East Asia"; the quest for an optimum integration area and the future of South Korea in East Asia; and after the dust settles--applying the lessons learned from the transformation theory.

Year	DE	Title and Abstract
2006		
2006	A12	CV: Wang, Yougui, Ning Xi, and Ning Ding. 2006. "The Contribution of Money-Transfer Models to Economics." In <i>Econophysics and Sociophysics: Trends and Perspectives</i> , ed. Bikas K. Chakrabarti, Anirban Chakraborti and Arnab Chatterjee, 191-217. Weinheim: Wiley.
2006	A20	CV: Fontana, Giuseppe. 2006. "Telling Better Stories in Macroeconomic Textbooks: Monetary Policy, Endogenous Money and Aggregate Demand." In <i>Complexity, Endogenous Money and Macroeconomic Theory: Essays in Honour of Basil J. Moore</i> , ed. Mark Setterfield, 353-67. Cheltenham, U.K. and Northampton, Mass: Elgar.
2006	B14	CV: Forstater, Mathew. 2006. "Tax-Driven Money: Additional Evidence from the History of Economic Thought, Economic History and Economic Policy." In <i>Complexity, Endogenous Money and Macroeconomic Theory: Essays in Honour of Basil J. Moore</i> , ed. Mark Setterfield, 202-20. Cheltenham, U.K. and Northampton, Mass: Elgar.
2006	C34	BAUWENS, Luc, and Michel LUBRANO. 2006. Bayesian Inference in Dynamic Disequilibrium Models : an Application to the Polish Credit Market. Universite catholique de Louvain, Departement des Sciences Economiques, Universite catholique de Louvain, Departement des Sciences Economiques Working Paper: 2006027. We review Bayesian inference for dynamic latent variable models using the data augmentation principle. We detail the difficulties of stimulating dynamic latent variables in a Gibbs sampler. We propose an alternative specification of the dynamic disequilibrium model which leads to a simple simulation procedure and renders Bayesian inference fully operational. Identification issues are discussed. We conduct a specification search using the posterior deviance criterion of Spiegelhalter, Best, Carlin, and van der Linde (2002) for a disequilibrium model of the Polish credit market.
2006	C92	Deck, Cary A., Kevin A. McCabe, and David P. Porter. 2006. "Why Stable Fiat Money Hyperinflates: Results from an Experimental Economy." <i>Journal of Economic Behavior and Organization</i>, 61(3): 471-86. Experiments are used to study acceptance of a fiat money as a medium of exchange. In these finite horizon markets, people trade valuable goods for intrinsically worthless money. However, when a public sector capable of printing money is introduced, the private sector is crowded out, producing dramatic hyperinflations and collapses in trading. This economic failure is found to be a consequence of the public sector undermining the market's ability to coordinate trade. The inefficiency associated with the hyperinflation is found not to be a purely monetary phenomenon resulting from an increasing money supply.
2006	D60	Dubey, Pradeep, and John Geanakoplos. 2006. Money and Production, and Liquidity Trap. Cowles Foundation, Yale University, Cowles Foundation Discussion Papers: 1574. We prove the existence of monetary equilibrium in a finite horizon economy with production. We also show that if agents expect the monetary authority to significantly decrease the supply of bank money available for short term loans in the future, then the economy will fall into a liquidity trap today.
2006	D61 E39 H59 R20	Erlandsen, Espen, Jens Lundsgaard, and Felix Hufner. 2006. The Danish housing market: less subsidy and more flexibility. OECD Economics Department, OECD Economics Department Working Papers: 513. While Denmark has fairly flexible labour and product markets in most respects, the housing market stands out with large direct and indirect subsidies for all types of housing and a highly regulated rental market hindering mobility, probably resulting in a mismatch between housing needs and use. In the current housing policy framework there is quite a contrast between the well-functioning market for transactions of owner-occupied housing (supported by the highly liberalised mortgage market) and the highly regulated rental housing market. This paper assesses the recent development in Danish house prices, followed by a discussion of ways of replacing the costly government intervention in the Danish housing market with more market-based mechanisms, thereby achieving policy objectives in a more efficient and targeted way. The paper reviews the main areas for reform, including overall subsidisation of housing, rent regulation, social housing, and how housing supply could be made more responsive.

"Agricultural and Monetary Shocks before the Great Depression: A Graph-Theoretic Causal Investigation." <i>Journal of Macroeconomics</i>, 28(4): 720-36. This paper uses graph-theoretic methods to investigate the causal relationships between agriculture, money, interest rates, prices, and real GDP in 12 countries during the years 1869-1929. We find that agricultural production directly and indirectly causes real GDP in two-thirds of the cases. Monetary shocks also play an important causal role in about half the cases, but unlike agriculture, the causal links are usually indirect through other variables to real GDP. The direct causal link between money and prices is also particularly strong. Between 1869 and 1929, money causes prices in nearly all of the countries in the sample.

2006	P20	Egert, Balazs, and Ronald MacDonald. 2006. <i>Transmission Mechanism in Transition Economies: Surveying the Surveyable</i>. CESifo GmbH, CESifo Working Paper Series: CESifo Working Paper No. 1739. This paper surveys recent advances in the monetary transmission mechanism (MTM). In particular, while laying out the functioning of the separate channels in the MTM, special attention is paid to exploring possible interrelations between different channels through which they may amplify or attenuate each others' impact on prices and the real economy. We take stock of the empirical findings especially as they relate to countries in Central and Eastern Europe, and compare them to results reported for industrialised countries, especially for the euro area. We highlight potential pitfalls in the literature and assess the relative importance and potential development of the different channels.
2006	P20	Coricelli, Fabrizio, Balazs Egert, and Ronald MacDonald. 2006. <i>Monetary Transmission Mechanism in Central & Eastern Europe: Gliding on a Wind of Change</i>. William Davidson Institute at the University of Michigan Stephen M. Ross Business School, William Davidson Institute Working Papers Series: wp850. This paper surveys recent advances in empirical studies of the monetary transmission mechanism (MTM), with special attention to Central and Eastern Europe. In particular, while laying out the functioning of the separate channels in the MTM, it explores possible interrelations between different channels and their impact on prices and the real economy. The empirical findings for Central and Eastern Europe are then briefly compared with results for industrialized countries, especially for the euro area. We highlight potential pitfalls in the literature and assess the relative importance, and potential development, of the different channels, emphasizing the relevant asymmetries between Central and Eastern European countries and the euro area.
2006	Q18	Khan, Mohsin S., and Axel Schimmelpfennig. 2006. "Inflation in Pakistan." <i>Pakistan Development Review</i>, 45(2): 185-202. This paper examines the factors that explain and help forecast inflation in Pakistan. A Simple inflation model is specified that includes standard monetary variables (money supply, credit to the private sector), an activity variable, the interest and the exchange rates, as well as the wheat support price as a supply-side factor. The model is estimated for the period January 1998 to June 2005 on a monthly basis. The results indicate that monetary factors have played a dominant role in recent inflation, affecting inflation with a lag of about one year. Private sector credit growth and broad money growth are also good leading indicators of inflation--which can be used to forecast future inflation developments.

2007	H21	Eden, Benjamin. 2007. <i>The Friedman Rule in an Overlapping Generations Model: Social Security in Reverse.</i> Department of Economics, Vanderbilt University, Working Papers: 0717. The welfare gains from adopting a zero nominal interest policy depend on the implementation details. Here I focus on a government loan program that crowds out lending and borrowing and other money substitutes. Since money can be costlessly created the resources spent on creating money substitutes are a "social waste". Moving from an economy with strictly positive nominal interest rate to an economy with zero nominal interest rate will increase consumption by the amount of resources spent on lending and borrowing. But in general welfare will increase by more than that because consumption smoothing is better under zero nominal interest rate.
2007	H23 H24	Gahvari, Firouz. 2007. "The Friedman Rule: Old and New." <i>Journal of Monetary Economics</i> , 54(2): 581-89. In overlapping generations models, money growth creates intergenerational wealth effects and leads to the breakdown of the Friedman rule; the rule can be restored via lump-sum tax and transfers that neutralize these wealth transfers. Additionally, and in contrast to money-in-the-utility-function models, the Friedman rule is not the unique first-best solution in cash-in-advance-constraint models of money: a continuum of combinations of money growth rates and consumption taxes implement the first-best allocation. This paper traces through the intellectual origins of the first (old) result, which was recently restated in Bhattacharya, et al. [2005. Monetary policy, fiscal policy, and the inflation tax: equivalence results. <i>Macroeconomic Dynamics</i> 7, 647-669.] and formally demonstrates the second (new) result.

This paper analyzes the propagation of monetary policy shocks through the creation of credit in an economy. Models of the monetary transmission mechanism typically feature responses that last for a few quarters contrary to what the empirical evidence suggests. To propagate the impact of monetary shocks over time, these models introduce adjustment costs by which agents find it optimal to change their decisions slowly. This paper presents another explanation that does not rely on any sort of adjustment costs or stickiness. In our economy, agents own assets and make occupational choices. Banks intermediate between agents demanding and supplying assets. Our interpretation is based on the way banks create credit and how the monetary authority affects the process of financial intermediation through its monetary policy. As the central bank lowers the interest rate by buying government bonds in exchange for reserves, high productive entrepreneurs are able to borrow more resources from low-productivity agents. We show that this movement of capital among agents sets in motion a response of the economy that resembles an expansionary phase of the cycle.

2007	N70	Steil, Benn. 2007. "Monetary Sovereignty as Globalization's Achilles' Heel." <i>Cato Journal</i> , 27(2): 203-17. It is remarkable how the world's short recent history of floating exchange rates among fiat currencies has affected popular thinking about what is eternally normal and proper in the economic system. Recently, Senators Charles Schumer and Lindsey Graham (2006) wrote matter of factly in the Wall Street Journal that "One of the fundamental tenets of free trade is that currencies should float." Such a "tenet," if it were such, could only have emerged since the 1970s. Of course, exchange rates had fluctuated widely in previous centuries, but it has been only since the 1970s that such fluctuations have been taken as connatural with the international monetary regime. Even John Maynard Keynes, the arch slayer of the last remnants of commodity money, was an adamant supporter of fixed exchange rates.
2007	N83	Glaisyer, Natasha. 2007. "Calculating Credibility: Print Culture, Trust and Economic Figures in Early Eighteenth-Century England." <i>Economic History Review</i> , 60(4): 685-711. Credit in early modern England has been studied by both social historians of the market and historians of the book. The intersection of these literatures is explored by asking the question: how did producers of books about interest (which was closely connected to credit) convince readers that their books could be trusted? One particular book is considered: a palm-sized book of interest calculations by John Castaing. Most importantly, and unusually, many copies of this book contain his signature, which, it is argued, must be interpreted in the context of the particular role that signatures played in guaranteeing financial transactions.

2008	D01	Fehr, Ernst, and Jean-Robert Tyran. 2008. "Limited Rationality and Strategic Interaction: The Impact of the Strategic Environment on Nominal Inertia." <i>Econometrica</i>, 76(2): 353-94. Much evidence suggests that people are heterogeneous with regard to their abilities to make rational, forward-looking decisions. This raises the question as to when the rational types are decisive for aggregate outcomes and when the boundedly rational types shape aggregate results. We examine this question in the context of a long-standing and important economic problem: the adjustment of nominal prices after an anticipated monetary shock. Our experiments suggest that two types of bounded rationality--money illusion and anchoring--are important behavioral forces behind nominal inertia. However, depending on the strategic environment, bounded rationality has vastly different effects on aggregate price adjustment. If agents' actions are strategic substitutes, adjustment to the new equilibrium is extremely quick, whereas under strategic complementarity, adjustment is both very slow and associated with relatively large real effects. This adjustment difference is driven by price expectations, which are very flexible and forward-looking under substitutability but adaptive and sticky under complementarity. Moreover, subjects' expectations are also considerably more rational under substitutability.

National Bureau of Economic Research, Inc, NBER Working Papers: 13936. We demonstrate that a rapid expansion in the supply of mortgages driven by disintermediation explains a large fraction of recent U.S. house price appreciation and subsequent mortgage defaults. We identify the effect of shifts in the supply of mortgage credit by exploiting within-county variation across zip codes that differed in latent demand for mortgages in the mid 1990s. From 2001 to 2005, high latent demand zip codes experienced large relative decreases in denial rates, increases in mortgages originated, and increases in house price appreciation, despite the fact that these zip codes experienced significantly negative relative income and employment growth over this time period. These patterns for high latent demand zip codes were driven by a sharp relative increase in the fraction of loans sold by originators shortly after origination, a process which we refer to as "disintermediation." The increase in disintermediation-driven mortgage supply to high latent demand zip codes from 2001 to 2005 led to subsequent large increases in mortgage defaults from 2005 to 2007. Our results suggest that moral hazard on behalf of originators selling mortgages is a main culprit for the U.S. mortgage default crisis.

2009	D53	Geanakoplos, John, and Pradeep Dubey. 2009. <i>Credit Cards and Inflation</i>. Cowles Foundation, Yale University, Cowles Foundation Discussion Papers: 1709. The introduction and widespread use of credit cards increases trading efficiency but, by also increasing the velocity of money, it causes inflation, in the absence of monetary intervention. If the monetary authority attempts to restore pre-credit card price levels by reducing the money supply, it might have to sacrifice the efficiency gains. When there is default on credit cards, there is even more inflation, and less efficiency gains. The monetary authority might then

Year	DE	Title and Abstract
		have to accept less than pre-credit card efficiency in order to restore pre-credit card price levels, or else it will have to accept inflation if it is unwilling to cut efficiency below pre-credit card levels. This could be a source of stagflation.
2009	E27	Beaton, Kimberly. 2009. <i>Credit Constraints and Consumer Spending</i>. Bank of Canada, Working Papers. This paper examines the relationship between aggregate consumer spending and credit availability in the United States. The author finds that consumer spending falls (rises) in response to a reduction (increase) in credit availability. Moreover, she provides a formal assessment of the possibility that credit availability is particularly important for consumer spending when it undergoes large changes. In this respect, she estimates a consumption function in which only large expansions and contractions in credit affect spending. She concludes that large changes in credit availability are particularly important for consumers' spending decisions. As should be expected, these periods tend to be associated with periods of high economic uncertainty. These results show that credit availability should be taken into account when modeling and forecasting consumer spending.
2009	F37 O50 O52	Cordero, Jose Antonio. 2009. The IMF's Stand-by Arrangements and the Economic Downturn in Eastern Europe: The Cases of Hungary, Latvia, and Ukraine. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This paper looks at three countries that have been hard-hit by the world economic recession, and have turned to the IMF for assistance: Hungary, Latvia, and Ukraine. In all of these countries, it would appear that there were more sensible responses to the crisis that would reduce the loss of employment and output, cuts in social services, and political instability that have resulted from the downturn. Instead, the governments' responses to the downturn as well as IMF conditions for assistance have caused additional harm.
2009	F62	Younus, Sayera, and Mark Wheeler. 2009. "The Impact of Monetary Policy Changes in a Global Economy: Evidence from Bangladesh." <i>Global Journal of Finance and Economics</i>, 6(2): 113-26. The study examines the impact of changes in monetary policy on Bangladesh's economy. Specifically, we examine the impact of domestic and foreign monetary shocks on Bangladesh's major economic aggregates. In the context of a global economy such as Bangladesh, the conduct of monetary policy becomes increasingly more difficult as globalization proceeds. It becomes important to examine the impact of changes in relevant foreign variables, such as the money supply, when formulating domestic monetary policy. The empirical results of our analysis show that innovations to the foreign money supply have significant impacts on Bangladesh's real exchange rate and, at long time horizons, Bangladesh's price level. However, the foreign money supply does not have an impact on Bangladesh's money supply or output. Our results also indicate that innovations to Bangladesh's money supply have significant impacts on Bangladesh's price level and output. That is, even in this small, open, economy, monetary policy can be used to alter domestic variables.
2009	H27	Munro, John. 2009. <i>Warfare, Liquidity Crises, and Coinage Debasements in Burgundian Flanders, 1384-1482: Monetary or Fiscal Remedies?</i>. University of Toronto, Department of Economics, Working Papers. Coinage debasements were a prevalent and generally very harmful feature of most economies in late-medieval western Europe, and most certainly in Burgundian Flanders (1384-1482). Flanders also experienced several economic recessions or contractions from three related sources: warfare; the so-called 'bullion famines', with liquidity crises; and the irredeemable decline of its former mainstay, the woolen textile industries. Since many of my previous publications dealt with the Flemish cloth industry, this paper focuses on the other two major economic problems, of which warfare was the most important factor. The question posed therefore is simply this: did the Burgundian dukes undertake coinage debasements principally as a monetary or as a fiscal policy? In this paper, I contend that warfare was indeed, directly and indirectly, a primary cause of those monetary scarcities, especially in reducing the income velocity of money and thus in increasing hoarding--in my view, far more important than any supposed balance of payments deficits and 'bullion outflows to the East'.
2009	H27	Munro, John. 2009. <i>Coinage and Monetary Policies in Burgundian Flanders during the late-medieval 'Bullion Famines', 1384-1482</i>. University of Toronto, Department of Economics, Working Papers. This paper seeks to answer two questions: were the coinage debasements in Burgundian Flanders (1384-1482) undertaken principally as monetary or fiscal policies; and were they beneficial or harmful? In a recent monograph, Sargent and Velde (Big Problem of Small Change: 2002) contend that monetary objectives governed almost all medieval, early-modern debasements, especially to remedy the chronic shortages of petty coins. My thesis is that the Burgundian rulers of Flanders, in competition with neighboring princes, undertook their debasements primarily as aggressive fiscal policies, specifically to finance warfare. Their goal was to increase their seigniorage revenues, the tax imposed on bullion brought to their mints, by two means: by increasing the tax rate itself, and by enticing an increased influx of bullion into their mints, both by the debasement techniques themselves and by auxiliary bullionist policies. This study further demonstrates that the inflationary consequences of debasements were always less than those predicted by mathematical formulae--possibly because those debasements failed to counteract the prevailing forces of monetary contraction and deflation. Note that this is an extensively revised and shortened version of an earlier working paper (no. 355), correcting some errors in that paper (concerning Spanish coinage): with the same tables, but with a new set of graphs

Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This paper shows that, in spite of a reasonably sized fiscal stimulus package, Costa Rica's economy continues on a downward path, partly because fiscal policy is being offset by a tightening of monetary policy. The paper notes that the International Monetary Fund has insisted that Costa Rica's monetary

Year	DE	Title and Abstract
		policy remain tight due to worries over inflation targets and a perceived risk of a balance of payments crisis. However, the author notes that the IMF could help prevent a balance of payments crisis through the provision of a credit line of foreign currency, as it has done, for example, in Mexico - a vastly larger economy. The paper also examines the government's macroeconomic policies in recent years, prior to the world recession, to see what alternative policies might have done better.

