2009	D53	Miyazaki, Kenji, Kiyohiko G. Nishimura, and Makoto Saito. 2009. "Incomplete Financial Markets, Irreversibility of Investments and Fiscal and Monetary Policy Instruments." <i>Japanese Economic Review</i>, 60(3): 271-300. In this paper, we analyse the use of fiscal and monetary instruments to improve long-run welfare when productive investment is irreversible and uncollateralizable and there is no insurance. Only fiat money or government issued bonds provide self-insurance. We demonstrate that an increase in precautionary savings reduces irreversible productive investment. Hence, subsidies to promote productive but irreversible investment should be financed in such a way that they do not reduce insurance capability. When lump-sum subsidies are high, a consumption tax is likely to be more redistributive and thus more consumption smoothing than are the other sets of instruments analysed in our model.
2009	G01	Bloom, David E., and Jocelyn E. Finlay. 2009. "Demographic Change and Economic Growth in Asia." <i>Asian Economic Policy Review</i>, 4(1): 45-64. Trade openness, high savings rates, human capital accumulation, and macroeconomic policy only accounted for part of the 1965-1990 growth performance in East Asia. Subsequently, demographic change was shown to be a missing factor in explaining the East Asian growth premium. Since 1990, East Asia has undertaken major economic reforms in response to financial crises and other factors. We reexamine the role of the demographic transition in contributing to cross-country differences in economic growth through to 2005, with a particular focus on East Asia. We highlight the need for policy to offset potential negative effects of aging populations in the future.

Year	DE	Title and Abstract
		households savings are not falling together with disposable income and GDP, behaving as a factor of stability of the social and economic scenario.
2009	G01	Kriesler, Peter. 2009. "Symposium: The Global Financial Crisis: The Current Financial Crisis: Causes and Policy." <i>Economic and Labour Relations Review</i> , 19(2): 17-25. The driver of the current crisis is the collapse in domestic aggregate demand, originating from international factors. It is important, therefore, to consider potential areas where aggregate demand can be expected to increase in order to understand the possibility of recovery. The current crisis was preceded by an unprecedented increase in the level of household debt, which will hinder the recovery of consumer expenditure. Consumption is also being affected by uncertainty with respect to both income and employment. Similarly, the outlooks for investment and net exports suggest that they are unlikely to contribute to the initial phase of recovery. This leaves the important area of government expenditure. It is argued that government expenditure, particularly in infrastructure and capital, is particularly important as in the short run it contributes directly to demand, while, in the longer run it boosts growth and productivity. Finally, approaches to financing the implications of increased government expenditure are examined.
2009	G01	Palma, Jose Gabriel. 2009. "The Revenge of the Market on the Rentiers: Why Neo-liberal Reports of the End of History Turned Out to Be Premature." <i>Cambridge Journal of Economics</i> , 33(4): 829-69. Starting from the perspective of heterodox Keynesian-Minskyian-Kindlebergian financial economics, this paper begins by highlighting a number of mechanisms that contributed to the current financial crisis. These include excess liquidity, income polarisation, conflicts between financial and productive capital, lack of appropriate regulation, asymmetric information, principal-agent dilemmas and bounded rationalities. However, the paper then proceeds to argue that perhaps more than ever the 'macroeconomics' that led to this crisis only makes analytical sense if examined within the framework of the political settlements and distributional outcomes in which it had operated. Taking the perspective of critical social theories the paper concludes that, ultimately, the current financial crisis is the outcome of something much more systemic, namely an attempt to use neo-liberalism (or, in US terms, neo-conservatism) as a new technology of power to help transform capitalism into a rentiers' delight. In particular, into a system without 'compulsions' on big business; i.e., one that imposes only minimal pressures on big agents to engage in competitive struggles in the real economy (while doing the opposite to workers and small firms). A key component in the effectiveness of this new technology of power was its ability to transform the state into a major facilitator of the ever-increasing rent-seeking practices of oligopolistic capital. The architects of this experiment include some capitalist groups (in particular rentiers from the financial sector as well as capitalists from the 'mature' and most polluting industries of the preceding techno-economic paradigm), some political groups, as well as intellectual networks with their allies--including many economists and the 'new' left. Although rentiers did succeed in their attempt to get rid of practically all fetters on their greed, in the end, the crisis materialised when markets took their inevitable revenge on the rentiers by calling their (blatant) bluff.
2009	G01	Dvorsky, Sandra, Thomas Scheiber, and Helmut Stix. 2009. "The 2008 Fall Wave of the OeNB Euro Survey--A First Glimpse of Households' Reactions to the Global Financial Crisis." <i>Focus on European Economic Integration</i> , 0(0): 67-77. This article presents selected results of the third wave of the OeNB Euro Survey, which was conducted in Central, Eastern, and Southeastern Europe (CESEE) in October/November 2008, i.e., at a time when the global financial crisis had arrived in Europe. Therefore, this article focuses on first evidence of households' reactions to the crisis by comparing the most recent results with those of the preceding survey wave of May/June 2008. Although people's general assessment of the economic situation and their trust in banks have both deteriorated substantially, according to our results, this has not (yet) changed people's behavioral patterns in terms of their foreign currency holdings. In particular, the dissemination of euro cash holdings and euro-denominated savings deposits remained stable relative to earlier waves of the OeNB Euro Survey.
2009	G01	Bergsten, C. Fred. 2009. "The Dollar and the Deficits: How Washington Can Prevent the Next Crisis." <i>Foreign Affairs</i> , 88(6): 20-38. The global economic crisis has revealed the folly of large U.S. budget and trade deficits, as well as of the strong dollar that makes them possible. If it is serious about recovery, the United States must balance the budget, stimulate private saving, and embrace a declining dollar.
2009	G01	Pressacco, Flavio, and Gilberto Seravalli. 2009. "The Real Origins of the Global Crisis." <i>Transition Studies Review</i> , 16(3): 791-801. In this paper, we present an interpretation of the economic and financial crisis that considers crucial the issue of income distribution (Krugman 2007; Piketty and Saez 2003; Reynolds 2008), a question that is instead ignored by more widespread interpretations. In fact, we ask what lies behind the disaster of the subprime loans and, if a more thorough view is taken, it seems clear that the true causes of the crisis lead back to income distribution, in other words the enormous increase in the gap between rich and poor. This consideration is fundamental. If the crisis were merely financial then (perhaps) the policies of financial adjustment that are currently in place might be sufficient. If instead the crisis is due to more serious causes, and nothing is more serious than distribution inequalities, then the cure must be much more profound (and difficult). In other words, the crisis will be long and severe until such inequalities are reduced, a difficult task when weighed against public intervention in aid of financial institutions.
2009	G01	Pal, Sudeshna. 2009. "Reassessing International Capital Mobility: The Feldstein-Horioka Puzzle Disappears?" <i>Indian Journal of Economics and Business</i> , 8(2): 261-67. Financial globalization, apart from creating new opportunities for investors, also exposes the economy to financial crises. The present study proposes a model that captures the dynamics of financial integration in developed countries over a period of thirty four years. The results show that the mid-nineties, marking the era of globalization, were also characterized by unprecedented increases in global capital mobility as reflected in saving-investment correlation coefficients. In doing so, the study is able to establish the possibility that the well-known Feldstein-Horioka puzzle does not exist any longer.
2009	G01	Hegerty, Scott W. 2009. "Capital Flows to Transition Economies: What Is the Role of External Shocks?" <i>Economics Bulletin</i> , 29(2): 1345-58. During the recent international financial crisis, capital flows into Central and Eastern European transition economies have faced a serious threat of a "sudden stop." But the specific dangers depend on these flows' macroeconomic determinants, which can be ambiguous because the underlying savings and investment decisions can vary depending upon the persistence of income shocks. This study applies VAR methodologies to examine the relative influences of foreign and domestic income growth on the capital accounts of six countries that have recently joined the European Union. Impulse response functions show that Bulgaria, the Czech Republic, and Lithuania are influenced more strongly by foreign shocks, while Latvia, Estonia, and Romania show more of a response to domestic shocks. As a result, these three countries--and Latvia in particular--show a vulnerability to a "sudden stop" if they experience localized recessions.

2009	G01	Katz, Richard. 2009. "Comparing Crises: Is the Current Economic Collapse Like Japan's in the 1990s? Katz Replies." <i>Foreign Affairs</i>, 88(3): 164-66.
2009	G01	Mayer-Foulkes, David A. 2009. "Long-Term Fundamentals of the 2008 Economic Crisis." <i>Global Economy Journal</i>, 9(4). The current economic crisis has long-term causes that are rooted in the economic dynamics of globalization. I argue that globalization (a) increases the world economic growth rate; (b) is consistent with development, underdevelopment, and miracle growth; (c) increases inequality in leading countries; and (d) generates a transition path along which the interest rate diminishes if capital accumulates at a faster rate than technological change. This condition is generated by cheap-factor-seeking foreign direct investment (FDI), which by combining advanced technologies with low costs yields extraordinary profits and experiences lower incentives for innovation. Over the period 1980-2007, liberalization unleashed a wave of globalization, and the international sector experienced miracle growth. Profits rose to all time highs and global saving exceeded global investment. This savings glut or investment shortfall fueled a global housing appreciation, after which excessive risk in a deregulated financial market led to a financial meltdown. While restoring financial markets and reducing the housing market fallout have been immediate priorities for the U.S., economic growth can only be recovered by restoring global investment. Lowering interest rates cannot generate very much investment, nor will consumption flows from fiscal spending. To stimulate the global economy, whole new economic sectors and technologies must be developed in advanced countries, and economic development deepened in underdeveloped countries. At the same time, a global harmonization of corporate taxes, ending the corporate tax haven loophole, would raise funds for publicly provided goods that complement private investment and balance incentives between local and international production. It would also reduce the polarization between developed and underdeveloped countries, balance global markets with global governance, and strengthen global cooperation.
2009	G01	Bosworth, Barry, and Aaron Flaaen. 2009. "Financial Crisis American Style." <i>Asian Economic Papers</i>, 8(3): 146-70. This paper reviews some of the research on the causes of the financial crisis of 2008-09, highlights the key events that triggered a financial panic in September 2008, and summarizes the key policy actions that the United States has taken to ameliorate the crisis. We document the characteristics and growth of the sub-prime mortgage market, and the distorted incentives and flawed regulatory structure surrounding the secondary market for mortgage-backed securities. We also assess the role for macroeconomic determinants of the crisis that serve to explain the bubble in U.S. asset prices, most notably low global interest rates attributed to either loose monetary policy or excess global saving. Although low global interest rates may have contributed to the boom in housing markets and speculative excesses, we believe that the financial innovations and microeconomic distortions played a more fundamental role. Finally, a recovery marked by higher private saving, weak domestic investment, and a large public deficit appears to be unsustainable. Ultimately, the U.S. economy will need to shift about 3 percent of GDP from domestic consumption to the export sector. This will pose some serious challenges to Asian economies that have come to rely on exports to the U.S. market.

2009	G01	Adam, Christopher, and David Vines. 2009. "Remaking Macroeconomic Policy after the Global Financial Crisis: A Balance-Sheet Approach." <i>Oxford Review of Economic Policy</i>, 25(4): 507-52. This paper describes the origins of the global financial crisis and how the prevailing New Keynesian macroeconomic orthodoxy failed to anticipate its severity. This failure, we argue, stemmed from an incomplete understanding of the pivotal role of financial institutions in the amplification of the crisis and its transmission to the wider economy. Low global interest rates and a consequent 'search for yield' in the pre-crisis period encouraged financial institutions to build highly leveraged balance sheets which, in turn, generated extremely large asset-price movements when a 'small event'--the downturn in the US sub-prime mortgage market--triggered the worldwide crisis. The paper then briefly describes the element of the broadly successful and coordinated macroeconomic policy response to the crisis before turning to the medium-term challenges facing policy-makers in sustaining global recovery. At the national level, we focus on the resolution of fiscal imbalances which contributed, in part, to the crisis, and which then worsened because of the policy actions which have been taken to deal with it. At the international level, we emphasize the need to rectify the imbalances between savings and investment in many significant countries. This will require greater coordination of macroeconomic policy across the world's major economies. It will also involve strengthening the role, and the governance, of the International Monetary Fund.
2009	G01	Boz, Emine. 2009. "Can Miracles Lead to Crises? The Role of Optimism in Emerging Markets Crises." <i>Journal of Money, Credit, and Banking</i>, 41(6): 1189-1215. Emerging market financial crises are abrupt and dramatic usually occurring after a precrisis bonanza. This paper develops an equilibrium asset pricing model with informational frictions in which crisis itself is a consequence of the investor optimism in the period preceding the crisis. If preceded by a sequence of positive signals, a small, negative noise shock can trigger a downward adjustment in investors' beliefs, asset prices, and consumption. The magnitude of this downward adjustment increases with the level of optimism attained prior to the negative signal. Moreover, with informational frictions, asset prices display persistent effects in response to transitory shocks.
2009	G01	Gonzalez-Paramo, Jose Manuel. 2009. "National Accounts for Monetary Policy Making: The Use of the Euro Area Accounts." <i>Economic and Financial Review</i>, 16(4): 171-84. This paper discusses the links between households' wealth and consumption. The estimates published separately by the ECB since 2006 show around 2/3 of Euro-area households' wealth is held in housing, whereas net financial wealth comprises around 1/3. The paper shows that, while the main focus so far has been on the use of Euro-area accounts for monetary and economic analysis, they are also key to financial stability analysis, in particular when aiming to identify the risks and vulnerabilities in the various sectors of the economy and in the markets and infrastructures that link these sectors together. It recommends that these accounts may in the future also provide information on the distribution of income and wealth items across euro area household groups.
2009	G01	Wray, L. Randall. 2009. "An Alternative View of Finance, Saving, Deficits, and Liquidity." <i>International Journal of Political Economy</i>, 38(4): 25-43. This article contrasts the orthodox approach with an alternative view on finance, saving, deficits, and liquidity, with the goal of shedding light on the current global financial crisis. It first briefly summarizes the orthodox view according to which global savings financed the U.S. speculative boom. Excessive growth of U.S. indebtedness was unsustainable, and matters were made worse by Fed monetary ease. The alternative view is based on Keynes's approach to finance and liquidity preference, integrated with the "modern money" view of currency sovereignty. It is argued that investment, budget deficits, and current account deficits create saving; on this view it is more revealing to think of U.S. current accounts as financing global dollar savings. Finally, an alternative interpretation of the causes of, and solutions to, the global financial crisis are offered.

2009	H26	Larsen, Erling Roed. 2009. "Using Inverted Engel Curves to Estimate Material Standards of Living in a Household." <i>Empirical Economics</i> , 36(1): 109-32. This article demonstrates how to estimate latent total consumption expenditure or material standard of living in households by inverting estimated Engel curves. While the conventional estimator, total purchase expenditure, is unbiased for latent total household consumption expenditure, it is not variance minimizing since it is an un-weighted sum. In two stages, this article derives a variance-minimizing, unbiased estimator by first estimating and inverting Engel curves; then combining the estimators from the inverted Engel curves. The employed latent variable method allows for utilization of non-expenditure relations. The suggested method may help improve the accuracy in studies of consumption inequality and tax evasion.
2009	I19	Cohen, Michael A., and Marina-Selini Katsaiti. 2009. <i>Evaluating Health Care Externality: Costs Generated by Risky Consumption Goods</i> . University of Connecticut, Department of Economics, Working papers: 2009-43. We present an overlapping-generations (OLG) macroeconomic model that applies a behavioral interpretation of preferences for goods that generate health risks. In this paper proneness to poor health is viewed as a cognitive miscalculation by economic agents between their expected health state over various consumption bundles and the actual health care they require for their health outcome. To model this the paper borrows insight from prospect theory and applies the reference-dependent preference framework to the specification of out utility model. In our model of the economy individual preferences are decomposed into intrinsic consumption utility and gain-loss utility associated with the miscalculation. Agents in the economy are stratified in their health states as well as their expected health care consumption according to some probability measure over the population. Heterogeneity introduced in this way generates consumers of varied proneness to risk associated with consumption of unhealthy goods because individuals have various marginal valuations of their miscalculation. In such a population, when all agents pay the same insurance premium, health-conscious agents shoulder the health care costs of their less health-conscious counterparts and the less health-conscious are engaged in less healthy consumption than they would if they paid actuarially fair premia. We demonstrate these effects in simulations by comparing the risk pooling equilibria to the actuarially fair pricing equilibria. This paper introduces the mathematical programming equilibrium constraint (MPEC) computational approach to compute model equilibria; we believe this approach is new to heterogeneous agent OLG model simulation.
2009	I23	Yang, Rudai, and Binkai Chen. 2009. "Higher Education Reform, Precautionary Saving and Consumer Behavior. (In Chinese. With English summary.)" <i>Jingji Yanjiu/Economic Research Journal</i> , 44(8): 113-24. Substantial empirical researches show that households in China have high incentive of precautionary saving; however, few micro-data-based studies on the reasons accounting for this incentive have been made. Based on the CHIP dataset, cross-section analysis demonstrates that higher education reform in 1999 has a significant squeeze-out effect on household consumption, and marginal propensity to consume of households with members attaining higher education had decreased by 12 percent from 1995 to 2002. Under the Life Cycle Model frame, a theoretical model is constructed with education being introduced in. Simulation analysis indicates that anticipation of increasing uncertainty as a result of higher education reform is the main reason that accounts for the higher incentive of precautionary saving and thus the sluggish consumption demand in China.
2009	K10	Oh, Yonghyup. 2009. "International Capital Market Imperfections: Evidence from Geographical Features of International Consumption Risk Sharing." <i>Applied Economics</i> , 41(7-9): 1043-53. This article attempts to rationalize the validity of gravity variables to explain the degree of international consumption risk sharing. We find that for a panel of 54 countries during 1950-2000, variables such as distance, affluence, a common language and the type of legal system are relevant in explaining not only cross-country consumption and output correlations, but consumption risk sharing. Common law countries share consumption risks more than civil law countries. English speaking countries turn out to share consumption risks more than other language groups, and show significantly higher consumption risk sharing even within the group of common law countries.

2010	C01	Deaton, Angus S. 2010. <i>Understanding the mechanisms of economic development</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 15891 . I argue that progress in understanding economic development (as in other branches of economics) must come from the investigation of mechanisms; the associated empirical analysis can usefully employ a wide range of experimental and non-experimental methods. I discuss three different areas of research: the life-cycle saving hypothesis and its implication that economic growth drives higher rates of national saving, the theory of speculative commodity storage and its implications for the time-series behavior of commodity prices, and the relationship between economic growth and nutritional improvement. None of these projects has yet been entirely successful in offering a coherent account of the evidence, but all illustrate a process of trial and error, in which although mechanisms are often rejected, unlikely theoretical propositions are sometimes surprisingly verified, while in all cases there is a process of learning about and subsequently modifying our understanding of the underlying mechanisms
2010	C58	Elder, John, and Apostolos Serletis. 2010. "Oil Price Uncertainty." <i>Journal of Money, Credit, and Banking</i> , 42(6): 1137-59. The theories of investment under uncertainty and real options predict that uncertainty about, for example, oil prices will tend to depress current investment. We reinvestigate the relationship between the price of oil and investment, focusing on the role of uncertainty about oil prices. We find that volatility in oil prices has had a negative and statistically significant effect on several measures of investment, durables consumption, and aggregate output. We also find that accounting for the effects of oil price volatility tends

Year	DE	Title and Abstract
		to exacerbate the negative dynamic response of economic activity to a negative oil price shock, while dampening the response to a positive oil price shock.
2010	C58	Maniatis, Paraschos. 2010. "Existence of Arch Effect in Consumer Goods Deflator the Greek Case 1960-1994." <i>International Research Journal of Finance and Economics</i>, 0(37): 85-95. Heteroscedasticity is a typical phenomenon in economic and financial time series. The variance of the series changes with time. This effect makes the series ipso facto non-stationary and deprives the investigator of the mathematical and statistical apparatus tailored for stationary time series. Given this situation, the investigator is obliged to consider non-linear stochastic models--the most popular of which are the (G)ARCH ones. In this study, we give the theoretical background of the ARCH model and an econometric application of the model to the Greek consumer goods deflator. The study gives evidence that ARCH effects are present in the investigated time series.
2010	C58	Li, Bin, and Benjamin Liu. 2010. "Return Predictability and State Variables in Consumption-Based CAPMs: International Perspectives." <i>International Research Journal of Finance and Economics</i>, 0(51): 132-61. Asset pricing literature contends that aggregate stock returns can be predicted by business cycle state variables. In this study, we compare the predictive power of three state variables in the context of consumption-based capital asset pricing model (CCAPMs): consumption growth, the consumption-wealth ratio, and the surplus consumption ratio in eight major equity markets in the world: Australia, Canada, France, Germany, Italy, Japan, the U.K., and the U.S. We find that both the consumption-wealth ratio and the surplus consumption ratio can predict future stock returns. In addition, the consumption-wealth ratio has much more predictive power for returns in the international markets than the surplus consumption ratio and consumption growth rate.
2010	C58	Li, Bin. 2010. "Consumption and Stock Returns in Australia: A Revisit." <i>International Research Journal of Finance and Economics</i>, 0(50): 26-44. This paper studies the empirical performance of a linearised version of the classic CCAPM in the Australian market. The studies of Faff and Oliver (1998) and Faff (1998) are extended by employing more recent data and utilising 25 size/BM portfolios as well as industry portfolios. By comparison, the CAPM and the Fama-French three-factor model are also considered. There is evidence that the market factor, the size and value factors can explain the time-series but not the cross-sectional variation in portfolio returns. By contrast, though the CCAPM is inferior to the CAPM and the Fama-French three-factor model in the time-series regressions, the restricted estimation results show that there exists a statistically positive estimate of the market price of consumption risk, which implies that an asset's expected return rises with its consumption risk. Using the lagged portfolio returns, the CCAPM is generally not rejected for both the industry portfolios and the 25 size/BM portfolios. This supports a linear equality between reward and risk implied by the CCAPM.
2010	F37	Prati, Alessandro, and Massimo Sbracia. 2010. "Uncertainty and Currency Crises: Evidence from Survey Data." <i>Journal of Monetary Economics</i>, 57(6): 668-81. How does uncertainty about fundamentals affect speculation in the foreign exchange markets? This paper studies empirically the role of uncertainty in currency crises. Uncertainty, which is measured using the dispersion of survey forecasts of key macroeconomic variables, is found to have a non-monotonic effect on exchange rate pressures: it heightens speculative pressures when expected fundamentals are good and eases them when they are bad. This prediction is consistent with a broad class of currency crisis theories, ranging from first-generation to global-game models. The proposed empirical strategy remains valid in the presence of forecasters with strategic objectives and addresses potential endogeneity bias by building a novel set of instrumental variables.
2010	F44	Gosse, Jean-Baptiste. 2010. "L'Europe face aux disequilibres mondiaux: Une analyse historique, theorique et empirique. (With English summary)." <i>Revue de la Regulation</i>, 0(8). In the 2000s, the United States received a record transfer of saving. In this thesis, we study the consequences of global imbalances for Europe. Firstly, we highlight a British cycle of global imbalances (1815-1944) during which Europeans benefited from saving transfers and an American cycle (since 1944) which Europeans did not really take part in. We built up a theoretical model to show that the British cycle is based on a "current account--foreign investments--investment income" loop which allowed countries in Europe to consume more than they produced while their foreign assets and investment incomes continued to rise. During the American cycle our model points out that the accumulation of global imbalances is due to the growth strategies of Asia, the OPEC and the United States which implies for Europe: (i) a slowdown in the growth; (ii) an appreciation of the euro; (iii) a weak impact on the current account balance. We use structural VAR model to confirm these three results for the euro area. Finally, we show with our theoretical model that if Europe had adopted a domestic demand-led strategy, the negative impact of global imbalances could have been avoided. The estimation of a long run relation between current account balance and budget deficit reveals that fiscal policy could have been an efficient way to deal with negative effects, especially for the small countries of the euro area.
2010	F65	Brender, Anton, and Florence Pisani. 2010. "La crise de la finance globalisee. (The Crisis of Globalized Finance. With English summary)." <i>Economie et Statistique</i>, 0(438-440): 85-104. This study explains the growth in international transfers of savings from the emerging countries to the developed ones since the late 1990s and analyses their consequences. For these transfers to occur, the associated financial risks had to be carried. Financial globalization permitted this to happen in an original way by allowing risk-taking and financing to be separated. Western market participants took on the risks not carried by the savings-exporting emerging countries. The latter took only the exchange-rate risk, investing most of their accumulated reserves in low-risk assets, hence leaving the Western financial system with the bulk of the credit- and maturity-transformation risks. Most of this risk accumulation took place in the system's least regulated and least monitored part. The nature and the magnitude of the financial crisis that began in summer 2007 are thus directly tied to the conditions in which the savings transfers of the 2000s took place.
2010	G29	Gorbachev, Olga, and Keshav Dogra. 2010. <i>Evolution of Consumption Volatility for the Liquidity Constrained Households over 1983 to 2004</i>. University of Delaware, Department of Economics, Working Papers: 10-12. We study whether the increased income uncertainty in the US over the last quarter-century had a negative impact on household welfare by looking at variability of household consumption growth. We are particularly interested in understanding the effect of greater uncertainty on the liquidity constrained households. We study the evolution of liquidity constraints in the US in the Panel Study of Income Dynamics, extending Jappelli et al. [1998] methodology using information from the Survey of Consumer Finances. We find that although household indebtedness increased substantially, reflecting greater availability of credit, there was no decline in the proportion of liquidity constrained households between 1983 and 2007. Applying methodology developed in Gorbachev [2009], we find that the evolution of consumption volatility for the liquidity constrained households increased by economically and statistically more than for the unconstrained households. This increase was lower than that of family income volatility for these groups. Nevertheless, the welfare cost to society is substantial: we estimate that an average household would be willing to sacrifice 4.7 percent of nondurable consumption per year to lower consumption risk to its 1984 levels.
2010	H00	Inkmann, Joachim, Paula Lopes, and Alexander Michaelides. 2010. <i>How Deep is the Annuity Market Participation Puzzle?</i> C.E.P.R. Discussion Papers, CEPR Discussion Papers: 7940. Using U.K. microeconomic data, we analyze the empirical determinants of voluntary annuity market demand. We find that annuity market participation increases with financial wealth, life