2010	C83	CV ; Hoover, Kevin D., Selva Demiralp, and Stephen J. Perez. 2010. <i>Empirical Identification of the Vector Autoregression: The Causes and Effects of U.S. M2</i> . Duke University, Department of Economics, Working Papers: 10-03. The M2 monetary aggregate is monitored by the Federal Reserve, using a broad brush theoretical analysis and an informal empirical analysis. This paper illustrates empirical identification of an eleven-variable system, in which M2 and the factors that the Fed regards as causes and effects are captured in a vector autoregression. Taking account of cointegration, the methodology combines recent developments in graph-theoretical causal search algorithms with a general-to-specific search algorithm to identify a fully specified structural vector autoregression (SVAR). The SVAR is used to examine the causes and effects of M2 in a variety of ways. We conclude that, while the Fed has rightly identified a number of special factors that influence M2 and while M2 detectably affects other important variables, there is 1) little support for the core quantity-theoretic approach to M2 used by the Fed; and 2) M2 is a trivial linkage in the transmission mechanism from monetary policy to real output and inflation.
2010	D43	CV ; Head, Allen, Lucy Liu, Guido Menzio, and Randall Wright. 2010. <i>Equilibrium Price Dispersion and Rigidity: A New Monetarist Approach</i> . Penn Institute for Economic Research, Department of Economics, University of Pennsylvania, PIER Working Paper Archive. Why do some sellers set prices in nominal terms that do not respond to changes in the aggregate price level? In many models, prices are sticky by assumption. Here it is a result. We use search theory, with two consequences: prices are set in dollars since money is the medium of exchange; and equilibrium implies a nondegenerate price distribution. When money increases, some sellers keep prices constant, earning less per unit but making it up on volume, so profit is unaffected. The model is consistent with the micro data. But, in contrast with other sticky-price models, money is neutral.

The objective of this study is to examine whether the notion of monetary neutrality holds in Malaysian stock market. Our findings indicate that there is considerable evidence against the long-run neutrality (LRN) of money in Malaysian stock market. The important implication is that the stock market is inefficient with respect to money supply. Agents might have the opportunity to gain excess profit from the stock market using the information on changes in the stock of money to predict the movements in stock indexes.

2011	B20 C25	CV ; Wray, L. Randall. 2011. "Is There Room for Bulls, Bears, and States in the Circuit?." <i>Levy Economics Institute, The Economics Working Paper Archive</i> . This paper takes off from Jan Kregel's paper "Shylock and Hamlet, or Are There Bulls and Bears in the Circuit?" (1986), which aimed to remedy shortcomings in most expositions of the "circuit approach." While some "circuitists" have rejected John Maynard Keynes's liquidity preference theory, Kregel argued that such rejection leaves the relation between money and capital asset prices, and thus investment theory, hanging. This paper extends Kregel's analysis to an examination of the role that banks play in the circuit, and argues that banks should be modeled as active rather than passive players. This also requires an extension of the circuit theory of money, along the lines of the credit and state money approaches of modern Chartalists who follow A. Mitchell Innes. Further, we need to take Charles Goodhart's argument about default seriously: agents in the circuit are heterogeneous credit risks. The paper concludes with links to the work of French circuitist Alain Parguez.
2011	B26	CV ; Labye, Agnes. 2011. "La crise financiere actuelle: Une application du modele de Minsky? (The Current Financial Crisis: An Application of Minsky Model? With English summary.)." <i>Revue d'Economie Financiere</i> , 0(102): 263-84. The currently observed turmoil in financial markets, which is believed to have been ignited by the collapse of the American subprime mortgage market, has recently brought to prominence the ideas of Hyman Minsky, member of the post-Keynesian school of economics. Many commentators are of the view that Minsky's framework of thinking accurately anticipated the current financial crisis. The key mechanism that pushes the economy towards a crisis is the accumulation of debt during the period of prosperity. So, the economy becomes more and more fragile. Financial innovations and deregulation in a context of globalisation are responsible of this situation. It's an important point of his analysis. It's an aspect of the "financial instability hypothesis" (FIH). Another aspect of FIH is that during good times, banks and other intermediaries try to lure investors to buy debt by means of sophisticated innovations. So the major role of financial intermediaries in a process of crisis is showed. Definitely, it's possible to show that the current crisis is an application of Minsky's model.

2011	B59	Ramskogler, Paul. 2011. "Credit Money, Collateral and the Solvency of Banks: A Post Keynesian Analysis of Credit Market Failures." <i>Review of Political Economy</i> , 23(1): 69-79. The discussion on endogenous money has led to a rich understanding of banking. The determination of creditworthiness though remains a black box in Post Keynesian economics. After a critique of the New Keynesian banking literature this paper argues that creditworthiness to a large extent is endogenous to the monetary economy and the credit system. It is argued that a solvency multiplier exists that affects the willingness of banks to grant credit. The multiplier works via the valuation of collateral goods. It can accelerate the growth but also the contraction of credit and explains both endogenous financial crises and credit rationing.

2011	C58	Jung, Hosung, and Dongcheol Kim. 2011. "Innovations in the Future Money Growth and the Cross-Section of Stock Returns in Korea." <i>Asia-Pacific Journal of Financial Studies</i> , 40(5): 683-709. This paper proposes revisions in the expectation of future money growth as a macroeconomic state variable in the perspective of Merton's (Econometrica, 41, 1973, 867) intertemporal capital asset pricing model, and examines whether the factor related with innovations in the expectation of future money growth is priced on stock returns in the Korean stock market after controlling for the market factor, Fama and French's SMB and HML, and the momentum factor. In both the cross-sectional regression tests and the generalized method of moments tests, regardless of the inclusion of the well-known priced factors, we find that the future money growth factor is significantly priced, even after controlling for the other macroeconomic factors. The significance of the future money growth factor becomes stronger in the period after the Asian foreign currency crisis than before the crisis.
2011	C58	Caginalp, G., and M. Desantis. 2011. "Stock Price Dynamics: Nonlinear Trend, Volume, Volatility, Resistance and Money Supply." <i>Quantitative Finance</i> , 11(6): 849-61. We present a methodology to study a data set of 119,260 daily closed-end fund prices using mixed-effects regressions with the objective of understanding price dynamics. There is strong statistical support that relative price change depends significantly on (i) the recent trend in a nonlinear manner, (ii) recent changes in valuation, (iii) recent changes in money supply (M2), (iv) longer-term trend, (v) recent volume changes, and (vi) proximity to a recent high price. The dependence on the volatility is more subtle, as short-term volatility has a positive influence, while the longer term is negative. The cubic nonlinearity in the weighted price trend shows that a percentage daily gain of up to 2.78% tends to yield higher prices, but larger gains lead to lower prices. Thus, the nonlinearity of price trend establishes an empirical and quantitative basis for both underreaction and overreaction within one large data set, facilitating an understanding of these competing motivations in markets. Increasing money supply is found to have a significant positive effect on stock price, while proximity to recent high prices has a negative effect. The data set consists of daily prices during the period 26 October 1998 to 30 January 2008.
2011	C58	Hsing, Yu, Antoinette S. Phillips, and Carl Phillips. 2011. "Stock Prices and Aggregate Economic Variables: The Case of Brazil." <i>International Research Journal of Applied Finance</i> , 2(5): 490-98. Applying the EGARCH model and using a quarterly sample for Brazil during 1997. Q1-2010. Q2, this paper finds that the Brazilian Bovespa stock index is positively associated with industrial production, the ratio of M2 money supply to GDP and the U.S. stock market index and negatively impacted by the lending rate, the depreciation of the Brazilian real, the Brazilian inflation rate, and the U.S. federal funds rate. There are several policy implications. Both the domestic and U.S. monetary policies would affect the Brazilian stock market performance. The contagion effect from the U.S. stock market to the Brazilian stock market is significant. Currency depreciation may help the export sector but would hurt the stock market.
2011	D02	Nasir, A. B. M. 2011. "Nexus between Inflation Rates and Institutional Rigidities in Bangladesh: An Overlooked Aspect for the Cause of Inflation." <i>Journal of Developing Areas</i> , 45(1): 339-58. In this study, we argue that institutional rigidities contribute to the inflation rates in Bangladesh. Using annual data covering the period 1982-2005 and incorporating three new measures of institutional rigidities, we estimate an inflation model by ARDL and OLS techniques. The results do confirm our prediction that higher degree of institutional rigidities leads to higher inflation rate in Bangladesh. Evidence also suggests that inflation is unlikely to be "monetary phenomenon" in Bangladesh. The results are reliable and robust to the inclusion of alternative measures of institution, money supply, real economic activities, and estimation techniques.
2011	F10	Furceri, Davide, Stephanie Guichard, and Elena Rusticelli. 2011. <i>Episodes of Large Capital Inflows and the Likelihood of Banking and Currency Crises and Sudden Stops</i> . OECD Publishing, OECD Economics Department Working Papers: 865. This paper provides an empirical investigation of the relationship between surges in capital inflows and the probability of subsequent banking, currency and balance-of-payment crises. Using a panel of developed and emerging economies from 1970 to 2007, it is shown that a large capital inflow episode increases substantially the probability of having a banking or a currency crisis in the two following years. The effect is especially large for the case of balance-of-payment crises. The paper also finds that the effect of large capital inflows is different depending on the type of flows characterising the episode. In particular, large capital inflows that are debt-driven significantly increase the probability of banking, currency and balance of payment crises, whereas if inflows are driven by equity portfolio investment or FDI there is a negligible effect. This means that structural reforms that modify the composition of capital flows towards a lower share of debt are likely to reduce the financial vulnerabilities to large capital inflows. At the same time, however, structural reforms may also increase the overall size of capital flows.
2011	F16 H22 J43	Munro, John. 2011. <i>From Gutsherrschaft to Grundherrschaft: Demographic, Monetary, and Fiscal Factors in the Late-Medieval Decline of English Manorial Desmesne Agriculture</i> . University of Toronto, Department of Economics, Working Papers. This study on the late-medieval decline of English manorial demesne agriculture is based on the Germanic paradigm of Gutsherrschaft and Grundherrschaft, which historians have utilized to explain the transformation of feudal agriculture, east of the Elbe River, from the 15th to the 18th centuries. The former is a manorial regime in which the lord derived his incomes primarily from the commercial exploitation of his demesne lands, using the compulsory labour services of servile tenants. The latter is a manorial regime in which the lord derived his incomes instead primarily from cash rents paid by largely free peasants. In East Elbia, the early-modern shift was from Grundherrschaft to Gutsherrschaft. Late medieval manorial England experienced a reverse shift: from Gutsherrschaft to Grundherrschaft. To explain this transformation, this paper employs a supplementary monetary and fiscal model to prove that the standard Ricardian demographic model is insufficient to explain these changes. My monetary model, based on my prior publications on the deflationary consequences of the first late-medieval bullion famine, from ca. 1375 to ca. 1420, demonstrates that all agrarian prices fell (in nominal terms), while the Ricardian model stipulates that the price fall was limited to grains, and further that the consequent rise in living standards would have led to rising livestock product and other agrarian prices. It also demonstrates that the rise in real wages (agrarian) was partly the result of deflation combined with institutional wage stickiness. My fiscal model demonstrates that the imposition of heavy fixed (specific and not ad valorem) taxes on exports of English wools, by so seriously injuring the chief consumers, the woollen draperies in the Low Countries, quickly led to sharply falling wool sales and (real) wool prices. With such a damaging price-cost scissors, English landlords

Year	DE	Title and Abstract
		found that the continued commercial exploitation of their demesnes based on grains and wool was no longer profitable, while leasing those lands to free peasants (abolishing most vestiges of serfdom) was very profitable, since the leasehold tenants had to pay rents whose real value rose during the era of this deflation (ca 1375 to ca. 1420).

2011	H10 H40 H44	Wray, L. Randall. 2011. "Keynes after 75 Years: Rethinking Money as a Public Monopoly". Levy Economics Institute, The Economics Working Paper Archive. In this paper I first provide an overview of alternative approaches to money, contrasting the orthodox approach, in which money is neutral, at least in the long run; and the Marx-Weblen-Keynes approach, or the monetary theory of production. I then focus in more detail on two main categories: the orthodox approach that views money as an efficiency-enhancing innovation of markets, and the Chartalist approach that defines money as a creature of the state. As the state's "creature," money should be seen as a public monopoly. I then move on to the implications of viewing money as a public monopoly and link that view back to Keynes, arguing that extending Keynes along these lines would bring his theory up to date.

2011	N53	Allen, Martin. 2011. "Silver Production and the Money Supply in England and Wales, 1086-c. 1500." <i>Economic History Review</i> , 64(1): 114-31. The contribution of English and Welsh lead mines to the silver supplies of mints between Domesday Book and the end of the fifteenth century is assessed in this article, comparing evidence for the size of silver production with mint output data. It is shown that the proposal that northern Pennine mines were the principal source of the silver in the late twelfth-century English currency is untenable. Welsh mines supplied limited amounts of silver to local mints around 1200. Devon silver made a significant but not predominant contribution to mint output at times of bullion scarcity in the 1290s and the mid-fifteenth century. Imported silver was usually a greater source of the metal in the English currency than locally mined silver, and gold coins constituted most of England's money supply from the mid-fourteenth century onwards.
2011	Z12	Hasan, Zubair. 2011. "Money Creation and Control from an Islamic Perspective." <i>Review of Islamic Economics</i> , 15(1): 93-111. This paper discusses some familiar aspects of monetary economics from an unfamiliar angle. It argues that it is not right to regard legal tender money and bank credit as of different genus: they work in tandem to the same ends in an economy, conventional, or Islamic. Also, it does not matter what serves as money--solid gold or flimsy paper--for the purpose of keeping its value stable. Money is just an instrument: it was never nor can ever be classed as Islamic or non-Islamic. What it does, good or bad, depends on how we use it. Money does not generate crises; its mismanagement does. It follows that the refuge the world is searching today from recurring financial crises does not lie in money substance: history testifies that national economies could not remain turmoil-free during the centuries that gold held sway over the monetary scene. The paper concludes that it is the human factor that has been the source of good or evil for mankind including money matters. And the quality of human factor true religion can alone improve: morality without faith is rudderless.

2012	E02	Dubois, Robert. 2012. "The European Central Bank and Why Things Are the Way They Are: A Historic Monetary Policy Pivot Point and Moment of (Relative) Clarity". Levy Economics Institute, The Economics Working Paper Archive. Not since the Great Depression have monetary policy matters and institutions weighed so heavily in commercial, financial, and political arenas. Apart from the eurozone crisis and global monetary policy issues, for nearly two years all else has counted for little more than noise on a relative risk basis. In major developed economies, a hypermature secular decline in interest rates is pancaking against a hard, roughly zero lower-rate bound (i.e., barring imposition of rather extreme policies such as a tax on cash holdings, which could conceivably drive rates deeply negative). Relentlessly mounting aggregate debt loads are rendering monetary- and fiscal policy-impaired governments and segments of society insolvent and struggling to escape liquidity quicksands and stubbornly low or negative growth and employment trends. At the center of the current crisis is the European Monetary Union (EMU)-a monetary union lacking fiscal and political integration. Such partial integration limits policy alternatives relative to either full federal integration of member-states or no integration at all. As we have witnessed since spring 2008, this operationally constrained middle ground progressively magnifies economic divergence and political and social discord across member-states. Given the scale and scope of the eurozone crisis, policy and actions taken (or not taken) by the European Central Bank (ECB) meaningfully impact markets large and small, and ripple with force through every major monetary policy domain. History, for the moment, has rendered the ECB the world's most important monetary policy pivot point. Since November 2011, the ECB has

Year	DE	Title and Abstract
		taken on an arguably activist liquidity-provider role relative to private banks (and, in some important measure, indirectly to sovereigns) while maintaining its long-held post as rhetorical promoter of staunch fiscal discipline relative to sovereignty-enclosed "peripheral" states lacking full monetary and fiscal integration. In December 2011, the ECB made clear its intention to inject massive liquidity when faced with crises of scale in future. Already demonstratively disposed toward easing due to conditions on their respective domestic fronts, other major central banks have mobilized since the third quarter of 2011. The collective global central banking policy posture has thus become more homogenized, synchronized, and directionally clear than at any time since early 2009.

2012	L71 L73	Azar, Samih Antoine. 2012. "Commodity Prices and the US Money Supply in the Long Run." <i>International Journal of Trade and Global Markets</i> , 5(3-4): 316-35. Theoretically commodity prices are expected to overshoot the money supply in the short run but to vary with unit proportionality in the long run. This follows from the observation that consumer prices are sticky and that commodity prices, set in auction markets are fully flexible. There is empirical evidence in the literature that commodity indexes are indeed anchored in the long run to the money supply with unit proportionality. However there is a dearth of research on the long-run behaviour of individual commodities with respect to the money supply. This paper fills this gap in the literature. When 48 individual commodity series and six commodity indexes series are studied over the monthly period 1980/2011, there is fairly strong evidence for unit proportionality to money supply. Individual regressions and panel regressions are both supportive of unit proportionality. The preconception that commodity prices move haphazardly is hence rejected.

2012	R30	Xu, Xiaoqing Eleanor, and Tao Chen. 2012. "The Effect of Monetary Policy on Real Estate Price Growth in China." <i>Pacific-Basin Finance Journal</i> , 20(1): 62-77. Using quarterly data from 1998:Q1 to 2009:Q4 and monthly data from July 2005 to February 2010, this paper examines the impact of key monetary policy variables, including long-term benchmark bank loan rate, money supply growth, and mortgage credit policy indicator, on the real estate price growth dynamics in China. Empirical results consistently demonstrate that expansionary monetary policy tends to accelerate the subsequent home price growth, while restrictive monetary policy tends to decelerate the subsequent home price growth. These results suggest that Chinese monetary policy actions are the key driving forces behind the change of real estate price growth in China. We also show that hot money flow does not have a significant impact on the change of home price growth after controlling for the money supply growth. Finally, a bullish stock market tends to accelerate subsequent home price growth.

2013	C31	La Cava, Gianni. 2013. <i>Inventory Investment in Australia and the Global Financial Crisis</i> . Reserve Bank of Australia, RBA Research Discussion Papers. A sharp decline in inventory investment was an important contributor to the economic slowdown in Australia in 2008/09. I identify the extent to which this was due to a tightening in short-term credit constraints. In an experimental design setting, I identify the causal effect of short-term credit constraints on inventory investment by exploiting variation in the debt maturity structure of Australian companies just prior to the global financial crisis. I show that the companies that were forced to refinance or repay a relatively large share of debt in 2008/09 reduced inventory investment by significantly more than companies that were due to refinance or repay their debt at some other time. A case study on the Australian motor vehicle industry supports the hypothesis that a decline in the availability of short-term credit significantly hampered corporate investment in inventories in 2008/09.

2013	D73	Manliev, Georgi. 2013. "Public Choice Theory: Critical Analysis of the Process of Making Collective Fiscal Decisions. (In Bulgarian. With English summary.)" <i>Economic Studies</i> , 22(1): 143-74. The paper presents the views of Buchanan on making collective fiscal decisions in conditions of simple majority, of the usefulness function of the politicians, bureaucrats and lobbies and the myopia in the behavior of the electors. He draws the conclusion that the fiscal decisions are ineffective, because they do not take into consideration the preferences of the electors. For overcoming this effect (defined by Arrow as theorem of impossibility of the society to reach effective collective decisions), Buchanan suggests introducing constitutional rights, which would make the public choice more effective. According to him, there are three different possible constitutions (on taxing, fiscal redistribution and money supply), or one Constitution, which includes tax, fiscal and monetary rules. To some or other degree, many countries have adopted fiscal and monetary rules in their Constitutions. After the crisis in 2008-2011, adopting fiscal rules is already considered an inevitable decision for achieving fiscal discipline and stability in the development of the different European countries and the Eurozone.

2013	D86	Dequech, David. 2013. "Is Money a Convention and/or a Creature of the State? The Convention of Acceptability, the State, Contracts, and Taxes." <i>Journal of Post Keynesian Economics</i> , 36(2): 251-73. This article begins by presenting the idea of money as a convention, first in the economics of conventions and then in post Keynesian economics, also examining whether and how one can reconcile money as a convention with Keynes's essential properties of money. The article then considers the view of money as a creature of the state, in two versions, which connect money to contracts or to taxes, respectively. Finally, it further explores the monetary foundations of a market economy, the conventional foundation of money, and the role of the state. Acknowledging that money is ultimately or fundamentally a convention requires recognizing limits to the state's ability to impose its money on the private agents. At the same time, the state is usually in a much better position than any private agent to influence the process through which the convention of acceptability of money emerges and is reproduced. A stronger proposition is that without state money there would be no stable money in a market economy. Both the fundamental conventionality of money and the essential role of the state can be thus emphasized.
2013	F38	Wu, Chia-Wei, and Tien-Wang Tsaur. 2013. "Tobin Tax Effects under Currency Substitution: Real Exchange Rate Dynamics and Stability. (In Chinese. With English summary)." <i>Academia Economic Papers</i> , 41(4): 559-96. This paper extends the model of Tsaur (2011) to include a Tobin tax. It proposes to examine how the real exchange rate will be affected by an increase in the Tobin tax, and investigate how the monetary expansion and the Tobin tax coordinate to maintain the real exchange rate stability. The major findings are as follows: (1) In the long run, the rise of the Tobin tax rate would cause the real exchange rate to decrease, output to increase, and real foreign currency balances to decrease, but whether the real balances increase or decrease depends on the magnitude between the currency substitution elasticities. (2) In the short run, the magnitude of foreign inflation rates is crucial in influencing the behavior of real exchange rates, (i.e., real exchange rates may overshoot, undershoot or misjump around their equilibrium values) while the magnitude of the effect of the Tobin tax on the stock of foreign currency and other structure parameters in the model are key elements to determine the degree of real exchange rate movements. (3) The range of an increase in the rate of the Tobin tax should be smaller than monetary expansion in order to maintain real exchange rate stability. It is shown that if the degree of currency substitution is higher, the range of an increase in the rate of the Tobin tax should be bigger; if the cost elasticity of holding foreign currency is higher, the range of an increase in the rate of the Tobin tax should be smaller.
2013	F38	Gandhi, Dheeraj, and I. C. Kashyap. 2013. "A Journey from FERA to FEMA and Its Impact on FOREX." <i>International Journal of Research in Commerce, Economics and Management</i> , 3(7): 10-14. This research topic is undertaken in order to understand provisions laid by FERA (Foreign Exchange Regulation Act) and the difficulty or problems faced by the individuals in abiding the provisions and also the problems faced by the government to raise foreign investment in the country. It was due to the stringent and aggressive provisions of FERA, that the need for introduction of FEMA (Foreign Exchange Management Act) was felt. After liberalization when the global markets were opened for trading and investing provisions of FERA was acting like obstacles in raising foreign currency. FEMA was introduced with the view to simplify provisions and encourage foreign investment in the country. This research paper focuses on introduction of FEMA which had a positive impact on foreign exchange (FOREX) as well as on money supply, Foreign Direct Investment (FDI) and Foreign Institutional Investors (FIIs).

With English summary)." <i>Revue Francaise de Socio-economie</i> , 0(2): 69-89. This paper presents a reflection on monetary federalism from the history of the Argentinian complementary currencies (trueque). The first national trueque system (RGT, 1995-2000) is analyzed as a form of monetary federalism. It is characterized by the decentralization of money-issuing and the uniqueness of the unit of account. This model has been challenged by two systems based on the centralization of money-issuing (RGT, 2001-2002 and RTZO, 2000-2002). The crisis that threatened the trueque in 2002 reveals ethical and political implications of the question of money-issuing.

2013	M31	Naqvi, Mona, and James Southgate. 2013. "Banknotes, Local Currencies and Central Bank Objectives." <i>Bank of England Quarterly Bulletin</i>, 53(4): 317-25. A few towns and cities in the United Kingdom have set up local currency schemes to promote local sustainability. The schemes issue paper instruments with some similar design features to banknotes. This article explains how these instruments differ from banknotes. The size, structure, and backing arrangements of existing schemes mean that local currencies are unlikely to pose a risk to the Bank's monetary and financial stability objectives. Nonetheless, consumers should be aware that local currency instruments do not benefit from the same level of consumer protection as banknotes.

2013	O32	Chu, Angus C., and Ching-Chong Lai. 2013. "Money and the Welfare Cost of Inflation in an R&D Growth Model." <i>Journal of Money, Credit, and Banking</i>, 45(1): 233-49. This study analyzes the effects of inflation on R&D and innovation-driven growth. In the theoretical section, we incorporate money demand into a quality-ladder model with elastic labor supply and derive the following result. If the elasticity of substitution between consumption and the real money balance is less (greater) than unity, then R&D and the growth rate of output would be decreasing (increasing) in the growth rate of money supply. Quantitatively, decreasing inflation in the U.S. to achieve price stability improves social welfare, and the welfare gain is equivalent to at least 0.5% of annual consumption. In the empirical section, we use cross-country data to establish a negative and statistically significant relationship between inflation and R&D.
2013	P28	Ratti, Ronald A., and Joaquin L. Vespignani. 2013. "Liquidity and Crude Oil Prices: China's Influence over 1996-2011." <i>Economic Modelling</i>, 33(0): 517-25. Movement in China's money supply is shown to drive the movement in world money supply over the last fifteen years. Structural shocks to G3 (U.S., Eurozone, and Japan) real M2 and to China's real M2 are both large over 1996:1-2011:12. The cumulative impact of real G3 M2 shocks on real oil prices is small and statistically insignificant. In contrast, the cumulative impact of China's real M2 on the real price of crude oil is large and statistically significant. Following a sharp fall in real oil price in the last half of 2008, the cumulative impact of China's real M2 on the real price of crude oil is particularly substantial in the recovery of oil price during 2009 from a low of \$41.68 for January 2009. The analysis sheds light on the causes of movement in oil prices over the last fifteen years and in assessing the relative importance of China in the upsurge of the real price of crude oil.
2013	Q54	Rozenberg, Julie, Stephane Hallegatte, Baptiste Perrissin-Fabert, and Jean-Charles Hourcade. 2013. "Funding Low-Carbon Investments in the Absence of a Carbon Tax." <i>Climate Policy</i>, 13(1): 134-41. Introducing a carbon tax is difficult, partly because it suggests that current generations have to make sacrifices for the benefit of future generations. However, the climate change externality could be corrected without such a sacrifice. It is possible to set a carbon value, and use it to create 'carbon certificates' that can be accepted as part of commercial banks' legal reserves. These certificates can be distributed to low-carbon projects, and be exchanged by investors against concessional loans, reducing capital costs for low-carbon projects. As the issuance of carbon certificates would increase the quantity of money, it will either lead to accelerated inflation or induce the Central Bank to raise interest rates. Low-carbon projects will thus have access to cheaper loans at the expense of either 'regular' investors (in case of higher interest rates) or of lenders and depositors (in case of accelerated inflation). Within this scheme, mitigation expenditures are compensated by a reduction in regular investments, so that immediate consumption is maintained. It uses future generation wealth to pay for a hedge against climate change. This framework is not as efficient as a carbon tax but is politically easier to implement and represents an interesting step in the trajectory towards a low-carbon economy.

Year	DE	Title and Abstract
2006		
2006	A20	CV: Fontana, Giuseppe. 2006. "Telling Better Stories in Macroeconomic Textbooks: Monetary Policy, Endogenous Money and Aggregate Demand." In <i>Complexity, Endogenous Money and Macroeconomic Theory: Essays in Honour of Basil J. Moore</i> , ed. Mark Setterfield, 353-67. Cheltenham, U.K. and Northampton, Mass: Elgar.
2006	D02	de Rato, Rodrigo. 2006. "Building Better Institutions." <i>Cato Journal</i> , 26(2): 215-22.
2006	D70	CV: Buchanan, James M., Richard E. Wagner, and John Burton. 2006. "The Consequences of Mr Keynes: An Analysis of the Misuse of Economic Theory for Political Profiteering, with Proposals for Constitutional Disciplines." In <i>The Road to Economic Freedom. Volume 2.</i> , ed. Philip Booth and John Meadowcroft, 221-32. An Elgar Reference Collection. Cheltenham, U.K. and Northampton, Mass.: Elgar in association with the Institute of Economic Affairs.
2006	F24	Diss: Cruz Zuniga, Martha. 2006. Three Essays on International Transmission and Monetary Policy in Emerging Countries. PhD diss. Western Michigan University. This dissertation investigates two aspects of foreign shocks that affect emerging countries: U.S. monetary shocks and workers' remittances. My attention in particular centers on the macroeconomic impact of these foreign shocks. More specifically, in the first essay (chapter 2) I analyze the international transmission of U.S. monetary policy to emerging economies distinguishing between a direct transmission process and an augmented international transmission. In the augmented transmission mechanism, U.S. shocks may impact leading countries in different regions, and those countries' reactions then affect smaller countries. In the second essay (chapter 3) I investigate the effects of monetary policy on stock market returns of emerging countries, distinguishing between the impact of domestic monetary policy and the impact of U.S. monetary actions, the latter is designed to capture the international transmission to stock markets. Finally, in the last essay (chapter 4), I evaluate the impact of workers' remittances on money in developing countries under a framework where the monetary approach to the balance of payments and currency substitution are used. The empirical analysis in chapters 2 and 3 is conducted using a sample of countries from Asia and Latin America. Results are extracted from impulse responses derived from vector error correction (VEC) models. The estimation in chapter 4 relies on panel data and three-stage least squares regressions for a sample of Latin American countries with strong remittance presence. The results presented in this dissertation indicate that emerging economies are impacted by U.S. monetary actions and by workers' remittances. Emerging economies seem to benefit from contractionary monetary policy actions originated in the United States because output in emerging economies shows a positive response. In addition, some evidence of the significance of U.S. monetary actions on stock markets in emerging economies is found. In these countries, stock markets receive a significant influence from domestic and foreign monetary policy actions. In particular, increases in interest rates, which correspond to contractionary monetary policy, reduce stock market returns. With respect to workers' remittances, they exert a negative impact on the money demand in developing economies, which suggests that remittances can be a factor that may accelerate the currency substitution process in these countries.
2006	F59	Vernengo, Matias. 2006. <i>The Political Economy of Monetary Institutions in Brazil: The Limits of the Inflation Targeting Strategy, 1999-2005.</i> University of Utah, Department of Economics, Working Paper Series, Department of Economics, University of Utah. The paper provides a critical analysis of the literature on monetary policy institutions. It presents a critique of the dominant notion of central bank independence, based on the literature on time-inconsistency of monetary policy. An alternative view that emphasizes the role of distributive conflict in establishing monetary policy regimes is developed and used to analyze the Brazilian inflation targeting regime implemented in 1999. The analysis suggests that financial or rentier's interests benefit from the current monetary regime, while manufacturing and worker's interests bear the costs.
2006	L26	Choi, Young Rok, and Phillip H. Phan. 2006. "The Influences of Economic and Technology Policy on the Dynamics of New Firm Formation." <i>Small Business Economics</i> , 26(5): 493-503. This study attempts to reveal how macroeconomic and technology policies that encompass the opportunity and individual drivers of entrepreneurship explain the dynamics of new firm formation in a country. To do so we rely on the Schumpeterian, industrial organization, and labor economics traditions of entrepreneurship, and performed an exploratory test with longitudinal U.S. data from 1968 to 1993. The results of this study suggest that R&D investments, patents, economic concentration, pro-competition policy, and labor mobility are important areas in which government policy can influence the intensity of new firm formation.
2006	L89	Ercolani, Marco G., and Jayasri Dutta. 2006. <i>The Euro-changeover and Euro-inflation: Evidence from Eurostat's HICP.</i> Department of Economics, University of Birmingham, Discussion Papers. Though anecdotal evidence suggests that retail price inflation increased temporarily in January 2002 when Euro notes and coins were introduced, the evidence from official statistics largely refutes this. We test for the presence of a sudden temporary increase in inflation for Euro-changeover countries. We use

Year	DE	Title and Abstract
		the countries that did not join the Euro: Denmark, Sweden and the UK; as a control group. Though the results are sensitive to the estimation method, we do uncover weak evidence of a minor increase in aggregate inflation in January 2002 for the countries that did join the Euro. Similar tests for the Restaurant sector find a strong Euro-changeover effect on temporary inflation. Summary tests for 129 other price sub-categories are also discussed.
2006	M48	CV: Lowe, Philip, and Glenn Stevens. 2006. "Procyclical Financial Behavior: What Can Be Done?." In <i>Procyclicality of Financial Systems in Asia</i> , ed. Stefan Gerlach and Paul Gruenwald, 137-60. Houndmills, U.K. and New York: Palgrave Macmillan.
2006	M48	CV: Gudmundsson, Mar. 2006. "Comments on "Procyclical Financial Behavior: What Can Be Done?."." In <i>Procyclicality of Financial Systems in Asia</i> , ed. Stefan Gerlach and Paul Gruenwald, 161-67. Houndmills, U.K. and New York: Palgrave Macmillan.
2006	P10	Booth, Philip, and John Meadowcroft, eds. 2006. <i>The Road to Economic Freedom. 2 vols., An Elgar Reference Collection.</i> Cheltenham, U.K. and Northampton, Mass.: Elgar. In association with the Institute of Economic Affairs. Thirty-eight previously published papers explore the market economy. Papers focus on monetary policy and price stability; unemployment; the economics of government; government regulation and the size of government; the power of language and ideas; and socialism.
2006	P42 Z12	Ahmed, Habib. 2006. "Money and Exchange Rate in an Islamic Economy." <i>Journal of Islamic Economics and Finance</i> , 2(1): 43-58. The paper discusses the nature of money in an Islamic economy and determines its value (exchange rate). The determinants of the demand for and the supply of money from an Islamic perspective are first discussed. Money supply in an Islamic economy is backed by claims on assets, gold, and foreign currency. A monetarist model of an exchange rate determination from an Islamic viewpoint is then outlined. The model indicates that as long as the money supply increases in the same proportion as the increase in money demand, the exchange rate will be stable. The paper shows that transactions based on Islamic principles have some inherent features of exchange rate stability. Policy implications for stable exchange rate are also pointed out. The establishment of Islamic institutions and financial instruments, however, are preconditions to the development of an international environment that will enable economies to pursue exchange rate policies in accordance to Shariah principles.
2006	Q01 Q56	CV: O'Hara, Phillip Anthony. 2006. "A New Neoliberal Social Structure of Accumulation for Sustainable Global Growth and Development?." In <i>Alternative Theories of the State</i> , ed. Steven Pressman, 91-112. Houndmills, U.K. and New York: Palgrave Macmillan.
2006	Q32	CV: Strand, Jon, and B. Gabriela Mundaca. 2006. "Impacts of Macroeconomic Policies on the Environment, Natural Resources, and Welfare in Developing Countries." In <i>Economic Development and Environmental Sustainability: New Policy Options</i> , ed. Ramon Lopez and Michael A. Toman, 90-121. Initiative for Policy Dialogue Series. Oxford and New York: Oxford University Press.
2006	Q56	THE SAME AS Q01 CV: O'Hara, Phillip Anthony. 2006. "A New Neoliberal Social Structure of Accumulation for Sustainable Global Growth and Development?."
2006	Z12	THE SAME AS P42 Ahmed, Habib. 2006. "Money and Exchange Rate in an Islamic Economy." <i>Journal of Islamic Economics and Finance</i> , 2(1): 43-58.
2007		
2007	B10	O'Brien, D. P. 2007. <i>The Development of Monetary Economics: A Modern Perspective on Monetary Controversies</i> , Cheltenham, U.K. and Northampton, Mass.: Elgar. Examines monetary controversies to provide a historical perspective on modern understanding of monetary policy. Discusses Jean Bodin's analysis of inflation; John Law--money and trade considered; the rate of interest--John Locke and his critics; the currency and banking controversy; monetary base control; the lender of last resort concept; Walter Bagehot and stabilization; Thomas Joplin's model--a formal statement; and stability with an inbuilt cycle.
2007	B50	Hein, Eckhard, and Achim Truger, eds. 2007. <i>Money, Distribution and Economic Policy: Alternatives to Orthodox Macroeconomics</i> , New Directions in Modern Economics. Cheltenham, U.K. and Northampton, Mass.: Elgar. Eleven papers explore alternative approaches to macroeconomics and economic policy analysis, developing a critical view of modern orthodoxy. Papers discuss the Cambridge approach to economics; heterodox economics--a common challenge to mainstream economics; elements of a monetary theory of production; the monetary circuit approach--a stock-flow consistent model; what drives profits--an income-spending model; wages and aggregate demand--an empirical investigation for France; new institutions for a new economic policy; structural reforms and macroeconomic policy--the example of Germany; theories of fiscal policies and fiscal policies in the European Monetary Union; the link between fiscal and monetary policy--lessons for Germany from Japan; and monetary policy, macroeconomic policy mix, and economic performance in the Euro area.
2007	C35	Basu, Deepankar, and Robert M. de Jong. 2007. "Dynamic Multinomial Ordered Choice with an Application to the Estimation of Monetary Policy Rules." <i>Studies in Nonlinear Dynamics and Econometrics</i> , 11(4): . We present a novel specification of a dynamic multinomial ordered choice model, where the latent variable is a function of strictly stationary exogenous variables and lags of the choice variable. We prove that such a model with weakly dependent errors will have a strictly stationary solution which is L-2 near epoch dependent. We also derive consistency and asymptotic normality of the maximum likelihood estimator for a probit specification of the model. We illustrate a possible application of the model by estimating a discrete version of a robust "difference" monetary policy rule for the period 1990:2006 at a monthly frequency.
2007	D86	Coenen, Gunter, Andrew T. Levin, and Kai Christoffel. 2007. "Identifying the Influences of Nominal and Real Rigidities in Aggregate Price-Setting Behavior." <i>Journal of Monetary Economics</i> , 54(8): 2439-66. We formulate a generalized price-setting framework that incorporates staggered contracts of multiple durations and that enables us to directly identify the influences of nominal vs. real rigidities. We estimate this framework using macroeconomic data for Germany (1975-1998) and for the U.S. (1983-2003). In each case, we find that the data are well-characterized by nominal contracts with an average duration of about two to three quarters. We also find that new contracts exhibit very low sensitivity to marginal cost, corresponding to a relatively high degree of real rigidity. Finally, our results indicate that backward-looking price-setting behavior (such as indexation to lagged inflation) is not needed in explaining the aggregate data, at least in an environment with a stable monetary policy regime and a transparent and credible inflation objective.
2007	F00	Christiano, Lawrence, Roberto Motto, and Massimo Rostagno. 2007. <i>Shocks, Structures or Monetary Policies? The Euro Area and US After 2001</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 13521. The US Federal Reserve cut interest rates more vigorously in the recent recession than the European Central Bank did. By comparison with the Fed, the ECB followed a more measured course of action. We use an estimated dynamic general equilibrium model with financial frictions to show that comparisons based on such simple metrics as the variance of policy rates are misleading. We find that--because there is