Year	DE	Title and Abstract
		expectancy and education and decreases with other pension income and a possible bequest motive for surviving spouses. We then show that these empirically motivated determinants of annuity market participation have the same, quantitatively important, effects in a life-cycle model of annuity and life insurance demand, saving and portfolio choice. Moreover, reasonable preference parameters predict annuity demand levels comparable to the data. For stockholders, a strong bequest motive can simultaneously generate balanced portfolios and low annuity demand.
2010	H10	Poterba, James M., Steven F. Venti, and David A. Wise. 2010. <i>The Asset Cost of Poor Health</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 16389. This paper examines the correlation between poor health and asset accumulation for households in the first nine waves of the Health and Retirement Survey. Rather than enumerating the specific costs of poor health, such as out of pocket medical expenses or lost earnings, we estimate how the evolution of household assets is related to poor health. We construct a simple measure of health status based on the first principal component of HRS survey responses on self-reported health status, diagnoses, ADLs, IADL, and other indicators of underlying health. Our estimates suggest large and substantively important correlations between poor health and asset accumulation. We compare persons in each 1992 asset quintile who were in the top third of the 1992 distribution of latent health with those in the same 1992 asset quintile who were in the bottom third of the latent health distribution. By 2008, those in the top third of the health distribution had accumulated, on average, more than 50 percent more assets than those in the bottom third of the health distribution. This "asset cost of poor health" appears to be larger for persons with substantial 1992 asset balances than for those with lower balances.
2010	J00	Dupuis, David, and Yi Zheng. 2010. <i>A Model of Housing Stock for Canada</i>. Bank of Canada, Working Papers. Using an error-correction model (ECM) framework, the authors attempt to quantify the degree of disequilibrium in Canadian housing stock over the period 1961-2008 for the national aggregate and over 1981-2008 for the provinces. They find that, based on quarterly data, the level of housing stock in the long run is associated with population, real per capita disposable income, and real house prices. Population growth (net migration, particularly for the western provinces) is also an important determinant of the short-run dynamics of housing stock, after controlling for serial correlation in the dependent variable. Real mortgage rates, consumer confidence, and a number of other variables identified in the literature are found to play a small role in the short run. The authors' model suggests that the Canadian housing stock was 2 per cent above its equilibrium level at the end of 2008. There was likely overbuilding, to varying degrees, in Saskatchewan, New Brunswick, British Columbia, Ontario, and Quebec.
2010	K20 K31	Kerdrain, Clovis, Isabell Koske, and Isabelle Wanner. 2010. <i>The Impact of Structural Policies on Saving, Investment and Current Accounts</i>. OECD, Economics Department, OECD Economics Department Working Papers: 815. This paper explores the impact of structural policies on saving, investment, and current accounts in OECD and non-OECD economies. Since the current account effects of structural reforms are often complex and ambiguous from a theoretical perspective, new OECD empirical analysis is carried out. Reduced-form equations are estimated for a panel of 30 OECD countries as well as for a panel/cross-section of 117 OECD and non-OECD countries that relate saving, investment and current accounts to policy indicators and a set of macroeconomic control variables. This work suggests that structural reforms may influence saving, investment and current accounts through their impact on macroeconomic conditions such as productivity growth or public revenues and expenditures, but also more directly: i) higher social spending (in particular on health care) is found to lower the saving rate and thereby to weaken the current account, most likely reflecting lower precautionary saving; ii) product market liberalisation temporarily boosts investment and thus also weakens the current account; iii) financial market deregulation may lower the saving rate, though only in less developed countries; iv) stricter employment protection may be associated with lower saving rates if unemployment benefits are low, as well as with higher investment rates possibly due to greater substitution of capital for labour. A scenario analysis indicates that fiscal consolidation and structural reforms in the main world economies could significantly reduce current global imbalances, possibly by about a third.
2010	N24	Belvederesi-Kochs, Rebecca. 2010. "Weltspartagsmarketing im "Wirtschaftswunder": Vom moralischen Sparappell zur Kundenorientierung. (World Thrift Day Marketing during the "Economic Miracle": From Moralising Appeals for Saving to Customer Orientation. With English summary.)." <i>Vierteljahrschrift für Sozial- und Wirtschaftsgeschichte</i>, 97(3): 283-309. The following paper analyses the marketing strategies of "Sparkassen" (savings banks) and their umbrella association, the German Savings and Giro Association, regarding World Thrift Day in post-war Germany. After the West German currency reform in 1948, the World Thrift Day was a very convenient occasion to restore the savers' confidence successfully. The latter is proved by a quantitative analysis. In addition, the paper identifies two different phases of World Thrift Day marketing. The first one is characterised by moralising advertising strategies, focussing on thrift education. This approach reflected the organisational basic assumptions. Till 1957, the conceptual design was based on generalised advertising messages: they turned to the public in order to communicate the social commitment of "Sparkassen". However, in the late 1950s marketing conceptions changed and customer orientation pervaded the World Thrift Day advertisement. In this context, two "emerging" target groups are discussed: women and wage earners' households.
2010	N92 Y10	Park, Haelim M., and Gary Richardson. 2010. <i>Retail Trade by Federal Reserve District, 1919 to 1939: A Statistical History</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 16617. Soon after beginning operations, the Federal Reserve established a nationwide network for collecting information about the economy. In 1919, the Fed began tabulating data by about retail sales, which it viewed as a fundamental measure of consumption. From 1920 until 1929, the Federal Reserve published data about retail sales each month by Federal Reserve district, but ceased to do so after 1929. It continued to compile monthly data on retail sales by reserve district, but this data remained in house. We collected these in-house reports from the archives of the Board of Governors and constructed a consistent series on retail trade at the district level. The new series enhances our understanding of economic trends during the Roaring '20s and Great Depression.
2010	O25	Buera, Francisco J., and Yongseok Shin. 2010. <i>Financial Frictions and the Persistence of History: A Quantitative Exploration</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 16400. We quantify the role of financial frictions and the initial misallocation of resources in explaining development dynamics. Following a reform that triggers efficient reallocation of resources, our model economy with financial frictions converges slowly to the new steady state--it takes twice as long to cover half the distance to the steady state as the neoclassical growth model. Investment rates and total factor productivity start out low and rise over time. These model dynamics are endogenously determined by the extent of initial resource misallocation and the degree of financial frictions. We present data from post-war miracle economies on the evolution of macro aggregates, factor reallocation, and establishment size distribution, which support the aggregate and micro-level implications of our theory.
2010	O54	Bugarin, Mirta N. S., Roberto Ellery Jr., Victor Gomes, and Arilton Teixeira. 2010. "From a Miracle to a Disaster: The Brazilian Economy in the Past 3 Decades." <i>Brazilian Review of Econometrics</i>, 30(1): 3-22. After showing a persistent and high growth rate since the World War II, in the beginning of the eighties the Brazilian growth rate of per capita GNP fell abruptly. In this paper, we ask if this fall can be explained by the behavior of technological progress (measured by total factor productivity or TFP). We study the period between 1970 and 1998. We divide this period in two sub-periods. In the first, the seventies, per capita GNP grew

Year	DE	Title and Abstract
		at 5.05% a year. In contrast with per capita GNP, TFP grew only until 1974, declining in the rest of the decade. After 1974, the growth rate of per capita GNP was sustained by an increasing investment as a share of GNP due to the increase in public (government plus state-owned firms) and private investments sustained by government subsidies that went from 1% to 4% of GNP in the second half of the seventies. In the second sub-period, the eighties and nineties, both TFP and per capita GNP decreased until 1993, increasing thereafter. We also find in the second half of the eighties that investment share was increasing while TFP was decreasing. In this second case it went up mainly as a result of the higher cost of capital relative to consumption. Our main conclusion is that the behavior of the technological progress can fairly describe the dynamics of the Brazilian economy during the period under study.

2011	C26	Gomes, Fabio Augusto Reis, and Lourenco S. Paz. 2011. "Narrow Replication of Yogo (2004) Estimating the Elasticity of Intertemporal Substitution When Instruments Are Weak." <i>Journal of Applied Econometrics</i>, 26(7): 1215-16. This narrow replication exercise of Yogo (Review of Economics and Statistics 2004; 86(3): 797-810) finds results identical to the original paper, and provides results on overidentification tests for specifications that do not suffer from the weak instruments problem. The null hypothesis of the Sargan test is rejected in several cases, in particular for US and UK quarterly data. When other combinations of instruments are used the null of the Sargan test is rejected again in several cases. These rejections cast doubts on either instrument validity or model specification.
2011	C36	Hansen, James. 2011. <i>Does Equity Mispricing Influence Household and Firm Decisions?</i>. Reserve Bank of Australia, RBA Research Discussion Papers. Qualitative literature on equity price bubbles has often emphasised the effects of mispriced equity on economic decisions. This paper investigates this issue quantitatively using two ideas. The first is that equity mispricing is transitory, and has no long-run effects on economic outcomes. The second is that there exist observables that are correlated with mispricing, but uncorrelated with changes in fundamentals. Estimates of mispricing appear to accord well with periods described as bubble episodes for the US. The effects of these shocks on household decisions are found to be statistically significant.
2011	C91 C93	Noussair, C. N., S. T. Trautmann, and G. van de Kuilen. 2011. <i>Higher Order Risk Attitudes, Demographics, and Financial Decisions</i>. Tilburg University, Center for Economic Research, Discussion Paper: 2011-055. We conduct an experiment to study the prevalence of the higher order risk attitudes of prudence and temperance, in a large demographically representative sample, as well as in a sample of undergraduate students. Participants make pairwise choices between lotteries of the form proposed by Eeckhoudt and Schlesinger (2006). The choices in these lotteries isolate prudent from imprudent, and temperate from intemperate, behavior. We relate individuals' risk aversion, prudence, and temperance levels to demographics and financial decisions. We observe that the majority of individuals' decisions are consistent with risk aversion, prudence, and temperance, in both the student and the demographically representative sample. An individual's level of prudence is predictive of his wealth, saving, and borrowing behavior outside of the experiment, while temperance predicts the riskiness of portfolio choices. Our findings suggest that the coefficient of relative prudence for a representative individual is approximately equal to two.
2011	E02	Muellbauer, John, and David M. Williams. 2011. <i>Credit Conditions and the Real Economy: The Elephant in the Room</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 8386. Changes in credit market architecture are an important but unobservable structural influence on economic activity. For Australian data, we model non-price credit supply conditions within equilibrium correction models of consumption, house prices, mortgage credit and housing equity withdrawal. Our "latent interactive variable equation system" (LIVES) employs a single latent variable to capture evolutionary shifts (in credit conditions) that affect not only the intercept of each equation, but also interact with key economic variables. We show that credit conditions impact on consumption by: (i) lowering the mortgage downpayment constraint facing young households; (ii) introducing a housing collateral channel from house prices to real activity; and (iii) facilitating intertemporal consumption smoothing.
2011	E02 L50 L93 L98 N75 O43	Herd, Richard, Paul Conway, Sam Hill, Vincent Koen, and Thomas Chalaux. 2011. <i>Can India Achieve Double-digit growth?</i> OECD Publishing, OECD Economics Department Working Papers: 883. In recent years, India has enjoyed one of the highest growth rates worldwide, weathering the global financial crisis better than many other countries. Prudent macroeconomic policies will be critical to prolonging the current expansion, given the risks associated with high inflation and volatile capital flows. A steadfast commitment to fiscal consolidation is needed to continue to reduce the large deficit that emerged in the aftermath of the slowdown and avoid crowding out private investment. Stepping up structural reforms will also be necessary if double-digit growth rates are to be achievable over the coming decade or so. Indeed, the operating environment for private business remains challenging. While infrastructure is improving in key sectors, partly thanks to greater private investment, bottlenecks endure and efforts to intensify competition and ensure continued strong investment are required. Labour market reforms are also required to promote job creation. Rapid economic development has boosted living standards and reduced poverty but poverty remains high. There is a need to strengthen social welfare systems and access to health and education to ensure widespread benefits from continued high growth. This Working Paper relates to the 2011 OECD Economic Survey of India (www.oecd.org/eco/surveys/india)

"The Interactive Effect of Remittances and Civil Liberties on Investment and Consumption." <i>International Journal of Development Issues</i>, 10(1): 20-33. The purpose of this paper is to investigate the level of influence that civil liberties has on the marginal effect of remittances on gross domestic investment and consumption separately and measures it across all levels of civil liberties. The authors employ a two-stage system generalized method of moments procedure and the civil liberties subset of the Freedom in the World Index as a proxy for civil liberty. The findings indicate a substitution effect from investment to consumption as civil liberties deteriorate for developing south economies, though not for emerging economies. In addition, the marginal effect of remittances on investment diminishes less quickly as economies become less free than it increases for consumption indicating that the substitution is not quite one-for-one.

A scenario analysis indicates that fiscal consolidation and structural reforms in the main world economies could significantly reduce current global imbalances, possibly by about one-third.
2011	E49	Livshits, Igor, James MacGee, and Michele Tertilt. 2011. <i>Costly Contracts and Consumer Credit</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 17448. Financial innovations are a common explanation of the rise in consumer credit and bankruptcies. To evaluate this story, we develop a simple model that incorporates two key frictions: asymmetric information about borrowers' risk of default and a fixed cost to create each contract offered by lenders. Innovations which reduce the fixed cost or ameliorate asymmetric information have large extensive margin effects via the entry of new lending contracts targeted at riskier borrowers. This results in more defaults and borrowing, as well as increased dispersion of interest rates. Using the Survey of Consumer Finance and interest rate data collected by the Board of Governors, we find evidence supporting these predictions, as the dispersion of credit card interest rates nearly tripled, and the share of credit card debt of lower income households nearly doubled.
2011	F20	Baxter, Marianne. 2011. <i>International Risk Sharing in the Short Run and in the Long Run</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 16789. International risk-sharing has far-reaching implications both for economic policy and for basic research in economics. When countries do not share risk, individuals in those countries experience fluctuations in their consumption levels that are undesirable and possibly unnecessary. This paper extends and refines the study of international risk-sharing in two dimensions. First, this paper investigates risk-sharing at short vs. long horizons. Countries might, for example, pool risks associated with high-frequency shocks (e.g., seasonal fluctuations in crop yields) but might not share risks associated with low frequency shocks (e.g., different long-run national growth rates). Second, this paper studies bilateral risk-sharing, which is different from the approach taken in most previous studies. We find that there is evidence of substantial international risk-sharing at medium and low frequencies. There is evidence of high and increasing risk-sharing within Europe that is not apparent for other regions of the world.

2011	H27	Pffelfmann, Marie. 2011. "Le mariage efficace de l'épargne et du jeu: Une approche historique du capital. (The Efficient Combination of Savings and Gambling: An Historical Approach of Capital. With English summary.)." <i>Revue d'Economie Politique</i>, 121(6): 893-914. By using an historical approach, this paper supports the idea that the popularity of lottery-linked financial assets does not come from an abnormally high expected return, but from their original framework that combines gambling and savings. We show that these kinds of assets are very famous and are able to raise a huge amount of money even when their expected returns are relatively low. Then it could stand for a relatively cheap source of funds. This study creates an empirical link between the skewness and the attractiveness of financial assets. It contributes to the recent theoretical behavioural finance studies. Moreover, we learn about these historical experiences while underlining how these lottery-linked-financial-assets could be used to develop public savings.
2011	J45	Mathivannan, S., and M. Selvakumar. 2011. "Savings and Investment Pattern of School Teachers--A Study with Reference to Sivakasi Taluk, Tamil Nadu." <i>Indian Journal of Finance</i>, 5(4): 12-26. Money is an inextricable part of our life. People toil to earn money to purchase a house, to marry off their children, to live and to eat. So, saving is necessary to survive. To Save means to put aside a portion of income, deferring its consumption until a future date. Saving means the total accumulated amount of income that is not spent on consumption. In economics, personal saving has been defined as personal disposable income minus personal consumption expenditure. Saving may take the form of increase in bank deposits, purchase of securities, or increased cash holdings. The extent to which individuals save is affected by their preference for future over present consumption, their expectations of future income and to some extent, by the rate of interest. Saving plays a vital role in building up the household economy as well as the national economy. Savings provide the financial security to savers. Hence, attractive saving devices are very much necessary to increase and channel the savings in developing countries. India is taking much effort in inculcating the saving habit among the people. In order to mobilize savings, the Government of India is issuing saving certificates, government bonds and securities carrying high rates of interest.
2011	L50	THE SAME AS E02 Herd, Richard, Paul Conway, Sam Hill, Vincent Koen, and Thomas Chalaux. 2011. <i>Can India Achieve Double-digit growth ?</i>. OECD Publishing, OECD Economics Department Working Papers: 883.
2011	L74 R52	Andre, Christophe. 2011. <i>Improving the Functioning of the Housing Market in the United Kingdom</i>. OECD Publishing, OECD Economics Department Working Papers: 867. A well-functioning housing market is essential for economic prosperity and well-being. A combination of favourable economic and financial conditions and tight housing supply led to sharp increases in real house prices between the mid-1990s and end 2007, which spurred household consumption. While this boosted output growth, economic imbalances and financial weaknesses mounted, leaving the economy vulnerable to the global financial crisis. Current land use planning policy is excessively restrictive, making supply unresponsive to demand and contributing to creating housing shortages and reducing affordability. While additional supply in the private rental market provides an alternative to homeownership for a significant number of households, social housing waiting list numbers have increased rapidly over the past decade. A reform to replace top-down building targets with incentives for local communities to allow development is underway, but the outcomes are somewhat uncertain. Housing taxation is regressive and encourages excessive demand for housing. More effective taxation could help contain demand and stabilise the housing market. Relying more on long-term and diversified funding for mortgages would also improve the stability of the housing market.
2011	L87	Kumar, Nitin. 2011. "A Non-parametric Approach to Financial Inclusion Analysis through Postal Network in India." <i>International Journal of Research in Commerce, Economics and Management</i>, 1(5). The postal department has emerged as a key institution

Year	DE	Title and Abstract
		with immense potential towards the ongoing financial inclusion drive in an emerging economy, such as, India. With its vast network of offices and array of financial services it enjoys familiarity of rural residents. In this context, it becomes useful to gauge the spatial and temporal distribution of financial inclusion efforts of the postal department and contemplate steps for further improvements of improving access and usage of finance, especially for the backward and disadvantaged fraction of the society. The results reveal that although there has been improvement, significant progress has not been observed in postal savings penetration and its usage as reflected by accounts per capita and savings per capita trend, respectively, in the study spanning over a period from 1990 to 2008 across eighteen major states of India. Across the states, low preference for postal services seems to be the norm by the more advanced states. The phenomenon could be due to superior avenues, better socio-economic factors and other demographic aspects available to inhabitants of more prosperous regions. The data envelopment analysis reveals a more or less continuous enhancement of the inclusion intensity (measured as the level of financial inclusion of a region compared to the optimal frontier), notably 1999 onwards. The inclusion growth has also registered positive and beneficial changes. Among the constituents of inclusion growth, both intensity change and technology change effects are turning out to be positive for most of the years. The results indicate that both usage of postal services and inherent macro economic conditions of the regions are contributing towards improved inclusion.

2011	N01 P46	Anker, Richard. 2011. <i>Engel's Law Around the World 150 Years Later</i>. Political Economy Research Institute, University of Massachusetts at Amherst, Working Papers. One of the most enduring relationships in economics is that proposed by Ernst Engel in 1857: "The poorer is a family, the greater is the proportion of the total outgo [family expenditures] which must be used for food. The proportion of the outgo used for food, other things being equal is the best measure of the material standard of living of a population." The 150th anniversary of Engel's law passed in 2007. With this in mind, the present paper looks at the extent to which Engel's law is relevant in today's world by looking across countries at the relationship between the share of household expenditure spent on food and national income per capita. This working paper provides an empirical analysis of Engel's law based on data for almost every country and territory in the world. This facilitates analysis of the relationship between the food share of household expenditure and national income per capita, especially how this differs by development level.
2011	N35	James, John A., and Isao Suto. 2011. "Early Twentieth-Century Japanese Worker Saving: Precautionary Behaviour before a Social Safety Net." <i>Cliometrica</i>, 5(1): 1-25. This paper pools data from independent household surveys of Japanese workers roughly spanning the Taisho period (1912-1926), a time before private-business or government-provided social safety nets. First, we construct estimates of permanent and transitory income and then estimate saving functions consistent with intertemporal optimization. The saving behaviour of Japanese worker households is in turn compared with that of American worker households before World War I, a time when they too lacked access to general social services. The estimated marginal propensities to save out of permanent and transitory incomes were quite similar for Japanese and American worker households, but the Japanese ones saved more at a given level of income. The economic environment facing Japanese workers, however, seemed to be no riskier than that facing American workers. We attribute instead this result primarily to the widespread postal savings banks in Japan which increased the convenience and decreased the risk of saving.
2011	N55	Cheng, Lingguo, and Ye Zhang. 2011. "Does Famine Experience in Childhood Influence One's Saving Decision? A New Explanation of China's High Household Saving Rate. (In Chinese. With English summary)." <i>Jingji Yanjiu/Economic Research Journal</i>, 46(8): 119-32 This paper attempts to provide a new explanation on the puzzle of extraordinarily high household saving rates in China in recent years. We proposed a new hypothesis that the extreme poverty and shortage of necessities that one experienced at childhood help to foster his saving-consumption habit of austerity. Using the CHIPs data, we testified this hypothesis adopting the Great Famine that happened in 1959-1961 as a natural experiment. Our results show that the famine happened long ago that influences indeed the household's consuming-saving decision, the more serious the famine that the head suffered was, the higher the household saving rate is. Considering the generation who suffered the great famine or "famine generation" is the main forces that produce and hold wealth, so their high propensity to save help to explain the overall high household saving rates.

2011	O44	Berg, Annukka, and Janne I. Hukkinen. 2011. "The Paradox of Growth Critique: Narrative Analysis of the Finnish Sustainable Consumption and Production Debate." <i>Ecological Economics</i>, 72(1): 151-60. Academic discussion on economic growth and the environment has made a comeback under the auspices of the degrowth debate. To date, however, literature on the topic has been mainly theoretical and empirical studies of actual policy discussions have received less attention. This article contributes to the debate with a narrative policy analysis of interviews with members of Finland's Committee on sustainable consumption and production. Narrative policy analysis is suitable for complex policy cases. By tracing and comparing the different stories, non-stories, and counterstories in the debate, the analysis clarifies the issue and paves the way for solutions. We found that it is common even among business and ministry representatives to criticize the current growth-bound economic system. From the perspective of narrative policy analysis, however, this critique only increases uncertainty and complexity in the policy field which, paradoxically, leads to a strengthening of the dominant growth stories. We suggest that constructing a complete degrowth story is essential for supporting democratic deliberation on sustainability. Robust institutional support for degrowth work together with research and experimentation are important milestones on the way.
2011	P37	Yueh, Linda. 2011. "The Chinese Box: The Opaque Economic Borders of the Chinese State." <i>Oxford Review of Economic Policy</i>, 27(4): 658-79. Although the state in China is no longer all encompassing as it had been during the pre-1979 centrally planned period, it still reaches into numerous areas of the economy, notably through its continuing ownership of state-owned enterprises. As a result, China poses a paradox in that it has incomplete property rights and rule of law which are thought to be essential for growth. There are, though, numerous inefficiencies associated with such a gradual transition which may have maintained a stable

Year	DE	Title and Abstract
		growth rate in the past, but could hamper future economic development. As a key example, state-owned firms continue to benefit from financial repression in which they received preferable allocations of credit. Thus, China's high savings rate fuels investment which has driven growth, but is increasingly inefficient as credit is funnelled to the less productive SOEs. This inefficiency points to the need for legal and institutional reforms which may conflict with the still broad but opaque borders of the Chinese state.

2011	R52	Cheung, Calista. 2011. <i>Policies to Rebalance Housing Markets in New Zealand</i>. OECD Publishing, OECD Economics Department Working Papers: 878. A considerable housing boom has been a key feature of persistently large saving-investment imbalances in New Zealand over the past decade. Wealth is concentrated to a greater extent in property compared to most other OECD countries, leaving households and the banking system heavily exposed to a correction in land and housing markets. Supply rigidities and tax incentives that bias savings decisions towards property investment have amplified the increase in house prices, widening wealth inequalities in the form of larger homes for those who can afford them, but deteriorating affordability for the rest of the population. Substantial distortions via tax planning have been evident in rental property markets. Although the 2010-11 budget introduced measures to reduce some of these distortions, further reforms are needed to remove the significant tax bias favouring housing. The economic downturn has increased financial pressures on the social housing sector, with a shortage of public dwellings in areas of high demand. Regional supply constraints reflect inefficient land-use policies and long delays arising from an overly complex urban planning system. The adoption of spatial planning frameworks is a positive step forward, but they should include pricing mechanisms for land and road use that are aligned with broader policy objectives. This Working Paper relates to the 2011 OECD Economic Review of New Zealand (www.oecd.org/eco/surveys/NewZealand).

2012	A14	Wray, L. Randall. 2012. "A Meme for Money". Levy Economics Institute, The Economics Working Paper Archive. This paper argues that the usual framing of discussions of money, monetary policy, and fiscal policy plays into the hands of conservatives. That framing is also largely consistent with the conventional view of the economy and of society more generally. To put it the way that economists usually do, money "lubricates" the market mechanism—a good thing, because the conventional view of the market itself is overwhelmingly positive. Acknowledging the work of George Lakoff, this paper takes the position that we need an alternative meme, one that provides a frame that is consistent with a progressive social view if we are to be more successful in policy debates. In most cases, the progressives adopt the conservative framing and so have no chance. The paper advances an alternative framing for money and shows how it can be used to reshape discussion. The paper shows that the Modern Money Theory approach is particularly useful as a starting point for framing that emphasizes use of the monetary system as a tool to accomplish the public purpose. It is not so much the accuracy of the conventional view of money that we need to question, but rather the framing. We need a new meme for money, one that would emphasize the social, not the individual. It would focus on the positive role played by the state, not only in the creation and evolution of money, but also in ensuring social control over money. It would explain how money helps to promote a positive relation between citizens and the state, simultaneously promoting shared values such as liberty, democracy, and responsibility. It would explain why social control over money can promote nurturing activities over the destructive impulses of our "undertakers" (Smith's evocative term for capitalists).
2012	B30	Peng, Hsiao Ping, and Ming Chung Chang. 2012. "The Foundations of Chinese Attitudes towards Advocating Luxury Spending." <i>European Journal of the History of Economic Thought</i>, 19(5): 691-708. In China, some scholars have argued that luxury spending is socially beneficial to equalise wealth, under the assumption that the total endowment of resources is a fixed amount. This argument is not only consistent with Confucianism but also might point to another lesser known side of Confucianism that the luxury spending of the rich can be regarded as a wealth-transferring mechanism. Furthermore, luxury spending was encouraged for purposes of enjoyment; it did not involve the consideration of power and protection. This is in sharp contrast to the extravagance of the European nobility; their intention was to maintain a hierarchical structure.

"Collective Consumption Models with Restricted Bargaining Weights: An Empirical Assessment Based on Experimental Data." <i>Review of Economics of the Household</i>, 10(3): 395-421. We use experimental data to analyze consumption decisions by groups of individuals who have to reach a consensus on spending a joint budget. Our experiment involves dyads (i.e., two-member groups) who have to compose consumption bundles consisting of three commodities (wine, orange juice, and M&Ms). We focus on the collective consumption model to describe group behavior. This model represents group decisions as Pareto optimal outcomes of a within-group bargaining process, with rational group members who are each characterized by individual bargaining weights. We also consider specifications of the collective model that restrict the variation of these bargaining weights. A distinguishing feature of our study is that we use revealed preference testing tools to assess the goodness-of-fit and discriminatory power of alternative specifications of the collective model. Our experimental results suggest that the most appropriate model specification allows for a limited variation of the bargaining weights.
2012	D19	Angelini, Viola, Agar Brugiavini, and Guglielmo Weber. 2012. <i>The Dynamics of Homeownership Among the 50+ in Europe</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 8889. We use life history data covering households in thirteen European countries to analyse residential moves past age 50. We observe four types of moves: renting to owning, owning to renting, trading up or trading down for home-owners. We find that in the younger group (aged 50-64) trading up and purchase decisions prevail; in the older group (65+), trading down and selling are more common. Overall, moves are rare, particularly in Southern European countries. Most moves are driven by changes in household composition (divorce, widowhood, nest-leaving by children), but economic factors play a role: low income households who are house-rich and cash-poor are more likely to sell their home late in life.

"The Size of the Tradable and Non-tradable Sectors: Evidence from Input-Output Tables for 25 Countries." <i>Economics Letters</i>, 116(3): 558-61. We compute the tradable and non-tradable input shares for consumption and investment from the latest release of OECD input-output tables. We document that input shares (the content of tradable and non-tradable goods per unit of final demand) differ substantially from final demand shares (the amount of tradable and non-tradable goods directly demanded for consumption or investment purposes). The deviation is especially large for investment expenditures. Non-tradable share estimates are essential to correctly parameterize multi-sector DSGE open economy models.

2012	F62	Antonakakis, Nikolaos, and Johann Scharler. 2012. "Has Globalization Improved International Risk Sharing?" <i>International Finance</i>, 15(2): 251-66. In this paper, we study the dynamics of international consumption risk sharing among the G-7 countries. Based on the dynamic conditional correlation model due to Engle (2002), we construct a time-varying, consumption-based measure of risk sharing. We find that the exposure to country-specific shocks has evolved heterogeneously across the G-7 countries and that risk sharing varies procyclically with the output gap. This dependence on the business cycle is especially pronounced in countries where credit constraints are relatively binding.
2012	F62	Flood, Robert P., Nancy P. Marion, and Akito Matsumoto. 2012. "International Risk Sharing during the Globalization Era." <i>Canadian Journal of Economics</i>, 45(2): 394-416. Though financial globalization should improve international risk sharing, empirical support is lacking. We develop a simple welfare-based measure that captures how far countries are from the ideal of perfect risk sharing. Applying it to data, we find some evidence that international risk sharing has improved during globalization. Improved risk sharing comes mostly from the convergence in rates of consumption growth among countries rather than from synchronization of consumption at the business cycle frequency.
2012	F62	Chica, Ricardo, Oscar Guevara, Diana Lopez, and Daniel Osorio. 2012. "Growth Determinants in Latin America and East Asia: Has Globalization Changed the Engines of Growth?" <i>Coyuntura Economica: Investigacion Economica y Social</i>, 42(1): 161-203. The answer that emerges to the question: Has globalization changed the engines of growth, from a comparative analysis between Latin America and East Asia, in spite of the extraordinary opportunities brought upon by this process, is a qualified no: investment, followed by industrial growth and savings, the traditional engines of growth, still have the most robust influence, far stronger than the variables epitomizing globalization, exports and capital flows (including FDI). In East Asia exports and capital flows are not as important as investment, industrial growth and savings. In Latin America exports and capital flows seem to have a somewhat stronger influence. In the same direction, a dynamic analysis shows that the Increasing Returns Dynamics involving the virtuous cycle Investment->productivity growth->exports competitiveness->growth->Investment continue to rule the growth process under globalization.
2012	N40	THE SAME AS F51 CV: Blomberg, S. Brock, and Gregory D. Hess. 2012.
2012	H44	Angles, Bruno. 2012. "Les partenariats public-privé: L'avenir du financement des infrastructures. (Public-Private Partnerships, the Future of Infrastructure Funding. With English summary.)" <i>Revue d'Economie Financiere</i>, 0(108): 221-28. According to a recent OECD study, the global needs for infrastructure investment amount to 40,000 billion euros by 2040. Faced with the scarcity of public funds, the financing of these needs is seen as a burden or a challenge, at a time when austerity is required even if the term itself is still taboo. Yet, through the existing legal and financial tools that are PPPs or concessions, the state has the capacity to use the private sector to ensure funding of projects to meet the fundamental changes in contemporary societies. But many obstacles remain for private investment, and especially the mobilization of capital over the long term. Infrastructure requires stable and sustainable investments. That is why the needs in economic and social development largely depend in the future, on the ability of states to shift long-term savings and to rely on specialized actors to fill the "infrastructure gap".
2012	H75	Gardner, Lara, and Donna B. Gilleskie. 2012. "The Effects of State Medicaid Policies on the Dynamic Savings Patterns and Medicaid Enrollment of the Elderly." <i>Journal of Human Resources</i>, 47(4): 1082-1127. Medicaid policies that may affect long-term care decisions vary across states and time. Using data from the 1993, 1995, 1998, and 2000 waves of the Assets and Health Dynamics Among the Oldest Old Survey, we estimate a dynamic empirical model of health insurance coverage, long-term care arrangement, asset and gift behavior, and health transitions over time. Long-run simulations from the estimated model reveal that most Medicaid eligibility and generosity policy variables associated with nursing home services have no effect on Medicaid enrollment and asset behavior. Those policies related to home- and community-based services, however, have a significant but small influence.