Year	DE	Title and Abstract
		greater inertia in the ECB's policy rule--the ECB's policy actions actually had a greater stabilizing effect than did those of the Fed. As a consequence, a potentially severe recession turned out to be only a slowdown, and inflation never departed from levels consistent with the ECB's quantitative definition of price stability. Other factors that account for the different economic outcomes in the Euro Area and US include differences in shocks and differences in the degree of wage and price flexibility.
2007	F65	Majid, Muhd-Zulhibri Abdul. 2007. "The Dynamic Interaction between Interest Rate and Exchange Rate in Asian Crisis Countries: Further Empirical Evidence." <i>Global Journal of Finance and Economics</i> , 4(2): 93-105. This paper aims at contributing to this key policy debate by providing new empirical evidence on the dynamic interaction of the exchange rate and interest rate in countries affected by Asian currency crisis. Our empirical results are consistent with the conventional view in the sense that monetary policy tightening leads to a nominal exchange rate appreciation during tranquil periods. However, they also provide support to the revisionist view in that tightening of monetary policy that occurred during the Asian financial crisis was excessive. By going beyond what was required to offset increasing risk premia, tighter monetary policy appears to have contributed to the collapse of the exchange rates when they came under speculative attack.
2007	H43	Temin, Peter. 2007. "The Rate of Time Preference in the United States Government." <i>American Economist</i> , 51(2): 8-15. I use Samuelson's Nonsubstitution Theorem (1961) to argue that government policies in the United States traditionally reflected a low discount rate. The government's discount rate appears to have risen sharply in the last generation, showing the usefulness of Samuelson's theorem and the difficulties facing the United States in the future.
2007	H51	Malpass, David. 2007. "Monetary Policy and the Growing Fiscal Imbalance." <i>Cato Journal</i> , 27(2): 219-30. The federal government has made commitments to increase entitlement spending rapidly in coming decades. In particular, Medicare expenditures are scheduled to balloon. My expectation is that these commitments will be met for many years by the current unfunded, pay-as-you-go system rather than being pre-funded, a preferable approach, with marketable investments. The 2005 discussion of personal accounts for Social Security didn't make much progress, nor is any marketable funding expected for the Medicare liability. Based on this assumption of a continuation of business-as-usual in Washington, this article focuses on the coming acceleration in outlay growth, in the context of rapidly growing unfunded entitlement liabilities, will affect monetary policy.
2007	H51	Gokhale, Jagadeesh. 2007. "Is the Fed Facilitating an Unpleasant Fiscal Arithmetic?" <i>Cato Journal</i> , 27(2): 237-59. Is the United States headed for an unprecedented economic disaster? The fact that prominent economists are posing that question says something about what they may be expecting. For example, in the St. Louis Fed's Review, Kotlikoff (2006) argues that the United States is headed for bankruptcy. Federal expenditure commitments on account of massive government entitlement programs are growing larger and becoming less reversible. The traditional perspective on how significant inconsistencies between outstanding government liabilities and the government's future expected budget balances are resolved suggests that higher inflation could be the mechanism by which those two items are realigned with each other.
2007	L53	CV: Lindley, Robert M. 2007. "Creating the 'Neo-Lisbon' Economy." In <i>Social Pacts, Employment and Growth: A Reappraisal of Ezio Tarantelli's Thought</i> , ed. Nicola Acocella and Riccardo Leoni, 273-88. AIEL Series in Labour Economics. Heidelberg and New York: Springer, Physica-Verlag.
2007	M15	Diss: Lu, Min. 2007. Essays on International Economics and Industrial Organization. PhD diss. University of British Columbia. This dissertation addresses two issues in international economics and one issue in industrial organization. The first two chapters use sticky-price intertemporal optimizing models with incomplete financial markets to analyze the dynamics of the current account after technology shocks and the effects of the optimal monetary policy on current account movements. The third chapter models the upgrade behavior of existing software users and new software users under two market structures. The first chapter studies a small open economy with two sectors. In a perfect foresight, rational expectation general equilibrium model, with sticky prices in the non-traded goods sector, the evolution of the current account following a positive technology shock is efficient even without time consistent optimal monetary policy. The second chapter extends the general equilibrium model to a two-country economy and analyzes the effects of the optimal monetary policy on current account dynamics. The welfare gain for home households from the individual optimal expansionary monetary policy mainly comes from the home country's terms of trade improvement when most firms price the export prices in buyer currency. The third chapter finds that, for the new software version, the software vendor should offer a price discount to existing users and charge a higher price to new users if software users are sufficiently heterogeneous. For the old software version, a price discount should be applied to existing users with a higher price to new users if the price of the coexisting new version is high.
2007	O43	Creel, Jerome, Eloi Laurent, and Jacques Le Cacheux. 2007. "Politiques et performances macroeconomiques de la zone euro: Institutions, Incitations, Strategies. (Macroeconomic Policies and Performance in the Euro Area: Institutions, Incentives, Strategies. With English summary.)." <i>Revue de L'OFCE</i> , 0(102): 249-81. Economic performance has been feeble in the Euro area since the monetary union process was put in motion in the early 1990s. While the cause for this under-performance remains subject to debate, we argue in this paper that the rules and institutions governing the Euro area are clearly not conducive to high coordinated growth policies. Because monetary authorities are too much concerned with price stability, the pro-cyclical bias of fiscal policies is reinforced and member states are even more pressured to pursue social disinflation policies by the misalignment of the exchange rate of the Euro. A more balanced interpretation of the European treaties should remedy the current predicament and foster macroeconomic policies oriented toward high sustainable growth and the preservation of social justice.
2007	R58	McVittie, Eric, and J. Kim Swales. 2007. "'Constrained Discretion' in UK Monetary and Regional Policy." <i>Regional Studies</i> , 41(2): 267-80. H. M. Treasury claims that the notion of 'constrained discretion', which directs the effective operation of UK monetary policy, applies equally to other delegated and devolved policies, such as the use of Regional Development Agencies in the delivery of English regional policy. A 'transaction cost politics' perspective is used to argue that the delegation of responsibility for monetary stabilization raises principal agent issues quite different to those encountered in the delegation of the responsibility for regional regeneration. In particular, the effectiveness and transparency that characterize present-day monetary policy cannot be expected in regional policy. Further, the institutional arrangements that accompany the operation of Regional Development Agencies in England should be critically reviewed.
2007	R58	Spiller, Cristina Nardi. 2007. "Economia dualistica, dinamica economica e strategie operative nel pensiero di Giuseppe Di Nardi. (Di Nardi's Thought about Italian Dualism, Economic Dynamics and Economic Strategies. With English summary.)." <i>Rassegna Economica</i> , 70(1): 129-44. The Italian post-war problems are explained in terms of structural malfunctions namely the disparity between technologically progressive, competitive, export-oriented industries on the one hand, and backward, inefficient, traditional industrial and service sectors on the other; between a rapid growth of private consumption and a very inadequate level of collective consumption; between shortages of skilled workers in some areas and the persistence of large-scale under-utilisation of labour resources in others, between excessive urbanisation and congestion, and the abandonment of rural regions. All these factors can explain the gap between the North and the South, which is well known as "the Italian problem". Di Nardi, an eminent

Year	DE	Title and Abstract
		professor and in particular a man of the South, analyses this peculiar situation and emphasises the role of technological combinations and in particular the quality of the different inputs. In his view, the human capital is basic. Differences in levels of education and training in political and social outlook and behaviour patterns can explain the gap. The author stresses the importance of state intervention thanks to budgetary and monetary policy and underlines the industrialization in the South as a fundamental means to solve the problem: an opinion not shared by all.

2008	A14	Evanoff, Douglas D., Philip F. Bartholomew, Robert DeYoung, Cosmin Lucaci, and Ronnie J. Phillips. 2008. "Bank Structure Conference Impact Study." <i>Journal of Financial Services Research</i>, 34(2-3): 99-121. The first Conference on Bank Structure and Competition was held at the Federal Reserve Bank of Chicago in 1963. Since that time, the Conference has served to stimulate and disseminate policy relevant research on issues affecting the financial services industry and as a forum for debating the relevant policy issues of the day. We evaluate the impact of the Conference on public policy and the banking and finance literature. We provide a qualitative argument that the Conference has helped promote policy change by showing that major financial reforms were typically discussed years earlier at the Conference. We then analyze data from the Social Science Citation Index and find that the Conference has had a strong and systematic impact on the banking and finance literature.
2008	B40	CV: King, John E. 2008. "Heterodox Macroeconomics: What, Exactly, Are We Against?." In <i>Keynes and Macroeconomics after 70 Years: Critical Assessments of The General Theory</i>, ed. L. Randall Wray and Mathew Forstater, 3-19. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2008	F38	Ferreira Gabriel, Luciano, and Jose Luis da Costa Oreiro. 2008. "Fluxos de capitais, fragilidade externa e regimes cambiais--Uma revisao teorica. (Capital Flows, External Fragility and Currency Regimes: A Theoretical Review. With English summary.)." <i>Revista de Economia Politica/Brazilian Journal of Political Economy</i>, 28(2): 331-57. The major integration and deregulation of the international financial markets increased the degree of interdependence and risk of incompatibility between the financial and monetary policy adopted by different countries. The consequences of these facts are the financial instability and the currency crisis. In this article we develop arguments advocating that independent of the currency regime adopted the national policy makers should take into account, between other factors, the major capital mobility and the integrations of markets. One of the corollaries of our analyses is that countries should pursue policies that reduces the degree of short-term capital volatile by the adoption of capital controls or though measures of prudential supervision.
2008	G17	Almeida, Caio, and Jose Vicente. 2008. "The Role of No-Arbitrage on Forecasting: Lessons from a Parametric Term Structure Model." <i>Journal of Banking and Finance</i>, 32(12): 2695-2705. Parametric term structure models have been successfully applied to numerous problems in fixed income markets, including pricing, hedging, managing risk, as well as to the study of monetary policy implications. In turn, dynamic term structure models, equipped with stronger economic structure, have been mainly adopted to price derivatives and explain empirical stylized facts. In this paper, we combine flavors of those two classes of models to test whether no-arbitrage affects forecasting. We construct cross-sectional (allowing arbitrages) and arbitrage-free versions of a parametric polynomial model to analyze how well they predict out-of-sample interest rates. Based on US Treasury yield data, we find that no-arbitrage restrictions significantly improve forecasts. Arbitrage-free versions achieve overall smaller biases and root mean square errors for most maturities and forecasting horizons. Furthermore, a decomposition of forecasts into forward-rates and holding return premia indicates that the superior performance of no-arbitrage versions is due to a better identification of bond risk premium.
2008	I20	Organisation for Economic Co-operation and Development. 2008. <i>OECD Economic Surveys: Norway 2008</i>, Paris and Washington, D.C.: Organisation for Economic Co-operation and Development. Reviews the economic situation and policies of Norway. Includes a table that presents basic statistics of Norway, including the land, people, production, government, foreign trade, and currency. Discusses maintaining prosperity while dealing with overheating and labor supply constraints; macroeconomic policies for a soft landing; the labor market--supply constraints and immigration; and making the best of Norwegian schools.
2008	J18	Floyd, David. 2008. "Have "European Politics" and EU Policy Making Replaced the Politics of Member State Countries?" <i>International Journal of Social Economics</i>, 35(5-6): 338-43. The purpose of this paper is to illustrate the ways in which the European Union (EU) is influencing policy making in EU member states. It covers the historical development of the UK, France and Germany. There is evidence to suggest politics and economic policy making in these countries are now similar particularly in the areas of adopting anti inflationist strategies and opening up markets. However, some differences remain particularly regarding the flexibility of labour markets in the various member states. Te paper draws on the various components of integration theory and incorporates also a business history approach. The main findings indicate that the EU is gradually having more influence over member states, newer areas of development include social policy, immigration and an increasing neoliberalist approach towards opening new markets. However, countries are still given some flexibility, for example, there are still a number of countries not yet willing to join the Euro currency. The paper illustrates the important role of the EU in formulating policy for member states in today's increasingly competitive business environment. Business needs to be fully aware of these implications in order to become more successful while operating in the expanding European market.
2008	K20	International Monetary Fund. 2008. <i>Current Developments in Monetary and Financial Law. Volume 5</i>, Washington, D.C.: International Monetary Fund. Twenty-one papers, based on presentations from the International Monetary Fund's tenth biennial seminar for legal advisers of central banks of member countries held in 2006, explore the legal instruments available to central banks, supervisors, international institutions, and others to promote a better understanding of financial stability. Papers discuss legal developments in the IMF; central bank law; financial stability; the rationale for regulation of derivatives and hedge funds; financial disclosure, liability of supervisors, and legal risk in financial markets; anti-money laundering--terrorist financing and financial stability; governance, deposit insurance, and market discipline; and payments, settlement, and securities infrastructure.
2008	K40	Hayo, Bernd, and Stefan Voigt. 2008. "Inflation, Central Bank Independence, and the Legal System." <i>Journal of Institutional and Theoretical Economics</i>, 164(4): 751-77. We argue that a higher degree of de facto independence of the legal system from other government branches as well as strong public trust in the working of the legal system may reduce the average inflation rate of countries through two channels: by lowering transaction costs in the economy and by strengthening de facto central bank independence. In the empirical section of the paper, we present evidence in favour of both channels after controlling for other influences in a sample containing both developed and less-developed countries.
2008	L61	CV: Rosenberg, Irma. 2008. "Monetary Policy and Commodity and Energy Prices." In <i>Commodities, Energy and Finance</i>, ed. Ernest Gnan and Mar Gudmundsson, 129-31. SUERF Studies 2008/2. 2008	L61	Hammoudeh, Shawkat, and Yuan Yuan. 2008. "Metal Volatility in Presence of Oil and Interest Rate Shocks." <i>Energy Economics</i> , 30(2): 606-20. This study uses three "two factor" volatility models of the GARCH family to examine the volatility behavior of three strategic commodities: gold, silver and copper, in the presence of crude oil and interest rate shocks. The results of the standard GARCH models suggest that gold and silver have almost the same volatility persistence which is greater than that of copper. The CGARCH estimates indicate that the (short-run) transitory component of volatility converges to zero much faster for copper than for gold and silver in this sequence. However, the permanent volatility component demonstrates equally strong persistence in the long-run for all three metals. The EGARCH results suggest that the leverage effect is present and significant for copper only, implying that gold and silver can be good investment in anticipation of bad times. Past oil shock does not impact all three metals similarly. Monetary policy and to lesser extent the oil shocks have calming effects on precious metals but not on copper if the T bill rate is used. Crises such as the 2003 Iraq war heighten metal volatility. These results have implications for derivatives valuations, using gold as a reserve asset, risk analysis, and for the commodity-exporting countries and commodity-producing firms.
2008	L66 Q54	Baskaya, Yusuf Soner, Tugrul Gurgur, and Fethi Ogunc. 2008. "Kuresel Isinma, Kuresellesme ve Gıda Krizi--Turkiye'de Islenmis Gıda Fiyatları Uzerine Ampirik Bir Calisma. (Global Warming, Globalization and Food Crisis--An Empirical Study on Processed Food Prices in Turkey. With English summary.)." <i>Central Bank Review</i> , 8(2): 1-32. For central banks, whose primary objective is to maintain low and sustainable inflation, understanding the determinants of food prices and their sensitivity to monetary policy is crucial for measuring the effectiveness of policy actions. This study empirically analyzes the determinants of the processed food inflation in Turkey. The findings point out that the recent acceleration in the processed food inflation mostly stems from supply side shocks triggered by domestic drought and the upsurge in the international food prices. The emergence of a steep difference between the level of temperature and the seasonal averages gives rise to an increase in the processed food inflation, whereas moderate rise in the temperatures above the seasonal averages slows down the food inflation. The study indicates that the import prices mostly affect the domestic processed food prices through the processed intermediate food products rather than consumption goods. Exchange rate pass-through to processed food prices is faster than the import price pass-through and its effect is mostly felt within the first three months of a change in the exchange rate. The effect of total demand conditions is found to be relatively weak in the sample period considered in this study.
2008	N63	Pascual Domenech, Pere, and Carles Sudria Triay. 2008. "Industrializacion, desarrollo financiero y oferta monetaria en Barcelona a mediados del siglo XIX. (Industrialization, Financial Development and Money Supply: Barcelona in the Mid-Nineteenth Century. With English summary.)." <i>Investigaciones de Historia Economica</i> , 0(12): 45-77. The article deals with the need, inherent in any process of industrialization, to increase money supply in order to avoid deflationary tensions. We examine the case of a major financial and commercial centre: Barcelona in the mid-nineteenth century. The paper specifies the volume of different types of fiat money in circulation (bank notes, "validated" cheques, internal pay orders, short-term bonds . . .) and their characteristics as means of payment. The aim of the study is to show that, in a context of "free banking" without legal tender of the paper money, there was an automatic process towards a balance between supply and demand for money and that any possible oversupply was eliminated through a "crowding out" effect. In such systems, money-supply growth seems not to have significant effects on prices, but instead, sudden contractions of money supply did have intense upward impacts on interest rate.

2009	E02	Pedersen, Lasse Heje. 2009. <i>When Everyone Runs for the Exit.</i> National Bureau of Economic Research, Inc. NBER Working Papers: 15297. The dangers of shouting "fire" in a crowded theater are well understood, but the dangers of rushing to the exit in the financial markets are more complex. Yet, the two events share several features, and I analyze why people crowd into theaters and trades, why they run, what determines the risk, whether to return to the theater or trade when the dust settles, and how much to pay for assets (or tickets) in light of this risk. These theoretical considerations shed light on the recent global liquidity crisis and, in particular, the quant event of 2007.
2009	F53	Hemerijck, Anton, Ben Knapen, and Ellen van Doorne, eds. 2009. <i>Aftershocks: Economic Crisis and Institutional Choice.</i> Amsterdam: Amsterdam University Press; distributed by University of Chicago Press. Twenty-five chapters explore the institutional impact, dimensions, and consequences of the global economic crisis of 2007. Papers discuss diagnosing the crisis; exploring domestic policy space under low growth; the culture of discontent that has emerged in the wake of the hegemony of neoliberal doctrines over the past quarter-century; the economic crisis, its challenges to policy repertoires, and the architecture of international organizations; and realigning Europe.
2009	F62	Younus, Sayera, and Mark Wheeler. 2009. "The Impact of Monetary Policy Changes in a Global Economy: Evidence from Bangladesh." <i>Global Journal of Finance and Economics</i> , 6(2): 113-26. The study examines the impact of changes in monetary policy on Bangladesh's economy. Specifically, we examine the impact of domestic and foreign monetary shocks on Bangladesh's major economic aggregates. In the context of a global economy such as Bangladesh, the conduct of monetary policy becomes increasingly more difficult as globalization proceeds. It becomes important to examine the impact of changes in relevant foreign variables, such as the money supply, when formulating domestic monetary policy. The empirical results of our analysis show that innovations to the foreign money supply have significant impacts on Bangladesh's real exchange rate and, at long time horizons, Bangladesh's price level. However, the foreign money supply does not have an impact on Bangladesh's money supply or output.