2012	I13	Ying, Meiling, and Zaichao Du. 2012. "The Effects of Medical Insurance on Durables Consumption in Rural China." <i>China Agricultural Economic Review</i>, 4(2): 176-87. The New Rural Cooperative Medical Scheme (NRCMS), implemented in China since 2003, has greatly increased the access of the poor to health services and alleviated the hardship caused by catastrophic medical payments. Both the precautionary saving theory and the Buffer-Stock saving theory would predict a positive effect of this event on consumption. The purpose of this paper is to empirically study the effects of medical insurance on durables consumption in rural China. Using China Health and Nutrition Survey (CHNS) data, the authors study the effects of medical insurance on durable goods consumption in rural China through a panel binary choice model. It is found that households with medical insurance

Year	DE	Title and Abstract
		have a significantly higher level of durables consumption, and their probabilities of purchasing durables increase by 2.0 per cent-4.4 per cent, which support the precautionary saving theory and the Buffer-Stock saving theory.
2012	I13	CV: Bai, Chong-En, and Binzhen Wu. 2012. "Social Insurance and Household Consumption in China." In <i>The Chinese Economy: A New Transition</i> , ed. Masahiko Aoki and Jinglian Wu, 166-95. IEA Conference Volume no. 150-IV. New York: St. Martin's Press, Palgrave Macmillan.
2012	I13	Imrohorglu, Selahattin, and Sagiri Kitao. 2012. "Social Security Reforms: Benefit Claiming, Labor Force Participation, and Long-Run Sustainability." <i>American Economic Journal: Macroeconomics</i> , 4(3): 96-127. This paper develops a general equilibrium life-cycle model with endogenous labor supply in both intensive and extensive margins, consumption, saving, and benefit claiming to measure the long-run effects of a proposed Social Security reform. Agents in the model face medical expenditure, wage, health, and survival shocks. Raising the normal retirement age by two years increases labor supply by 2.8 percent and the capital stock by 12.6 percent, showing that both margins of adjustment are critical. General equilibrium effects are important to account for the effects of reform on savings, although the effects on labor supply are less important.
2012	I15	Wang, Dihai. 2012. "Health, Human Capital, Economic Growth and Poverty Trap. (In Chinese. With English summary.)." <i>Jingji Yanjiu/Economic Research Journal</i> , 47(6): 143-55. Based on Fogel's research, this paper studies the relationship between capital accumulation and consumption and discusses the effect of health on economic growth in an extended Ramsey model with assumption that consumption not only brings agents' utility but increases agents' health. The paper has two important features: (1) treading health as a simple function of consumption, which allows us to study health and growth in an aggregate macroeconomic model; (2) the existence of multiple equilibria of capital stock, health, and consumption, which is highly relevant to the reality-rich countries, may end up with higher capital, better health, and higher consumption than poor countries.
2012	J58	Bouis, Romain, Orsetta Causa, Lilas Demmou, Romain Duval, and Aleksandra Zdzienicka. 2012. <i>The Short-Term Effects of Structural Reforms: An Empirical Analysis</i> . OECD Publishing, OECD Economics Department Working Papers: 949. Drawing on new empirical analysis of 30 years of structural reforms across the OECD, this paper sheds light on the impact of reforms over time, identifies the horizon over which their full effects materialise, and investigates whether such effects vary with prevailing economic conditions and institutions. Impulse responses of aggregate outcomes (GDP growth, employment rate) to various labour, product market and tax reforms are estimated at different horizons. This analysis indicates that the benefits from reforms typically take time to fully materialise. When significant effects are found in the short run, reforms seldom involve significant aggregate economic losses; on the contrary they often deliver some benefits. The absence of major depressing effects does not lend support to the view that reforms should be in general accompanied by substantial macroeconomic policy easing in order to deliver some short-term gains. Nevertheless, there is also tentative evidence that some labour market reforms (e.g. of unemployment benefit systems and job protection) pay off more quickly in good times than in bad times, and can even entail short-term losses in severely depressed economies.
2012	M14	Balderjahn, Ingo, and Mathias Peyer. 2012. "Das Bewusstsein für fairen Konsum: Konzeptualisierung, Messung und Wirkung. (The Consciousness for Fair Consumption: Conceptualization, Measuring, and Impacts. With English summary.)." <i>Betriebswirtschaft/Business Administration Review</i> , 72(4): 343-64. The present paper focuses on fair consumption, as a part of ethical consumerism. Fair consumption means purchasing decisions made in the light of compliance with fair labor and business conditions in the manufacturing process. Using a new developed scale for the measurement of the consciousness for fair consumption, we can prove empirically that fair trade products can provide an additional moral value for consumers for which they are willing to pay an extra charge.

2012	P11	Oosterhaven, Jan. 2012. "Adding Supply-Driven Consumption Makes the Ghosh Model Even More Implausible." <i>Economic Systems Research</i> , 24(1): 101-11. Guerra and Sancho (2011) argue that adding a supply-driven consumption function to the Ghosh model diminishes its implausibility in the case of centrally planned economies. Extending the Leontief model with a demand-driven consumption function does make that model more realistic. Extending the Ghosh model, however, makes it even more implausible in the case of a market economy, while it becomes even more problematic as a guide for a centrally planned economy. The prime reason is that complementarities between inputs are negated, not only for firms, but now also for households. Consequently, industry and aggregate output may now increase, while corresponding value added decreases, and vice versa.
2012	P11	Chaudhuri, Saumitra. 2012. "Le contexte économique global et les défis du 12e plan quinquennal. (The Global Economic Context and the 12th Five Year Plan Agenda. With English summary.)." <i>Revue d'Economie Financière</i> , 0(107): 53-72. The developing countries' share of GDP in the world GDP is increasing and could become 42% by 2017. If the growth achieved by these countries partly depends on dynamics which is unique to them, it needs to be reiterated that they are evolving in a global context, characterized by the existing difficulties of the United States and the European Union. This global context, of which the Indian economy is now increasingly a part, is analysed through the prism of short term, medium term, and long term perspectives. In the second part, the paper undertakes an analysis of the characteristics of the Indian economy from the angle of investment and saving, before proposing a series of measures enabling it to face the challenges before it, especially in the field of infrastructure and agro-foods production.
2012	Q40	Cansino, Jose Manuel, Manuel Alejandro Cardenete, Manuel Ordonez, and Rocio Roman. 2012. "Análisis multisectorial de las intensidades energéticas en España. (Multisectorial Analysis of Energy Intensities in Spain. With English summary.)." <i>Economía Agraria y Recursos Naturales</i> , 12(1): 71-97. This paper estimates the sectorial energy intensities of the Spanish economy. The multiplier analysis is applied to Social Accounting Matrix for Spain in 2006 elaborated by Ordonez (2011). Energy intensities are estimated in different scenarios when labor income, capital income, private consumption, and investment accounts are treated as endogenous. The results show that there are significant variations among sectors and that they improve when accounts are treated as endogenous. The energy sectors are those that have the highest energy intensity, along with others such as building materials, chemical industry, and transport and communications.
2012	Z10	Bursztyn, Leonardo, and Davide Cantoni. 2012. <i>A Tear in the Iron Curtain: The Impact of Western Television on Consumption Behavior</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 9101. This paper examines the impact of exposure to foreign media on the economic behavior of agents in a totalitarian regime. We study private consumption choices focusing on former East Germany, where differential access to Western television was determined by geographic features. Using data collected after the transition to a market economy, we find no evidence of a significant impact of previous exposure to Western television on aggregate consumption levels. However, exposure to Western broadcasts affects the composition of consumption, biasing choices in favor of categories of goods with high intensity of pre-reunification advertisement. The effects vanish by 1998.

2012	Z18	Kast, Felipe, Stephan Meier, and Dina Pomeranz. 2012. <i>Under-Savers Anonymous: Evidence on Self-Help Groups and Peer Pressure as a Savings Commitment Device</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 18417. We test the effectiveness of self-help peer groups as a commitment device for precautionary savings, through two randomized field experiments among 2,687 microentrepreneurs in Chile. The first experiment finds that self-help peer groups are a powerful tool to increase savings (the number of deposits grows 3.5-fold and the average savings balance almost doubles). Conversely, a substantially higher interest rate has no effect on most participants. A second experiment tests an alternative delivery mechanism and shows that effects of a similar size can be achieved by holding people accountable through feedback text messages, without any meetings or peer pressure.

2013	C92	Asparouhova, Elena, Peter Bossaerts, Nilanjan Roy, and William Zame. 2013. <i>Lucas' In The Laboratory</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 19068. This paper reports on experimental tests of an instantiation of the Lucas asset pricing model with heterogeneous agents and time-varying private income streams. Central features of the model (infinite horizon, perishability of consumption, stationarity) present difficult challenges and require a novel experimental design. The experimental evidence provides broad support for the qualitative pricing and consumption predictions of the model (prices move with fundamentals, agents smooth consumption) but sharp differences from the quantitative predictions emerge (asset prices display excess volatility, agents do not hedge price risk). Generalized Method of Moments (GMM) tests of the stochastic Euler equations yield very different conclusions depending on the instruments chosen. It is suggested that the qualitative agreement with and quantitative deviation from theoretical predictions arise from agents' expectations about future prices, which are almost self-fulfilling and yet very different from what they would need to be if they were exactly self-fulfilling (as the Lucas model requires).
2013	C92	Duffy, John, and Enrica Carbone. 2013. <i>Lifecycle Consumption Plans, Social Learning and External Habits: Experimental Evidence</i>. University of Pittsburgh, Department of Economics, Working Papers: 513. We report results from a laboratory experiment exploring the extent to which individuals can solve a deterministic, intertemporal lifecycle consumption optimization problem. The environment we study has a positive interest rate on savings and no discounting implying that the optimal consumption path should be linearly increasing over time, i.e., agents maximize their lifecycle payoff by smoothing their consumption over time. In addition to studying the individual intertemporal consumption/savings problem, we explore the role played by social information regarding the consumption/savings decisions of other, homogeneously endowed agents as well as the role played by an external habit formation specification for preferences. We find that subjects are generally closest to the conditionally optimal consumption path when they do not have access to social information on the consumption decisions made by other, similarly situated subjects or when social concerns (external habits) are explicitly incorporated into their utility functions.
2013	D44	Jouini, Elyes, Clotilde Napp, and Diego Nocetti. 2013. "On Multivariate Prudence." <i>Journal of Economic Theory</i>, 148(3): 1255-67. In this note, we extend the theory of precautionary saving to the case of multivariate risk. We introduce a notion of multivariate prudence, related to a precautionary premium, and we propose a matrix-measure to capture the strength of the precautionary saving motive. We discuss the usefulness of this measure, in particular for comparing precautionary behavior among individuals. We also characterize the notion of multivariate downside risk aversion as a preference for disaggregating harms across outcomes of multivariate lotteries. We show the link between this notion and the notion of multivariate prudence, we propose a matrix-measure of its intensity, and we illustrate the usefulness of our results in a problem of social discounting.

2013	I14	De Nardi, Mariacristina, Eric French, and John Bailey Jones. 2013. <i>Medicaid Insurance in Old Age</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 19151. The old age provisions of the Medicaid program were designed to insure poor retirees against medical expenses. However, it is the rich who are most likely to live long and face expensive medical conditions when very old. We estimate a rich structural model of savings and endogenous medical spending with heterogeneous agents, and use it to compute the distribution of lifetime Medicaid transfers and Medicaid valuations across single retirees. We find that retirees with high lifetime incomes can end up on Medicaid, and often value Medicaid's insurance features the most, as they face a larger risk of catastrophic medical needs at old ages, and face the greatest consumption risk. Finally, our compensating differential calculations indicate that retirees value Medicaid insurance at more than its actuarial cost, but that most would value expansions of the current Medicaid program at less than cost.
2013	I14 I24	Poterba, James M., Steven F. Venti, and David A. Wise. 2013. <i>Health, Education, and the Post-Retirement Evolution of Household Assets</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 18695. This paper explores the relationship between education and the evolution of wealth after retirement. Asset growth following retirement depends in part on health capital and financial capital accumulated prior to retirement, which in turn are strongly related to educational attainment. These "initial conditions" for retirement can have a lingering effect on subsequent asset evolution. Our aim is to disentangle the effects of education on post-retirement asset evolution that operate through health and financial capital accumulated prior to retirement from the effects of education that impinge directly on asset evolution after retirement. We consider the indirect effect of education through financial resources--in particular Social Security benefits and defined benefit pension benefits--and through health capital that was accumulated before retirement. We also consider the direct effect of education on asset growth following retirement, emphasizing the correlation between education and the returns households earn on their post-retirement investments. Households with different levels of education invest, on average, in different assets, and they may consequently earn different rates of return. Finally, we consider the additional effects of education that are not captured through these pathways. Our empirical findings suggest a substantial association between education and the evolution of assets. For example, for two person households the growth of assets between 1998 and 2008 is on average much greater for college graduates than for those with less than a high school degree. This difference ranges from about \$82,000 in the lowest asset quintile to over \$600,000 in the highest.
2013	J43	Berloffa, Gabriella, and Francesca Modena. 2013. "Income Shocks, Coping Strategies, and Consumption Smoothing: An Application to Indonesian Data." <i>Journal of Asian Economics</i>, 24(1): 158-71. Using the Indonesian Family Life Survey, this study investigates whether Indonesian farmers respond differently to income shocks (crop loss) depending on the level of their asset

Year	DE	Title and Abstract
		ownership, and whether their responses are aimed at preserving consumption levels or at accumulating assets. We consider a framework in which assets contribute directly to the income generation process. In this context, the need to accumulate assets to ensure future income may lead poor farmers to behave quite differently in terms of both their responses to shocks and their consumption decisions. Our results suggest that while non-poor farmers smooth consumption relative to income, poor households use labor supply to compensate the income loss and, on average, they save half of this extra income. These results confirm the importance of savings for poor households, and highlight a crucial role for policies that support savings or, more precisely, the accumulation of productive assets.
2013	L63	Greenwood, Jeremy, and Karen A. Kopecky. 2013. "Measuring the Welfare Gain from Personal Computers." <i>Economic Inquiry</i>, 51(1): 336-47. The welfare gain to consumers from the introduction of personal computers (PCs) is estimated. A simple model of consumer demand is formulated that uses a slightly modified version of standard preferences. The modification permits marginal utility, and hence total utility, to be finite when the consumption of computers is zero. This implies that the good will not be consumed at a high enough price. It also bounds the consumer surplus derived from the product. The model is calibrated/estimated using standard national income and product account data. The welfare gain from the introduction of PCs is 2%-3% of consumption expenditure.
2013	M40	Anagol, Santosh, Alvin Etang, and Dean Karlan. 2013. <i>Continued Existence of Cows Disproves Central Tenets of Capitalism?</i> National Bureau of Economic Research, Inc, NBER Working Papers: 19437. We examine the returns from owning cows and buffaloes in rural India. We estimate that when valuing labor at market wages, households earn large, negative average returns from holding cows and buffaloes, at negative 64% and negative 39% respectively. This puzzle is mostly explained if we value the household's own labor at zero (a stark assumption), in which case estimated average returns for cows is negative 6% and positive 13% for buffaloes. Why do households continue to invest in livestock if economic returns are negative, or are these estimates wrong? We discuss potential explanations, including labor market failures, for why livestock investments may persist.
2013	N71	Burr, Thomas. 2013. "Market Cycles: Bicycles, Riders, Industries, and Environments in France and the United States, 1865-1914." <i>American Journal of Economics and Sociology</i>, 72(2): 468-96. Issues of supply and demand are basic to markets, but economic sociologists ignore consumers, while sociologists of consumption rarely treat consumption as demand. I conceptualize markets as cyclic interactions of producers and consumers around a product, each group embedded in different types of macrosocial patterns, with different purposes and structures. I apply this conceptualization to the French and U.S. bicycle markets from 1865 to 1914. The model helps explain differing market trajectories in these cases.
2013	O55	Bruckner, Markus, and Mark Gradstein. 2013. <i>Effects of Transitory Shocks to Aggregate Output on Consumption in Poor Countries</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 9658. This paper provides instrumental variables estimates of the response of aggregate private consumption to transitory output shocks in poor countries. To identify exogenous, unanticipated, idiosyncratic and transitory variations in national output we use year-to-year variations in rainfall as an instrumental variable in a panel of 39 sub-Saharan African countries during the period 1980-2009. Our estimates yield a marginal propensity to consume out of transitory output of around 0.2. To explain this result we show, using instrumental variables techniques, that there is a significant negative effect of transitory output shocks on net current transfers and a significant positive and quantitatively large effect on the trade balance. An important implication is that frictions to private financial flows do not necessarily imply large effects of transitory shocks to aggregate output on private consumption in poor countries.
2013	P10	CV: Moller, Jorgen Orstrom. 2013. "Conventional Economic Theory--A Critique Highlighting Flaws in American Style Capitalism." In <i>The Global Economy in Transition: Debt and Resource Scarcities</i>. Jorgen Orstrom Moller, 77-97. Foreword by Jagdish Bhagwati. Hackensack, N.J. and Singapore: World Scientific.
2013	P10	Cingolani, Massimo. 2013. "Finance Capitalism: A Look at the European Financial Accounts." <i>Panoeconomicus</i>, 60(3): 249-90. The paper explores the financial accounts database of Eurostat, a rich set of data that is largely unexploited. It describes the main financial developments at EU level during the 1990-2010 period, both in terms of institutional agents and financial products. The paper provides evidence on the consequences of asset price inflation for wealth distribution between institutional agents and argues that the conceptual scheme of the "double monetary circuit" of existing and recycled savings helps in describing and explaining the observed patterns of financialisation.
2013	P48	PECHER, Pierre. 2013. <i>Ethnic conflict, power dynamics and growth</i>. Universite catholique de Louvain, Institut de Recherches Economiques et Sociales (IRES), Discussion Papers (IRES - Institut de Recherches Economiques et Sociales): 2014008. I construct a successive generations model of appropriative competition between ethnicities where de facto power puts an upper-bound on the consumption of each clan. My aim is to derive the implications of the structure of the ethnic and political divisions in terms of economic prosperity. I expose a mechanism reducing negative externalities in consumption implying that long-run economic growth is larger when influence is concentrated rather than dispersed. I find that competition intensity sometimes is beneficial if it is above a thresh-old or if small groups initially have a large influence. I provide an argument in favour of the Ethno-Linguistic Fractionalization index over a polarization index when considering the impact of diversity on growth. This paper fills a gap in the literature by allowing for the possibility of more than two groups of different sizes in a dynamical setup and by being consistent with the evidence of proportionality between ethnic and political share sin sub-Saharan Africa.
2013	Q13	Jensen, Jorgen Dejgard, and Sinne Smed. 2013. "The Danish Tax on Saturated Fat--Short Run Effects on Consumption, Substitution Patterns and Consumer Prices of Fats." <i>Food Policy</i>, 42(0): 18-31. Denmark introduced a tax on saturated fat in food products with effect from October 2011. The objective of this paper is to make an effect assessment of this tax for some of the product categories most significantly affected by the new tax, namely fats such as butter, butter-blends, margarine, and oils. This assessment is done by conducting an econometric analysis on weekly food purchase data from a large household panel dataset (GfK Panel Services Denmark), spanning the period from January 2008 until July 2012. The econometric analysis suggest that the introduction of the tax on saturated fat in food products has had some effects on the market for the considered products, in that the level of consumption of fats dropped by 10-15%. Furthermore, the analysis points at shifts in demand from high price supermarkets towards low-price discount stores--at least for some types of oils and fats, a shift that seems to have been utilised by discount chains to raise the prices of butter and margarine by more than the pure tax increase. Due to the relatively short data period with the tax being active, interpretation of these findings from a long-run perspective should be done with considerable care. It is thus recommended to repeat--and broaden--the analysis at a later stage, when data are available for a longer period after the introduction of the fat tax.
2013	Q15	Ercin, A. Ertug, Mesfin M. Mekonnen, and Arjen Y. Hoekstra. 2013. "Sustainability of National Consumption from a Water Resources Perspective: The Case Study for France." <i>Ecological Economics</i>, 88(0): 133-47. It has become increasingly evident that local water depletion and pollution are often closely tied to the structure of the global economy. It has been estimated that 20% of the water consumption and pollution in the world relates to the production of export goods. This study analyzes how

Year	DE	Title and Abstract
		French water resources are allocated over various purposes, and examines impacts of French production in local water resources. In addition, it analyzes the water dependency of French consumption and the sustainability of imports. The basins of the Loire, Seine, Garonne, and Escaut have been identified as priority basins where maize and industrial production are the dominant factors for the blue water scarcity. About 47% of the water footprint of French consumption is related to imported agricultural products. Cotton, sugar cane, and rice are the three major crops that are identified as critical products in a number of severely water-scarce river basins: The basins of the Aral Sea and the Indus, Ganges, Guadalquivir, Guadiana, Tigris and Euphrates, Ebro, Mississippi, and Murray rivers. The study shows that the analysis of the external water footprint of a nation is necessary to get a complete picture of the relation between national consumption and the use of water resources.
2013	Q15	Chaudhry, Anita M., and Edward B. Barbier. 2013. "Water and Growth in an Agricultural Economy." <i>Agricultural Economics</i>, 44(2): 175-89. We present a model of economic growth of an agricultural household that is faced with an exogenous water availability constraint. We examine the long-run investment and consumption choices under two scenarios: (i) when the water availability constraint is binding and (ii) when it is not binding. We then compare the two scenarios to derive conditional convergence hypotheses regarding the impact of water availability on long-run agricultural growth. Panel data from Wyoming are used to test these conditional convergence hypotheses. We find that Wyoming counties exhibit strong conditional convergence in agricultural growth. Our theoretical and empirical results demonstrate that water availability is not a determinant but can be a constraint on long-run agricultural growth. Higher water use leads to higher growth in agricultural yield per capita but when water rights constrain water use in a county, as we found in southeastern Wyoming, there are significant losses in agricultural growth.
2013	Q38	Collier, Paul. 2013. "Epargner les revenus tires des ressources naturelles dans les pays en developpement: Principes et regles de politiques. (Savings from Natural Resource Revenues in Developing Countries: Principles and Policy Rules. With English summary.)." <i>Revue d'Economie du Developpement</i>, 0(4): 59-96. Many poor countries are now discovering valuable non-renewable natural resources. Unlike most other sources of tax revenue, the government revenues from the depletion of these resources are both unsustainable and volatile. Each of these features implies that the savings rate appropriate for resource revenues should differ from that on other revenues. Further, a discovery is 'news,' requiring a transition from a situation which has suddenly become sub-optimal. Such transitions must be expected to generate costs which will themselves affect the optimal savings rate. While the features themselves have long been well-understood, the implications for optimal savings behaviour are surprisingly underdeveloped. A fortiori, the implications for the rules which might be the practical embodiment of these analytic underpinnings are also underdeveloped. Our analysis proceeds in four stages. In Section 1, we discuss how savings should optimally respond to the known depletion path of a finite natural resource. In Section 2, we discuss revenue volatility in the context of costly adjustments in spending. In Section 3, we discuss the implications of costs of transition. Finally, in Section 4, we discuss the implications for fiscal rules and institutions. We argue that where revenues from depleting resources are significant, fiscal optimization requires that the intra-temporal rules conventionally incorporated into annual budgeting be supplemented by inter-temporal rules. Such rules protect the efficient fiscal allocation which in conventional circumstances integrated budgets are designed to achieve.
2013	R58	Machacek, Jaroslav, Hana Silovska, Gabriela Rihova, and Petr Jilek. 2013. "Regionální multiplikacní efekt jako indikátor lokálního rozvoje. (The Regional Multiplier Effect as a Local Economic Development Indicator. With English summary.)." <i>Ekonomie a Management</i>, 16(3): 20-33. Lots of knowledge and historical experience in regional policy constantly bring new impulses to explore different regions, entities, institutions and individuals. Especially mutual comparison leads to the desire for new possibilities and methods of analysis or modeling. The purpose of this paper is to approach one of the methods that can be sorted into groups that is still not explored enough, but still has many supporters and opponents. This contribution highlights the role of multiplier effects in the regional and local economies, both from the theoretical and the practical perspective. It briefly presents several methods, including the multiplier effect, and their usage in practice. The method of the "local multiplier" is explored more in detail and the paper shows its possible use in everyday life. This method is quite new and there do not exist many studies about it at the moment. It was created to help both public and private organizations and individuals to evaluate the impact of their expenditures on the local economy. Local multiplier observes the money trail and its flow after it is spent by local organization or individual. Maintaining the money flow is important especially for small open economies to strengthen their self-sufficiency. Despite all the pitfalls of the local multiplier method, that are represented mainly by obtaining and identifying required data and accurate information, the contribution tries to show possible use in practice. At the same time it is trying to answer the question whether the right "value multiplier" can be considered as one of the support criteria when deciding on issues of regional policy.

2006		
2006	E39	Erlandsen, Espen, Jens Lundsgaard, and Felix Hufner. 2006. <i>The Danish housing market: less subsidy and more flexibility</i> . OECD Economics Department, OECD Economics Department Working Papers: 513. While Denmark has fairly flexible labour and product markets in most respects, the housing market stands out with large direct and indirect subsidies for all types of housing and a highly regulated rental market hindering mobility, probably resulting in a mismatch between housing needs and use. In the current housing policy framework there is quite a contrast between the well-functioning market for transactions of owner-occupied housing (supported by the highly liberalised mortgage market) and the highly regulated rental housing market. This paper assesses the recent development in Danish house prices, followed by a discussion of ways of replacing the costly government intervention in the Danish housing market with more market-based mechanisms, thereby achieving policy objectives in a more efficient and targeted way. The paper reviews the main areas for reform, including overall subsidisation of housing, rent regulation, social housing, and how housing supply could be made more responsive.
2006	F10	Draca, Mirko, Raffaella Sadun, and John Van Reenen. 2006. <i>Productivity and ICT: A Review of the Evidence</i> . Centre for Economic Performance, LSE, CEP Discussion Papers. We survey the micro and macro literature on the impact of Information and Communication Technologies (ICTs) on productivity. The "Solow Paradox" of the absence of an impact of ICT on productivity no longer holds, if it ever did. Both growth accounting and econometric evidence suggest an important role for ICTs in accounting for productivity. In fact, the empirical estimates suggest a much larger impact of ICT on productivity than would be expected from

Year	DE	Title and Abstract
		the standard neoclassical model that we focus on. We discuss the various explanations for these results, including the popular notion of complementary organizational capital. Finally, we offer suggestions for where the literature needs to go.

2006	F10	CV: Knetsch, Thomas A. 2006. "Short-Run and Long-Run Comovement of GDP and Some Expenditure Aggregates in Germany, France and Italy." In <i>Convergence or Divergence in Europe? Growth and Business Cycles in France, Germany and Italy</i> , ed. Olivier de Bandt, Heinz Herrmann and Giuseppe Parigi, 209-49. Berlin and New York: Springer.
2006	F10	CV: Bulligan, Guido. 2006. "Synchronisation of Cycles: A Demand Side Perspective." In <i>Convergence or Divergence in Europe? Growth and Business Cycles in France, Germany and Italy</i> , ed. Olivier de Bandt, Heinz Herrmann and Giuseppe Parigi, 187-207. Berlin and New York: Springer.
2006	F18	Cabo, Francisco, and Guiomar Martin-Herran. 2006. "North-South Transfers vs Biodiversity Conservation: A Trade Differential Game." <i>Annals of Regional Science</i>, 40(2): 249-78. Trade relationships connect developed and developing countries. The former produces a consumption good, using labor, capital, and an intermediate 'natural' good which is produced in the developing countries using labor and natural species. A finite horizon differential game is settled out. The North decides about either the saving rate or the portion of its disposable income to transfer to the South or both variables jointly. The South selects the range of species used in the production of the intermediate 'natural' good required in the North's productive process. This is a measure of biodiversity loss. The aim of the paper is to study how transfers from North to South affect capital growth and biodiversity conservation.
2006	F24	Caceres, Luis Rene, and Nolvía N. Saca. 2006. "El mecanismo de transmisión de los efectos de las remesas en El Salvador. (The Transmission Mechanism of the Impact of Remittances in El Salvador. With English summary.)" <i>Comercio Exterior</i>, 56(10): 875-85. By means of a vast literary review on the economic impact of remittances and the construction of a self-regressive vectors model, the authors study the reasons behind the paradox of the coexistence of economic stagnation, decrease of investment, and national saving, with unprecedented figures of remittances income. In this sense, while analyzing the impact of remittances on certain money and real variables, they help to clarify the so-called "remittances syndrome".
2006	H72	Ahearne, Alan, Finn Kydland, and Mark A. Wynne. 2006. "Ireland's Great Depression." <i>Economic and Social Review</i>, 37(2): 215-43. We argue that Ireland experienced a great depression in the 1980s comparable in severity to the better known and more studied depression episodes of the interwar period. Using the business cycle accounting framework of Chari, Kehoe and McGrattan (2005), we examine the factors that led to the depression and the subsequent recovery in the 1990s. We calculate efficiency, labour, investment and government wedges and evaluate the contribution of each to the downturn and subsequent recovery. We find that the efficiency wedge on its own can account for a significant portion of the downturn, but predicts a stronger recovery in output than occurred. The labour wedge also helps account for what happened during the depression episode. We also find that the investment wedge played no role in the depression.
2006	H76	Hao, Feng. 2006. "Estimate of Provincial Capital Stock in China: 1952-2004. (In Chinese. With English summary.)" <i>Journal of Data Analysis</i>, 1(6): 11-29. The paper briefly reviews the research of China's capital stock estimating, and makes particular adjustment to investment data in virtue of the up to date statistics available. Then I try to use some new methods to estimate the depreciation rate and the benchmark capital stock, which are two key steps in estimating capital stock. Finally I construct the countrywide and provincial capital stock series of China from 1952 to 2004 by PIM.
2006	J17 L31	Lalich, Walter F. 2006. <i>Measurement and Spatial Effects of the Immigrant Created Cultural Diversity in Sydney</i>. Fondazione Eni Enrico Mattei, Working Papers: 2006.47. This paper analyses the contribution to the creation of a culturally diverse Sydney landscape by ethnic communities following the arrival of over a million and half non-English speaking settlers since 1948. Through fragmented collective actions, around 450 communal places were established to satisfy collectively perceived needs: places of worship, social and sports clubs, schools, childcare and aged care. Immigrants organised to overcome problems of social deprivation and scarcity of public places. They created needed collective goods on their own, through mutuality and compensated for their own meagre material resources with engendered social capital, time and energy. The diversity and intensity of development reflects differences in the perception of the settlement needs, urgency and aims within diverse ethnic groups. Immigrants enhanced the quality of life and developed a liveable city. Collected data inform on the outcome, developed capacities, investment patterns, annual income and expenditure, usage, management and employment patterns, gender and youth participation, functions and generated activities.
2006	J18	Bandyopadhyay, Subhayu, and Sudeshna C. Bandyopadhyay. 2006. "The Role of Capital Mobility in Illegal Immigration Policy." <i>Journal of International Trade and Economic Development</i>, 15(2): 173-89. This paper analyzes the effectiveness of enforcement in controlling illegal immigration in two scenarios, capital mobility and capital immobility in the host nation (for illegal immigrants). The source nation is assumed throughout to have immobility of capital. We show that the net enforcement expenditure is higher (lower) in the presence of capital mobility if the host nation is an importer (exporter) of capital at the target immigration level. Furthermore, we show that if the host nation is an exporter of capital at the point of zero enforcement (unrestricted immigration), it must have lower enforcement expenditure (compared to capital immobility) for any illegal immigration target. If it is an importer of capital at zero enforcement, there is some ambiguity. National income must be higher (lower) under capital mobility (compared to immobility) if the host nation is an importer (exporter) of capital at the target immigration level. The analysis is extended to consider endogenous determination of optimal immigration level. Under capital mobility, for a capital exporting nation, the optimal enforcement and the national income levels are higher, while the optimal immigration level is lower.
2006	J54	Whyman, Philip. 2006. "Post-Keynesianism, Socialisation of Investment and Swedish Wage-Earner Funds." <i>Cambridge Journal of Economics</i>, 30(1): 49-68. This paper analyses the performance of one of the most controversial of recent economic policy "experiments", namely Swedish Wage-earner Funds (WEFs). It examines the ability of the WEFs to meet macroeconomic, financial and democratic objectives. The analysis indicates a favourable financial performance, but little significant

Year	DE	Title and Abstract
		democratisation. Macroeconomic influence was constrained by the limited size of the scheme and, though associated with positive changes in economic variables, the experiment was ultimately overwhelmed by the collapse of an asset price "bubble". Nevertheless, the performance of the WEFs has legitimised the concept of collective investment funds as an economic policy instrument.
2006	L26	Diss: Francis, Johanna. 2006. Savings, Investment, and the Entrepreneurial Decisions of the Wealthy. PhD diss. Johns Hopkins University.
2006	L31	THE SAME AS J17 Lalich, Walter F. 2006. <i>Measurement and Spatial Effects of the Immigrant Created Cultural Diversity in Sydney</i> . Fondazione Eni Enrico Mattei, Working Papers: 2006.47.
2006	L40	Organisation for Economic Co-operation and Development. 2006. <i>Policy Framework for Investment: A Review of Good Practices</i> , Paris and Washington, D.C.: Organisation for Economic Co-operation and Development. Companion volume to the Policy Framework for Investment reproduces the analytical background reports that supported the development of the material in the Framework. Discusses investment policy; investment promotion and facilitation; trade policy; competition policy; tax policy; corporate governance; policies for promoting responsible business conduct; human resource development policy; infrastructure and financial sector development; and public governance.
2006	O43	CV: Holcombe, Randall G., Robert A. Lawson, and James D. Gwartney. 2006. "Constitutions and Prosperity: The Impact of Legal and Economic Institutions on the Wealth of Nations." In <i>Democratic Constitutional Design and Public Policy: Analysis and Evidence</i> , ed. Roger D. Congleton and Birgitta Swedenborg, 289-316. Cambridge and London: MIT Press.
2006	O43	CV: Eicher, Theo S., Cecilia Garcia-Penalosa, and Utku Teksoz. 2006. "How Do Institutions Lead Some Countries to Produce So Much More Output per Worker than Others?." In <i>Institutions, Development, and Economic Growth</i> , ed. Theo S. Eicher and Cecilia Garcia-Penalosa, 65-80. CESifo Seminar Series. Cambridge and London: Cambridge University Press.
2006	O54	Hsieh, Chang-Tai, and Jonathan A. Parker. 2006. <i>Taxes and Growth in a Financially Underdeveloped Country: Evidence from the Chilean Investment Boom</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 12104. This paper argues that taxation of retained profits is particularly distortionary in an economy with good growth prospects and poorly developed financial markets because it primarily reduces the investment of financially constrained firms, investment that has marginal product greater than the after-tax market real interest rate. Contrarily, taxes on distributed profits or capital gains primarily reduce the investment of financially unconstrained firms. Chile experienced a banking crisis over the period from 1982 to 1986 and in 1984 reduced its tax rate on retained profits from 50 percent to 10 percent. We show that, consistent with our theory, there was a large increase in aggregate investment after the reform which was entirely funded by an increase in retained profits. Further, we show that investment grew by more in industries that depend more on external financing, according to the Rajan and Zingales (1998) measure. Finally, we present some weak evidence from comparisons of investment rates across firms for several different measures of their likelihood of being financially constrained.
2006	P43 Z12	Toutounchian, Iraj. 2006. "Integrating Money in Capital Theory: A Legal Perspective towards Islamic Finance." <i>Review of Islamic Economics</i> , 10(2): 75-113. This paper attempts to distinguish money and capital by discussing legal aspects of their relationship. For many years the technicalities of the production function have been emphasized at the cost of neglect of the legalities, which precede that function and indeed effect the transformation of money into capital. Conventionally, money and capital (both thought of as loans) have been distinguished on the basis of the duration of the loan period. We show that the failure to see the legal difference(s) between money and capital has been the source of many fundamental confusions and misunderstandings. As a result of that confusion, Islamic banks are rightly accused of operating on the basis of usury. We argue that, in contrast to the environment in which both conventional and Islamic banks operate today, if, as a result of the elimination of money markets, the supply of money and the emerging institution become endogenous to economic structure, a stable Islamic economic system can be assured.
2006	Q15 Q24	Araujo, Claudio, Catherine Araujo Bonjean, Jean-Louis Combes, and Pascale Combes Motel. 2006. "Relacao entre mercado de terras, crescimento economico e inseguranca fundiaria explicada por um modelo a "geracao imbricada". (Relationship between the Land Market, Economic Growth and Land Insecurity Explained by an Overlapping Model. With English summary.)." <i>Revista de Economia Politica/Brazilian Journal of Political Economy</i> , 26(4): 575-95. In this paper, we analyze the relationship between the land market failures and the economic growth in Brazil, starting from an overlapping model including two sectors: agricultural and industrial. The land is both a specific factor for agriculture and an asset that can be substituted for the capital used in industry. The trade-off between land and capital holding depends, among other factors, on the transaction costs on the land market. These costs result from land insecurity and generate a decrease in the land price that favors capital accumulation. Two assumptions follow from our model: on the one hand, land insecurity has a negative effect on the land price; on the other hand it has a positive effect on economic growth. These two hypotheses are tested on panel data for Brazilian Federation. The econometric results do not reject our hypothesis.
2006	Q51	CV: Narain, Urvasi, and Anthony Fisher. 2006. "The Optimal Control of a Stock Pollutant with Sunk Capital and Endogenous Risk of Catastrophic Damages." In <i>The Theory and Practice of Environmental and Resource Economics: Essays in Honour of Karl-Gustaf Lofgren</i> , ed. Thomas Aronsson, Roger Axelsson and Runar Brannlund, 260-86. New Horizons in Environmental Economics. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2006	Q54	Ikefuji, Masako. 2006. "The Impact of Natural Disasters on Economic Growth." <i>Osaka Economic Papers</i> , 55(4): 52-59. This paper studies the impact of natural disasters on economic growth in an endogenous growth model. Production with the use of fossil fuels as input brings about air pollution, which can be one of the causes of climate change. Climate change may be accompanied by natural disasters that causes serious damage to physical capital stock. We assumed that when more polluting inputs are used, the risk of natural disaster is greater, which results in more damage to capital stock. We examine the social planner's problem taking the risk of natural disasters into account. We show that a steady state exists and that it is saddle path stable. In addition, optimal growth with natural disasters is positive but lower than that without pollution and natural disasters.
2006	Q54 Q55	CV: Schwoon, Malte, and Richard S. J. Tol. 2006. "Induced Technological Change and Slow Energy Capital Stock Turnover in an Optimal CO2 Abatement Model." In <i>Economic Modelling of Climate Change and Energy Policies</i> , ed. Carlos De Miguel, Xavier Labandeira and Baltasar Manzano, 129-46. New Horizons in Environmental Economics. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2006	Z12	THE SAME AS P43 Toutounchian, Iraj. 2006. "Integrating Money in Capital Theory: A Legal Perspective towards Islamic Finance." <i>Review of Islamic Economics</i> , 10(2): 75-113.

2007	C13	Murray, James. 2007. <i>Empirical Significance of Learning in a New Keynesian Model with Firm-Specific Capital</i> . Center for Applied Economics and Policy Research, Economics Department, Indiana University Bloomington, Caep Working Papers: 2007-027. This paper examines the empirical significance of learning, a type of adaptive, boundedly rational expectations, in the U.S. economy within the framework of the New Keynesian model. Two popular specifications of the model are estimated: the standard three equation model that does not include capital, and an extended model that allows for endogenous capital accumulation. Estimation results for learning models can be sensitive to the choice for the initial conditions for agents expectations, so four different methods for choosing initial conditions are examined, including jointly estimating the initial conditions with the other parameters of the model. Maximum likelihood results show that learning under all methods for initial conditions lead to very similar predictions as rational expectations, and do not significantly improve the fit the model. The evolution of forecast errors show that the learning models do not out perform the rational expectations model during the run-up of inflation in the 1970s and the subsequent decline in the 1980s, a period of U.S. history which others have suggested learning may play a role. Despite the failure of learning models to better explain the data, analysis of the paths of expectations and structural shocks during the sample show that allowing for learning in the models can lead to different explanations for the data.
2007	C83	CV: Weichselberger, Annette. 2007. "Investment Survey in Manufacturing." In <i>Handbook of Survey-Based Business Cycle Analysis</i> , ed. Georg Goldrian, 41-56. Ifo Economic Policy series. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2007	D86	Philippon, Thomas, and Yuliy Sannikov. 2007. <i>Real Options in a Dynamic Agency Model, with Applications to Financial Development, IPOs, and Business Risk</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 13584. We study investment options in a dynamic agency model. Moral hazard creates an option to wait and agency conflicts affect the timing of investment. The model sheds light, theoretically and quantitatively, on the evolution of firms' dynamics, in particular the decline of the failure rate and the decrease in the age of IPOs.
2007	F40	Diss: Hernandez, Ramon Antonio Gonzalez. 2007. <i>Essays in Open Economy Macroeconomics</i> . PhD diss. Florida International University. Research macroeconomists have witnessed remarkable methodological developments in mathematical, statistical, and computational tools during the last two decades. The three essays in this dissertation took advantage of these advances to analyze important macroeconomic issues. The first essay, "Habit Formation, Adjustments Costs, and International Business Cycle Puzzles" analyzes the extent to which incorporating habit formation and adjustment costs in investment in a one-good two-country general equilibrium model would help overcome some of the international business cycle puzzles. Unlike standard results in the literature, the model generates persistent, cyclical adjustment paths in response to shocks. It also yields positive cross-country correlations in consumption, employment, investment, and output. Cross-country correlations in output are higher than the ones in consumption. This is qualitatively consistent with the stylized facts. These results are particularly striking given the predicted negative correlations in investment, employment, and output that are typically found in the literature. The second essay, "Comparison Utility, Endogenous Time Preference, and Economic Growth," uses World War II as a natural experiment to analyze the degree to which a model where consumers' preferences exhibit comparison-based utility and endogenous discounting is able to improve upon existing models in mimicking the transitional dynamics of an economy after a shock that destroys part of its capital stock. The model outperforms existing ones in replicating the behavior of the saving rate (both on impact and along the transient paths) after this historical event. This result brings additional support to the endogenous rate of time preference being a crucial element in growth models. The last essay, "Monetary Policy under Fear of Floating: Modeling the Dominican Economy," presents a small scale macroeconomic model for a country (Dominican Republic) characterized by a strong presence of fear of floating (reluctance to have a flexible exchange rate regime) in the conduct of monetary policy. The dynamic responses of this economy to external shocks that are of interest for monetary policy purposes are analyzed under two alternative interest rate policy rules: One being the standard Taylor rule and another that responds explicitly to deviations of the exchange rate with respect to its long-term trend.

2007	J08 J58	Soo, Kwok Tong. 2007. "Endogenous Economic Policy and the Structure of Production: Theory and Evidence." <i>Scottish Journal of Political Economy</i> , 54(2): 220-53. This paper develops and tests a model that predicts a positive relationship between absolute levels of capital stock and how favourable are policies toward capital. The theoretical model we use is a model of campaign contributions and electoral competition, extended to consider the implications for factor mobility and hence the structure of production. There are two main predictions. First, countries with more capital stock tend to implement more pro-capital policies. Second, in a two-country model, the country that initially has more capital will be able to attract capital inflows from the other country. Given additional assumptions on the production side, this yields the prediction that the more different are countries' policies, the more different will be the set of goods that they produce. These predictions of the model are confirmed using panel data on cross-state differences in policies and economic outcomes in India.

2007	J42	Uribe, Jose Ignacio, Carlos Humberto Ortiz, and Gustavo Adolfo Garcia. 2007. "La segmentacion del mercado laboral colombiano en la decada de los noventa. (Colombian Labor Market Division during the Nineties. With English summary.)" <i>Revista de Economia Institucional</i> , 9(16): 189-221. This article shows that the Mincer equations, augmented with variables of firm size and corrected by selectivity bias, yield results that are consistent with the theories of human capital and labor segmentation. Greater firm endowments of human capital and physical capital are related to greater labor income. This result is consistent with scale economies at the firm level. It also implies divisions between economic sectors due to physical and human capital markets barriers.

2007	K11	Andonova Zuleta, Veneta. 2007. "Two Paths to Prosperity When Property Rights Enforcement Is Weak." <i>Globalizacion, Competitividad y Gobernabilidad/Globalization, Competitiveness and Governability</i> , 1(1): 136-45. Governments are not always the most effective mechanism for guaranteeing private investment. In many countries governments are unable to enforce property rights, whatever the degree of protection promised by the law. In this context, I argue that there are at least two alternative private paths to prosperity. Firstly, businesses can adopt production technologies that are less sensitive to institutional voids. These are

Year	DE	Title and Abstract
		cheaper, mobile versions of existing technologies, so they can reduce exposure to the hold-up problem. Secondly, entrepreneurs can implement employee ownership, together with other motivational strategies, in order to preserve the ownership itself. Employees are thus encouraged to support the current allocation of property rights instead of challenging it.

In flexible labour markets, capital increases the productivity of skilled workers more than that of unskilled workers, and in the US faster investment is associated with wider wage inequality. But labour market institutions that keep unskilled workers' wages high also imply that firms may find it profitable to invest so as to boost those workers' productivity. Our empirical analysis based on industry-level data confirms that a higher capital intensity in Germany is associated with smaller wage differentials and with a larger share of unskilled workers in the labour costs. Changes in capital-labour ratios during the 1980s reduced wage differentials by 5-8% in German industries, while in the US capital deepening in such industries as machinery and retail was accompanied by an increase of wage differentials larger than 7%.

2007	N36	Ronchi, Veronica. 2007. <i>The Neoliberal Myth in Latin America: The Cases of Mexico and Argentina in the '90s</i> . Fondazione Eni Enrico Mattei, Working Papers: 2007.42. During the '90s most Latin American countries were submitted to neoliberal structural reform policies. Neoliberal policies imposed market supremacy, reduced the State's role in the economy and deregulated the markets. This paper aims at describing how these policies affected the most important macroeconomic indexes, with special emphasis on Argentina and Mexico, the two countries that suffered most from the economic crises of the '80s and '90s, and where the neoliberal policies were applied with greater orthodoxy. In spite of a slight improvement in some macroeconomic indexes, in Latin America neoliberalism failed to reduce poverty and unemployment, and was unable to guarantee a fair distribution of the wealth and improve welfare.
2007	N43 N93	Lindberg, Erik. 2007. "Mercantilism and Urban Inequalities in Eighteenth-Century Sweden." <i>Scandinavian Economic History Review</i> , 55(1): 1-19. It is sometimes argued that inequality promotes growth. If savings are the key to economic growth and the marginal propensity to save rises with income, a more unequal society will save more and grow faster. Thus, by sacrificing equality and concentrating income and wealth in the hands of the entrepreneurial class, society might enjoy higher economic growth. The economic policies taken by the Swedish state during the eighteenth century had the explicit goal of concentrating trade and opportunities for income formation and capital accumulation in the hands of the merchant class. Both an older tradition as well as recent research have emphasised the positive sides of these policies, as the privileged merchants are depicted as dynamic engines of growth and an important factor in the process of capital accumulation. However, in this paper it is argued that this assertion is not warranted. The mercantilist policies resulted in neither measurable per capita growth nor dynamic transformation but in institutional rigidities and the enrichment of the rich and impoverishment of the poor, leading to increasing urban inequalities.

2007	N67	Shenoy, Sudha R. 2007. "Investment Chains through History or an Historian's Outline of Development: 'Using Goods of Ever Higher Orders'." <i>Indian Journal of Economics and Business</i> , 0(0): 185-215. Technology is widely seen as the key to development. But this does not explain how a single innovative machine multiplies itself. An alternative tack: Menger's analysis of investment chains. Begin with first-order (consumer) goods and examine the second, third-, and other successively higher-order goods required. The range of final goods produced in four historical contexts (Upper Paleolithic Europe, early modern England, DCs in the late 20th century, Mali in the same period) are set out. In each context, for a selected first-order good, the investment chain of successively higher-order goods is detailed. Such investment chains are most complex in DCs.

2008	A20	Vazquez-Cognet, Jose J. 2008. "The Production of Mathematical Problems: A Diminishing Marginal Returns Experiment." <i>International Review of Economics Education</i> , 7(1): 103-16. This article presents a classroom experiment to demonstrate several important production concepts, particularly the critical concept of the diminish marginal returns to an input. Although this experimental design shares principles with other variants of diminishing returns experiments described previously in the literature, it differs from them in two important feature: (1) it is specifically designed for large enrollment courses, and (2) it introduces the notion of capital as part of the experiment. Playing in teams, students recreate a production process where they allocate some scarce resources (namely time, mathematical problems, students, and calculators) to the production of mathematical solutions. Each round of production is allowed to change only by increasing labour (students) in marginal amounts while holding capital (calculators) constant. All teams are facing diminishing marginal returns to labour once the game is played for three or four rounds. Not only is this experience useful to introduce students to the nature of the critical concept of diminishing marginal

Year	DE	Title and Abstract
		returns, but with very little effort the instructor can expand the experiment to include dynamics related to issues of costs and profits.

2008	C45	Joseph, Anthony, Maurice Larrain, and Eshwar Singh. 2008. "Forecasting Real Inventories and the Anomaly of Money Illusion." <i>Business Economics</i>, 43(1): 19-30. While the transmission mechanism of inventory behavior in the business cycle has been studied, less effort has been devoted to applied forecasting of inventory change. Inventory fluctuations have accounted for a sizable portion of the changes in U.S. GDP during recessions over the past fifty years. In this paper, we report on out-of-sample forecasts of manufacturing and trade inventories generated by regression and neural network methodology. Our forecasting model is Metzlerian in approach, in that the divergence between actual and targeted sales is hypothesized as the primary cause of inventory imbalance. Our forecasts also rely on the slow adjustment of inventory investment to sales surprises. However, the likely presence of money illusion is a caveat to users, and we address several distortions it introduces to inventory management measures.

2008	F63	Bresser-Pereira, Luiz Carlos. 2008. "Globalization, Nation-State and Catching Up." <i>Revista de Economia Política/Brazilian Journal of Political Economy</i>, 28(4): 557-77. Globalization and nation-states are not in contradiction, since globalization is the present stage of capitalist development, and the nation-state is the territorial political unit that organizes the space and population in the capitalist system. Since the 1980s, global capitalism constitutes the economic system characterized by the opening of all national markets and a fierce competition between nation-states. Developing countries tend to catch up, while rich countries try to neutralize such competitive effort, using globalism as an ideology, and conventional orthodoxy as a strategy. Middle-income countries that are catching up in the realm of globalization are the ones that count with a national development strategy. This is broadly the case of the dynamic Asian countries. In contrast, Latin American countries no longer have their own strategy, and grow less. To add data to the argument, the author conducts an econometric test comparing these two groups of countries, and three variables: the rate of investment, the current account deficit or surplus that would indicate or not a competitive exchange rate, and public deficit.

2008	J44	Belhocine, Nazim. 2008. <i>The Embodiment of Intangible Investment Goods: a Q-Theory Approach</i>. Queen's University Department of Economics, Working Papers: 1217. Recent empirical findings on firms' expenditure towards the creation and acquisition of knowledge goods, otherwise known as intangibles, suggest that their share in overall investment has grown considerably. Still, intangible investment is rarely present in investment models. In this paper, I extend the q-theory of investment to model explicitly the decision of firms to invest in intangibles. I then use the model to measure the contribution of intangible goods to the overall capital stock in the U.S. The model highlights the embodiment of intangible goods in tangibles and the role of relative price movements in the measurement of the contribution of each type of investment to the overall capital stock. In particular, given that the relative cost of the main input to intangible production, skilled labor, rose substantially in the 80s and 90s, the price of intangibles inherits this rise. As a result, the downward trend in the aggregate investment deflator series reported by national accounts, which accounts only for the presence of tangible investment goods, is found to have a significant downward bias in the 90s. The model also shows that the growth in the overall capital stock from the late-80s until 2000 was driven mainly by an increase in the contribution of intangibles. However, the contribution of intangibles fell consistently after 2000. These results underscore the importance of accounting for the movements in the price of intangibles rather than focusing only on their rising share in overall investment.
2008	L24	Diss: Pal, Sudeshna. 2008. <i>Essays on Evidence and Effects of International Movements of Capital and Labor</i> . PhD diss. West Virginia University. This dissertation presents three essays on the evidence and effects of international mobility of capital and labor. Essay 1 explores the behavior of this coefficient in OECD countries over a thirty year period. The second and third essays focus on international movements of labor measured by immigration and outsourcing. The second essay theoretically examines the impact of low skill outsourcing on domestic tax rates, namely labor tax and profit tax. The third essay empirically shows the impact of low skilled immigration and outsourcing on labor tax rates in OECD countries. What follows is a summary of the essays. The first essay, Reassessing International Capital Mobility: The Feldstein-Horioka Puzzle Disappears examines how capital mobility changed over the years, especially during the 1990s often termed as the era of globalization. Feldstein-Horioka type regressions using pooled annual data for OECD countries show that savings-investment correlations fall continuously throughout the 1990s implying increasing capital mobility. This is in sharp contrast to the fairly stable behavior of the coefficient till late 1980s. Evidences show that the phenomenon is indeed global and not country specific. Current account data also confirms increased capital mobility. Developing countries too become financially integrated during the 1990s, but they had an earlier start than OECD nations. The second essay, Outsourcing and Domestic Tax Policy, is a theoretical depiction of the impact of foreign outsourcing on domestic tax rates. The model includes two types of workers, namely managers or high skilled workers who also own the firms and workers who are low skilled and are hired by the managers. An individual can choose to become either of the two given his innate ability and the cost of acquiring skills. In addition, we introduce outsourcing as a factor in a firm's decision making. The firms or managers can hire native workers and outsource jobs abroad. The government taxes both labor income and profit income and provides transfers. The tax rates are determined through a process of voting in which the median voter plays a pivotal role. Our model shows that if the domestic firms increase foreign outsourcing, labor tax rates decline and profit tax rates increase unambiguously in the home country. The third essay, Immigration, Outsourcing and Tax Policy: Evidence from OECD Countries studies effects of immigration and outsourcing on domestic labor tax rates. Immigration and outsourcing are typically portrayed as substitutes in production and in terms of their effects on the domestic economy. A political economy analysis shows that immigration and outsourcing may actually have very different impact on the domestic economy, so that they may not be viewed as substitutes anymore. A study on 15 OECD countries finds that while low skilled immigration increases tax burden on domestic labor, low skilled outsourcing may actually reduce it. Low skilled immigration may impose additional fiscal burden and thus lead to higher tax rates on labor. Outsourcing of low skilled jobs, on the other hand, does not make any claims on government transfers and therefore, may result in lower domestic labor tax rates.

2008	N35	Self, Sharmistha, and Richard Grabowski. 2008. "Symposium: Lessons from Chinese Economic History: Examining the Link between Japan's Development and Education of Females." <i>Pacific Economic Review</i>, 13(3): 279-88. This paper studies the role of education of females in Japan's development process. It analyses the pre-war years (1888 to 1940) as well as the five decades following the war and Japan's rise to economic power (1947 to 1990). This paper finds that Japan's pre-war growth was fuelled primarily by agricultural growth and primary education (of males in particular). The story is different in the post-war period, however. Capital accumulation, secondary and tertiary education of females, and tertiary education for males seem to provide the driving forces of growth.
2008	N43	Schulze, Max-Stephan. 2008. "The Growth and Composition of Imperial Austria's Fixed Capital Stock: New Annual Times Series for 1870-1913." <i>Economies et Societes</i>, 42(9): 1597-1613. Research into the origins of economic growth in the late nineteenth century Habsburg Empire has so far suffered from a lack of evidence on the evolution of the capital stock. This paper documents new annual estimates of the gross domestic fixed capital stock in imperial Austria, distinguishing between buildings (residential, agricultural, commercial, public), infrastructure (railway tracks, roads), vehicles (railway rolling stock, ships), and machinery. The evidence shows that capital stock growth in late nineteenth century Austria was significantly slower than in Hungary, her partner in the Habsburg customs union, and in Germany.

2008	Q50	Bond, Steve, Stephen R. Bond, and Adeel Malik. 2008. <i>Natural resources, export structure and investment</i>. University of Oxford, Department of Economics, Economics Series Working Papers: CSAE WPS/2008-20. We present cross-country empirical evidence on the role of natural resources in explaining long-run differences in private investment as a share of GDP in a sample of 72 developing countries. Our empirical results suggest important differences between oil and non-oil resources. While revenue from oil exports tends to increase private (and public) investment, there is also a robust negative effect from a measure of export concentration. After controlling for these two aspects of export structure, there is little additional information in other measures of resource abundance, or in other suggested investment determinants, such as measures of the quality of institutions, political instability or macroeconomic volatility.
2008	R38	Fan, Hongzhong. 2008. "The Ineffectiveness of Public Policies and Excessive Concentration of Production and Population. (In Chinese. With English summary.)" <i>Jingji Yanjiu/Economic Research Journal</i>, 43(6): 73-84. Through a model of the flow of capital and population, it is found that without investment control and with the flow of population, policies of reducing the costs of commuting and housing, or favorable policies only for large cities will result in even more excessive concentration, higher cost of commuting and housing. However, the policies may cause false prosperity, that is nominal GDP go up, but a lot of social product is offset by the cost of commuting and housing, the real income and welfare of most people don't change except for land owners.
2008	Y10	World Bank. 2008. <i>The Little Data Book on Private Sector Development 2008</i>, Washington, D.C.: World Bank. Presents data from World Development Indicators 2008 with a focus on the private sector in development. Includes indicators covering the economic and social context; the business environment; private sector investment; finance and banking; and infrastructure. Regional tables cover East Asia and the Pacific, Europe and Central Asia, Latin America and the Caribbean, the Middle East and North Africa, South Asia, and sub-Saharan Africa. Country tables present statistics on economic and social context, the business environment, private sector investment, finance and banking, and infrastructure for the years 2000 and 2006.