Year	DE	Title and Abstract
		Our results also indicate that innovations to Bangladesh's money supply have significant impacts on Bangladesh's price level and output. That is, even in this small, open, economy, monetary policy can be used to alter domestic variables.
2009	F62	Bandoi, Anca, Dorel Berceanu, and Dana Danculescu. 2009. "Price Stability and Financial Stability in the Context of EUROSISTAM's Monetary Policy." <i>European Research Studies</i>, 12(4): 19-36. In this article we propose to review some aspects of the relationship between price stability and financial stability in the current economic context. It is acknowledged that monetary policy of the EUROSISTAM still has as the main objective price stability, this being one of the most important ways of supporting sustainable economic growth. Although there are many theoretical approaches of the price stability concept all converging towards the idea of measuring and control of permanent inflation. Financial stability can be seen in the broad sense as the situation in which the financial system may ensure the efficient allocation of savings to investment opportunities and may face the shock without major disruptions. Viewed from this perspective the increased complementarity between price stability and financial stability is associated with economic globalization and, in particular, eliminating impediments to the free movement of capital flows. On the other hand the financial stability may be defined as a situation characterized by the absence of banking crises and by the existence of a certain level of price stability of the assets, including interest rates.
2009	H27	Munro, John. 2009. <i>Warfare, Liquidity Crises, and Coinage Debasements in Burgundian Flanders, 1384-1482: Monetary or Fiscal Remedies?</i>. University of Toronto, Department of Economics, Working Papers. Coinage debasements were a prevalent and generally very harmful feature of most economies in late-medieval western Europe, and most certainly in Burgundian Flanders (1384-1482). Flanders also experienced several economic recessions or contractions from three related sources: warfare; the so-called 'bullion famines', with liquidity crises; and the irredeemable decline of its former mainstay, the woollen textile industries. Since many of my previous publications dealt with the Flemish cloth industry, this paper focuses on the other two major economic problems, of which warfare was the most important factor. The question posed therefore is simply this: did the Burgundian dukes undertake coinage debasements principally as a monetary or as a fiscal policy? In this paper, I contend that warfare was indeed, directly and indirectly, a primary cause of those monetary scarcities, especially in reducing the income velocity of money and thus in increasing hoarding--in my view, far more important than any supposed balance of payments deficits and 'bullion outflows to the East'.
2009	H27	Munro, John. 2009. <i>Coinage and Monetary Policies in Burgundian Flanders during the late-medieval 'Bullion Famines', 1384-1482</i>. University of Toronto, Department of Economics, Working Papers. This paper seeks to answer two questions: were the coinage debasements in Burgundian Flanders (1384-1482) undertaken principally as monetary or fiscal policies; and were they beneficial or harmful? In a recent monograph, Sargent and Velde (Big Problem of Small Change: 2002) contend that monetary objectives governed almost all medieval, early-modern debasements, especially to remedy the chronic shortages of petty coins. My thesis is that the Burgundian rulers of Flanders, in competition with neighboring princes, undertook their debasements primarily as aggressive fiscal policies, specifically to finance warfare. Their goal was to increase their seigniorage revenues, the tax imposed on bullion brought to their mints, by two means: by increasing the tax rate itself, and by enticing an increased influx of bullion into their mints, both by the debasement techniques themselves and by auxiliary bullionist policies. This study further demonstrates that the inflationary consequences of debasements were always less than those predicted by mathematical formulae--possibly because those debasements failed to counteract the prevailing forces of monetary contraction and deflation. Note that this is an extensively revised and shortened version of an earlier working paper (no. 355), correcting some errors in that paper (concerning Spanish coinage): with the same tables, but with a new set of graphs
2009	H52	de Michelis, Andrea. 2009. <i>Iceland: Challenging Times for Monetary and Fiscal Policies</i>. OECD, Economics Department, OECD Economics Department Working Papers: 726. Monetary and fiscal policies face huge challenges: the banking sector has collapsed; the economy is in the midst of a deep recession; the exchange rate has plunged; capital flows have been frozen; inflation is elevated; public debt has risen; source of revenues have disappeared; social needs have increased; and the unemployment insurance fund has been nearly depleted. Against this difficult background, this paper discusses what policy makers should do in order to restore balance in the Icelandic economy and lay out the foundations for a sustainable recovery. The key recommendations are to seek entry in the euro area and implement the fiscal consolidation measures necessary to comply with the IMF programme.
2009	J42	Mattesini, Fabrizio, and Lorenza Rossi. 2009. "Optimal Monetary Policy in Economies with Dual Labor Markets." <i>Journal of Economic Dynamics and Control</i>, 33(7): 1469-89. We present a dynamic stochastic general equilibrium (DSGE) New Keynesian model with indivisible labor and a dual labor market: a Walrasian one where wages are fully flexible and a unionized one characterized by real wage rigidity. We show that the negative effect of a productivity shock on inflation and the positive effect of a cost-push shock are crucially determined by the proportion of firms that belong to the unionized sector. The larger this number, the larger are these effects. Consequently, the larger the union coverage, the larger should be the optimal response of the nominal interest rate to exogenous productivity and cost-push shocks. The optimal inflation and output gap volatility increases as the number of the unionized firms in the economy increases.
2009	K33	Herrera-Bernal, Ximena. 2009. "Impuestos sobre ganancias extraordinarias (windfall taxes) y medidas provisionales: Cuatro casos recientes. (Windfall Taxes and Provisional Measures: Four Recent Decisions. With English summary.)." <i>International Law: Revista Colombiana de Derecho Internacional</i>, 0(15): 125-54. The article looks at four recent decisions granting provisional measures requested by the Claimants in four investment arbitrations, namely the decisions of the ICSID tribunals in the City Oriente v. Ecuador and Petroecuador case, the Perenco vs. Ecuador and Petroecuador, Burlington v. Ecuador and Petroecuador case, and the decisions in the SC case of Sergei Paushok v. Mongolia. In describing these decisions the article looks at the tension between the State's right to implement its monetary policy and the powers of an arbitral tribunal to impose restrictions to its enforcement via provisional measures pending the resolution of the dispute on its merits.
2009	L21	de Oliveira, Fernando N. 2009. "Effects of Monetary Policy on Firms in Brazil: An Empirical Analysis of the Balance Sheet Channel." <i>Brazilian Review of Econometrics</i>, 29(2): 171-204. This paper investigates the transmission mechanism of monetary policy in Brazil. It is an empirical analysis of the effects of monetary policy on the behavior of firms in Brazil. We build an original database composed of financial statements of 291 public firms and of 4,735 private firms. We use the balance sheet theory to investigate how firms respond to monetary contractions. Our results show that small firms are more sensitive to monetary contractions than large firms.

2006	O25	Levy-Orlik, Noemi. 2009. "Protectionism and Industrialization: A Critical Assessment of the Latin American Industrialization Period." <i>Revista de Economia Política/Brazilian Journal of Political Economy</i> , 29(4): 436-53. Protectionist policies were considered one of the pivotal features of the import industrialization process in Latin America. In this paper the effects of protectionist policies are assessed in terms of the principal macroeconomic variables, productive structure and external trade composition; also, ECLAC's perspective on the import substitution process is discussed. The main conclusions are that regional protectionist policies were spontaneous, and their effects were limited due to the generalized protection that took place and the government's commitment to price stability.
2009	O50	Cordero, Jose Antonio. 2009. <i>The IMF's Stand-by Arrangements and the Economic Downturn in Eastern Europe: The Cases of Hungary, Latvia, and Ukraine</i> . Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This paper looks at three countries that have been hard-hit by the world economic recession, and have turned to the IMF for assistance: Hungary, Latvia, and Ukraine. In all of these countries, it would appear that there were more sensible responses to the crisis that would reduce the loss of employment and output, cuts in social services, and political instability that have resulted from the downturn. Instead, the governments' responses to the downturn as well as IMF conditions for assistance have caused additional harm.
2009	O50	Cordero, Jose Antonio. 2009. <i>Costa Rica During the Global Recession: Fiscal Stimulus with Tight Monetary Policy</i> . Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This paper shows that, in spite of a reasonably sized fiscal stimulus package, Costa Rica's economy continues on a downward path, partly because fiscal policy is being offset by a tightening of monetary policy. The paper notes that the International Monetary Fund has insisted that Costa Rica's monetary policy remain tight due to worries over inflation targets and a perceived risk of a balance of payments crisis. However, the author notes that the IMF could help prevent a balance of payments crisis through the provision of a credit line of foreign currency, as it has done, for example, in Mexico - a vastly larger economy. The paper also examines the government's macroeconomic policies in recent years, prior to the world recession, to see what alternative policies might have done better.
2009	O50	Weisbrot, Mark. 2009. <i>CEPR Responds to the IMF's Reply and Defense of Its Policies During the World Recession</i> . Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This paper is part of a discussion between CEPR and the International Monetary Fund (IMF) regarding CEPR's paper, "IMF-Supported Macroeconomic Policies and the World Recession: A Look at Forty-One Borrowing Countries." An IMF representative presented a response to that paper at an October 15, 2009 event in Washington D.C., in remarks and a power point presentation. The earlier CEPR paper examined IMF agreements with 41 countries during the current global recession and found that 31 of the 41 countries had implemented pro-cyclical policies--for example cutting spending or tightening monetary policy--that would be expected to exacerbate an economic downturn. This new discussion paper responds to the IMF's defense of its policies.
2009	O50	Weisbrot, Mark, Rebecca Ray, Jake Johnston, and Jose Antonio Cordero. 2009. <i>IMF-Supported Macroeconomic Policies and the World Recession: A Look at Forty-One Borrowing Countries</i> . Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This paper finds that 31 of 41 of countries with current International Monetary Fund (IMF) agreements have been subjected to pro-cyclical macroeconomic policies that, during the current global recession, would be expected to have exacerbated economic slowdowns.
2009	Q30	Frey, Laure, and Benoit Mojon. 2009. "Le dollar et l'inflation mondiale. (Dollar and World Inflation. With English summary.)." <i>Revue d'Economie Financiere</i> , 0(94): 81-106. The relations between the world inflation and the dollar are analysed through the monetary policies and the price variations of the raw materials. According to the authors, the American monetary policy is not directly responsible for the correlation of the worldwide inflation. These correlations result rather from the effects of different monetary policies in different areas. On the other hand, being the main reserve and trade currency, the dollar may have furthered the strong rise of the price of the raw materials during these last years.
2010		
2010	A10	Lechthaler, Wolfgang, Christian Merkl, and Dennis Snower. 2010. <i>Monetary Persistence and the Labor Market: A New Perspective</i> . CESifo Group Munich, CESifo Working Paper Series: CESifo Working Paper No. 2935. In this paper we propose a novel way to model the labor market in the context of a New-Keynesian general equilibrium model, incorporating labor market frictions in the form of hiring and firing costs. We show that such a model is able to replicate many important stylized facts of the business cycle. The reactions to monetary and real shocks become much more sluggish. Job creation and job destruction are negatively correlated. And the volatility of unemployment is much larger than in the standard search and matching model.
2010	A10	Uhlig, Harald. 2010. <i>Economics and Reality</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 16416. This paper is a non-technical and somewhat philosophical essay, that seeks to investigate the relationship between economics and reality. More precisely, it asks how reality in the form empirical evidence does or does not influence economic thinking and theory. In particular, which role do calibration, statistical inference, and structural change play? What is the current state of affairs, what are the successes and failures, what are the challenges? I shall tackle these questions moving from general to specific. For the general perspective, I examine the following four points of view. First, economics is a science. Second, economics is an art. Third, economics is a competition. Forth, economics politics. I then examine four specific cases for illustration and debate. First, is there a Phillips curve? Second, are prices sticky? Third, does contractionary monetary policy lead to a contraction in output? Forth, what causes business cycles? The general points as well as the specific cases each have their own implication for the central question at hand. Armed with this list of implications, I shall then attempt to draw a summary conclusion and provide an overall answer.
2010	B26	Corsi, Marcella, and Giulio Guarini. 2010. "Le cause reali delle crisi finanziarie: L'approccio di Paolo Sylos Labini. (With English summary.)." <i>Studi e Note di Economia</i> , 15(3): 389-412. In his "Le prospettive dell'economia mondiale" ("Prospects for the world economy") of 2003 Paolo Sylos Labini analyses the real and financial factors of the American economy and expresses pessimistic forebodings on the future economic trends in the USA and other parts of the world which, in the light of the events occurring as from 2007, can now be seen to have been justified. The aim of this paper is to provide his ideas with a place in the present debate on the American financial crisis and, to this end, the paper is divided into three parts. At first, we delineate the approach taken by Paolo Sylos Labini in examining the links between the financial system and economic system, highlighting the Classical, Schumpeterian, and Keynesian elements contained in it. We then turn the focus on the four key elements of financial crisis according to Sylos Labini: income distribution, innovation, market forms, and debt sustainability. Finally, we recall some

Year	DE	Title and Abstract
		considerations by Sylos Labini on the three themes central to the present debate on the American crisis, namely the rate of interest in monetary policy, the role of the managers, and expectations.
2010	C34 D85	Bhattacharjee, Arnab, and Sean Holly. 2010. <i>Understanding Interactions in Social Networks and Committees</i>. Faculty of Economics, University of Cambridge, Cambridge Working Papers in Economics. While much of the literature on cross section dependence has focused mainly on estimation of the regression coefficients in the underlying model, estimation and inferences on the magnitude and strength of spill-overs and interactions has been largely ignored. At the same time, such inferences are important in many applications, not least because they have structural interpretations and provide useful interpretation and structural explanation for the strength of any interactions. In this paper we propose GMM methods designed to uncover underlying (hidden) interactions in social networks and committees. Special attention is paid to the interval censored regression model. Our methods are applied to a study of committee decision making within the Bank of England's monetary policy committee.
2010	C36	Enders, Walter, Kyung So Im, Junsoo Lee, and Mark C. Strazicich. 2010. "IV Threshold Cointegration Tests and the Taylor Rule." <i>Economic Modelling</i>, 27(6): 1463-72. The usual cointegration tests often entail nuisance parameters that hinder precise inference. This problem is even more pronounced in a nonlinear threshold framework when stationary covariates are included. In this paper, we propose new threshold cointegration tests based on instrumental variables estimation. The newly suggested IV threshold cointegration tests have standard distributions that do not depend on any stationary covariates. These desirable properties allow us to formally test for threshold cointegration in a nonlinear Taylor rule. We perform this analysis using real-time U.S. data for several sample periods from 1970 to 2005. In contrast to the linear model, we find strong evidence of cointegration in a nonlinear Taylor rule with threshold effects. Overall, we find that the Federal Reserve is far more policy active when inflation is high than when inflation is low. In addition, we reaffirm the notion that the response to counteract high inflation was weakest in the 1970s and strongest in the Greenspan era.
2010	C46	Hannsgen, Greg. 2010. <i>Infinite-variance, Alpha-stable Shocks in Monetary SVAR</i>. Levy Economics Institute, The Economics Working Paper Archive. The process of constructing impulse-response functions (IRFs) and forecast-error variance decompositions (FEVDs) for a structural vector autoregression (SVAR) usually involves a factorization of an estimate of the error-term variance-covariance matrix V . Examining residuals from a monetary VAR, this paper finds evidence suggesting that all of the variances in V are infinite. Specifically, this study estimates alpha-stable distributions for the reduced-form error terms. The ML estimates of the residuals' characteristic exponents "alpha" range from 1.5504 to 1.7734, with the Gaussian case lying outside 95 percent asymptotic confidence intervals for all six equations of the VAR. Variance-stabilized P-P plots show that the estimated distributions fit the residuals well. Results for subsamples are varied, while GARCH(1,1) filtering yields standardized shocks that are also all likely to be non-Gaussian alpha stable. When one or more error terms have infinite variance, V cannot be factored. Moreover, by Proposition 1, the reduced-form DGP cannot be transformed, using the required nonsingular matrix, into an appropriate system of structural equations with orthogonal, or even finite-variance, shocks. This result holds with arbitrary sets of identifying restrictions, including even the null set. Hence, with one or more infinite-variance error terms, structural interpretation of the reduced-form VAR within the standard SVAR model is impossible.
2010	C58	Raghavan, Mala, Jonathan Dark, and Elizabeth Ann Maharaj. 2010. "Impact of Capital Control Measures on the Malaysian Stock Market: A Multiresolution Analysis." <i>International Journal of Managerial Finance</i>, 6(2): 116-27. The purpose of this paper is to examine the extent to which the capital control measures implemented by the Malaysian central bank in late 1998 had an influence on segmenting the Malaysian equity market from other major equity markets. The S&P 500, the Nikkei 225 Index, the STI Index and the KLSE Composite Index are considered. The discrete wavelet transform technique--"Haar" is employed to decompose the series into various time scales during the pre- and post-capital control periods in Malaysia. The decomposed series are then used to estimate the interdependence between KLSE Composite Index with the other three markets at various time scales. The empirical findings support three conclusions. First, in the pre-capital control period, Singapore is the most influential market followed by the US across all time scales in transmitting news into Malaysia. Second, after the imposition of capital controls, the spillover effects from Singapore to Malaysia have declined substantially, suggesting a reduced integration between these two markets. Finally, in the post-capital control period, all three markets appear to be imparting a similar but moderate level of influence on the Malaysian market.
2010	C58	Jawadi, Fredj, Mohamed Hedi Aroui, and Duc Khuong Nguyen. 2010. "Global Financial Crisis, Liquidity Pressure in Stock Markets and Efficiency of Central Bank Interventions." <i>Applied Financial Economics</i>, 20(7-9): 669-80. In this article, we investigate the hypothesis of efficiency of central bank intervention policies within the current global financial crisis. We firstly discuss the major existing interventions of central banks around the world to improve liquidity, restore investor confidence and avoid a global credit crunch. We then evaluate the short-term efficiency of these policies in the context of the UK, the US and the French financial markets using different modelling techniques. On the one hand, the impulse response functions in a Structural Vector Autoregressive (SVAR) model are used to apprehend stock market reactions to central bank policies. On the other hand, since these reactions are likely to be of an asymmetric and nonlinear nature, a two-regime Smooth Transition Regression-Generalized Autoregressive Conditional Heteroscedasticity (STR-GARCH) model is estimated to explore the complexity and nonlinear responses of stock markets to exogenous shifts in monetary policy shocks. As expected, our findings show strong repercussions from interest rate changes on stock markets, indicating that investors keep a close eye on central bank intervention policies to make their trading decisions. The stock markets lead monetary markets, however, when central banks are slow to adjust their benchmark interest rates.
2010	C58	Laopodis, Nikiforos T. 2010. "Dynamic Linkages between Monetary Policy and the Stock Market." <i>Review of Quantitative Finance and Accounting</i>, 35(3): 271-93. This paper examines the dynamic linkages between the federal funds rate and the stock market during the 1970-2004 period using the VAR methodology. We detected a disconnection between Fed actions and market responses in the 1990s relative to the 1970s and 1980s. Upon further analyses, we observed asymmetric effects of monetary policy actions on the stock market and that such actions were more turbulent during bear markets than bull markets. Overall, our results appear to suggest that there was consistent dynamic relationship between the conduct of monetary policy and the corresponding behavior by the stock market during the last three decades.
2010	C58	Lengwiler, Yvan, and Carlos Lenz. 2010. "Intelligible Factors for the Yield Curve." <i>Journal of Econometrics</i>, 157(2): 481-91. We construct a factor model of the yield curve and specify time series processes for these factors, so that the innovations are mutually orthogonal. At the same time, the factors are such that they assume clear, intuitive interpretations. The resulting "intelligible factors" should prove useful for investment professionals to discuss expectations about yield curves and the implied dynamics. Moreover, they allow us to distinguish announced changes of the monetary policy stance versus monetary policy surprises, which we find to be rare. We identify two such events, namely September 11, 2001, and the Fed reaction to the sub-prime crisis of 2007.
2010	C83	Ridhwan, Masagus M., Henri L. F. de Groot, and Peter Nijkamp. 2010. <i>The Impact of Monetary Policy on Economic Activity--Evidence from a Meta-Analysis</i>. Tinbergen Institute, Tinbergen Institute Discussion Papers: 10-043/3. This paper presents the