Papers discuss the central core of heterodox macroeconomics; an introduction to a unified heterodox macroeconomic theory; methodology and heterodox economics; whether heterodox economics needs a unified crisis theory--from profit-squeeze to the global liquidity meltdown; the current crisis in macroeconomic theory; modern business behavior--the theory of the active firm; a Keynes-Marx theory of investment; whether financialization increases macroeconomic fragility--an analysis of the U.S. nonfinancial corporate sector; Karl Marx, Hyman Minsky, and James Crotty on crises in capitalism; labor demand under strategic competition and the cyclical profit squeeze; cyclical labor shares under Keynesian and neoliberal regimes; economic crisis and institutional structures--a comparison of regulated and neoliberal capitalism in the United States; historically contingent, institutionally specific--class struggles and American employer exceptionalism in the age of neoliberal globalization; unequal exchange reconsidered in our age of globalization; from capital controls and miraculous growth to financial globalization and the financial crisis in Korea; Keynes's bourgeois socialism; the case of capital controls revisited; neoliberal finance and third world (mal)development; and heterodox macroeconomics and the current global financial crisis.
2009	C11	Justiniano, Alejandro, Giorgio E. Primiceri, and Andrea Tambalotti. 2009. <i>Investment Shocks and the Relative Price of Investment</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 7598. We estimate a New-Neoclassical Synthesis business cycle model with two investment shocks. The first, an investment-specific technology shock, affects the transformation of consumption into investment goods and is identified with the relative price of investment. The second shock affects the production of installed capital from investment goods or, more broadly, the transformation of savings into the future capital input. We find that this shock is the most important driver of U.S. business cycle fluctuations in the post-war period and that it is likely to proxy for more fundamental disturbances to the functioning of the financial sector. To corroborate this interpretation, we show that it correlates strongly with interest rate spreads and that it played a particularly important role in the recession of 2008.
2009	F53	Sapienza, Elvira. 2009. "A Multilateral Framework on Investment: Attempts, Outcomes and Proposals." <i>Studi Economici</i>, 64(98): 59-88. So far the efforts to develop a multilateral regime have failed because of a divergence in approaches between developed and developing countries. States have made efforts to create rules through bargaining and negotiating within international economic institutions that they see as instruments through which pursuing their specific economic interests. These rules, in turn, will shape state behaviour. The key question, especially for developing countries, is whether such sets of rules reflect an existing distribution of economic power or whether these rules can transform power based relationships. This paper examines the complexity of the issues involved in the creation of a comprehensive framework for investment going through the different

Year	DE	Title and Abstract
		attempts, the results obtained and analysing the different positions in order to discuss the need of creating such a framework, its form and the best forum.
2009	F54	de Carvalho, Fernando J. Cardim. 2009. "Financing Development: Some Conceptual Issues." <i>International Journal of Political Economy</i> , 38(4): 5-24. Developing economies were traditionally conceived as economies where capital was scarce with respect to labor and land. Capital scarcity was explained by different reasons, such as low domestic savings propensities (the poor were too poor to save and the rich consumed like their counterparts in developed economies), international exploitation (as in theories of imperialism), and so on. Nowadays these theories face the problem of having developing economies actually exporting savings to developed countries. In development theory, as in all macroeconomics, the concept of savings has been difficult to grasp, with different authors talking at cross purposes. Financing development, in particular, is surrounded by conceptual and analytical inconsistencies, which responds for at least part of the confusion that reigns in this subdiscipline. This paper tries to dispel some of these confusions by exploring the different meanings of the term "financing" and examining what each one implies for the discussion of overcoming development (itself, in fact, a rather equivocal term, as the paper also suggests).
2009	F59	Palma, Jose G. 2009. <i>The Revenge of the Market on the Rentiers: Why neo-liberal Reports of the end of history turned out to be premature.</i> Faculty of Economics, University of Cambridge, Cambridge Working Papers in Economics. Starting from the perspective of heterodox Keynesian-Minskyian-Kindlebergerian financial economics, this paper begins by highlighting a number of mechanisms that contributed to the current financial crisis. These include excess liquidity, income polarisation, conflicts between financial and productive capital, lack of appropriate regulation, asymmetric information, principal-agent dilemmas and bounded rationalities. However, the paper then proceeds to argue that perhaps more than ever the 'macroeconomics' that led to this crisis only makes analytical sense if examined within the framework of the political settlements and distributional outcomes in which it had operated. Taking the perspective of critical social theories the paper concludes that, ultimately, the current financial crisis is the outcome of something much more systemic, namely an attempt to use neo-liberalism (or, in US terms, neo-conservatism) as a new technology of power to help transform capitalism into a rentiers' delight. In particular, into a system without much 'compulsions' on big business; i.e., one that imposes only minimal pressures on big agents to engage in competitive struggles in the real economy (while doing the opposite to workers and small firms). A key component in the effectiveness of this new technology of power was its ability to transform the state into a major facilitator of the ever-increasing rent-seeking practices of oligopolistic capital. The architects of this experiment include some capitalist groups (in particular rentiers from the financial sector as well as capitalists from the 'mature' and most polluting industries of the preceding techno-economic paradigm), some political groups, as well as intellectual networks with their allies—including many economists and the 'new' left. Although rentiers did succeed in their attempt to get rid of practically all fetters on their greed, in the end, the crisis materialised when markets took their inevitable revenge on the rentiers by calling their (blatant) bluff.
2009	I10	Kalyoncu, Kahraman, and Huseyin Kalyoncu. 2009. "The Empirics of the Imbalance Effect: Per-Capita Income and Human to Physical Capital Ratio." <i>Empirical Economics Letters</i> , 8(2): 119-26. One of the important problems in the theory of economic growth is whether the growth of output per capita depends positively or negatively on the ratio of human to physical capital. Following Duczynski (2003), we apply his approaches for the panel data set. However, we have described the human capital not only with education data but also with the health proxy. This paper provides evidence that this dependence tends to be positive.
2009	N46	de la Escosura, Leandro Prados, and Isabel Sanz-Villarroya. 2009. "Contract Enforcement, Capital Accumulation, and Argentina's Long-Run Decline." <i>Cliometrica</i> , 3(1): 1-26. Argentina has slipped from being among the ten world's richest countries by the eve of World War I to its current position close to mid-range developing countries. Why did Argentina fall behind? We employ a structural model to investigate the extent to which the enforceability of contracts and the security of property rights, as measured by Clague et al.'s "contract intensive money" (CIM), conditioned broad capital accumulation and, subsequently, economic performance in Argentina. Our results suggest that poor contract enforcement played a significant role at the origins of Argentina's unique experience of long-run decline.
2009	N66	Tafunell, Xavier. 2009. "Capital Formation in Machinery in Latin America, 1890-1930." <i>Journal of Economic History</i> , 69(4): 928-50. Investment in machinery is a key component in the analysis of long-term economic growth during the spread of industrialization. This article offers consistent annual series on the magnitude of machinery imports per capita into all Latin American countries for the period 1890-1930. Analysis of these series shows that machinery imports diverged across countries from 1890 through 1913. After 1913 a number of the more backward countries experienced rapid growth in machinery imports. These large differences in machinery investment contributed to unequal development across the Latin American countries.
2009	O22	Rajeswari, T., and Amit Kamal. 2009. "Alternative Estimates of Value Added from Construction." <i>Journal of Income and Wealth</i> , 31(1): 3-8. Considering the heterogeneous character of various types of construction taking place in the economy (e.g., housing, roads, irrigation, and other works) it is necessary to have an independent estimate of value added from construction for different types of construction namely, housing, nonresidential buildings, roads, and other construction works. Data required for such compilation is available from various direct sources like budget documents of central/state governments and local authorities, RBI studies of sample joint stock companies, All India Debt and Investment Survey (AIDIS) etc. The approach adopted by CSO for working out the estimates of fixed capital formation for pucca construction, also provides the estimates of value of output (which includes new construction and repair and maintenance) for different types of construction. In this paper, this data has been utilized to compile GVA from construction for different types of construction. This would also serve the purpose of studying the extent of variation between estimates obtained from commodity flow method and the estimates obtained directly from available sources of data. The difference between the commodity flow estimate and the estimate obtained from direct sources of data has been attributed to the household sector as the AIDIS which is the source of data for the household sector covers only pure households and not the entire household sector which includes unincorporated enterprises and non-profit institutions.
2009	O22 R40	Lydall, Marian. 2009. "Assessing the Impact of Transnet's and Eskom's Infrastructure Investment Programmes on the Capital Goods Sector." <i>Development Southern Africa</i> , 26(3): 429-46. Transnet and Eskom have embarked on a R160.8 billion capital expenditure (capex) programme to improve South Africa's logistics and energy infrastructure over the next 5 years. Although considerable backward linkages will be created in the process of procuring goods and services needed in the construction and operation of the planned projects, a significant portion of investment will be lost because of having to import foreign skills and components that are unavailable locally. It has thus become a government priority to increase local content in the procurement process. Drawing on a series of interviews with leading suppliers involved in the capex programme, this article assesses the impact of such expenditure on the domestic capital goods sector and the constraints that militate against increased local participation.
2009	O25	Benhassine, Najy, and Gael Raballand. 2009. "Beyond Ideological Cleavages: A Unifying Framework for Industrial Policies and Other Public Interventions." <i>Economic Systems</i> , 33(4): 293-309. This paper introduces a new framework to characterize the diversity of public policies and interventions to spur investment and growth. Going beyond ideological cleavages on this topic,

Year	DE	Title and Abstract
		we argue that two orthogonal features determine how much interventions depart fundamentally from neutral policies: (1) their degree of selectivity (in terms of sectors or other targeted categories of firms) and (2) the extent of price subsidies embedded in such interventions. These two characteristics of interventions respond to different types of justifications, and they do not necessarily need to go hand in hand, even if they often do in practice. Depending on their selectivity and/or the extent of price subsidies, interventions are shown to vary in their distortions, their benefits, and their opportunity costs. The framework is used to illustrate how different country characteristics affect these pros and cons of interventionism. In particular, we look at the effects of the initial state of the investment climate, the country's institutional capacity, its political economy context and the nature of the State-business interaction. Using the examples of poor countries with a small undiversified industrial base, we show that it is often in the situations where interventions may be the most needed, that the conditions for their success are likely to be the weakest, which does not mean either that some interventions cannot succeed in low-income countries.
2009	O25	Alam, Quamrul, Thanh Hai Nguyen, and Namul Majumdar. 2009. "Shock Therapy versus Gradualism: The Central Eastern Europe (CEE) and East Asia Compared--A Review of Literature." <i>International Business Research</i>, 2(2): 3-8. This paper reviews a numbers of policy measures taken by the governments in different countries from CEE to East Asia. The findings suggest that despite a number of discrepancies in the economic transition path and policies to support private sector development and SMEs from country to country, there are two distinct models: The Central and Eastern European "shock therapy" approach and the East Asian "gradualism" approach. The findings also highlight that regardless of the political and cultural context, in the early stage of economic transition process where institutional support and market conditions are not apparent, the state and public sectors play key roles. Despite of different levels of interventions, governments from those countries have taken some institutional measures in encouraging the development of private sector and capital formation, and enabling political flexibility and economic structural flexibility for the development of economic transition from centrally planned to market oriented economy. It is important to emphasize that no matter how those inventions are, but how the state can support economic transition and private sector development through political shifts and economic interventions. It could be concluded that the state has significant importance in encouraging capital formation and capitalist industrialization in CEE and East Asian countries.
2009	R40	THE SAME AS O22 Lydall, Marian. 2009. "Assessing the Impact of Transnet's and Eskom's Infrastructure Investment Programmes on the Capital Goods Sector." <i>Development Southern Africa</i>, 26(3): 429-46.

2010	B40	Delbecque, Vincent, and Laurence Nayman. 2010. <i>Measuring Intangible Capital Investment: an Application to the "French Data"</i>. CEPII research center, Working Papers. Following Corrado, Hulten and Sichel (2005) this paper investigates French spending in intangible capital. In this work, we tackle two issues. First, working on national accounting data we sharply investigate the data sources, using detailed supply & use tables taken from the French national accounts. Second, referring to different fields in the economic literature, we deepen the analysis and the measurement methods that have been used recently in the empirical literature. We are then able to assess more accurately the items of interest. We estimate that French intangible GFCF could be valued for the whole economy between 8% and 9% of GDP in 2004 and between 6% and 7% for the business sector.
2010	C24 C25	Cooper, Russell, John C. Haltiwanger, and Jonathan L. Willis. 2010. <i>Euler-Equation Estimation for Discrete Choice Models: A Capital Accumulation Application</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 15675. This paper studies capital adjustment at the establishment level. Our goal is to characterize capital adjustment costs, which are important for understanding both the dynamics of aggregate investment and the impact of various policies on capital accumulation. Our estimation strategy searches for parameters that minimize ex post errors in an Euler equation. This strategy is quite common in models for which adjustment occurs in each period. Here, we extend that logic to the estimation of parameters of dynamic optimization problems in which non-convexities lead to extended periods of investment inactivity. In doing so, we create a method to take into account censored observations stemming from intermittent investment. This methodology allows us to take the structural model directly to the data, avoiding time-consuming simulation-based methods. To study the effectiveness of this methodology, we first undertake several Monte Carlo exercises using data generated by the structural model. We then estimate capital adjustment costs for U.S. manufacturing establishments in two sectors.
2010	C44	Song, Jing-Sheng, Hanqin Zhang, Yumei Hou, and Mingzheng Wang. 2010. "The Effect of Lead Time and Demand Uncertainties in (r,q) Inventory Systems." <i>Operations Research</i>, 58(1): 68-80. We study a single-item (r, q) inventory system, where r is the reorder point and q is the order quantity. The demand is a compound-Poisson process. We investigate the behavior of the optimal policy parameters and the long-run average cost of the system in response to stochastically shorter or less-variable lead times. We show that although some of the properties of the base-stock system can be extended to this more general model, some cannot. The same findings also apply when the comparison is conducted on the lead-time demand distributions.
2010	C58	Elder, John, and Apostolos Serletis. 2010. "Oil Price Uncertainty." <i>Journal of Money, Credit, and Banking</i>, 42(6): 1137-59. The theories of investment under uncertainty and real options predict that uncertainty about, for example, oil prices will tend to depress current investment. We reinvestigate the relationship between the price of oil and investment, focusing on the role of uncertainty about oil prices. We find that volatility in oil prices has had a negative and statistically significant effect on several measures of investment, durables consumption, and aggregate output. We also find that accounting for the effects of oil price volatility tends to exacerbate the negative dynamic response of economic activity to a negative oil price shock, while dampening the response to a positive oil price shock.
2010	D01	Jones, Charles I., and Paul M. Romer. 2010. "The New Kaldor Facts: Ideas, Institutions, Population, and Human Capital." <i>American Economic Journal: Macroeconomics</i>, 2(1): 224-45. In 1961, Nicholas Kaldor highlighted six "stylized" facts to summarize the patterns that economists had discovered in national income accounts and to shape the growth models being developed to explain them. Redoing this exercise today shows just how much progress we have made. In contrast to Kaldor's facts, which revolved around a single state variable, physical capital, our updated facts force consideration of four far more interesting variables: ideas, institutions, population, and human capital. Dynamic models have uncovered subtle interactions among these variables, generating important insights about such big questions as: why has growth accelerated and why are there gains from trade?
2010	D01	Calcagnini, Giorgio, and Enrico Saltari, eds. 2010. <i>The Economics of Imperfect Markets: The Effects of Market Imperfections on Economic Decision-Making</i>. Contributions to Economics. Heidelberg and New York: Springer. Physica. Eleven papers, originally presented at a conference held at the University of Rome "La Sapienza" in May 2008, examine the effects of market imperfections on the decision making of economic agents and on economic policies that try to correct inefficient market outcomes due to those imperfections. Papers discuss what cash shortfalls and windfalls can tell us about finance constraints; non-Tobin's q in tests for financial constraints to investment; cash holdings, firm value, and the role of market imperfections--a cross-country analysis;

		multiple bank relationships and the main bank system--evidence from a matched sample of Japanese small firms and main banks; the role of fixed assets in reducing asymmetric information; financial development and long-run growth--cross-sectional evidence revised; investment, productivity, and employment in the Italian economy; the macroeconomics of imperfect capital markets--whether saving-investment imbalances; the effects of uncertainty and sunk costs on firms' decision making--evidence from net entry, industry structure, and investment dynamics; investment and trade patterns in a sticky-price, open-economy model; and the anticompetitive effects of the antitrust policy.
2010	D04	Mairate, Andrea. 2010. "The Rationale for Economic Evaluation in Europe: The Case of EU Regional Policy." <i>Cuadernos Economicos de I.C.E.</i> , 0(80): 11-27. In an economic context characterised by scarce EU budgetary resources and strained public finances, cost-benefit analysis (CBA) plays a crucial role in informing public investment decisions. Drawing from the CBA experience under the Structural and Cohesion Funds, the paper reviews the main developments over the last decade. It points out the relevance of CBA in assisting the allocation of EU funds across projects. Particularly, it shows how the 'funding gap' method used to determine the level of community assistance should prevent the crowding out of other sources of finance by increasing the leverage effect and creating incentives for attracting private capital. The paper discusses the main policy implications in terms of trade-offs and incentives. Finally, it highlights the role of the European Commission in institutionalising the practice of CBA in public decision making and explores possible developments in economic evaluation.
2010	D10	CV: Lu, Feng. 2010. "On Consumerism and the 'Logic of Capital'." In <i>Eco-socialism as Politics: Rebuilding the Basis of Our Modern Civilization</i> , ed. Qingzhi Huan, 77-102. Dordrecht and New York: Springer.
2010	D22	Alexiou, Constantinos. 2010. "A Keynesian-Kaleckian Model of Investment Determination: A Panel Data Investigation." <i>Journal of Post Keynesian Economics</i> , 32(3): 427-43. The undertaken study purports to assess the empirical merits of the Post Keynesian doctrine as this is reflected by both the Keynesian as well as the Kaleckian theoretical approaches to investment determination. In doing so, a generalized method of moments panel data methodology provides the econometric platform upon which the respective models have been vigorously tested. Annual time-series data were used, spanning from 1970 to 2005, for the G7 economies. The generated evidence confirms previous analyses insofar as capacity utilization and profits assume a key role in the determination of investment.
2010	D53	House, Christopher L., and Yusufcan Masatlioglu. 2010. <i>Managing Markets for Toxic Assets</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 16145. We present a model in which banks trade toxic assets to raise funds for investment. The toxic assets generate an adverse selection problem and, as a consequence, the interbank asset market provides insufficient liquidity to finance investment. While the best investments are fully funded, socially efficient projects with modest payoffs are not. Investment is inefficiently low because acquiring funding requires banks to sell high-quality assets for less than their "fair" value. We then consider whether equity injections and asset purchases can improve market outcomes. Equity injections do not improve liquidity and may be counterproductive as a policy for increasing investment. By allowing banks to fund investments without having to sell high-quality assets, equity injections reduce the number of high-quality assets traded and further contaminate the interbank market. Paradoxically, if equity injections are directed to firms with the greatest liquidity needs, the contamination effect causes investment to fall. In contrast, asset purchase programs, like the Public-Private Investment Program, often have favorable impacts on liquidity, investment and welfare.
2010	D53	Martin, Alberto, and Filippo Taddei. 2010. <i>International Capital Flows and Credit Market Imperfections: A Tale of Two Frictions</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 8131. The financial crisis of 2007-08 has underscored the importance of adverse selection in financial markets. This friction has been mostly neglected by macroeconomic models of financial frictions, however, which have focused almost exclusively on the effects of limited pledgeability. In this paper, we fill this gap by developing a standard growth model with adverse selection. Our main results are that, by fostering unproductive investment, adverse selection: (i) leads to an increase in the economy's equilibrium interest rate, and; (ii) it generates a negative wedge between the marginal return to investment and the equilibrium interest rate. Under financial integration, we show how this translates into excessive capital inflows and endogenous cycles. We also explore how these results change when limited pledgeability is added to the model. We conclude that both frictions complement one another and argue that limited pledgeability exacerbates the effects of adverse selection.
2010	H51	Cruz, Aline Cristina, Erly Cardoso Teixeira, and Marcelo Jose Braga. 2010. "Os Efeitos dos Gastos Publicos em Infraestrutura e em Capital Humano no Crescimento Economico e na Reducao da Pobreza no Brasil. (With English summary)." <i>Economia (University of Brazil)</i> , 11(4): 163-85. This paper proved the efficiency of public expenditures in education, health, roads, and energy, regarding the improvement of human and physical capital quality in Brazil, whose advances increase per capita income and total factors productivity. It is observed that the expenditures in these categories promote growth economics with a reduction on poverty. If in one hand, the per capita GDP and the level of TFP have inverse relation with the poverty, on the other; direct relation exists between income concentration and population growth and the number of poor people. Thus, public expenditure in human capital and in physical infrastructure generates growth pro-poor.

On endogenous growth with

Year	DE	Title and Abstract
		physical capital, human capital and product variety. European Economic Review 44, 491-515] suggest that the typical advanced economy follows three development phases, characterized in a temporal order by physical capital accumulation, human capital formation, and innovation, and that the transitional dynamics of the model reproduce such a sequencing. I argue that other sequences of the phases of development are possible and show that the model can generate a trajectory in which innovation precedes human capital formation. This trajectory accords with the observation that the rise in formal education followed with a considerable lag the process of industrialization. U.S. income and educational time series data are used to corroborate the innovation-education trajectory.

2010	K21	Sudsawasdi, Sasatra. 2010. "An Empirical Assessment of the Relationship between Competition Policy and Investment." <i>Journal of Asian Economics</i> , 21(5): 466-75. The relationship between competition policy and investment is empirically examined. Empirical findings suggest that increasing market competition has a positive and robust impact on the share of total investment in GDP per capita. Developing countries enjoy benefits from competition legislation efficiency improvement, whereas the reduction of government anti-competitive price control intervention enhances the good investment environment in developed countries. In relation to the potential impacts of ASEAN competition policies, if ASEAN-4 countries (Indonesia, Malaysia, Philippines, and Thailand) become as competitive as Singapore, the investment shares are expected to increase to approximately 2-4%. Further, foreign direct investment inflows from the 30 OECD countries are expected to increase roughly 0.6-1.2%.
2010	K31	Kerdrain, Clovis, Isabell Koske, and Isabelle Wanner. 2010. <i>The Impact of Structural Policies on Saving, Investment and Current Accounts</i> . OECD, Economics Department, OECD Economics Department Working Papers: 815. This paper explores the impact of structural policies on saving, investment, and current accounts in OECD and non-OECD economies. Since the current account effects of structural reforms are often complex and ambiguous from a theoretical perspective, new OECD empirical analysis is carried out. Reduced-form equations are estimated for a panel of 30 OECD countries as well as for a panel/cross-section of 117 OECD and non-OECD countries that relate saving, investment and current accounts to policy indicators and a set of macroeconomic control variables. This work suggests that structural reforms may influence saving, investment and current accounts through their impact on macroeconomic conditions such as productivity growth or public revenues and expenditures, but also more directly: i) higher social spending (in particular on health care) is found to lower the saving rate and thereby to weaken the current account, most likely reflecting lower precautionary saving; ii) product market liberalisation temporarily boosts investment and thus also weakens the current account; iii) financial market deregulation may lower the saving rate, though only in less developed countries; iv) stricter employment protection may be associated with lower saving rates if unemployment benefits are low, as well as with higher investment rates possibly due to greater substitution of capital for labour. A scenario analysis indicates that fiscal consolidation and structural reforms in the main world economies could significantly reduce current global imbalances, possibly by about a third.

2010	P41	Felipe, Jesus, and John McCombie. 2010. <i>Modeling Technological Progress and Investment in China: Some Caveats</i> . Levy Economics Institute, The Economics Working Paper Archive. Since the early 1990s, the number of papers estimating econometric models and using other quantitative techniques to try to understand different aspects of the Chinese economy has mushroomed. A common feature of some of these studies is the use of neoclassical theory as the underpinning for the empirical implementations. It is often assumed that factor markets are competitive, that firms are profit maximizers, and that these firms respond to the same incentives that firms in market economies do. Many researchers find that the Chinese economy can be well explained using the tools of neoclassical theory. In this paper, we (1) review two examples of estimation of the rate of technical progress, and (2) discuss one attempt at modeling investment. We identify their shortcomings and the problems with the alleged policy implications derived. We show that econometric estimation of neoclassical models may result in apparently sensible results for misinformed reasons. We conclude that modeling the Chinese economy requires a deeper understanding of its inner workings as both a transitional and a developing economy.
2010	Q52	Guest, Ross. 2010. "The Economics of Sustainability in the Context of Climate Change: An Overview." <i>Journal of World Business</i> , 45(4): 326-35. The emerging field of sustainable business has its roots in both science and economics--in particular the fields of environmental science and the economics of sustainability. This article provides an overview to the latter field with application to environmental damage due to climate change. The aim is to provide an economic context for the papers in this special issue. The article outlines four essential elements in what has become a vast literature in the economics of sustainability in the context of climate change. First is the dilemma in valuing the distant future which concerns the vexed issue of discounting outcomes that are expected to occur over a very long time horizon. The second is the related characteristics of uncertainty and irreversibility that create an option value in taking action. The third element is the peculiarities of natural capital (arising from the natural environment) compared with reproducible capital (things we make that are used to produce goods and services). The post-neoclassical notions of social capital and knowledge capital are also briefly mentioned. The fourth element is how to manage the

Year	DE	Title and Abstract
		global "commons", the prime example of which is the climate. This article is written for the general business reader with an understanding of basic economic concepts and therefore avoids mathematics. References to more technical treatments are provided.

2011	D44	Bratland, John. 2011. "The Myth of the "Winner's Curse" in Auctions of Capital Goods." <i>Quarterly Journal of Austrian Economics</i>, 14(1): 25-52. The winner's curse was "discovered" in low rates of return on certain types of capital goods acquired in auctions or negotiated acquisitions. The inference was that companies were systematically bidding amounts in excess of their presumed "common investment worth." In exploring this phenomenon, experimental auctions have uncritically relied on this exogenous ex ante standard of common capital worth. However, experiment auction are irrelevant to auctions of capital goods. Capital goods imply strategies for their employment. But an assumed common investment worth implies an absence of differentiated strategies. In fact, the prospective investment worth of a capital good inheres in strategically sought complementarities in the production of often distinctively differentiated goods and services. Hence, there is no likelihood that capital goods would ever have an appraised worth common to competing bidders. Bids can only be assessed ex post in the success or failure of an entrepreneurial strategy. This inquiry suggests a revised interpretation of the winner's curse.
2011	E02	Tiwari, Aviral Kumar. 2011. "Foreign Aid, FDI, Economic Freedom and Economic Growth in Asian Countries." <i>Global Economy Journal</i>, 11(3). This study examines the effectiveness of foreign aid, foreign direct investment, and economic freedom for selected 28 Asian countries in a panel framework. The model includes foreign aid, foreign direct investment, economic freedom, labor force, and capital stock. The estimation procedure was carried out on pooled annual time series data for the period 1998-2007. For the purpose of analysis, we used static and dynamic panel data techniques. The results indicated that an increase in the fiscal freedom, financial freedom, and domestic capital stock were significant factors positively affecting economic growth. Freedom from corruption, inflow of foreign direct investment and foreign aid were significant factors negatively affecting economic growth. Further, we found that life expectancy played a significant and positive role in economic growth. Foreign aid had a non-linear impact (negative impact of high aid flows) upon economic growth.
2011	E02 N75	Herd, Richard, Paul Conway, Sam Hill, Vincent Koen, and Thomas Chalaux. 2011. <i>Can India Achieve Double-digit growth?</i> OECD Publishing, OECD Economics Department Working Papers: 883. In recent years, India has enjoyed one of the highest growth rates worldwide, weathering the global financial crisis better than many other countries. Prudent macroeconomic policies will be critical to prolonging the current expansion, given the risks associated with high inflation and volatile capital flows. A steadfast commitment to fiscal consolidation is needed to continue to reduce the large deficit that emerged in the aftermath of the slowdown and avoid crowding out private investment. Stepping up structural reforms will also be necessary if double-digit growth rates are to be achievable over the coming decade or so. Indeed, the operating environment for private business remains challenging. While infrastructure is improving in key sectors, partly thanks to greater private investment, bottlenecks endure and efforts to intensify competition and ensure continued strong investment are required. Labour market reforms are also required to promote job creation. Rapid economic development has boosted living standards and reduced poverty but poverty remains high. There is a need to strengthen social welfare systems and access to health and education to ensure widespread benefits from continued high growth. This Working Paper relates to the 2011 OECD Economic Survey of India (www.oecd.org/eco/surveys/india)
2011	E02	Edwards, Jeffrey A., and Jennis J. Biser. 2011. "The Interactive Effect of Remittances and Civil Liberties on Investment and Consumption." <i>International Journal of Development Issues</i>, 10(1): 20-33. The purpose of this paper is to investigate the level of influence that civil liberties has on the marginal effect of remittances on gross domestic investment and consumption separately and measures it across all levels of civil liberties. The authors employ a two-stage system generalized method of moments procedure and the civil liberties subset of the Freedom in the World Index as a proxy for civil liberty. The findings indicate a substitution effect from investment to consumption as civil liberties deteriorate for developing south economies, though not for emerging economies. In addition, the marginal effect of remittances on investment diminishes less quickly as economies become less free than it increases for consumption indicating that the substitution is not quite one-for-one.