Year	DE	Title and Abstract
		findings a meta-analysis identifying the causes of variation in the impact of monetary policies on economic development. The sample of observations included in our meta-analysis is drawn from primary studies that uniformly employ Vector Autoregressive (VAR) models. Our findings reveal that capital intensity, financial deepening, the inflation rate, and economic size are important in explaining the variation in outcomes across regions and over time. Differences in the type of models used in the primary studies also significantly contribute to the explanation of the variation in study outcomes.
2010	C83	Hoover, Kevin D., Selva Demiralp, and Stephen J. Perez. 2010. <i>Empirical Identification of the Vector Autoregression: The Causes and Effects of U.S. M2</i>. Duke University, Department of Economics, Working Papers: 10-03. The M2 monetary aggregate is monitored by the Federal Reserve, using a broad brush theoretical analysis and an informal empirical analysis. This paper illustrates empirical identification of an eleven-variable system, in which M2 and the factors that the Fed regards as causes and effects are captured in a vector autoregression. Taking account of cointegration, the methodology combines recent developments in graph-theoretical causal search algorithms with a general-to-specific search algorithm to identify a fully specified structural vector autoregression (SVAR). The SVAR is used to examine the causes and effects of M2 in a variety of ways. We conclude that, while the Fed has rightly identified a number of special factors that influence M2 and while M2 detectably affects other important variables, there is 1) little support for the core quantity-theoretic approach to M2 used by the Fed; and 2) M2 is a trivial linkage in the transmission mechanism from monetary policy to real output and inflation.
2010	D85	THE SAME AS C34 Bhattacherjee, Arnab, and Sean Holly. 2010. <i>Understanding Interactions in Social Networks and Committees</i>. Faculty of Economics, University of Cambridge, Cambridge Working Papers in Economics.
2010	H83	Khademian, Anne M. 2010. "The Pracademic and the Fed: The Leadership of Chairman Benjamin Bernanke." <i>Public Administration Review</i>, 70(1): 142-50. When President Barack Obama nominated Ben Bernanke for a second term as chair of the Federal Reserve Board in August 2009, he emphasized Bernanke's "bold action and outside-the-box thinking" in preventing the recent financial collapse from turning into another Great Depression. While many saw this renomination as providing monetary policy stability and necessary institutional continuity during the crisis, Bernanke's "bold action" has generated robust criticism, mainly because Bernanke initiated fundamental reforms of traditional Fed practices. How has Bernanke's leadership style at the Fed evolved as the financial crisis of 2008-2009 has unfolded? Did his prior academic experience influence his decisions? What are the long-term implications of Bernanke's innovative strategies for the Federal Reserve as an independent, powerful, policy making institution, traditionally one that possesses tremendous financial and political autonomy?
2010	I11 L31	Ahmadi, Ali Mohammad, Mehdi Yousefi, and Somayeh Fazaeli. 2010. "Consumer Price Index Changes in Iran's Public and Health Sectors. (In Farsi. With English summary)." <i>Quarterly Journal of the Economic Research</i>, 0(1): 99-111. One of the major macroeconomic objectives of the governments is to control the inflation rate. High inflation and its associate destructive impacts on public welfare are a concern of social and economic policymakers. Consequently, they aim to control the inflation rate. Inflation within the health sector is attributed to various factors including aging population, insurance problems such as imperfect coverage and maladministration, lower productivity of production factors mainly medical staff and equipment, technological variation in delivering medical services, population growth and the lack of symmetric information among the suppliers and the demanders of health services. The findings of this study show that the resulting inflation rate for the health sector is relatively higher than the overall CPI inflation in Iran. To achieve a better understanding of inflation process in the Iranian health sector, in addition to the above factors, other issues should be considered. They include the effects of technological development, the existence of a verity of formal and informal fees in the private sector, the role of non-governmental Organizations (NGO) in setting medical and paramedical fees.
2010	I11	Gupta, Rangan, and Cobus Vermeulen. 2010. "Private and Public Health Expenditures in an Endogenous Growth Model with Inflation Targeting." <i>Annals of Economics and Finance</i>, 11(1): 139-53. This paper develops a monetary endogenous growth overlapping generations model characterized by endogenous longevity and an inflation targeting monetary authority, and analyzes the growth dynamics that emerges from this framework. Besides the endogenous longevity which depends on the complementarity of private and public health expenditures, the growth process is endogenized by allowing for a productive role of government expenditure on infrastructure. Following the huge existing literature, money is introduced by assuming that banks are obligated to hold a fraction of the deposits as cash reserve requirements. Given this framework, we show that multiple equilibria emerges, with the low-growth (high-growth) equilibrium being unstable (stable) and locally determinate (locally indeterminate). In addition, we show that, under certain conditions, endogenous fluctuations and even chaos could emerge around the high-growth equilibrium.
2010	J70	Seguino, Stephanie, and James Heintz. 2010. <i>Contractionary Monetary Policy and the Dynamics of U.S. Race and Gender Stratification</i>. Political Economy Research Institute, University of Massachusetts at Amherst, Working Papers. This paper explores the distributional effects of contractionary monetary policy by race and gender in the U.S. from 1979-2008 using state-level panel data. We hypothesize that women and Blacks, as groups with less power and lower status in the social hierarchy, fare worse in the competition over jobs, resulting in a disproportionate rise in female and Black unemployment rates relative to White males. We also investigate the possibility that Blacks bear a greater burden of joblessness than females as Black population density rises. Results indicate the costs of fighting inflation are unevenly distributed amongst workers, weighing more heavily on Black females and Black males, followed by White females, and lastly, White males.
2010	L31	THE SAME AS I11 Ahmadi, Ali Mohammad, Mehdi Yousefi, and Somayeh Fazaeli. 2010. "Consumer Price Index Changes in Iran's Public and Health Sectors. (In Farsi. With English summary)." <i>Quarterly Journal of the Economic Research</i>, 0(1): 99-111.
2010	L85	Goukasian, Levon, and Mehdi Majbouri. 2010. "The Reaction of Real Estate-Related Industries to the Monetary Policy Actions." <i>Real Estate Economics</i>, 38(2): 355-98. We study the impact of changes in U.S. monetary policy on the equity returns of real estate-related industries. We find that, over the 1989-2005 sample period covered in our study, a hypothetical unexpected rate cut of 25 basis points (bps) is associated with an increase of about 170 bps in the value-weighted returns of real estate-related industries. We find that monetary policy impacts the stock prices in real estate-related industries through its impact on the future expected stock returns and not on real interest rates or expected future dividends. There is also some evidence of asymmetry in the responses of the industry returns to the monetary policy actions. A strong stock price response to reversals in the direction of the Federal Reserve's monetary policy is reported.
2010	M12	CV: Goodhart, C. A. E. 2010. "Banks and Public Sector Authorities: The International Financial Crisis and Policy Challenges in Asia-Pacific." In <i>The International Financial Crisis and Policy Challenges in Asia and the Pacific: Proceedings of the Wrap-Up Conference of the Asian Research Programme, Shanghai, 6-8 August 2009</i>. 2010	Q21	Askari, Hossein, and Noureddine Krichene. 2010. "Monetary Policy and World Commodity Markets: 2000-2007." <i>PSL Quarterly Review</i>, 63(252-255): 143-75. Expansionary monetary policy in key industrial countries and a rapidly depreciating US dollar sent commodity prices soaring at unprecedented rates during 2003-2007. In contrast, consumer price indices in major OECD countries,

Year	DE	Title and Abstract
		a leading indicator for monetary policy, showed almost no inflation. This twin development is a puzzle as the evolution of consumer prices were not responsive to record low interest rates, double-digit commodity inflation, and a sharp depreciation of the dollar. A common trend, identified as a monetary shock, drives commodity prices. Policymakers face a policy dilemma: maintain expansionary monetary policy stance with persistent commodity price inflation, subsequent severe world recession, and financial disorder, or tighten monetary policy with subsequent sustained economic growth and financial and price stability.
2011		
2011	B15 H40 H44	Wray, L. Randall. 2011. "Keynes after 75 Years: Rethinking Money as a Public Monopoly". Levy Economics Institute, The Economics Working Paper Archive. In this paper I first provide an overview of alternative approaches to money, contrasting the orthodox approach, in which money is neutral, at least in the long run; and the Marx-Veblen-Keynes approach, or the monetary theory of production. I then focus in more detail on two main categories: the orthodox approach that views money as an efficiency-enhancing innovation of markets, and the Chartalist approach that defines money as a creature of the state. As the state's "creature," money should be seen as a public monopoly. I then move on to the implications of viewing money as a public monopoly and link that view back to Keynes, arguing that extending Keynes along these lines would bring his theory up to date.
2011	B15	Wray, L. Randall. 2011. <i>Money in Finance</i> . Levy Economics Institute, The Economics Working Paper Archive. This paper begins by defining, and distinguishing between, money and finance, and addresses alternative ways of financing spending. We next examine the role played by financial institutions (e.g., banks) in the provision of finance. The role of government as both regulator of private institutions and provider of finance is also discussed, and related topics such as liquidity and saving are explored. We conclude with a look at some of the new innovations in finance, and at the global financial crisis, which could be blamed on excessive financialization of the economy.
2011	B15	Wray, L. Randall. 2011. "The Financial Crisis Viewed from the Perspective of the 'Social Costs' Theory". Levy Economics Institute, The Economics Working Paper Archive. This paper examines the causes and consequences of the current global financial crisis. It largely relies on the work of Hyman Minsky, although analyses by John Kenneth Galbraith and Thorstein Veblen of the causes of the 1930s collapse are used to show similarities between the two crises. K.W. Kapp's "social costs" theory is contrasted with the recently dominant "efficient markets" hypothesis to provide the context for analyzing the functioning of financial institutions. The paper argues that, rather than operating "efficiently," the financial sector has been imposing huge costs on the economy--costs that no one can deny in the aftermath of the economy's collapse. While orthodox approaches lead to the conclusion that money and finance should not matter much, the alternative tradition--from Veblen and Keynes to Galbraith and Minsky--provides the basis for developing an approach that puts money and finance front and center. Including the theory of social costs also generates policy recommendations more appropriate to an economy in which finance matters.
2011	C01	Reade, J. James. 2011. <i>Modelling Monetary and Fiscal Policy in the US: A Cointegration Approach</i> . Department of Economics, University of Birmingham, Discussion Papers. As governments and economists worldwide reflect on the unprecedented peacetime build-ups of government deficits and debts since 2008 and the Great Recession, the importance of fiscal and monetary policy interactions and their sustainability is key. This involves both thorough theoretical and careful econometric analysis. This paper provides the latter. We use multivariate cointegration methods to investigate monetary and fiscal interactions using the example of the United States since the early 1980s. Using survey data for inflation expectations, we find that monetary policymaking is heavily forward looking, and passive in the sense that it responds to policy rule. Fiscal policy is found to be active in that it does not respond to the fiscal policy rule discovered in the data. Entering into debates on the efficacy of fiscal policy, we find that in the long-term fiscal deficits are very harmful to growth, but in the short run fiscal stimuli can be effective in restoring the economy to equilibrium. The interactions between the two policy spheres appear somewhat limited in that neither policy tool enters the policy rule of the other policy sphere, but the more passive monetary policy does move in reaction to fiscal policy movements--the two policy spheres are complementary in that both respond in the same direction to revive and restrain the economy in downturns and boom times respectively.
2011	C18	Anderson, Heather M., Mardi Dungey, Denise R. Osborn, and Farshid Vahid. 2011. "Financial Integration and the Construction of Historical Financial Data for the Euro Area." <i>Economic Modelling</i> , 28(4): 1498-1509. Time series analysis for the Euro Area requires the availability of sufficiently long historical data series, but the appropriate construction methodology has received little attention. The benchmark dataset, developed by the European Central Bank for use in its Area Wide Model (AWM), is based on fixed-weight aggregation across countries with historically distinct monetary policies and financial markets of varying international importance. This paper proposes a new methodology for producing back-dated financial series for the Euro Area, that is based on the time-varying distance of periphery countries from core countries with respect to monetary integration. Historical decompositions of the residuals of vector autoregressive models of the Euro Area economy are then used to explore and compare the monetary policy implications of using the new methodology versus the use of AWM fixed weight series.
2011	C18	Angrist, Joshua D., and Guido M. Kuersteiner. 2011. "Causal Effects of Monetary Shocks: Semiparametric Conditional Independence Tests with a Multinomial Propensity Score." <i>Review of Economics and Statistics</i> , 93(3): 725-47. We develop semiparametric tests for conditional independence in time series models of causal effects. Our approach is motivated by empirical studies of monetary policy effects and is semiparametric in the sense that we model the process determining the distribution of treatment--the policy propensity score--but leave the model for outcomes unspecified. A conceptual innovation is that we adapt the cross-sectional potential outcomes framework to a time series setting. We also develop root-T consistent distribution-free inference methods for full conditional independence testing, appropriate for dependent data and allowing for first-step estimation of the (multinomial) propensity score.
2011	C38	Mumtaz, Haroon, Pawel Zabczyk, and Colin Ellis. 2011. <i>What lies beneath? A time-varying FAVAR model for the UK transmission mechanism</i> . European Central Bank, Working Paper Series: 1320. This paper uses a time-varying Factor Augmented VAR to investigate the evolving transmission of monetary policy and demand shocks in the UK. Simultaneous estimation of time-varying impulse responses of a large set of macroeconomic variables and disaggregated prices suggest that the response of inflation, money supply and asset prices to monetary policy and demand shocks has changed over the sample period. In particular, during the post-1992 inflation targeting period, monetary policy shocks started having a bigger impact on prices, a smaller impact on activity and began contributing more to overall volatility. In contrast, demand shocks had the largest impact on these variables before the 1990s. We also document changes in the response of disaggregated prices, with the median reaction to contractionary policy shocks becoming more negative and the distribution more dispersed post-1992.
2011	C41	Guo, Yingwen, and Sherry Z. F. Zhou. 2011. "Duration Analysis of Interest Rate Spells: Cross-National Study of Interest Rate Policy." <i>Hitotsubashi Journal of Economics</i> , 52(1): 1-11. A duration analysis is adopted in this study to investigate the determinants of the "interest rate spells" across ten countries (or area). Both parametric and nonparametric methods are employed

Year	DE	Title and Abstract
		for the analysis. It is found that the length of "interest rate spells" is affected by both the rate of inflation and the rate of economic growth. In contrast, the influence of exchange and unemployment rates proved to be insignificant and the lagged interest rate is significant only for Denmark. The empirical results support the contention that central banks usually design their interest rate policies based on the Taylor Rule.
2011	C91	Assenza, Tiziana, Peter Heemeijer, Cars Hommes, and Domenica Massaro. 2011. <i>Individual Expectations and Aggregate Macro Behavior</i>. Netherlands Central Bank, Research Department, DNB Working Papers. The way in which individual expectations shape aggregate macroeconomic variables is crucial for the transmission and effectiveness of monetary policy. We study the individual expectations formation process and the interaction with monetary policy, within a standard New Keynesian model, by means of laboratory experiments with human subjects. We find that a more aggressive monetary policy that sets the interest rate more than point for point in response to inflation stabilizes inflation in our experimental economies. We use a simple model of individual learning, with a performance-based evolutionary selection among heterogeneous forecasting heuristics, to explain coordination of individual expectations and aggregate macro behavior observed in the laboratory experiments. Three aggregate outcomes are observed: convergence to some equilibrium level, persistent oscillatory behaviour and oscillatory convergence. A simple heterogeneous expectations switching model fits individual learning as well as aggregate outcomes and outperforms homogeneous expectations benchmarks.
2011	C91	Pfafjar, D., and B. Zakelj. 2011. <i>Inflation Expectations and Monetary Policy Design: Evidence from the Laboratory (Replaces CentER DP 2009-007)</i>. Tilburg University, Center for Economic Research, Discussion Paper: 2011-091. Using laboratory experiments within a New Keynesian macro framework, we explore the formation of inflation expectations and its interaction with monetary policy design. The central question in this paper is how to design monetary policy in the environment characterized by heterogeneous expectations. Rules that use actual rather than forecasted inflation produce lower inflation variability and alleviate expectational cycles. Degree of responsiveness to deviations of inflation from its target in the Taylor rule produces nonlinear effects on inflation variability. We also provide considerable support for the existence of heterogeneity of inflation expectations and show that a significant proportion of subjects are rational in our experiment. However, most subjects rather than using a single model they tend to switch between alternative models.
2011	D10	Anderson, Emily, Atsushi Inoue, and Barbara Rossi. 2011. <i>Heterogeneous consumers and fiscal policy shocks</i>. Department of Economics and Business, Universitat Pompeu Fabra, Economics Working Papers. This paper studies empirical facts regarding the effects of unexpected changes in aggregate macroeconomic fiscal policies on consumers that are allowed to differ depending on their individual characteristics. We use data from the Consumption Expenditure Survey (CEX) to estimate individual-level impulse responses as well as multipliers for government spending. The main empirical finding of this paper is that unexpected fiscal shocks have substantially different effects on consumers depending on their income and age levels. In particular, the wealthiest individuals tend to behave according to the predictions of standard RBC models, whereas the poorest individuals tend to behave according to standard IS-LM (non-Ricardian) models, most likely due to credit constraints. Furthermore, government spending policy shocks tend to decrease consumption inequality.
2011	D62	Chiu, Jonathan, and Miguel Molico. 2011. "Uncertainty, Inflation, and Welfare." <i>Journal of Money, Credit, and Banking</i>, 43(0): 487-512. This paper studies the welfare costs and the redistributive effects of inflation in the presence of idiosyncratic liquidity risk, in a microfounded search-theoretical monetary model. We calibrate the model to match the empirical aggregate money demand and the distribution of money holdings across households and study the effects of inflation under the implied degree of market incompleteness. We show that in the presence of imperfect insurance the estimated long-run welfare costs of inflation are on average 40% to 55% smaller compared to a complete markets, representative agent economy, and that inflation induces important redistributive effects across households.
2011	H29	Tambuwalla, Nilofer, Rohan Bennett, Abbas Rajabifard, Jude Wallace, and Ian Williamson. 2011. "On the Role of Government Land Information in Macroeconomic Policies." <i>Environment and Planning C: Government and Policy</i>, 29(6): 1087-1101. In many countries macroeconomic policy making and land administration operate independently. A review of the literature from both disciplines supports this view. The failure to include authoritative land information generated by a country's land administration system in macroeconomic policy making can result in suboptimal governmental fiscal and monetary decisions. This is demonstrated through two case studies of the Australian context, with a focus on managing land taxes and administering interest on debt financing. A simplified empirical model is derived from the study results. The model aims to articulate and promote the important role of government land information in policy and decision making. Practical implementation will require determination of the legal, institutional, and technical requirements of the model.