2011	E02	Kerdrain, Clovis, Isabell Koske, and Isabelle Wanner. 2011. "Current Account Imbalances: Can Structural Reforms Help to Reduce Them?" <i>OECD Journal: Economic Studies</i>, 2011(0): 31-74. This article explores the impact of structural policies on saving, investment, and current accounts in OECD and non-OECD economies. Since the current account effects of structural reforms are often complex and ambiguous from a theoretical perspective, new OECD empirical analysis is carried out. Reduced-form equations are estimated for a panel of 30 OECD countries as well as for a panel/cross-section of 117 OECD and non- OECD countries that relate saving, investment and current accounts to policy indicators and a set of macroeconomic control variables. This work suggests that structural reforms may influence saving, investment and current accounts through their impact on macroeconomic conditions such as productivity growth or public revenues and expenditures, but also more directly: (i) higher social spending (in particular on health care) is found to lower the saving rate and thereby to weaken the current account, most likely reflecting lower precautionary saving; (ii) product market liberalisation temporarily boosts investment and thus also weakens the current account; (iii) financial market deregulation may lower the saving rate, though only in less developed countries; (iv) stricter employment protection may be associated with lower saving rates if unemployment benefits are low, as well as with higher investment rates possibly due to greater substitution of capital for labour. A scenario analysis indicates that fiscal consolidation and structural reforms in the main world economies could significantly reduce current global imbalances, possibly by about one-third.

2011	K13	Greenhalgh, Christine, Mark Rogers, and Philipp Schautschick. 2011. Do firms that create intellectual property also create and sustain more good jobs? Evidence for UK firms, 2000-2006. Princeton University, Department of Economics, Industrial Relations Section., Working Papers: 1319. A common assumption in innovation policy circles is that creative and inventive firms will help to sustain employment and wages in high wage countries. The view is that firms in high cost production locations that do not innovate are faced with loss of market share from import competition, so jobs move to producers in developing countries with lower labour costs. Domestic firms are encouraged to innovate, and to obtain intellectual property assets to protect their innovations, so that they can sustain local employment and pay high wages. Policies to subsidise R&D and to encourage intellectual property protection are partly justified on these grounds. Nevertheless the available evidence concerning the employment and wage benefits of such activity is rather sparse. In this paper we first survey some existing literature on innovation and jobs. We outline arguments for using both patents and trade marks as indicators of innovation. We then construct a large sample of UK firms observed from 2000 to 2006, matching records of patents and trade marks to company data. We begin by estimating a cross section employment growth equation for 2003-2006 to discover if there is any impact of stocks of trade marks acquired in 2000-2003. We then explore in more detail the impact of recent trade mark and patenting activity on the level of employment and the average rate of pay in these firms. We do this using the data as a six year panel, estimating both an employment function and a relative earnings equation at the firm level. Our aim throughout is to identify and calibrate the assumed positive effects that underpin modern innovation policy.

2011	K40	Ferrando, Annalisa, and Nicolas Griesshaber. 2011. Financing obstacles among euro area firms: Who suffers the most?. European Central Bank, Working Paper Series: 1293. In this study we investigate the determinants of financing obstacles using survey data on a sample of around 5000 firms from the euro area countries. This completely new survey--started at the end of 2009--gives us the opportunity to test whether firm characteristics such as size, age, economic branch, financial autonomy and ownership are valid predictors of financing obstacles also during the recent financial crisis. Our results show that only age and ownership are robust explanatory variables for firms' perceived financing obstacles while mixed results are found for size and economic branches.
2011	N32	Diss: Orrego Peche, Fabrizio. 2011. Essays in Overlapping Generations Economies. PhD diss. Carnegie Mellon University. In Chapter 1, Habit formation and sunspots in overlapping generations models, I introduce habit formation into an otherwise standard overlapping generations economy with pure exchange populated by three-period-lived agents. Habits are modeled in such a way that current consumption increases the marginal utility of future consumption. With logarithmic utility functions, I demonstrate that habit formation may give rise to stable monetary steady states in economies with hump-shaped endowment profiles and reasonably high discount factors. Intuitively, habits imply adjacent complementarity in consumption, which in turn helps explain why income effects are sufficiently strong in spite of logarithmic utility. The longer horizon further strengthens the income effect. Finally, I use the bootstrap method to construct stationary sunspot equilibria for those economies in which the steady state is locally stable. Chapter 2, Demography and the long-run trend of interest rates and the price-earnings ratio, states that during the twentieth century, the U.S. witnessed a cyclical birth rate: 52 million people were born between 1925 to 1944, 79 million from 1945 to 1964, and 69 million in the baby bust from 1965 to 1984. These birth waves in turn shaped the evolution of the ratio of middle-age to young adults, or MY ratio, which captures the stance of the population pyramid at any given time. In this paper, I study the effects of demographic change, as measured by the MY ratio, on interest rates and the price-earnings ratio. In order to accomplish this, I construct a deterministic overlapping generations model with pure exchange in the spirit of Geanakoplos, Magill and Quinzii [2004]. The behavior of the MY ratio gives rise to exogenous cycles that last forty years. The first prediction of the model is that the price-earnings ratio should be in phase with the MY ratio. Since interest rates adjust to prevent any arbitrage opportunities, the second prediction is that real interest rates should move inversely with the MY ratio, except after the peak in the MY ratio. The model matches qualitatively the long-run trends in real interest rates and the price-earnings ratio in the U.S. postwar era. With production, the results do not change significantly, provided that capital adjustment costs are allowed for. In chapter 3, Sequential incompleteness and dynamic suboptimality in stochastic overlapping generations economies with production. I study a stochastic overlapping generations model with production and three-period-lived agents. Agents trade bonds and risky capital. Unlike the two-period model, I show that a stationary equilibrium in which prices and allocations depend solely on the aggregate capital stock and the current shock does not exist. The recursive equilibrium becomes the relevant equilibrium concept. For the recursive formulation of the model, markets are sequentially incomplete and hence I show that there is room for Pareto improvements in terms of intergenerational risk sharing. Finally, I examine whether the introduction of capital income taxation improves the allocation of risk.
2011	N75	THE SAME AS E02 Herd, Richard, Paul Conway, Sam Hill, Vincent Koen, and Thomas Chalaux. 2011. Can India Achieve Double-digit growth ?. OECD Publishing, OECD Economics Department Working Papers: 883
2011	O44	Zhang, Weibin. 2011. "Environmental Policy and Pollution Dynamics in an Economic Growth Model." Modern Economy, 2(4): 633-41. The purpose of this paper is to study dynamic interactions among capital accumulation, environmental change and labor distribution. We try to synthesize the growth mechanism in the neoclassical growth theory and the environmental dynamics in traditional models of environmental economics within a comprehensive framework with an alternative approach to household behavior. We build a model which describes a dynamic interdependence among physical accumulation, environmental change, and division of labor under perfect competition with environmental taxes on production, wealth income, wage income, and consumption. We simulate the model to demonstrate existence of equilibrium points and motion of the dynamic system. The simulation demonstrates some dynamics which can be predicted neither by the neoclassical growth theory Solow model nor by the traditional economic models of environmental change.
2011	P20	Vuong, Quan Hoang, Van Nhue Dam, Daniel van Houtte, and Tri Dung Tran. 2011. The Entrepreneurial Facets as Precursor to Vietnam's Economic Renovation in 1986. ULB -- Universite Libre de Bruxelles, Working Papers CEB: 11-010. In this research, we aim to develop a conceptual framework to assess the entrepreneurial properties of the Vietnamese reform, known as Doi Moi, even before the kickoff of Doi Moi policy itself. We argued that unlike many other scholars' assertion, economic crisis and harsh realities were neither necessary nor sufficient conditions for the reform to take place, but the entrepreneurial elements and

Year	DE	Title and Abstract
		undertaking were, at least for case of Vietnam's reform. Entrepreneurial process on the one hand sought for structural changes, kicked off innovation, and on the other its induced outcome further invited changes and associated opportunities. The paper also concludes that an assessment of possibility for the next stage of Doi Moi in should take into account the entrepreneurial factors of the economy, and by predicting the emergence of new entrepreneurial facets in the next phase of economic development.
2011	P40	Asari, Abbas, Mohsen Khezri, and Ahmad Rasooli. 2011. "Capital Market Equilibrium in the Islamic Economy. (In Farsi. With English summary.)." <i>Biquarterly Journal of Economic Essays</i> , 7(14). This paper investigates the capital market equilibrium in an Islamic Economy by modeling the behavior of economic agents in an Islamic economy and developing a general equilibrium mode. Accordingly, the authors have tried to determine the capital market regulator variable by determining the affecting factors on supply and demand of capital in an economy without interest. According to the result, compared with an economy with interest that determined exogenous interest rates in the money market is a regulator for the capital market. The variable profit sharing ratio of families in the productive partnership is earned as a capital market endogenous regulator variable in an economy without interest. Also in this article, capital market equilibrium point and maximum production point of producers is obtained, which means more investment in an economy interest-free to the economy with interest.
2011	Q16	Dwivedi, Sudhakar, Pawan Sharma, and Anil Bhat. 2011. "An Analytical Study of Capital Formation in India with Special Reference to Indian Agriculture." <i>Economic Affairs</i> , 56(4): 359-63. An increase in the stock of capital in a fixed period is known as capital formation of an economy. The capital formation depends upon three factors--formation of savings, mobilization of savings and investment. The agriculture sector still dominates the Indian economic scene by providing livelihood to majority of the population. In most of the developing countries including India, agricultural development is a precondition for economic development. Capital formation is one of the basic factors for increasing production. This is all the more important in the agricultural sector where we are faced with the task of increasing production to keep pace with the increase in population against the odd of the vagaries of monsoon. The judicious use of natural resources for sustainable production of agriculture, adoption of advanced technology and development of infrastructure for facilitating all agricultural activities, ensuring food security in the broader sense of making adequate nutritious food available and accessible to all and making agriculture a profitable activity on par with other industries in the sphere of global economy are the problems that can be successfully tackled only with a strong capital base. This requires a close monitoring of the status of capital formation which in turn rests on the nature of statistical systems and the quality of data available for measurement of capital formation. The share of agriculture in GDP has registered a steady decline from 18.6 per cent in 2004-05 to 14.6 per cent in 2009-10 (at 2004-05 prices). The declining share of agricultural sector in the GDP is a characteristic of all developing economies. The gross capital formation (GCF) in agriculture sector relative to GDP in this sector has an increasing trend from 15.8 per cent in 2005-06 to 21.3 per cent in 2008-09.

2012	A11	Steele, G. R. 2012. "Keynes, Keynesianism and Krugman." <i>Economic Affairs (Institute of Economic Affairs)</i> , 32(1): 64-67. Short courses in economics carry an implicit warning: superficial analysis leads to simplistic conclusions. Where textbooks might be forgiven, a Nobel-Prize-winning economist who builds upon that superficiality deserves a reprimand.
2012	E16	Lombardo, Giovanni, and Federico Ravenna. 2012. "The Size of the Tradable and Non-tradable Sectors: Evidence from Input-Output Tables for 25 Countries." <i>Economics Letters</i> , 116(3): 558-61. We compute the tradable and non-tradable input shares for consumption and investment from the latest release of OECD input-output tables. We document that input shares (the content of tradable and non-tradable goods per unit of final demand) differ substantially from final demand shares (the amount of tradable and non-tradable goods directly demanded for consumption or investment purposes). The deviation is especially large for investment expenditures. Non-tradable share estimates are essential to correctly parameterize multi-sector DSGE open economy models.
2012	E16	Liard-Muriente, Carlos F. 2012. "Integración vertical y productividad: La intensificación de capital en Puerto Rico durante las décadas del 1960-1970. (Vertical Integration and Productivity: The Intensification of Capital in Puerto Rico during the Decades of 1960-1970. With English summary.)." <i>Revista de Economía del Caribe</i> , 9(0): 79-106. This article aims to use the technique of vertical integration as an alternative to traditional productivity measures based on input-output methodology. Leontief scheme suffers certain limitations, which are based on the hypothesis that the technical coefficients are constant. Technical parameters may vary because of technological change, which acts independently of the technical coefficients. That is why the factor "time" plays an important role while in the case of vertical integration, without confronting this problem, any change, either by economies of scale or technological progress, only causes a change in the coefficient vertically integrated, without altering the structure of the system. The article uses the economy of Puerto Rico as applied study. We derive direct and indirect requirements of capital and labor respectively, and the maximum characteristic values (eigenvalues), using the technical coefficient matrices and vectors for use in the economy of Puerto Rico.

The article overviews the results of the research on the operations of mergers and acquisitions (M&As) at the Ukrainian market and discovers the benefits from the positive impact of these processes upon the economic growth, analyzing also their scales and economic sectors involved. The necessity for development and strengthening the M&As in order to increase the investment attractiveness and the competitiveness of Ukraine's economy and for more active involvement of state in the processes of globalization is determined.
2012	H44	Angles, Bruno. 2012. "Les partenariats public-privé: L'avenir du financement des infrastructures. (Public-Private Partnerships, the Future of Infrastructure Funding. With English summary.)." <i>Revue d'Économie Financière</i> , 0(108): 221-28. According to a recent OECD study, the global needs for infrastructure investment amount to 40,000 billion euros by 2040. Faced with the scarcity of public funds, the financing of these needs is seen as a burden or a challenge, at a time when austerity is required even if the term itself is still taboo. Yet, through the existing legal and financial tools that are PPPs or concessions, the state has the capacity to use the private sector to ensure funding of projects to meet the fundamental changes in contemporary societies. But many obstacles remain for private investment, and especially the mobilization of capital over the long term. Infrastructure requires stable and sustainable investments. That is why the needs in economic and social development largely depend in the future, on the ability of states to shift long-term savings and to rely on specialized actors to fill the "infrastructure gap".

Year	DE	Title and Abstract
2012	I19	Alassane, DRABO, COMBES MOTEL Pascale, and AUDIBERT Martine. 2012. <i>Global burden of disease and economic growth</i>. CERDI, Working Papers: 201212. Relationships between health and economic prosperity or economic growth are difficult to assess. The direction of the causality is often questioned and the subject of a vigorous debate. For some authors, diseases or poor health had contributed to poor growth performances especially in low-income countries. For other authors, the effect of health on growth is relatively small, even if one considers that human capital accumulation needs also health investments. It is argued in this paper that commonly used health indicators in macroeconomic studies (e. g. life expectancy, infant mortality or prevalence rates for specific diseases such as malaria or HIV/AIDS) imperfectly represent the global health status of population. Health is rather a complex notion and includes several dimensions which concern fatal (deaths) and non-fatal issues (prevalence and severity of cases) of illness. The reported effects of health on economic growth vary accordingly with health indicators and countries included in existing analyses. The purpose of the paper is to assess the effect of health on growth, by using a global health indicator, the so-called disability-adjusted life year (DALY) that was proposed by the World Bank and the WHO in 1993. Growth convergence equations are run on 159 countries over the 1999-2004's period, where the potential endogeneity of the health indicator is dealt for. The negative effect of poor health on economic growth is not rejected thus reinforcing the importance of achieving MDGs.

2012	Q02	Céspedes, Luis Felipe, and Andres Velasco. 2012. "Macroeconomic Performance during Commodity Price Booms and Busts." <i>IMF Economic Review</i>, 60(4): 570-99. Fluctuations in commodity prices are often associated with macroeconomic volatility. But not all nations are created equal in this regard. The macro response to commodity booms and busts depends both on the structural characteristics of the economy and on the policy framework that is in place. This paper investigates the macro response of a group of commodity-producing nations in episodes of large commodity prices shocks. First, it provides a theoretical framework to analyze how shocks to commodity prices affect the domestic economy. For this the paper uses a simple open-economy model with nominal rigidities and financial frictions. Then it provides empirical evidence (using commodity price boom and bust episodes) that commodity price shocks have a significant impact on output and investment dynamics. Economies with more flexible exchange rate regimes exhibit less pronounced responses of output during these episodes. The paper also provides evidence that the impact of those shocks on investment tends to be larger for economies with less developed financial markets. Moreover, it finds that international reserve accumulation, more stable political systems, and less open capital accounts tend to reduce the real exchange rate appreciation (depreciation) in episodes of commodity price booms (busts).
2012	R51	Dutta, Subrata. 2012. "The Economics of Government Savings: An Analysis of Indian State-Level Fiscal Restructuring." <i>Indian Economic Journal</i>, 60(1): 106-29. Government saving in revenue account may lead to a higher capital outlay, which may in turn increase level of infrastructure in backward region. Backward region is thus empowered to attract private investment, thereby leaving scopes for an increase in demand for investment goods. Demand for consumption goods is also expected to rise as a spillover effect. However, creation of government saving may--at least, in the short run--lead to shrinkage in government consumption (revenue) expenditure. This paper with the help of the Indian state-level budget data attempts to examine these propositions (the fiscal ones).
2013		
2013	C31	La Cava, Gianni. 2013. <i>Inventory Investment in Australia and the Global Financial Crisis</i>. Reserve Bank of Australia, RBA Research Discussion Papers. A sharp decline in inventory investment was an important contributor to the economic slowdown in Australia in 2008/09. I identify the extent to which this was due to a tightening in short-term credit constraints. In an experimental design setting, I identify the causal effect of short-term credit constraints on inventory investment by exploiting variation in the debt maturity structure of Australian companies just prior to the global financial crisis. I show that the companies that were forced to refinance or repay a relatively large share of debt in 2008/09 reduced inventory investment by significantly more than companies that were due to refinance or repay their debt at some other time. A case study on the Australian motor vehicle industry supports the hypothesis that a decline in the availability of short-term credit significantly hampered corporate investment in inventories in 2008/09.
2013	F38	Asongu, Simplice A. 2013. "Fighting African Capital Flight: Timelines for the Adoption of Common Policies." <i>Empirical Economics Letters</i>, 12(10): 1135-40. This paper provides an exhaustive assessment of feasible horizons for policy harmonization against African capital flight. The empirical evidence is based on a methodological innovation on common policy initiatives and the results are premised on 15 fundamental characteristics of African capital flight based on income-levels, legal origins, natural resources, political stability and religious domination. Based on the findings, a genuine standard-setting timeframe is in the horizon of 6-13 years. Within the timeframe, common policies are feasible and could be enforced without distinction of nationality or locality in identified fundamental characteristics with full convergence.
2013	F49	Matsuyama, Kiminori. 2013. <i>Institution-Induced Productivity Differences and Patterns of International Capital Flows</i>. Institute for Advanced Studies, Economics Series: 301. This paper studies theoretically how the cross-country differences in the institutional quality (IQ) of the domestic credit markets shape the patterns of international capital flows when such IQ differences cause productivity differences across countries. IQ affects productivity by changing productivity-agency cost trade-offs across heterogeneous investment projects, which have opposite effects on the investment and capital flows from exogenous productivity differences. The overall effect of IQ could generate U-shaped responses of the investment and capital flows. This means that capital could flow from middle-income to low-income and high-income countries; and starting from a low IQ, a country could experience both growth and a current account surplus after an institutional reform. More generally, the results here offer some

Year	DE	Title and Abstract
		cautions when interpreting the evidence on the role of productivity and institutional differences on capital flows and question the validity of using financial frictions as a proxy for the quality of financial institutions.
2013	F64	CV: Lawn, Philip. 2013. "Globalisation, Economic Transition, and the Environment: An Introduction." In <i>Globalisation, Economic Transition and the Environment: Forging a Path to Sustainable Development</i> , ed. Philip Lawn, 3-35. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2013	H71	Mallick, Jagannath. 2013. "Private Investment in India: Regional Patterns and Determinants." <i>Annals of Regional Science</i> , 51(2): 515-36. This paper analyses private investment by type for 15 major states over the period from 1993-1994 to 2004-2005. This study is new in investigating the determinants of total private investment and domestic private investment at the state level in the Indian context by using generalized method of moments panel estimator. The results show that there is high variation in private investment across Indian states. The results obtained from the regressions show that private investment in the Indian states is explained by infrastructure, the gross fiscal deficit, market size, and labour productivity. This paper contributes to the literature on regional development by empirically establishing the existence of simultaneity between private investment and income at the state level in Indian economy.
2013	J78	Menon, Jayant, and Thiam Hee Ng. 2013. <i>Are Government-Linked Corporations Crowding out Private Investment in Malaysia?</i> The Australian National University, Arndt-Corden Department of Economics, Departmental Working Papers. Private investment in Malaysia has been sluggish since the Asian financial crisis. One explanation is that the growing presence of government-linked corporations (GLCs) has been crowding out private investment. For the first time, we provide empirical evidence on the relationship between GLC presence and private investment. We find that when GLCs are dominant in an industry, investment by private firms is significantly negatively impacted. Conversely, when GLCs do not dominate an industry, the impact on private investment is not seen. Sensitivity tests associated with varying the level of the threshold used to determine dominance confirm the robustness of the results. To revive private investment in Malaysia, government must not only redress its growing fiscal deficit, but also expedite its program of divestment.
2013	J83	Radulescu, Roxana, and Martin Robson. 2013. "Does Labour Market Flexibility Matter for Investment? A Study of Manufacturing in the OECD." <i>Applied Economics</i> , 45(4-6): 581-92. This study examines whether a more flexible labour market--defined here in terms of the strictness of labour regulations regarding the flexibility of employers to adjust levels of employment in response to changing economic conditions--helps to promote a higher level of fixed capital formation in an economy. Theory generates ambiguous predictions concerning the sign of the relationship between investment and the labour market regulation regarding hiring and firing workers, although a positive relationship may be expected. Using an index of labour market regulation compiled from surveys of business executives in 19 Organization for Economic Co-operation and Development (OECD) economies, an econometric analysis is carried out to examine the effects of labour market flexibility on the level of investment in the manufacturing sector. The findings support the proposition that freeing-up regulatory constraints on employers' use of labour helps to create a more favourable environment for investment.
2013	K32	CV: Lai, Desheng, Ning Cai, and Tingting Rong. 2013. "Government Green Investment." In <i>China Green Development Index Report 2011</i> , ed. Xiaoxi Li and Jiancheng Pan, 317-50. Current Chinese Economic Report Series. New York and Heidelberg: Springer.
2013	N34	Bridji, Slim. 2013. "The French Great Depression: A Business Cycle Accounting Analysis." <i>Explorations in Economic History</i> , 50(3): 427-45. Using the business cycle accounting framework [Chari V., P. Kehoe and E. McGrattan 2007], this paper sheds new light on the French Great Depression. Frictions that reduce the efficiency with which factor inputs are used (efficiency wedge) were the primary factor in the economic downturn. The decline in consumption can be attributed to distortions in the Euler equation (investment wedge). In addition, frictions creating a gap between the marginal rate of substitution and the marginal product of labor (labor wedge) contributed to the slowdown of the economy after 1936. This drop in the efficiency wedge might have resulted from financial frictions, whereas the investment wedge might have been caused by financial frictions due to agency costs. Institutional changes in the labor market could serve as a potential explanation for the decline of the labor wedge after 1936.
2013	N51 N52	Turner, Chad, Robert Tamura, and Sean E. Mulholland. 2013. "How Important Are Human Capital, Physical Capital and Total Factor Productivity for Determining State Economic Growth in the United States, 1840-2000?" <i>Journal of Economic Growth</i> , 18(4): 319-71. This paper introduces new data on state-level physical capital by sector and land in the farm sector for the states of the United States from 1840 to 2000. These data are incorporated into aggregate accounting exercises with the aim of comparing cross-state results to those found in cross-country samples. Our aggregate results agree closely with the cross-country literature: input accumulation accounts for most of output growth, between three-fifths and three-quarters, but variation in the growth of TFP accounts for about three-quarters of the variation in the growth rate of output per worker. In convergence accounting, convergence of log TFP accounts for about seventy percent of the observed convergence in log output per worker.
2013	N56	Grinberg, Nicolas. 2013. "Capital Accumulation and Ground-Rent in Brazil: 1953-2008." <i>International Review of Applied Economics</i> , 27(4): 449-71. The paper measures the size of primary-sector surpluses in the form of ground-rent appropriated by social subjects other than landowners in Brazil, and assesses their weight in supporting the process of capital accumulation during the period 1953-2008. For that purpose, the paper identifies the mechanisms through which state policies channelled a portion of ground-rent to capital, especially in the industrial sector, assessing their individual impact. The paper finds that transferred ground-rent has complemented surplus-value normally available for appropriation by capital and thus helped sustain its process of accumulation throughout most the period analysed here, including the post-1990 'neoliberal' era.
2013	P32 Q14	Ma, Hengyun, Jikun Huang, and Les Oxley. 2013. "Capital Formation and Agricultural Growth in China." <i>Asian Economic Papers</i> , 12(1): 166-90. The paper considers the role and determinants of capital formation in Chinese agriculture and, in particular, the effects of capital formation on agricultural total factor productivity (TFP) growth. The results show that capital investment in agriculture by both government and farmers has risen significantly in the past two and a half decades, particularly in recent years. As China remains in the early stages of agricultural policy transition, its political economy would suggest that there will likely be more public investment in, and more subsidies to, agriculture in the coming years. Increased public investment in agriculture appears to have also induced increased farmers' capital formation in agriculture. Credit policy, the overall growth of farmer's income, rural wages, and comparative advantage of commodities are important factors that may facilitate farmers' investment in agriculture. The results also show that the successful growth of China's agriculture has been associated with its high TFP growth. Both public and private agricultural capital formations have played an important role in raising China's agricultural productivity. The TFP decomposition analyses show that technological change is a primary driver of the TFP growth in China's agriculture.

Year	DE	Title and Abstract
2013	P32	CV: Yuan, Tangjun. 2013. "Poverty of Chinese Farmers: What Should the Chinese Government Do?." In <i>Unfinished Reforms in the Chinese Economy</i> , ed. Jun Zhang, 155-96. Hackensack, N.J. and Singapore: World Scientific.
2013	P32	He, Qichun. 2013. "Price Scissors and Economic Growth: The Role of Openness." <i>Pacific Economic Review</i> , 18(1): 60-78. The present paper examines how the reduction in the price scissors impacted economic development during the early stage of China's reform period (i.e., 1981-1998). It is found that an increase in agriculture's terms of trade had a significant complementary effect with exportation on China's economic growth. Moreover, our data supports the results of Sah and Stiglitz (1987), who suggest that a reduction in the price scissors is associated with a decrease in physical capital accumulation in an open economy.

2013	R39	Wu, Jing, Joseph Gyourko, and Yongheng Deng. 2013. <i>Is There Evidence of a Real Estate Collateral Channel Effect on Listed Firm Investment in China?</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 18762. Previous research on the United States and Japan finds economically large impacts of changing real estate collateral value on firm investment. Working with unique data on land values in 35 major Chinese markets and a panel of firms outside the real estate industry, we estimate investment equations that yield no evidence of a collateral channel effect. One reason for this stark difference appears to be that some of the most dominant firms in China are state-owned enterprises (SOEs) which are unconstrained in the sense that they do not need to rely on rising underlying property collateral values to obtain all the financing necessary to carry out their desired investment programs. However, we also find no collateral channel effect for non-SOEs when we perform our analysis on disaggregated sets of firms. Norms and regulation in the Chinese capital markets and banking sector can account for why there is no collateral channel effect operating among these firms. We caution that our results do not mean that there will be no negative fallout from a potential real estate bust on the Chinese economy. There are good reasons to believe there would be, just not through a standard collateral channel effect on firm investment.

2006	A14	Chow, Gregory. 2006. "Are Chinese Official Statistics Reliable?" <i>CESifo Economic Studies</i>, 52(2): 396-414. This article points out that Chinese official statistics are by and large reliable because of the assigned responsibility of the officials preparing them, of their being used in government decision making that is open to public scrutiny, and in many published articles in referred journals. Errors or statistical discrepancies do exist and users of these statistics need to be cautious. Studies by the author using official statistics are cited to support their usefulness. In particular, the estimates of gross domestic product growth rates are re-examined and the errors in the allegation of overestimation by Young, A. ((2003), "Gold into base metals: productivity growth in the People's Republic of China during the reform period," J. P. E. 111 (December), 1220-1261.) are revealed.
2006	B50	CV: Taylor, Lance, Nelson H. Barbosa-Filho, and Codrina Rada. 2006. "Heterodox Business Cycles." In <i>Economic Growth and Distribution: On the Nature and Causes of the Wealth of Nations</i> , ed. Neri Salvadori, 291-310. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2006	C10	Koetse, Mark J., Henri L. F. de Groot, and Raymond J. G. M. Florax. 2006. <i>Capital-Energy Substitution and Shifts in Factor Demand: A Meta-Analysis</i>. Tinbergen Institute, Tinbergen Institute Discussion Papers: 06-061/3. This paper presents results of a meta-regression analysis on empirical estimates of capital-energy substitution. Theoretically it is clear that a distinction should be made between Morishima substitution elasticities and cross-price elasticities. The former represent purely technical substitution possibilities while the latter include an income effect and therefore represent economic substitution potential. We estimate a meta-regression model with separate coefficients for the two elasticity samples. Our findings suggest that primary model assumptions on returns to scale, technological change and separability of input factors matter for the outcome of a primary study. Aggregation of variables and the type of data used in empirical research are also relevant sources of systematic effect-size variation. Taking these factors into consideration, we compute ideal-typical elasticities for the short, medium and long run. The resulting figures clearly show that substitution elasticities are substantially higher than cross price elasticities. Therefore, despite considerable technical opportunities for capital-energy substitution, they are almost entirely outweighed by the negative income effect brought about by energy price increases; the short and medium run cross price elasticities are not statistically different from zero. In the long run this pattern does not hold. Our findings therefore suggest that actual changes in the demand for capital due to energy price increases take time.
2006	C23	Kasahara, Hiroyuki, and Beverly Lapham. 2006. <i>Import Protection as Export Destruction</i>. University of Western Ontario, RBC Financial Group Economic Policy Research Institute, University of Western Ontario, RBC Financial Group Economic Policy Research Institute Working Papers: 20062. This paper develops an open economy model with heterogeneous final goods producers who simultaneously choose whether to export their goods and whether to use imported intermediates. The model highlights mechanisms whereby import policies affect aggregate productivity, resource allocation, and industry export activity along both the extensive and intensive margins. Using the theoretical model, we develop and estimate a structural empirical model that incorporates heterogeneity in productivity and shipping costs using Chilean plant-level manufacturing data. The estimated model is consistent with the key features of the data regarding productivity, exporting, and importing. We perform a variety of counterfactual experiments to assess quantitatively the positive and normative effects of barriers to trade in import and export markets. These experiments suggest that there are substantial aggregate productivity and welfare gains due to trade. Furthermore, because of import and export complementarities, policies which inhibit the importation of foreign intermediates can have a large adverse effect on the exportation of final goods.
2006	C31	Yang, Lijian, Byeong U. Park, Lan Xue, and Wolfgang Hardle. 2006. "Estimation and Testing for Varying Coefficients in Additive Models with Marginal Integration." <i>Journal of the American Statistical Association</i>, 101(475): 1212-27. We propose marginal integration estimation and testing methods for the coefficients of varying-coefficient multivariate regression models. Asymptotic distribution theory is developed for the estimation method, which enjoys the same rate of convergence as univariate function estimation. For the test statistic, asymptotic normal theory is established. These theoretical results are derived under the fairly general conditions of absolute regularity (beta-mixing). Application of the test procedure to West German real GNP (gross national product) data reveals that a partially linear varying coefficient model is best parsimonious in fitting the data dynamics, a fact that is also confirmed with residual diagnostics.
2006	D12	Choudhary, M. Ali, and Paul Levine. 2006. "Idle Worship." <i>Economics Letters</i>, 90(1): 77-83. This paper shows that where there is habit formation in consumption and labour effort, output levels can be driven above or below those levels a social planner would choose depending on the relative size of these two habit effects. In the steady state of an economy where consumption habit persistence dominates, people work excessive hours compared with the social optimum. Some simple empirical evidence suggests that excessive output inefficiencies exist in both the US and the Euro-zone.
2006	D30 D58 D64 H00 H31	Cagetti, Marco, and Mariacristina De Nardi. 2006. <i>Wealth Inequality: Data and Models</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 12550. In the United States wealth is highly concentrated and very unequally distributed: the richest 1% hold one third of the total wealth in the economy. Understanding the determinants of wealth inequality is a challenge for many economic models. We summarize some key facts about the wealth distribution and what economic models have been able to explain so far.
2006	D53 D58	Kato, Ryo. 2006. "Liquidity, Infinite Horizons and Macroeconomic Fluctuations." <i>European Economic Review</i>, 50(5): 1105-30. This paper develops a computable dynamic general equilibrium model in which corporate demand for liquidity is endogenously determined. In the model, liquidity demand is motivated by moral hazard, as in Holmstrom and Tirole (J. Politic. Econom. 106(1998)1). As a result of incorporating agency cost and endogenously determined liquidity demand, the model can replicate an empirical business cycle fact, the hump-shaped dynamic response of output, which is seldom observed in standard RBC dynamics. Further, in the model the corporate demand for liquidity from a financial intermediary (credit line, for instance) is pro-cyclical, while the degree of liquidity dependence (defined as liquidity demand divided by corporate investment) is counter-cyclical. These business cycle patterns are consistent with a stylized fact empirically verified in the lending view literature.
2006	D58	THE SAME AS D30 Cagetti, Marco, and Mariacristina De Nardi. 2006. <i>Wealth Inequality: Data and Models</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 12550.
2006	D64	THE SAME AS D30 Cagetti

Year	DE	Title and Abstract
2006	D73 K42	Coppier, Raffaella, and Elisabetta Michetti. 2006. "Corruption vs Production: A Non-Linear Relationship." <i>Economic Modelling</i> , 23(4): 622-37. This paper analyzes the relationship between corruption, monitoring and production that exists in an economy. We show that high levels of corruption can be connected to high levels of production and that increased monitoring of corruption over some range negatively affects production. In point of fact, we prove that equilibrium production is a non-linear function of the monitoring level, by presenting three different equilibria: high corruption with intermediate production, no corruption but low production and no corruption with high production. We also analyze an optimal strategy depending on the policy objective of the State.
2006	F10	Draca, Mirko, Raffaella Sadun, and John Van Reenen. 2006. <i>Productivity and ICT: A Review of the Evidence</i> . Centre for Economic Performance, LSE, CEP Discussion Papers. We survey the micro and macro literature on the impact of Information and Communication Technologies (ICTs) on productivity. The "Solow Paradox" of the absence of an impact of ICT on productivity no longer holds, if it ever did. Both growth accounting and econometric evidence suggest an important role for ICTs in accounting for productivity. In fact, the empirical estimates suggest a much larger impact of ICT on productivity than would be expected from the standard neoclassical model that we focus on. We discuss the various explanations for these results, including the popular notion of complementary organizational capital. Finally, we offer suggestions for where the literature needs to go.
2006	F10	CV: Bulligan, Guido. 2006. "Synchronisation of Cycles: A Demand Side Perspective." In <i>Convergence or Divergence in Europe? Growth and Business Cycles in France, Germany and Italy</i> , ed. Olivier de Bandt, Heinz Herrmann and Giuseppe Parigi, 187-207. Berlin and New York: Springer.

OECD Economics Department, OECD Economics Department Working Papers: 482. The OECD makes frequent use of the supply-side framework and associated measures of factor productivity, productive potential and associated output gaps in the assessment of the short-term conjunctural situation, comparative economic performance and longer-term growth determinants. This paper describes a number of recent changes and improvements in the methods used in estimating potential output for OECD countries and the systems in which they are used, notably for the production of medium-term economic scenarios. By and large, these reflect important changes and improvements in available statistical data sets, notably for measuring productive capital, as well as the development of more efficient model-based methods for making medium-term projections on a consistent international basis/
2006	F47	Landesmann, M. A., and R. Stehrer. 2006. "Goodwin's Structural Economic Dynamics: Modelling Schumpeterian and Keynesian Insights." <i>Structural Change and Economic Dynamics</i> , 17(4): 501-24. In this paper we pursue the work started jointly with R. Goodwin in the 1990s. Goodwin's later work went very much in the direction of modelling Schumpeter's insights into structural and technological transformations in the context of disaggregated models while allowing for non-full employment outcomes and macroeconomic cyclical patterns to develop alongside these transformations. In a series of papers we have followed up this work for closed and open economies, drawing out in particular the implications of structural transformations for macro-distributional dynamics and effective demand problems. This has been analysed for advanced and catching-up economies and their interdependencies on the global stage. We shall review our modelling efforts in this respect and trace these back to Goodwin's life-long preoccupation with synthesising disaggregated (linear) modelling with macro-dynamic analysis.
2006	G11	Stojkov, Aleksandar. 2006. "A Survey of Competing Theoretical Approaches to Current Account Determination." <i>CEA Journal of Economics</i> , 1(1): 19-32. Recent theoretical approaches to current account determination suggest that the appropriate measure of external balance depends on the country's exposition to international asset trade and the structure of national portfolio. Although valuation changes may reach significant fractions of GDP, the external current account still matters, even for the advanced economies that maintain strong links with the international capital market. The intertemporal (or dynamic-optimizing) model has kept its reputation of workhorse model in new open economy macroeconomics and through its extended versions has preserved its validity at the beginning of the new century, as well. This does not mean that the other approaches have been declared outmoded. The Mundell-Fleming model, for instance, is still a legitimate tool for policy analysis in many countries. There are calls for revisiting the portfolio balance model on the grounds of increasing international asset diversification, as well. Apparently, there is a growing interest in this particular field of international macroeconomics aimed at re-assessing the importance of the concepts of external balance, adjustment and sustainability.

We develop a two-sector growth model in which there are conventional profit-maximizing private firms, together with "public firms", whose objective is to produce a specified quantity of government investment goods--determined by government policy--at minimum cost. We characterize the equilibrium dynamics, and analyze a variety of fiscal disturbances, by simulating a calibrated economy. The effects of different policies, normalized in terms of their impact on the government's intertemporal deficit, are compared. We find that the effects of tax policies are robust with respect to the relative capital intensities of the two productive sectors. However, the effects of government investment are much more sensitive to this aspect.

2006	H51	Kiyamaz, Halil, Yasemin Akbulut, and Ahmet Demir. 2006. "Tests of Stationarity and Cointegration of Health Care Expenditure and Gross Domestic Product: An Application to Turkey." <i>European Journal of Health Economics</i> , 7(4): 285-89. This study examines the long-run relationship among the per capita private, public, and total health care expenditure and per capita gross domestic product and population growth of Turkey. We find some evidence of multivariate cointegrating relationships among the health care expenditure and gross domestic product, and population growth. We further find a bivariate cointegrating relationship between private health care expenditure and per capita gross domestic product. Accordingly, a 10% increase in gross domestic product would translate into a 21.9% increase in total health care expenditure while controlling population growth. The income

Year	DE	Title and Abstract
		elasticity of health expenditure is found to be greater than 1, implying that health care is a luxury good in Turkey. Finally we note that there exists one-way causality running from per capita gross domestic product to various definitions of health care expenses.
2006	H61	Kutan, Ali M., and Niina Pautola-Mol. 2006. "Integration of the Baltic States into the EU and Institutions of Fiscal Convergence." <i>Scientific Journal of Administrative Development</i>, 4(0): 1-53. This paper evaluates the functioning, suitability, and effectiveness of the Maastricht convergence criteria regarding fiscal policy and the Stability and Growth Pact for the Baltic States. We argue that the Maastricht fiscal targets from the Baltic perspective should be considered as long-term goals as opposed to short-run objectives of fiscal policy. Using the European Commission's approach as well as impulse response and variance decomposition techniques, we assess the fiscal discipline and cyclical sensitivity of each state's budget to changes in output gap. Empirical evidence indicates that Estonia and Latvia have been more successful in maintaining fiscal discipline than Lithuania during 1996-2000. We also observe that the Stability and Growth Pact signed in July 1997 would offer enough room for automatic fiscal stabilizers in Estonia and Latvia, but not necessarily in Lithuania. Policy implications of the findings for future perspectives are also discussed.

2006	H61	Song, Lei Lei, and John Freebairn. 2006. "How Big Was the Effect of Budget Consolidation on the Australian Economy in the 1990s?" <i>Australian Economic Review</i>, 39(1): 35-46. This article evaluates the effects of budget consolidation on the Australian economy in the 1990s. As the economy recovered from the 1991-92 recession, the need to improve the fiscal balance to lift national saving became the dominant influence on fiscal policy. The article argues that spending cuts by the Australian federal government announced in 1996 had immediate effects on financial markets, with reduced long-term interest rates of about 50 basis points in 1996-97. Using a modified version of the Treasury macroeconomic model of the Australian economy (TRYM), the article simulates the net macroeconomic effects of the expenditure cuts, fiscal consolidation and lower long-term interest rates. The article finds that the program of budget consolidation had a sizeable short- and medium-term impact on the economy, raising Gross Domestic Product by up to three-quarters of a percentage point and reducing unemployment by 0.3 percentage points over the next two to three years.
2006	I11 I18 J14	Westerhout, Ed W. M. T. 2006. "Does Ageing Call for a Reform of the Health Care Sector?" <i>CESifo Economic Studies</i>, 52(1): 1-31. A popular view is that ageing populations increase health expenditure to GDP ratios because health expenditure correlates positively with age and because the concomitant shrinking of the labour force depresses GDP. The resulting increase in transfers from the young to the old then calls for a reform of health care policies. This article critically examines the arguments underlying this view. It gives credit to factors that counteract the expenditure effect, the effects upon health care market and labour market distortions and the effects upon intergenerational solidarity. Although important, these factors are found to have insufficient weight to invalidate the popular view.
2006	I20	Simoes, Marta. 2006. "Education and Growth in the OECD: An Industry Level Analysis." <i>Ekonomia</i>, 9(2): 202-21. This paper follows the suggestion of recent empirical studies on growth and convergence that highlight the importance of industry-level analysis to shed additional light on the conclusions of aggregate level studies to investigate the role of education on productivity growth in a sample of fifteen manufacturing industries in eleven OECD countries over 1980-2000. The insights from new growth theory and a modified and augmented version of the Benhabib and Spiegel (1994) specification are the basis for the empirical analysis of the role of education in innovation and imitation activities highlighting a role for specific schooling levels across industries according to their technological characteristics. The results can have interesting policy implications. The specialisation of countries in industries with different technological characteristics requires the education of a country's population on the appropriate schooling level and the returns to investing in education differ across industries and countries depending on whether they are leaders or not.
2006	I25	Costelenos, Georgios, E. Athanasiou, and A. Antoniou. 2006. "Aspects of Long Run Growth in 19th Century/Pre-WWI Greece (1833-1910): A Tentative Approach." <i>Spoudai</i>, 56(2): 44-74. The purpose of this work is to shed some light on the characteristics of the growth experienced in Greece during the first eighty years of its existence. In this respect it is argued that Greece appears to have experienced a rather moderate growth in per-capita terms during this period. Furthermore, assuming a steady state economy, there are indications that education expenditure played a relatively important role in the process.

2006	I30	Pizzuti, Felice Roberto. 2006. "Welfare state e crescita economica: Note sulla situazione in Europa e in Italia. (Welfare State and Economic Growth: Notes on the Situation in Europe and Italy. With English summary)." <i>Economia e Lavoro</i> , 40(3): 5-25. The various approaches employed in analysing and investigating the relationships between welfare state and economic growth can in some cases lead to very different policies and findings. Despite the widespread use and prestige of the trade-off thesis and the applicative indications deriving from it, more appropriate econometric verification fails to confirm the existence of the negative links between social policies and economic growth hypothesised applying the approach of economic liberalism. Historical, analytic, and empirical examination reveals a range of possible interactions. In the article, it is suggested that between social spending and growth there exists a qualified complementarity, the intensity of which depends on the productive system and the composition of welfare services. In the last few years, the role of social goals in relation to the aims of growth and employment has been a central issue in the debate and choices developing alongside the uncertain evolution of the European Union. However, shortcomings in the EU policies and institutions, disparities in their relations with the market, and an unfavourable socio-political climate have got in the way of positive development in relations of complementarity between welfare and growth delineated in the Lisbon Strategy. Citing the findings of the report on the welfare state, 2006, edited by the author, the article contains analysis--with reference to Europe and in particular to Italy--of welfare issues in relation to matters of growth, market globalization, and the increasing need for innovation in the productive systems. For Italy possible sectoral reform lines are also indicated, and in the specific case of the social security system reference is made to a proposal aiming at improving the degree of coverage and, at the same time, the health of the budget.

"Temporal Causality and the Dynamics of Judicial Appellate Caseload, Real Income and Socio-economic Complexity in Australia." <i>Applied Economics</i> , 38(19): 2209-19. This study applies Granger causality tests within a multivariate error correction framework to examine the relationship between judicial caseload, real income and urbanization for Australia using annual data from 1904 to 2001. Decomposition of variance and impulse response functions are also considered. The Granger causality results as well as the decomposition of variance and impulse response functions suggest that urbanization is the most exogenous of the three variables in both the long run and short run while judicial caseload and real income are relatively exogenous in the short run.

"Romania: Comparative Advantage in Foreign Trade and the Achievement of a Solid Catching-Up Growth in the Future." <i>Romanian Economic and Business Review</i> , 1(2): 54-57. The systemic transformation from centrally planned system to market economy in Romania began 16 years ago. The market-oriented reforms involved a radical change of economic policies. The list of these changes is extremely large but the proposed prescription of systemic transformation has established at least six key policy measures: macroeconomic stabilization; internal liberalization; removal of restrictions on trade, and foreign direct investment--the so called external liberalization; privatization of state owned enterprises; development of a new private sector; establishment of a market supportive legal framework. The outcome of Romania's economic performance during transition remains until now somewhat puzzling.
2006	L68	Ashraf, Mohammad, and Khan A. Mohabbat. 2006. "The Inflation and Output-Gap Tradeoff Debate Revisited." <i>Journal of Economics (MVEA)</i> , 32(2): 71-90. In this study, using the Phillips curve type models, we use four different measures of U.S. output to test the hypothesis that there is a positive correlation between the output-gap and wage inflation. We measure the output-gap using a constant natural level of output as well as a Kalman filter where the natural level of output changes over time. Neither the use of real GDP nor services sector data generated any support for the hypothesis. However, we found overwhelming evidence of positive correlation between the output-gap and wage inflation in the durable goods industries. Our results suggest that a requiem for the Phillips curve may be premature.
2006	M11	Bivin, David G. 2006. "Has Production Management Improved since 1984?" <i>Economic Inquiry</i> , 44(4): 671-88. The growth rate of GDP stabilized around 1984, and improvements in production management have been cited as a possible cause. This article examines this rationale with two-digit SIC manufacturing data. The empirical questions are whether there is evidence of structural change in industry output around 1984 and, if so, did output track demand more closely following the change? The results indicate that only two industries exhibited structural change in the 1982-86 period. There is evidence that output has tracked demand more closely in recent years, but this is because demand shocks have become less persistent.

Recent evidence suggests that oil prices affect output of the economy in a non-linear complex fashion. However, there is no clear agreement on the unknown functional form. An application of artificial neural network for short-term forecasting of GDP using oil prices and utilizing cascaded learning is proposed. We find that the mean absolute forecasting error and the mean square forecasting error is reduced by applying cascaded neural network relative to conventional artificial neural networks and popular linear models. Results also indicate that the developed forecasting approach is useful and point to the potential of this methodology for other economic applications. Our results are important for improving economic forecasts and introduce oil prices as a strong candidate for future forecasting exercises.

With English summary.)." <i>Revue d'Etudes Comparatives Est-Ouest</i> , 37(4): 119-64. Since independence, Ukraine's economy has gone through a deep depression followed by spectacular growth since 1999. After a 50% decline, industrial output bounced back in 2006 to its 1990 level. This upturn has taken place without any major institutional change, the rule of law still being as absent as during earlier periods. Growth resumed apparently thanks to classical economic reforms, conducted in line with the Washington consensus and after much hesitation. This case shows that growth is compatible with a "bad institutional equilibrium."

"Coverage and Reliability of Chinese Statistics Regarding Sulfur Dioxide Emissions during the Late 1990s." <i>Environmental Economics and Policy Studies</i> , 7(4): 415-34. According to official Chinese statistics, sulfur dioxide emissions dropped significantly in the late 1990s before rising again. Some researchers have expressed concern over data reliability, however, and the sample of enterprises represented by sulfur dioxide emission statistics generates only one third of China's industrial output, which may result in undercounting of emissions. In addition, coal production and consumption during the late 1990s may have been undercounted due to politically motivated manipulation of numbers, and this phenomenon may also partly explain the reported reductions in sulfur dioxide emissions. Coal sulfur content derived from coal supply-side information is generally found to be higher than from demand-side information used to calculate emissions for official statistics. Meanwhile, no solid data are available that demonstrate improvement of the desulfurization of smokestack emissions. All of these are potential factors in the underestimation of China's emissions.

2006	Q53 Q57	Tan, Xiaomei. 2006. "Environment, Governance and GDP: Discovering Their Connections." <i>International Journal of Sustainable Development</i> , 9(4): 311-35. This article investigates the impacts of governance and GDP on environmental quality, as measured by water quality, air quality, wilderness of land and biodiversity, using data from 123 countries. It finds no evidence that GDP growth will turn environmental degradation around after a certain point, as much of the literature has suggested. Instead, GDP's impact is mixed and conditional upon governance. Increases in GDP and progress of governance are associated with constant improvement of air and water quality. Specifically, water quality improvements are more dependent on governance, while GDP seems to have a greater impact on air quality. Wilderness of the territorial system is found to correlate negatively with GDP and governance. Biodiversity, however, does not relate to either factor.

2006	R51	Kantike, Ingrida. 2006. "The Role of Commercial Banks in the Regional Development." <i>Journal of International Research Publications: Economy and Business</i> , 1(0): 26-38. The article is devoted to the research of activity of commercial banks at the regions of Latvia. Researches about how to promote economically underdeveloped regions and reduce poverty are carried out all over the world. To qualify the increase of the development of a region gross domestic product (GDP) is used as a basic indicator. The author in her research has worked out that activity of commercial banks is very important for the development of regions of Latvia. Results of the research demonstrate the dependence of GDP from the amount of granted loans. Establishing local branches of the big commercial banks instead of organizing new small banks is a specific feature of Latvia. The number of local branches of banks depends on the economical growth at the particular region.

2007	A10	Farhi, Emmanuel. 2007. <i>Capital Taxation and Ownership when Markets are Incomplete</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 13390. This paper analyzes the theoretical and quantitative implications of optimal capital taxation in the neoclassical growth model with aggregate shocks and incomplete markets. The model features a representative-agent economy with proportional taxes on labor and capital. I first consider the case that the only asset the government can trade is a real risk-free bond. Taxes on capital are set one period in advance, reflecting inertia in tax codes and ruling out replication of the complete

Year	DE	Title and Abstract
		markets allocation. Because capital income varies with the state of the economy, capital taxation provides a state contingent source of revenues. I thus identify a novel potential role for capital taxation as a risk sharing instrument between the government and private agents. However, this benefit must be weighted again the distortionary cost of capital taxation. For a baseline case, the optimal policy features a zero tax on capital. Moreover, numerical simulations show that the baseline case provides an excellent benchmark. I next allow the government to hold a non trivial position in capital. Capital ownership provides the same benefit or risk sharing but without the cost of tax distortions. In a variety of quantitative exercises, I show that capital ownership allows the government to realize about 90% of the welfare gains from moving to complete markets. Large positions are typically required for optimality. But smaller positions achieve substantial benefits. In a business-cycle simulation, I show that a 15% short equity position achieves over 40% of the welfare gains from completing markets.
2007	B16 B23	Maddison, Angus. 2007. "Fluctuations in the Momentum of Growth within the Capitalist Epoch." <i>Cliometrica</i> , 1(2): 145-75. This paper reviews the history of cyclical and long wave analysis and examines the evidence on changes in the momentum of economic growth in 16 advanced capitalist countries from 1820 to 2001. It assesses the work of the main Business Cycle Research Institutes in Western Europe the USA and Russia, as well as that of Kondratieff, Kuznets, Schumpeter, Abramovitz and the long-wave revivalists--Rostow, Mandel and Mensch. It concludes that the existence of regular long-term rhythms in capitalist development is not proven, but distinguishes major changes in the momentum of growth due to disturbances of an ad hoc character. The role of system shocks and historical accidents is important but the role of policy error and success is also emphasised. It identifies five major phases of capitalist development since 1820.

2007	G28	Gupta, Rangan. 2007. "Rational Expectations and the Effects of Financial Liberalisation of Price Level and Output." <i>South African Journal of Economic and Management Sciences</i> , N.S., 10(1): 107-15. This paper develops a generalised short-term model of a small open financially repressed economy, characterised by unorganised money markets, intermediate goods imports, capital mobility, flexible exchange rates and rational expectations, to analyse the price- and output-effects of financial liberalization. The analysis shows that financial deregulation, in the form of increased rate of interest on deposits and higher cash reserve requirements, unambiguously and unconditionally reduces domestic price level, but fails to affect output. Moreover, the result does not depend on the degree of capital mobility. The paper recommends that a small open developing economy should deregulate interest rates and tighten monetary policy if reducing inflation is a priority. Such a policy, however, requires the establishment of a flexible exchange rate regime.
2007	H20	Wang, Hao. 2007. "China Should Improve Its Tax Regime to Reduce Excess Tax Burden." <i>China Economist</i> , 0(9): 88-96. After reviewing relevant theories, this article uses Barro's tax-smoothing model to present an empirical analysis on China's excess tax burden. Whilst providing an explanation for the abnormally high growth of tax revenue, the author suggests further improvements to the tax regime, and in light of current tax policies and the new round of tax reforms, puts forward policy recommendations on how to realize tax-smoothing and reduce the excess tax burden for higher economic efficiency.
2007	H21	Farhi, Emmanuel. 2007. <i>Capital Taxation and Ownership when Markets are Incomplete</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 13390. This paper analyzes the theoretical and quantitative implications of optimal capital taxation in the neoclassical growth model with aggregate shocks and incomplete markets. The model features a representative-agent economy with proportional taxes on labor and capital. I first consider the case that the only asset the government can trade is a real risk-free bond. Taxes on capital are set one period in advance, reflecting inertia in tax codes and ruling out replication of the complete markets allocation. Because capital income varies with the state of the economy, capital taxation provides a state contingent source of revenues. I thus identify a novel potential role for capital taxation as a risk sharing instrument between the government and private agents. However, this benefit must be weighted again the distortionary cost of capital taxation. For a baseline case, the optimal policy features a zero tax on capital. Moreover, numerical simulations show that the baseline case provides an excellent benchmark. I next allow the government to hold a non trivial position in capital. Capital ownership provides the same benefit or risk sharing but without the cost of tax distortions. In a variety of quantitative exercises, I show that capital ownership allows the government to realize about 90% of the welfare gains from moving to complete markets. Large positions are typically required for optimality. But smaller positions achieve substantial benefits. In a business-cycle simulation, I show that a 15% short equity position achieves over 40% of the welfare gains from completing markets.
2007	H52	Heylen, Freddy, and Lorenzo Pozzi. 2007. "Crises and Human Capital Accumulation." <i>Canadian Journal of Economics</i> , 40(4): 1261-85. This paper studies the effects of crises on human capital formation. Theoretically, a crisis undermines total factor productivity, which reduces the return to working and to accumulating physical capital. If the crisis is temporary, young agents will study now and work later. Human capital rises. To test our model we rely on inflation crises as our main empirical proxy. Using GMM panel procedures, our analysis for 86 countries in 1970-2000 confirms the positive effects of crises on human capital. Our main findings survive several robustness tests.
2007	H71 R50	Alinska, Agnieszka. 2007. "Finanse sektora samorządowego na tle finansów publicznych krajów Unii Europejskiej. (Finance of the Municipal Sector in Comparison with Public Finance of the European Union Countries. With English summary.)." <i>Contemporary Economics</i> , 1(1): 5-15. The general financial situation of municipal government in the European Union countries seems to be very good. The dynamics of tax income value growth achieved by local and regional authorities considerably exceed the figures characterizing the all public sector. Moreover, municipal authorities at the local and regional level are a leading public investor in many EU countries, they finance 69.3% of all public investments in average in all EU. Besides the value of their budget deficits, at the level of 0.2% GDP, and also their share in values of the national debt at the level of 5.8% GDP the European Union can be qualified as safe having no negative impact on getting positive economic effects in many countries of the European Union.

With English summary.)." <i>Información Comercial Española Revista de Economía</i> , 0(837): 211-30. This paper provides a quantitative estimate of the order of magnitude of the possible effects of community aid on key macroeconomic variables such as GDP, per capita income, unemployment rate and productivity over the period 1989-2006. The HERMIN-España macroeconomic model was used to compare the variation in such indicators with and without community aid.
2007	H87	Brochner, Jens, Jesper Jensen, Patrik Svensson, and Peter Birch Sorensen. 2007. "The Dilemmas of Tax Coordination in the Enlarged European Union." <i>CESifo Economic Studies</i> , 53(4): 561-95. This study evaluates the economic effects of corporate tax coordination in the enlarged European Union (EU) using a computable general equilibrium model. Our main findings are as follows. (i) Corporate tax coordination can yield modest aggregate welfare gains. The 2004 enlargement of the EU has increased the potential gains from tax harmonization, provided corporate tax rates and tax bases are harmonized at their unweighted averages. (ii) All scenarios for coordination leave some EU Member States as winners and others as losers. An agreement on tax coordination is therefore likely to require elaborate compensation mechanisms. (iii) The large and diverse country effects suggest that enhanced cooperation for a subset of the Member States may be the most likely route towards tax coordination. (iv) Identifying winners and losers from coordination for the purpose of a compensation mechanism may be problematic, since countries experiencing gains in GDP and welfare tend to lose tax revenues, and vice versa.
2007	I21	Lin, Tin-Chun. 2007. "Do Technology Shocks Matter in Taiwan in the 1990s?" <i>Asian-African Journal of Economics and Econometrics</i> , 7(1-2): 407-16. This paper attempts to test the hypothesis that the real output growth in Taiwan in the 1990s could be traced primarily to exogenous factors, such as technology shocks. The evidence supports the consensus view that human capital growth is important for explaining Taiwan's growth over the sample period 1965-1990, but no longer has significant explanatory power for Taiwan's growth over the sample period 1975-2000. More importantly, this paper emphasizes the contrasting empirical results and draws the inference that economic growth in Taiwan in the 1990s could be traced mainly to exogenous factors.
2007	I21	Islam, Tariq Saiful, Md Abdul Wadud, and Qamarullah Bin Tariq Islam. 2007. "Relationship between Education and GDP Growth: A Multivariate Causality Analysis for Bangladesh." <i>Economics Bulletin</i> , 3(35): 1-7. This paper uses the multivariate causality analysis to examine relationship between education and growth in Bangladesh using annual time series data from 1976 to 2003. Recent research works have preferred multivariate to the bivariate approach as the former is thought to be more general than the latter. Besides growth and education whose relationship we examined, two other variables included in our analysis are capital and labour. The empirical results show evidence of bidirectional causality between education and growth in Bangladesh.
2007	I21	Sen, Tapas K. 2007. "Performance Measurement in Social Sectors." <i>Margin: The Journal of Applied Economic Research</i> , 1(3): 299-319. Large public sectors in countries like India need to be efficient; one of the tools to achieve this end is performance measurement. Performance indicators have been in use in the private corporate sector for a long time, and the idea of its adoption in the public sector is also not new. By now, there are several instances of practical application in the public sector, with varying degrees of success. This paper, after briefly discussing the rationale and practical issues relating to use of performance indicators in general and for social sector interventions in particular, illustrates its possible use by the state governments in India with the case of two departments of the Government of Chhattisgarh—health and school education. It discusses the administrative setup of the selected departments and desirable revamp of the setup along with the budgetary system, and discusses the preconditions of useful application of performance indicators. The paper then lists out some output and outcome indicators that can be used to begin with in the two departments of the state government.
2007	I21	Sitz, Alfred. 2007. "Zur Verzinsung von Ausbildung. (Returns on Education. With English summary.)." <i>Wirtschaftspolitische Blätter</i> , 54(1): 143-53. Macroeconomic production and therefore growth as well as employment depend on the level and quality of education. Additional empirical support for this statement is delivered. Central for this paper are investigations and their empirical results concerning the return on education in Austria including also international comparisons. Furthermore differences in return between alternative levels of education are presented and analyzed. In Austria, partly this returns diverge very much which is finally discussed.
2007	J68	Perugini, Cristiano, and Marcello Signorelli. 2007. "Labour Market Performance Differentials and Dynamics in EU-15 Countries and Regions." <i>European Journal of Comparative Economics</i> , 4(2): 209-62. The aim of this paper is to contribute to empirical analysis of the differentials, dynamics and determinants of labour market performance in EU-15. One innovation of the paper reflects our decision not to use a single indicator of labour market performance, but to adopt three variables: employment rate, unemployment rate, and long-term unemployment rate. In addition to national data (1997-2006), the use of data at regional NUTS-2 level (1999-2005) is a key characteristic of this study. Empirical analyses are carried out by means of various comparative statistics and econometric approaches. In the latter, a large set of explicative variables is applied to examine the potential determinants of regional (un)employment levels and dynamics.

(Structure of Production, Intraindustry Trade and Their Relevance for the Optimum Currency Areas Theory. With English summary.)." <i>Politická ekonomie</i> , 55(5): 603-24. This paper deals with the recent empirical phenomenon of intraindustry trade, i.e., trade in similar goods between similar countries. It treats this phenomenon from the point of view of the theory of structure of production, highlighting the importance of sequential nature of production and heterogeneity and specificity of factors of production, as developed by Carl Menger, Eugen von Boehm-Bawerk and their followers of the so-called Austrian school of economics. Simple theory of production structure, along the lines of Austrian economics, is presented and a useful tool for the analysis of intraindustry trade is developed. In the following discussion we make the case for vertical intraindustry specialization, complex manufactured goods and sliced-up production chains across countries. The reader immediately observes the importance of Austrian production structure theory for the analysis of intraindustry trade. We accordingly apply the concepts of the structure of production on intraindustry trade and analyze, in particular, the time- and place-aspects of international production. Finally, we show the relevance of our approach to intraindustry trade for the analysis of business cycle synchronization and optimum currency areas theory.

2007	L94 R42	Noriega, Antonio, and Matias Fontenla. 2007. "La infraestructura y el crecimiento economico en Mexico. (With English summary.)." <i>El Trimestre Economico</i> , 74(4): 885-900. We develop a model where investment in infrastructure complements private investment. We then provide time series evidence for Mexico on both the impact of public infrastructure on output, and on the optimality with which levels of infrastructure have been set. In particular, we look at the long-run effects of shocks to infrastructure on real output. We compute Long-Run Derivatives for kilowatts of electricity, kilometers of roads and phone lines, and find that shocks to infrastructure have positive and significant effects on real output for electricity and roads. These effects of infrastructure on output are in agreement with growth models where long-run growth is driven by endogenous factors of production. Our results further indicate that for electricity and roads, infrastructure provision has not reached growth maximizing levels.

2007	P10	Golebiowski, Grzegorz. 2007. "Modele kapitalizmu a kierunek rozwoju gospodarczego Polski. (Models of Capitalism vs. the Direction of Economic Development in Poland. With English summary.)." <i>Contemporary Economics</i> , 1(3): 5-17. Firstly, the article endeavors to define the very concept of capitalism as well as to catalogue studies of socio-economic systems contained in contemporary literature. Described are the key drivers of a free-market economy that provide the basis for further classification. Having surveyed diverse models of capitalism, the positions of individual states have been displayed. States classed within individual model groups have been then ranked vis-a-vis their competitive factors. The classification and analyses have subsequently led to a more general recommendation in respect of the desirable direction of economic expansion in Poland.
2007	P11	Szilagyi, Judit. 2007. "The Feasibility of the Hungarian Convergence Programme." <i>Romanian Economic and Business Review</i> , 2(3): 83-97. The paper provides an overview of the Hungarian Convergence Programme (CP) that envisages the path to restore macroeconomic equilibrium during the next three years. The spiralling budget deficit in 2006 made an update of the previous CP inevitable. In the September 2006 version, the government shows strong commitment to face up to the fiscal imbalances and structural problems, yet several aspects question the feasibility of the Programme. The paper focuses on the evaluation of the major objectives and their realisation during the first year of the CP as well as on significant technical assumptions and external factors that may constitute a downside risk for the implementation. Besides introducing a corrective fiscal package the Convergence Program draws the outlines of several, long-awaited reforms of almost the entire sphere of the social welfare systems. As the primary focus is on the feasibility of the budgetary consolidation strategy, the paper deals with these reforms only in the context of the long-term sustainability of public finances.
2007	Q02	Soderberg, Johan. 2007. "Prices and Economic Change in Medieval Sweden." <i>Scandinavian Economic History Review</i> , 55(2): 128-52. The article explores relative price changes in medieval Sweden, with a focus on grain, beer, salt, oxen, butter, wax and iron. Supplementary data are provided on copper and hops. Most of these goods declined substantially in price relative to grain. The magnitude of the relative price shifts reflects technological and organisational change. Price cuts tended to be larger for goods that possessed a high knowledge content, such as iron, copper, and beer, or were involved in a more efficiently organised international trade, such as salt. This parallels the notion that north-western Europe, at least from the sixteenth century, developed a distinctive pattern of relative prices, with low prices of industrial goods and high prices of food. It is striking that Sweden, a peripheral economy of medieval Europe, exhibits these traits even before the sixteenth century. The great expansion of the European economy of the early modern period appears as a continuation of the innovations of the late medieval era.
2007	Q10	Mushtaq, Khalid, Faisal Abbas, Abedullah, and Abdul Ghafoor. 2007. "Energy Use for Economic Growth: Cointegration and Causality Analysis from the Agriculture Sector of Pakistan." <i>Pakistan Development Review</i> , 46(4): 1065-73. Economic growth is energy-intensive. Nonetheless, in developing countries like Pakistan, the present energy use in agriculture is not strictly commensurate with energy consumption trends in developed countries. Sharp increases in energy prices have serious implications for the agrarian economy of Pakistan. This study implies the Johansen's co-integration approach and Granger causality to check the degree of integration and the direction of causality among different economic time series for the period 1972-2005. It is found that all the series are first-differenced stationary and there exists a long-run equilibrium relationship among concerned variables. The Granger causality test result suggests that unidirectional causality is running from GDP to oil consumption; electricity to GDP; while neutrality exists for gas and GDP. The implications of this study are that any future growth in the agriculture sector will increase the demand for oil, and if government improves the infrastructure and subsidises rural and agricultural electricity, it would significantly enhance agricultural share of GDP.
2007	Q17	Baek, Jungho, and Won W. Koo. 2007. "Dynamic Interrelationships between the U.S. Agricultural Trade Balance and the Macroeconomy." <i>Journal of Agricultural and Applied Economics</i> , 39(3): 457-70. The effects of the exchange rate and the income and money supply of the United States and its major trading partners on the U.S. agricultural trade balance are examined using an autoregressive distributed lag (ARDL) model. Results suggest that the exchange rate is the key determinant of the short- and long-run behavior of the trade balance. It is also found that the income and money supply in both the United States and the trading partners have significant impacts on U.S. agricultural trade in both the short and long run.

2007	Q30	Kartashov, Georgy. 2007. "Economic Growth and Institutional Quality in Resource Oriented Countries. (In Russian. With English summary.)." <i>Quantile</i> , 0(2): 141-57. According to the Mehлум-Moene-Torvik model, the influence of institutions and natural resources on the level of GDP is ambiguous: depending on the value of a threshold function of institutional quality and natural resource endowment, the economy may be in one of the two equilibrium types--producer equilibrium or grabber equilibrium. In a grabber equilibrium, growth is negatively impacted by resource endowment and positively by institutions; in a producer equilibrium, more resources fosters economic growth, while institutions have no effect at all. Even though the empirical analysis supports the main result, the estimated specification does not fully correspond to the theoretical model. In this paper, we propose a different empirical testing strategy, more adequate to the Mehлум-Moene-Torvik model: the threshold function depends on both resources and institutions, and the regression specification more precisely reflects the influence of institutions and resources on the GDP growth rate. The econometric specification is a two-regime threshold regression, where a threshold value is also estimated. We show that the implications of the theoretical model are fully confirmed in the producer equilibrium, and only partly in the grabber equilibrium. We also discuss and compare various threshold and linear regression specifications.

2007	R21	Esteban, Marisol. 2007. "The Spanish Housing Market: The Likely Effects on the Economy." <i>Ekonomia</i> , 10(2): 138-59. The Spanish housing boom has finally come to an end by the second half of 2007 and the change in the property cycle is under way. The future of the Spanish housing market is very difficult to forecast because uncertainties are great in the national and international markets. Despite so many predictions of a crash of the Spanish real estate market, the evidence available suggests a gradual adjustment of demand and supply. The aim of this paper is threefold: (1) to analyse the workings of the housing market in Spain and identify the determinants of the housing boom in the last decade; (2) to analyse the prospects of the housing sector; and (3) to discuss the likely effects on the economy as a whole from the current downturn in the housing market.
2007	R42	THE SAME AS L94 Noriega, Antonio, and Matias Fontenla. 2007. "La infraestructura y el crecimiento economico en Mexico. (With English summary)." <i>El Trimestre Economico</i> , 74(4): 885-900.
2007	R42	Graham, Daniel J. 2007. "Agglomeration, Productivity and Transport Investment." <i>Journal of Transport Economics and Policy</i> , 41(3): 317-43. This paper is concerned with the links between agglomeration, productivity, and transport investment. It develops an econometric model to investigate the relationship between the density of economic activity and productivity for different sectors of the UK economy. The motivation for exploring this theme is to test whether there might be any external agglomeration benefits that arise from the provision of transport infrastructure but that are not included in standard transport appraisals. The results show that there are positive externalities from increasing urban densities and that these can be substantial, particularly for service industries.

2008	B12	Kurz, Heinz D. 2008. "Innovations and Profits: Schumpeter and the Classical Heritage." <i>Journal of Economic Behavior and Organization</i> , 67(1): 263-78. The paper discusses the problem of innovations and profits from a Schumpeterian perspective using the analytical tools of modern classical economics. The concept of "circular flow" is formalised and Schumpeter's zero-profits assumption investigated. Next a typology of process innovations is discussed using a simple two-sector framework. In Schumpeter profits are transitional phenomena. In the conditions contemplated, increases in labor productivity will lead to rising real wages. The argument is generalized to product-cum-process innovations in systems with joint production where a bad that is costly to dispose of is transformed into a good that can be marketed profitably.
2008	C02	Flaschel, Peter, and Michael Landesmann, eds. 2008. <i>Mathematical Economics and the Dynamics of Capitalism: Goodwin's Legacy Continued</i> . Routledge Frontiers of Political Economy. London and New York: Taylor and Francis, Routledge. Fourteen papers explore the macroeconomic, structural, and microeconomic contributions of Richard Goodwin to the field of economics. Papers discuss coexistence of multiple business cycles in Goodwin's 1951 model; an encompassing theory of macroeconomic growth and fluctuation; Kaleckian investment and employment cycles in postwar industrialized economies; a Goodwin cycle with changing regimes of industrial relations; varieties of capitalism--the flexicurity model; Goodwin cycles and the U.S. economy, 1948-2004; the classical growth cycle after fifteen years of new observations; debt-equity cycles in the twentieth century--empirical evidence and a dynamic Keynesian model; monetary policy rules in small open economies--a Keynesian perspective; semistructural Keynes-Goodwin modeling--elaboration and calibration of a baseline theoretical framework; decomposition methods for analyzing intraregional and interregional income distribution; computational explorations of vertically coupled markets; microfounded animal spirits and Goodwinian income distribution dynamics; and Goodwin's structural economic dynamics in the context of globalization.

2008	C65	Bilancini, Ennio. 2008. "Imprimitivity in Decomposable Economies." <i>Economics Bulletin</i> , 3(69): 1-10. This note extends the analysis of imprimitive indecomposable economies (e.g. Nikaido, 1968, 1970) to the case of economies represented by a decomposable matrix. Using graph theory we show that imprimitivity leads to cyclical production lags also in decomposable economies, although in such a case the property must not be referred to the matrix representing the economy but to its indecomposable sub-matrices along the block-diagonal. The structure of the overall flow of commodities depends on both the number of imprimitive sub-matrices and their imprimitivity index.
2008	C65	Crowley, Patrick M., and David G. Mayes. 2008. "How Fused Is the Euro Area Core? An Evaluation of Growth Cycle Co-movement and Synchronization Using Wavelet Analysis." <i>OECD Journal: Journal of Business Cycle Measurement and Analysis</i> , 4(1): 63-95. This paper uses several recent advances in time-varying spectral methods to analyse the growth cycles of the core of the euro area in terms of frequency content and phasing of cycles. There are two main findings. First that coherence and phasing between the three core members of the euro area (France, Germany, and Italy) continue to differ, and that for France they increased in the 1990s but not noticeably since the launch of the euro. Second that similarities vary considerably according to the length of cycle. They are high for low frequencies but lower at traditional business cycle frequencies. Simply looking at business cycles loses much of the detail of the extent of co-movement in different frequency cycles within the euro area.

2008	D86	Lee, Junsang, and Yili Chien. 2008. <i>Why Tax Capital?</i> . Australian National University, College of Business and Economics, School of Economics, ANUCBE School of Economics Working Papers. We study optimal capital income taxation with a Ramsey problem and relate this optimal taxation problem to the question that has been asked in the asset pricing literature, which is why the risk free interest rate is too low. We show that the Ramsey planner chooses the optimal level of capital stock to be one that satisfies the modified golden rule in the steady state under some conditions. The conditions include sufficient government tax instruments and ability to issue bonds. We argue that the optimal capital level is different from that chosen in a competitive equilibrium unless the competitive equilibrium risk free interest rate is same as the time discount rate in the steady state. This difference in the choice of capital motivates imposing a positive capital income tax (or subsidy) on households to induce them to invest at the socially optimal

Year	DE	Title and Abstract
		amount. As examples, we investigate optimal capital taxation in a decentralized economy with limited commitment and one with private information. However, the result still holds in various types of economies with risk free interest rate that is too low.

2008	F55	Kontsas, Stamatis, John Mylonakis, and Nicos Papasyriopoulos. 2008. "An Analysis of Key Economic Dimensions of the European Union Enlargement." <i>International Journal of Economic Issues</i>, 1(2): 189-201. The traditional model of European Union (EU) enlargement is based on certain principles linked to the rights and duties of both applicant countries and current members. These principles have been applied successfully in previous enlargement rounds and may yet serve as a sound model for some applicant in the future. The scope of this paper is to consider some of the key economic dimension of EU enlargement, focusing on the characteristics of the new member states and on the economic implications of enlargement for the EU. Analysis showed that the overall economic effects of the 10 + 2 enlargement are positive. They are so particularly for the acceding countries, which have the prospect of clear gains, even if the costs are greater and many of the benefits are slower to arrive than they anticipated. For the EU-15, the direct economic gains are relatively modest, with enlargement not expected to bring much extra efficiency or growth, or to create many new jobs.
2008	F63 F66	Chatterjee, Biswajit. 2008. "Globalisation, Growth and Employment: An Analytical Enquiry." <i>Indian Journal of Labour Economics</i>, 51(4): 517-32. Globalisation in the sense of the opening up of domestic economies to international trade and factor mobility has led to acceleration of the growth profile of many countries including the developing ones. But such growth acceleration has been accompanied by falling employment elasticities in many of the developing countries and there is greater flexibilisation of the labour market behaviour and increasing informalisation of the employment, which is a serious consequence of the globalization process unleashed on the world economy. The present paper provides an explanation of such employment contraction and labor market flexibilisation in developing countries in terms of a North-South framework of free trade and capital mobility involving economies of scale and structural specifications in developing countries.
2008	G20 N23	Della Torre, Giuseppe, Mimi Coccia, Valentina De Leonardis, and M. Carmela Schisani. 2008. "Growth of the Italian Financial System after Political Unification, 1861-1914: Financial Deepening and/or Statistical and Methodological Biases?" <i>Rivista di Storia Economica, N.S.</i>, 24(2): 135-73.
2008	G20	Hachicha, Ahmed. 2008. "Does Financial Innovation of Credit Derivatives Make Bank Riskier?" <i>International Journal of Economic Perspectives</i>, 2(1): 1-4. This paper brings some theoretical evidence from financial innovation and their impact in the credit market. Normally, financial innovations tend to reduce transaction costs and risk, and as a result bring about widening, deepening, and integration of capital markets. Such financial development accelerates the pace of economic development through its favourable impact on saving, investment, and output. But this may exhort us to search for any possible drawbacks of the financial innovation in the credit market.
2008	G20	Corduneanu, Carmen, and Laura Raisa Iovu. 2008. "Steps in the Development of the Romanian Financial System and the Correlation with the Level of Economic Growth." <i>Timisoara Journal of Economics and Business</i>, 1(1): 83-108. Throughout history it has been asserted that among the determinant agents of the economical growth, the conservation and the endowment with physical, technological and human capital can also be cited. This involves the realization of certain investigations in the infrastructure, development, and innovation, as well as in the education and the formation, that can raise the existent level of these resources in every country and to lead to a growth in the productivity, and in the competition of that country materialized through a higher GDP of a capital. But there is an extremely important factor like the way of financing, the degree of development of the financial system of the economy that leads to economical growth. On a microeconomic level, in what concerns the economical agents, financing is the most important for the development. All in all, no matter how good the product or how efficient the commercialization channels or the correlation level between technology and the human factor may be, if the business does not have efficient financing politics, regarding the liquidity as well as the solvency and the profitability, it will crash, minimizing the other successfully realized aspects. Excluding the fact that it offers an efficient allocation and a reduced cost of the financial services, a well developed financial compartment identifies the potential investors, monitors and gives information regarding the behavior of the beneficiaries of the chartered capital. In order to do a thorough analysis of the way in which the Romanian financial system evolved, being correlated with the economical growth of the financing structure of the Romanian economy between 1990 and 2006, we leveled this analysis depending on the mutations that took place during the time in the Romanian economical and financial landscape. We have taken one by one the mutations that took place during this period regarding the Romanian banking system and capital market, as main financial agents, then the macro economical politics and their impact on the development of the financial system, and, last but not least, recent evolutions experienced by the Romanian financial system and regional level (Central and Eastern Europe) and European Union comparisons.
2008	G20	Ferreira, Candida. 2008. "The Banking Sector, Economic Growth and European Integration." <i>Journal of Economic Studies</i>, 35(5-6): 512-27. This paper seeks to contribute to the study of the link between financial intermediation and economic growth in the context of the European Union and particularly in the context of the integration of new member-states. Panel fixed and dynamic Arellano-Bond estimates (with balanced panels) were used to explain and compare the influence of financial intermediation with the real per-capita GDP growth in two sub-sets of EU countries: the first one takes into account the availability of quarterly data and comprises 11 "old" EU countries, excluding Luxembourg, Denmark, Ireland and Sweden, for the period between Q2 1980 and Q4 1998; the second panel includes 24 EU countries (excluding only Luxembourg) for the period between Q2 1999 and Q4 2002. The existing empirical evidence was enhanced by introducing some financial variables to explain the real per-capita GDP growth, namely, the real domestic credit growth, the real foreign liabilities growth, the real growth of the sum of the bonds and money market instruments, in addition to two ratios: bank assets/bank liabilities and domestic credit/bank deposits. The results obtained confirm the importance of these variables to the real per-capita GDP growth and allow one to draw conclusions on some differences in the behaviour and the level of integration of the two groups of EU countries. There is a relatively more homogeneous behaviour in the first panel, while the results for the second panel indicate that, in spite of the relative heterogeneity and the differences in their historical evolution, all the countries have had to adapt rapidly to the increasing competition and to the new EU market conditions. The paper confirms the influence of financial systems on output growth, as well as the efforts of financial institutions to adapt to the new conditions of the European and global markets in spite of all the differences in the historical evolution and initial conditions among EU member-states.

2008	G22	Vadlamannati, Krishna Chaitanya. 2008. "Do Insurance Sector Growth and Reforms Affect Economic Development? Empirical Evidence from India." <i>Margin: The Journal of Applied Economic Research</i>, 2(1): 43-86. A well-developed insurance sector is necessary for the economic development of an emerging economy like India, as it provides long-term funds for physical and social infrastructure, while simultaneously strengthening risk-taking abilities. The investment requirements for India in the coming years are well-known and the rapid growth of the insurance sector in the post-liberalisation period is seen as a good sign as it can, to some extent, facilitate investment in infrastructure development to help sustain the economic growth of the country. Against this backdrop, this paper raises an important question: what has been the contribution of insurance sector growth to economic development in India? The paper further examines the economic growth effects of insurance sector reforms and the rate of growth of insurance reforms. The claims brought forward by this study are mixed. The contribution of the insurance sector to economic development is positive and exhibits a long-run equilibrium relationship. We find that reforms exert no strong relationship, but the rate of growth of reforms has a positive influence on economic development. The study therefore suggests that in order to make the insurance sector a more important component of the financial intermediation process, complete deregulation and an increase in the pace of reforms are the need of the hour.
2008	G38	Lee, Keun, and Chung H. Lee. 2008. "The Miracle to Crisis and the Mirage of the Postcrisis Reform in Korea: Assessment after Ten Years." <i>Journal of Asian Economics</i>, 19(5-6): 425-37. Ten years have passed since Korea underwent a severe financial crisis in 1997-98. The crisis prompted the Korean government to undertake a number of reforms in finance, corporate governance, and labor market. This paper analyzes the dynamics of the reform process and assesses the outcomes of the reforms, which aimed at introducing the Anglo-Saxon economic model. It argues that the reform outcomes were conditioned on the interplay of local-specific conditions and interest politics and that the reforms were intent more on establishing a market-oriented economy than promoting the long-term growth potential and the competitiveness of the economy.
2008	H22 J33 J82	Koskela, Erkki, and Jan Konig. 2008. <i>Flexible Outsourcing, Profit Sharing and Equilibrium Unemployment</i>. CESifo GmbH, CESifo Working Paper Series: CESifo Working Paper No. 2382. We analyze the questions associated with flexible outsourcing both with committed and flexible profit sharing under imperfect domestic labour markets. How does profit sharing influence flexible outsourcing? What is the relationship between outsourcing cost, profit sharing and equilibrium unemployment, when profit sharing is also a part of the compensation schemes in other industries? In the case of committed profit sharing, outsourcing cost increases wage. Optimal flexible profit sharing is smaller than in the absence of outsourcing, but outsourcing cost and wage will have ambiguous effect on optimal flexible profit sharing. Implementing profit sharing can help to avoid outsourcing due to a direct productivity effect and a wage effect. For equilibrium unemployment the effects of outsourcing cost and profit sharing are ambiguous both in case of committed and flexible profit sharing. In the case of zero effort elasticity there is no committed or flexible profit sharing in the absence or presence of outsourcing and in this case lower outsourcing cost will decrease unemployment.
2008	H22	Upender, M. 2008. "Degree of Tax Buoyancy in India: An Empirical Study." <i>International Journal of Applied Econometrics and Quantitative Studies</i>, 5(2): . An attempt is made in the present to provide an empirical content to differential coefficient of tax [revenue] buoyancy during post tax reform period in India by fitting a double-log regression model with an interaction variable to the stationary time series data based on Augmented Dicky-Fuller [ADF] and Phillips-Parron [PP] tests. The period after 1992 is considered as post tax reform period to look at the prognostications of tax reforms that had been initiated by the government of India. The regression results illustrate that the estimate of constant gross tax buoyancy is positively significant and more than unity during pre tax reform period illuminating that gross tax is moderately elastic. From this upshot it can be comprehended that a one percent increase in income leads to increase the gross tax revenue by more than one percent, all else equal. Further it can be understood that the average propensity to tax [ratio of gross tax revenue to gross domestic product] was increasing with the increase in gross domestic product during pre tax reform period. The regression coefficient of interaction variable is significantly negative and stumpy showing a downward shift in the degree of tax buoyancy during post tax reform period. The estimate of the tax buoyancy, which was just above the unity during pre tax reform period, is less than unity during post tax reform period evincing the fact that the gross tax is relatively inelastic. From this it can also be understood that the average propensity to tax is declining with the increase in gross domestic product during post tax reform period. Thus the estimates of gross tax buoyancy during pre and post tax reform periods are not stable.

2008	H22	Bovi, Maurizio. 2008. "Measuring Tax Burdens in the Presence of Non Observed Incomes." <i>Economics Bulletin</i>, 5(10): 1-6. The Tax-to-GDP ratio is an important tool for both economists and policymakers. Despite its pivotal role, this indicator is measured and analyzed without due attention to the potential biases stemming from the so called non-observed economy. This note aims at filling this gap, pointing out the effects of untaxed and undeclared incomes on both sides of the Tax-to-GDP ratio.
2008	H40 I10	Diewert, Erwin. 2008. <i>The Measurement of Nonmarket Sector Outputs and Inputs Using Cost Weights</i>. UBC Department of Economics, UBC Departmental Archives. In many sectors of the economy, governments either provide various services at no cost or at highly subsidized prices. Examples are the health, education and general government sectors. The System of National Accounts 1993 recommends valuing these nonmarket outputs at their costs of production but it does not give much guidance on exactly how to do this. In this paper, an explicit methodology is developed that enables one to construct these marginal cost prices. However, in the main text, an activity analysis approach is taken in order to simplify the analysis, so in particular, constant returns to scale, no substitution production functions for the specific activities in the nonmarket sector are assumed. It is shown that it is possible to obtain meaningful measures of Total Factor Productivity growth in this framework. An Appendix relaxes some of the restrictive assumptions that are used in the main text.
2008	I10	Trefler, Daniel. 2008. "Innis Lecture: Canadian Policies for Broad-Based