2011	H68	Galati, Gabriele, John Lewis, Steven Poelhekke, and Chen Zhou. 2011. <i>Have market views on the sustainability of fiscal burdens influenced monetary authorities' credibility?</i>. Netherlands Central Bank, Research Department, DNB Working Papers. During the Great Crisis, most governments in industrial countries supported their domestic financial sector under stress and responded to strong declines in output growth with fiscal stimulus packages. Starting in 2010, attention focused on the sustainability of the resulting debt burdens. We conduct an empirical study to test whether in the United States, the euro area and the United Kingdom, views on the sustainability of fiscal burdens have influenced markets' assessment of central banks' commitment to price stability. Using a daily measure of inflation expectations extracted from nominal and indexed-linked government bonds, or inflation swaps, we test whether these react to alternative measures of fiscal burdens. These include rescue package announcements, credit default swap (CDS) spreads and changes in either the outlook or the credit rating of governments. We find no evidence of a significant effect of market participants' perceptions of fiscal burdens on long-term inflation expectations in the United States, the euro area and the United Kingdom. These results are broadly consistent with the view that long term inflation expectations have remained well anchored.
2011	I10 I12	Weisbrot, Mark, Rebecca Ray, Juan Montecino, and Sara Kozameh. 2011. <i>The Argentine Success Story and its Implications</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. The Argentine economy has grown 94 percent for the years 2002-2011, using International Monetary Fund projections for the end of this year. This is the fastest growth in the Western Hemisphere for this period, and among the highest growth rates in the world. It also compares favorably to neighboring economies that are commonly seen as quite successful, such as Brazil, which has had less than half as much growth over the same period.

		editions were in 2001 and 2005) that traces a long-term growth failure in most of the world's countries. This paper is the third installment in a series (the first and second editions were in 2001 and 2005) that traces a long-term growth failure in most of the world's countries.
2011	K21	Soliani, Riccardo. 2011. "Antonio Pesenti e la sua "Critica economica". (Antonio Pesenti and His "Critica Economica". With English summary.)." <i>Il Pensiero Economico Italiano</i>, 19(1): 117-37. Antonio Pesenti was a prominent Italian economist and politician of the twentieth century, strong opponent of Fascism and Minister and deputy of the Communist Party. In the present paper we deal with "Critica economica", the journal founded in 1946 and directed by him until 1956, when it merged with "Notizie economiche" and "Riforma agraria", giving birth to "Politica ed economia". The paper considers a group of several columns (Nostro paese), useful to understand his opinion on the economic and social situation of Italy in the European and Occidental context. Then we examine a few essays, relevant to explain his theoretical position on monetary policies and international monopolistic competition. Pesenti and other authors debated in the journal the Italian financial and anti-trust policy thoroughly. Two important projects of economic planning, never implemented, were proposed in Italy at the end of the forties and in the fifties: the Piano del lavoro (1949-1950), promoted by CGIL (the Italian Trade Union near the Socialist and Communist Parties), and the "Piano Vanoni" (1954), elaborated by minister Ezio Vanoni; "Critica economica" paid great attention to them. "Critica economica" was very interested in the Socialist world, and Pesenti looked at Socialism as the final stage of the dialectical evolution of Capitalism, not so far in the time. We have chosen to focus on one specific point: the lively controversy about the book Esperienze di economia pianificata by Cesare Dami, which witnesses the different theoretical insight of Pesenti, Dami and others scholars, and gives a few clues as to the atmosphere of that cultural and political community.
2011	M31	Guimaraes, Bernardo, and Kevin D. Sheedy. 2011. "Sales and Monetary Policy." <i>American Economic Review</i>, 101(2): 844-76. A striking fact about pricing is the prevalence of "sales": large temporary price cuts followed by prices returning to exactly their former levels. This paper builds a macroeconomic model with a rationale for sales based on firms facing customers with different price sensitivities. Even if firms can adjust sales without cost, monetary policy has large real effects owing to sales being strategic substitutes: a firm's incentive to have a sale is decreasing in the number of other firms having sales. Thus the flexibility seen in individual prices due to sales does not translate into flexibility of the aggregate price level.

2011	O44	Reyes, Javier A., and W. Charles Sawyer. 2011. <i>Latin American Economic Development</i>, London and New York: Taylor and Francis, Routledge. Addresses the economic problems of Latin America throughout its history, including why the continent can be considered to have underperformed, how the various economies function, and future prospects for the region. Discusses Latin America and the world economy; economic growth and Latin America; growth and the environment in Latin America; Latin American economic history; Latin America and primary commodities; import substitution in Latin America; Latin American trade policy; exchange rate policy; financing current account deficits; macroeconomic policy in Latin America; macroeconomic stability; and poverty and inequality.
2011	P28	Algieri, Bernardina. 2011. "The Dutch Disease: Evidences from Russia." <i>Economic Change and Restructuring</i>, 44(3): 243-77. The present study examines whether the Russian economy exhibits the symptoms of the Dutch Disease over the transition period begun in the early 1990s. Five warning signs have been detected, namely, a real exchange rate appreciation (1); a flourishing economic situation pushed by higher oil prices (2); a relative de-industrialisation (3); an export reduction in the non-booming-sector (4) and a real wage growth (5). The first three symptoms are estimated simultaneously in a VECM dimension. The results suggest the existence of three long-run cointegrating vectors, thus confirming the presence of the first three symptoms. Specifically, a 10% oil price shock leads to a real appreciation by 4%, a rise in GDP by 3%, and a decline in domestic manufacturing production vis-a-vis service production by another 3%. Finally, a number of manufacturing exports have been crowded out and real wages have recorded important increases. To a certain extent, this corroborates the presence of symptom 4 and 5. The paper concludes that the risk of the Dutch Disease exists, and two preventive thrusts of action could be undertaken to reduce its threat: namely to diversify the economy and to hold back the appreciation of the exchange rate through targeted fiscal and monetary policies. These instruments would render Russia less vulnerable to exogenous shocks.

2012	C21	Areosa, Waldyr Dutra, Michael McAleer, and Marcelo C. Medeiros. 2011. "Moment-Based Estimation of Smooth Transition Regression Models with Endogenous Variables." <i>Journal of Econometrics</i>, 165(1): 100-111. Nonlinear regression models have been widely used in practice for a variety of time series and cross-section datasets. For purposes of analyzing univariate and multivariate time series data, in particular, smooth transition regression (STR) models have been shown to be very useful for representing and capturing asymmetric behavior. Most STR models have been applied to univariate processes, and have made a variety of assumptions, including stationary or cointegrated processes, uncorrelated, homoskedastic or conditionally heteroskedastic errors, and weakly exogenous regressors. Under the assumption of exogeneity, the standard method of estimation is nonlinear least squares. The primary purpose of this paper is to relax the assumption of weakly exogenous regressors and to discuss moment-based methods for estimating STR models. The paper analyzes the properties of the STR model with endogenous variables by providing a diagnostic test of linearity of the underlying process under endogeneity, developing an estimation procedure and a misspecification test for the STR model, presenting the results of Monte Carlo simulations to show the usefulness of the model and estimation method, and providing an empirical application for inflation rate targeting in Brazil. We show that STR models with endogenous variables can be specified and estimated by a straightforward application of existing results in the literature.
2012	D01	Rene, TAPSOBA. 2012. <i>Does Inflation Targeting Matter for Attracting Foreign Direct Investment into Developing Countries?</i> CERDI, Working Papers: 201203. This paper investigates the effect of Inflation Targeting (IT) on Foreign Direct Investment (FDI). Based on panel data of 53 developing countries over the period 1980-2007, this study is the first, to the best of the author's knowledge, to evaluate directly the effect of IT on FDI. Using a variety of propensity scores-matching methods which allow controlling for selfselection in policy adoption, it finds that the treatment effect of IT on FDI is positive, statistically significant and robust to a set of alternative specifications. In terms of policy recommendations, this finding therefore suggests that if well implemented, IT adoption can be a legitimate part of the policy toolkit available to policymakers in developing countries in their competition to attract more FDI.

Year	DE	Title and Abstract
2012	D22	Miwa, Yoshiro. 2012. "Are Japanese Firms Becoming More Independent from Their Banks?: Evidence from the Firm-Level Data of the "Corporate Enterprise Quarterly Statistics," 1994-2009." <i>Public Policy Review</i>, 8(4): 415-51. The Ministry of Finance's "Corporate Enterprise Quarterly Statistics" (Hojin kigyō tokeikiho) is the only statistical source of well-balanced information about the financing behavior of Japanese firms. Indeed, there are few comparable sources available anywhere in the world. Using this firm-level data set from 1994 to 2009, the author investigates the financing behavior of Japanese firms with over yen 10 million in paid-in capital. The conclusions contrast sharply with the conventional wisdom. Much of the research and policy discussions about Japanese finance begin from the premise that banks play a decisive role in firm behavior. This paper shows that firms have maintained a dependence on financial institutions well below the level that the conventional wisdom has claimed. Under the recent "zero-interest-rate, quantity easing" monetary policy, this "independence of the firms from the banks" has increased further. This tendency is clearest among the smaller firms. In turn, this first conclusion raises doubts about the plausibility of the basic premise of research and policy debate on financial issues, and leads us to question whether observers may not have confused a "crisis of financial institutions" with a "financial crisis". Investigation into firm financing behavior under the "financial crisis" from the end of 1997 to the beginning of 1999 does indeed suggest that it was a fiasco caused by the confusion of a "crisis of financial institutions" with a "financial crisis".
2012	E16	Andre, Francisco J., M. Alejandro Cardenete, and M. Carmen Lima. 2012. "Using a CGE Model to Identify the Policy Trade-Off between Unemployment and Inflation: The Efficient Phillips Curve." <i>Economic Systems Research</i>, 24(4): 349-69. This paper provides a new reading of a classical economic relation: the short-run Phillips curve. Our point is that, when dealing with inflation and unemployment, policy-making can be understood as a multicriteria decision-making problem. Hence, we use so-called multiobjective programming in connection with a computable general equilibrium (CGE) model to determine the combinations of policy instruments that provide efficient combinations of inflation and unemployment. This approach results in an alternative version of the Phillips curve labelled as efficient Phillips curve. Our aim is to present an application of CGE models to a new area of research that can be especially useful when addressing policy exercises with real data. We apply our methodological proposal within a particular regional economy, Andalusia, in the south of Spain. This tool can give some keys for policy advice and policy implementation in the fight against unemployment and inflation.
2012	E16	Sudo, Nao. 2012. "Sectoral Comovement, Monetary Policy Shocks, and Input-Output Structure." <i>Journal of Money, Credit, and Banking</i>, 44(6): 1225-44. The comovement of output across the sector producing nondurables (i.e., nondurable goods and services) and the sector producing durables is well established in the monetary business cycle literature. However, standard sticky-price models that incorporate sectoral heterogeneity in price stickiness (i.e., sticky nondurables prices and flexible durables prices) cannot generate this feature. We argue that an input-output (I-O) structure provides a solution to this problem. Here, we develop a two-sector model with an I-O structure, which is calibrated to the U.S. economy. In the model, each sector's output affects those of the others by acting as an intermediate input. This connection between the sectors provides a channel through which sectoral comovement is induced.
2012	F54	Grubb, Farley. 2012. <i>Chronic Specie Scarcity and Efficient Barter: The Problem of Maintaining an Outside Money Supply in British Colonial America</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 18099. Colonial Americans complained that gold and silver coins (specie) were chronically scarce. These coins could be acquired only through importation. Given unrestricted trade in specie, market arbitrage should have eliminated chronic scarcity. A model of efficient barter and local inside money is developed to show how chronic specie scarcity in colonial America could prevail despite unrestricted specie-market arbitrage, thus justifying colonial complaints. The creation of inside fiat paper monies by colonial governments was a welfare-enhancing response to preexisting chronic specie scarcity, not the cause of that scarcity.
2012	H12	Drudi, Francesco, Alain Durre, and Francesco Paolo Mongelli. 2012. <i>The interplay of economic reforms and monetary policy: the case of the Euro area</i>. European Central Bank, Working Paper Series: 1467. The world has been struck by a mutating systemic financial crisis that is unprecedented in terms of financial losses and fiscal costs, geographic reach, and speed and synchronisation. The crisis from August 2007 to date can be divided into three main phases: the financial turmoil from August 2007 to the collapse of Lehman Brothers; the global financial crisis from September 2008 until spring 2010; and the euro area sovereign debt crisis from spring 2010 to the current period. While each phase has brought significant challenges, the current sovereign debt crisis has been the most critical stage for the euro area. It has brought unprecedented challenges for the monetary union and triggered extraordinary adjustments in both monetary policy and institutional arrangements at the euro area level. The purpose of this article is to outline the features of each crisis phase, to describe the actions taken by the European Central Bank (ECB) during each phase and to explain the rationale for such measures. It also discusses the need to strengthen further the economic union in order to guarantee the sustainability of the monetary union of the euro area. In this respect, it is argued that the recent institutional adjustments made at the EU level would have been necessary independently of the financial crisis.
2012	K14	Homburg, Stefan. 2012. "Der neue Kurs der Europäischen Zentralbank." <i>Wirtschaftsdienst</i>, 92(10): 673-77. In September 2012, the European Central Bank (ECB) announced its new "Outright Monetary Transactions (OMT)" programme, which entails unlimited purchases of member states' government bonds. Following an idea by George Soros, Goldman Sachs and Citigroup, the ECB intends to sterilise these purchases through the liabilities side of its balance sheet, i.e., through the issuance of ECB bonds. The article analyses this plan and argues that the ECB is introducing a second unlimited European Stability Mechanism (ESM). This clearly violates European law and is likely to be punishable under German criminal law.
2012	M10	Choi, J. Jay, and Heibatollah Sami, eds. 2012. <i>Transparency and Governance in a Global World</i>. International Finance Review series, vol. 13. Bingley, U.K.: Emerald; distributed by Turpin Distribution, Biggleswade, U.K.. Thirteen papers examine transparency as an essential concept in a global, open economy. Papers discuss a conceptual overview of corporate transparency from the global perspective; institutional ownership, internal control, and disclosure transparency; corporate transparency of business group firms in the absence of internal market benefits; influence of tax accounting on transparency; board transparency, CEO monitoring and firms' financial performance; symmetry in the sensitivity of executive bonus compensation to earnings and returns in high-technology firms; empirical evidence from India of the differences in corporate transparency between a multinational corporation's subsidiaries and domestic corporations; if investors value cash flow stability versus transparency in listed infrastructure funds; earnings management behavior under the recent economic downturn in Spain; the role of analysts' recommendation revisions in helping investors understand the valuation implications of announced earnings; whether broker anonymity hides informed traders; central bank and private sector's welfare under partial transparency versus publicity--a two-player monetary policy game; and a case study comparison of Argentina and Chile examining opacity in Latin America.
2012	M40	Bezemer, Dirk J. 2012. "Modelos contables y comprensión de la crisis financiera. (Understanding Financial Crisis through Accounting Models. With English summary.)." <i>Revista de Economía Institucional</i>, 14(26): 47-76. This paper presents evidence that macroeconomic accounting models helped to anticipate the credit crisis and economic recession, whereas equilibrium models, ubiquitous in mainstream policy and research, did not. This study traces the intellectual pedigree of the accounting approach as an

Year	DE	Title and Abstract
		alternative to neo-classical economics, and the post-war rise and decline of flow-of-funds models in policy use. The paper includes contemporary case studies of both types of models, and considers why the accounting approach has remained outside mainstream economics. Finally, it provides constructive recommendations for revising financial stability evaluation methods, and advocates an "accounting of economics."
2012	N56	Romero, Carmen Astrid. 2012. "El efecto transmisión del tipo de cambio en Colombia durante los años de la industrialización. (The Effect of Exchange Rate Transmission in Colombia during the Years of Industrialization. With English summary.)." <i>Ensayos sobre Política Económica</i>, 30(67): 214-51. An intricate system of multiple exchange rates (SMER) allowed Colombia, in part, to achieve an exchange-rate based protection policy during its period of state-managed industrialization. This is confirmed by a transmission effect from the exchange rate to the prices of some imported goods as well as those for coffee, the main exporting good during the period of study. The first part of this paper studies the transmission from the exchange rate to the prices of a variety of imported products and raw materials used in manufacturing intermediate industrial goods along with some selected capital goods, using annual data from 1948 to 1974. In the second part, the transmission from the exchange rate to coffee export prices is verified using monthly data from January, 1932 to December, 1974. In the long run, the transmission effect from the exchange rate to the domestic coffee prices was 0.95. The transmission of international coffee price movements into the domestic price was complete. The coffee-related economic activity, actively influenced the decision about maintaining multiple exchange rates which provided a reliable exchange tool to effectively deal with fluctuations in the international price of coffee.
2012	O34	Liu, Lanbiao, and Jingjia Zhang. 2012. "The Investment Portfolio of China's Foreign Reserves--An Endogenous Perspective of Foreign Reserves Flow Cycle. (In Chinese. With English summary.)." <i>Jingji Yanjiu/Economic Research Journal</i>, 47(4): 137-48. This article has established a Stackelberg and a Cournot game model, involving the central banks and financial markets of China and the US, as well as the real economic sector of China, in order to depict a cycle of the foreign investment of China's foreign exchange reserves through the perspective of the essential differences of China and the US. In addition, we have simulated the optimal investment portfolio of China's foreign reserves and its contribution to China's domestic economy. The results have shown that the risky assets investment of China's foreign exchange reserves on the US assets will affect the proportion of China's reserves which transform indirectly into the FDI to China from the US. However, the reaction of our central bank has been relatively slow. Therefore, in order to enable our central bank to gain profits, we suggest that it is necessary to bring down the CRR coefficient of our residents, and improve our financial market development as well.
2012	P13	Mainelli, Michael. 2012. "Short Monetary Systems: Take a Risk, Create Money." <i>Journal of Risk Finance</i>, 13(4): 280-84. Purpose--The purpose of this editorial is to examine fiat currencies and common tenders (trade-based money) from a risk perspective. The editorial encourages risk managers to consider the distributive benefits of a multiplicity of currencies and urges them to examine common tenders both old, such as the Swiss WIR, and novel, such as capacity exchange monies, as risk management tools. Design/methodology/approach--The editorial is based on research conducted for the City of London Corporation in 2011 into capacity, trade and credit which examined new architectures for commerce and money. Findings--The editorial links <i>Freiwirtschaft</i> movement ideas with some characteristics of common tenders. Further, it considers whether some simple regulatory approaches might make such common tenders more useful.
	P13	Gutierrez Fernandez, Milagros, and Ricardo Palomo Zurdo. 2012. "Los sistemas institucionales de protección como respuesta de la banca cooperativa española ante la crisis: Hacia la búsqueda de la eficiencia en su integración. (Institutional Protection Systems as an Answer to the Economic Crisis by Spanish Cooperative Banks: Seeking Efficiency in Concentration. With English summary.)." <i>CIRIEC-España, Revista de Economía Pública, Social y Cooperativa</i>, 0(76): 27-50. One of the main consequences of the economic and financial crisis that began in the summer of 2007 has been an acceleration of the restructuring processes in the Spanish banking system, which includes credit cooperatives. In view of this, the aim of this research is to analyse the decade before the concentration processes in this sector began, in order to study whether the rationale for the groups that have been set up was based on criteria of homogeneous performance (degree of efficiency) of the constituent entities. To this end, it examines the groups that existed beforehand. In other words, this article tries to study whether the groups that have been formed or projected have followed the recommendations of the Spanish Central Bank or, on the contrary, whether the choice between the different alternatives or processes has been made for different reasons.
2012	P36	Xu, Jianwei, Yang Ji, and Binkai Chen. 2012. "An Estimate of the Degree of Nominal Wage Rigidity in China. (In Chinese. With English summary.)." <i>Jingji Yanjiu/Economic Research Journal</i>, 47(4): 64-76. This paper is the first one to study the degree of nominal wage rigidity in China using micro-data. Results find that the degree of wage rigidity is very low in China compared to that in the United States and some European countries. This suggests that if the adjustments in the Chinese labor market are flexible enough when facing economy fluctuations, then positive monetary policies will push up the price level instead of the aggregate output. The analysis is applied to many groups (e.g., by income and occupation) to assess how wage rigidities vary across groups. What's more, this paper provides a creative estimation of downward rigidity and upward rigidity. The results show an increasing downward rigidity since 2002, while the trend of upward rigidity is not pronounced.
2012	Q02	Tamakoshi, Go, and Shigeyuki Hamori. 2012. "Informational Roles of Commodity Prices for Monetary Policy: Evidence from the Euro Area." <i>Economics Bulletin</i>, 32(2): 1282-90. This paper examines the linear and nonlinear causal relationships between commodity price indices and macroeconomic variables such as the consumer price index (CPI) and the industrial production index (IP) in the Euro zone. We use monthly time series data from January 1999 to December 2011 and employ a solid nonparametric, nonlinear causality test by Diks and Panchenko (2006) as well as the linear Granger causality test using Lag Augmented Vector Autoregression (LA-VAR) approach. Main findings of the study include: (i) Oil price only linearly Granger-causes the CPI and hence can be seen as a better information variable for the general price level than non-energy commodity price. (ii) There is a significant one-way linear causality from commodity price to IP. (iii) A significant nonlinear relationship between CPI and IP is identified by the nonparametric causality test. Such results are relevant for monetary policy makers who wish to mitigate the possible future inflation by using commodity or oil price indices as information variables.
2012	Q02	De Gregorio, Jose. 2012. "Commodity Prices, Monetary Policy, and Inflation." <i>IMF Economic Review</i>, 60(4): 600-633. During the second half of the 2000s, the world experienced a rapid and substantial rise in commodity prices. This shock posed complex challenges for monetary policy, in particular because of the significant increase in food and energy prices, and the repercussions they had on aggregate inflation measures. This paper discusses the role of commodity price shocks (CPS) in monetary policy in the light of recent episodes of such shocks. It begins by discussing whether monetary policy should target core or headline inflation, and what should be the role of CPS in setting interest rates. It is argued that there are good reasons to focus on headline inflation, as most central banks actually do. Although core inflation provides a good indicator of underlying inflation pressures, the evolution of commodity prices should not be overlooked, because of pervasive second-round effects. This paper reviews the evidence on the rise of inflation across countries and reports that food inflation, more than energy inflation, has relevant propagation effects on core inflation. This finding is particularly important in emerging market economies, where the share of food in the consumer basket is significant. The evidence also shows that countries that had lower inflation during the run up of commodity prices before

Year	DE	Title and Abstract
		the global crisis had more inflation in the subsequent rise after the global crisis, suggesting that part of the precrisis inflationary success may have been because of repressed inflation. This paper also discusses other factors that may explain different inflationary performances across countries.
2012	R20	Luciani, Matteo. 2012. <i>Monetary Policy and the Housing Market: A Structural Factor Analysis</i>. ULB--Universite Libre de Bruxelles, Working Papers ECARES: ECARES 2012-035 . This paper studies the role of the Federal Reserve's policy in the recent boom and bust of the housing market, and in the ensuing recession. By estimating a Structural Dynamic Factor model on a panel of 109 US quarterly variables from 1982 to 2010, we find that, although the Federal Reserve's policy between 2002 and 2004 was slightly expansionary, its contribution to the recent housing cycle was negligible. We also show that a more restrictive policy would have smoothed the cycle but not prevented the recession. We thus find no role for the Federal Reserve in causing the recession.
2013		
2013	A23	Vegh, Carlos A. 2013. <i>Open Economy Macroeconomics in Developing Countries</i>, Cambridge and London: MIT Press . Presents a small open economy model and shows how it can be extended to answer many macroeconomic questions that arise in emerging markets and developing economies, particularly those regarding monetary, fiscal, and exchange rate issues. Discusses the basic intertemporal model; capital market imperfections; intertemporal prices; nontradable goods and relative prices; the basic monetary model; the monetary approach to the balance of payments; temporary policy; sticky prices; interest rate policy; optimal fiscal and monetary policy in the open economy; optimal exchange rate regimes; real anchors; stopping high inflation; capital inflows; dollarization; balance-of-payments crises; and financial crises.
2013	B21	Laidler, David. 2013. <i>Three Revolutions in Macroeconomics: Their Nature and Influence</i>. University of Western Ontario, Economic Policy Research Institute, University of Western Ontario, Economic Policy Research Institute Working Papers: 20134 . Harry Johnson's 1971 ideas about the factors affecting the success of the Keynesian Revolution and the Monetarist Counter-revolution are summarised and extended to the analysis of the Rational Expectations-New Classical (RE-NC) Revolution. It is then argued that, whereas Monetarism brought about a revival of the quantity theory of money from the limbo into which Keynesianism had pushed it, RE-NC modelling was responsible for that theory's most recent disappearance. This happened despite the fact that, initially, RE-NC economics appeared to be a mainly technical extension and refinement of Monetarism, rather than a radically new economic doctrine. Some implications of this story for today's macroeconomics are briefly discussed.
2013	D04	Krueger, Anne O. 2013. "Lessons from the Great Recession for Developing Countries." <i>Asian-Pacific Economic Literature</i>, 27(2): 14-24 . Many lessons can be taken from the Great Recession and the Euro crisis with respect to both pre-crisis and post-crisis policies. Appropriate measures can reduce the risk of crisis in individual countries, the severity of crises, and the magnitude of needed adjustments. These include an appropriate exchange rate policy (flexibility is highly desirable), ensuring the soundness of the financial system, not allowing expansion of credit at too high a rate, adopting structural fiscal budgeting policies, and avoiding dangerous sovereign debt build-up. On the crisis resolution side, the lesson that stands out is the desirability of decisive and credible action to address the causes of the crisis. The issues that arise when the banking and financial system is weakened in the run-up to crisis are extremely difficult, especially when sovereign debt is unsustainable. Therefore, while the important lesson is to avoid overly expansive credit build-up during good times, in the event of a crisis, it is important that the health of the banks be restored as quickly as possible and that a viable supervision and resolution framework be put in place.
2013	D13	Diss: Sun, Ling. 2013. <i>Essays on Money, Business Cycles and Household Formation</i>. PhD diss. University of Toronto . This dissertation consists of three independent essays in Macroeconomics. The first essay studies whether efficiency can be improved by introducing government-issued illiquid bonds to an economy where money is the only asset and essential. In contrast with perfectly liquid bonds, illiquid bonds can increase societal welfare in two ways: First, allocating consumption goods among heterogeneous agents more efficiently; second, stimulating consumption and output level by loosening the liquidity constraints of households. More importantly, since societal welfare is elevated persistently when the inflation rates range from a level slightly above Friedman Rule to an upper bound, this essay provides an insight into the essentiality of illiquid bonds. The second essay provides a novel propagation mechanism of productivity shocks to explain an empirical fact: The response curve of output to a positive productivity shock reaches its peak up to eight quarters after the shock. Using a micro-founded monetary search model and focusing on agents' decisions on establishing long-term trading relationships in the goods market, I show that when a positive shock takes place in the economy, marginal agents break down previous trading relationships and explore better matching opportunities. As a result, shortly after the shock, the average productivity level of transactions increases, but the total number of transactions decreases. The calibrated model shows that the latter effect dominates, resulting a slightly decrease of aggregate output after a positive productivity shock. The search friction, together with the monetary channel, gives rise to a delayed output response at the aggregate level. The third essay develops a general equilibrium theory of household formation--i.e., marriage--following Coase's theory of firm formation. Individuals in the model consume both market- and home-produced commodities, and home production is facilitated through marriage. Market frictions, including taxation, search and bargaining problems, increase marriage rates when home and market goods are substitutes. In particular, inflation, as a tax on market activity, makes household production and hence marriage more attractive, as long as singles use cash more than married individuals, which is supported by data. The prediction that inflation and other taxes affect household formation is also supported by evidence.
2013	F38	Diss: Ahn, Young Bin. 2013. <i>The Role of Anti-speculative Taxation in Asian Emerging Market Economies</i>. PhD diss. University at Buffalo . I analyze the effects of anti-speculative taxation on the short-term carry trade in Asian emerging market countries by building a simple welfare-based insurance model with a Tobin tax. This model provides the optimal level of international reserves with a Tobin tax in Asian emerging market economies and shows that a Tobin tax on the short-term carry trade improves the welfare of the economies. In addition, the model explains that a Tobin tax is the key solution for the puzzle of the excessive accumulation of international reserves in Asian emerging market economies. A Tobin tax is operating as a self-insurance tool from the severe damage of sudden stops of capital inflows during financial crises. I then empirically examine the effects of anti-speculative taxation on the short-term carry trade in Asian emerging market countries by calibrating the optimal level of international reserves with a Tobin tax. This simulation verifies the predictions of the theoretical framework. In addition, the result of plausible calibrations on the optimal level of foreign reserves with a Tobin tax in Asian emerging market economies is consistent with empirical instance of a Tobin tax observed in real world. Finally, I investigate the massive effects of US monetary policies on the Asian emerging market economies after the global financial crisis by employing the open economy model. I then empirically test the model by using the daily time-series data of 8 individual Asian emerging market countries over the 2007-2013 period and find that the global crisis switched the Granger-causality relationship between exchange rate change and the change in stock market index.
2013	F39	Aron, Janine, Kenneth Creamer, John Muellbauer, and Neil Rankin. 2013. <i>Exchange Rate Pass-Through to Consumer Prices in South Africa: Evidence from Micro-Data</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 9735 . A sizeable literature

Year	DE	Title and Abstract
		examines exchange rate pass-through to disaggregated import prices but very few micro-studies focus on consumer prices. This paper explores exchange rate pass-through to consumer prices in South Africa during 2002-2007, using a unique data set of highly disaggregated data at the product and outlet level. The paper adopts an empirical approach that allows pass-through to be calculated over various horizons, including controls for domestic and foreign costs. It studies how pass-through differs across types of consumption goods and services and draws some aggregate implications about pass-through, using actual weights from the CPI basket. The heterogeneity of pass-through for different food sub-components and the role of switches between import and export parity pricing of maize is investigated and found significant for five out of ten food sub-components. Overall pass-through to the almost 63 percent of the CPI covered is estimated at about 30 percent after two years, but is higher for food.
2013	G02	Proano, Christian R. 2013. "Monetary Policy Rules and Macroeconomic Stabilization in Small Open Economies under Behavioral FX Trading: Insights from Numerical Simulations." <i>Manchester School</i> , 81(6): 992-1011. In this paper the interaction between foreign exchange (FX) markets driven by trading based on behavioral forecasting rules and the macroeconomy of a small open economy is investigated. A special focus of the paper is set on the consequences of chartism or technical analysis for the stability at the macroeconomic level. Furthermore, the performance of alternative monetary policy rules concerning the overall stabilization of the economy is investigated through numerical analysis.
2013	H57	Diss: Cisternas Leyton, Gonzalo. 2013. Essays on Continuous-Time Games with Learning. PhD diss. Princeton University. This dissertation studies the impact of learning about unobserved payoff-relevant variables on economic decisions. In chapter 1 I study a labor market in which employers learn about a worker's unobserved skills by observing output. Skills evolve as a mean-reverting process with a trend that is potentially endogenous due to human capital accumulation. Output is additively separable in the worker's skills and in his hidden effort decision, and is also distorted by Brownian noise. Under general conditions, I show that there is an equilibrium in which effort is a deterministic function of time. This equilibrium is almost always inefficient. In chapter 2 I study a class of continuous-time games in which one long-run agent and a population of small players learn about a hidden state from a public signal that is subject to Brownian shocks. The long-run agent can influence the small players' beliefs by affecting the signal or by affecting the hidden state itself, in both cases in an additively separable way. The impact of the small players' beliefs on the long-run agent's payoff is nonlinear. At a general level, I derive necessary conditions for Markov Perfect Equilibria in the form of an ordinary differential equations. For a subclass of games with linear-quadratic structure, I obtain closed-form solutions for global incentives through solving a new type of partial differential equation. Applications to procurement and monetary policy in the context of partial information are developed. In chapter 3, joint with Yuliy Sannikov, a firm's earnings are driven by its stock of capital and by an underlying fundamental process. Earnings are not observable at the moment of investing in capital, thus making fundamentals unobserved. The manager learns about fundamentals by observing a signal which is distorted by Brownian noise. Investment is costly and subject to adjustment costs. We show that the sensitivity of investment to expected earnings increases as uncertainty decays over time if and only if earnings are a concave function of fundamentals. We also show that the firm's value is always below its corresponding value in the full-information benchmark.
2013	K34	Flores-Macias, Gustavo A., and Sarah E. Kreps. 2013. "Political Parties at War: A Study of American War Finance, 1789-2010." <i>American Political Science Review</i> , 107(4): 833-48. What determines when states adopt war taxes to finance the cost of conflict? We address this question with a study of war taxes in the United States between 1789 and 2010. Using logit estimation of the determinants of war taxes, an analysis of roll-call votes on war tax legislation, and a historical case study of the Civil War, we provide evidence that partisan fiscal differences account for whether the United States finances its conflicts through war taxes or opts for alternatives such as borrowing or expanding the money supply. Because the fiscal policies implemented to raise the revenues for war have considerable and often enduring redistributive impacts, war finance--in particular, war taxation--becomes a high-stakes political opportunity to advance the fiscal interests of core constituencies. Insofar as the alternatives to taxation shroud the actual costs of war, the findings have important implications for democratic accountability and the conduct of conflict.

2013	N30	Ormerod, P., B. Rosewell, and P. Phelps. 2013. "Inflation/Unemployment Regimes and the Instability of the Phillips Curve." <i>Applied Economics</i> , 45(10-12): 1519-31. Using the statistical technique of fuzzy clustering, regimes of inflation and unemployment are explored for the United States, the United Kingdom and Germany between 1871 and 2009. We identify for each country three distinct regimes in inflation/unemployment space. Similarities exist across countries in both the regimes and the timings of the transitions between regimes. However, the typical rates of inflation and unemployment experienced in the regimes are substantially different. Further, even within a given regime, the results from the cluster analysis reveal persistent fluctuations in the degree of attachment to that regime of inflation/unemployment observations over time. The economic implications of this are that, first, the inflation/unemployment relationship or Phillips curve experiences from time to time major shifts. Second, that it is also inherently unstable even in the short run. It is likely that the factors which govern the inflation/unemployment trade-off are so multi-dimensional that it is hard to identify periods of short-run Phillips curves which can be assigned to particular historical periods with any degree of accuracy or predictability. The analysis shows that reliance on a trade-off between inflation and unemployment for policy purposes is misplaced even in the short run.
2013	N83	Marin-Acena, Pablo, Elena Martinez-Ruiz, and Pilar Nogues-Marco. 2013. "The Bank of Spain: A National Financial Institution." <i>Journal of European Economic History</i> , 42(1): 11-45. This paper explains the process by which the Bank of Spain became a national bank, first by obtaining the monopoly of note issue in 1874 and then by extending its sphere of financial action by creating the country's only network of bank branches before 1900. The implementation of a "unified or national banknote" in 1884 and the creation of a system of free transfers for its clients were also decisive steps towards the Bank's transformation from a local Madrid-based institution into a Spanish national institution. The paper also argues that the transformation of the Bank of Spain into a genuine national financial institution contributed to the modernization of the Spanish administrative structure.
2013	P48	Tahir, Sayyid. 2013. "Fiscal and Monetary Policies in Islamic Economics: Contours of an Institutional Framework." <i>Islamic Economic Studies</i> , 21(2): 1-22. This paper summarizes salient features of the existing thinking on fiscal and monetary policies in the Islamic economics literature. It outlines institutional framework for these policies from the Islamic economics perspective. The nature and role of government, in the light of the Shariah principles, are revisited. The general goals for macroeconomic policies are discussed along with separate goals for each of the two policies. The argument is capped with a look at practical considerations in the actual working of both the policies. The following are the main points in the paper. (1) Roles of both the policies shall be complementary in the context of the overall objectives at the state level. (2) Thrust of both policies would be

Year	DE	Title and Abstract
		different from that presently recognized. These conclusions are drawn in the context of the government's role being limited to prudent governance and the society's economic and distributional concerns being addressed as much as possible without adopting the budgetary channel.
2013	Q16 Q42	Conley, Dennis M. 2013. "Analysis for Strategic Planning Applied to Ethanol and Distillers' Grain." <i>International Food and Agribusiness Management Review</i> , 16(3): 37-53. While traditional economic analysis is a look back on past events and relationships, the motivation for strategic planning is to look forward. An example, based on the ethanol and distillers' grain industry, illustrates the kind of analysis that can be used for strategic planning by agribusiness firms and non-governmental organizations. It is expected that the current U.S. monetary policy of expanding the money supply, a Renewable Fuel Standard mandating 15 billion gallons of ethanol, and a growing export market for distillers' grains could potentially result in the future production of ethanol and distillers' grain that would be well above a normal trend. The corresponding derived demand for corn, relative to the normal increases in supply, would significantly affect the price levels for corn.
2013	Q37	Rabee Hamedani, Hasti, and Mehdi Pedram. 2013. "Oil Price Shock and Optimal Monetary Policy in a Model of Small Open Oil Exporting Economy--Case of Iran." <i>Journal of Money and Economy</i> , 8(3): 21-61. Oil price shocks are the main source of macroeconomic fluctuations in oil exporting countries. It is believed that appropriate monetary policy can help to stabilize these unwanted variations toward optimal allocations. A stochastic dynamic general equilibrium model featuring the properties of both cost push and wealth effect transmission channels is developed for the Iranian economy. In this context, it is possible to evaluate the role of monetary policy measures to accommodate supply side cost push effects and demand side wealth effect of oil price shock. This paper is intended to investigate the optimal monetary policy strategy for the economy of Iran and calibrated for its structural characteristics and patterns of external shocks. The comparative analysis of alternative monetary policies in terms of Ramsey, and optimal simple rules is performed based on key nominal and real variables variance reductions and the linear quadratic loss (LQ) function. Our findings show that domestic inflation targeting rule is the optimal monetary policy both in terms of stabilization performance and welfare costs. It must be mentioned that the addition of exchange rate to domestic inflation targeting rule has failed to improve the welfare measure and stabilization in comparison to domestic inflation targeting rule.

2013	R53	Blagun, I. S., and M. Y. Zaets. 2013. "Modelling the Influence of Monetary Instruments upon Region's Economy. (In Ukrainian. With English summary.)" <i>Actual Problems of Economics</i> , 140(2): 96-105. The article is based on the developed models of the monetary policy's influence upon a region's economy and confirms statistically the significant relationship between investment in fixed assets of a region, the required reserves, and the value added. Based on this, the dependence on interest rates is downward, and the one on aggregate demand is growing. It is also determined that changes within the monetary base are insensitive to changes in the refinancing rate, and the authors fail to find any time lag to obtain the meaningful relationship.
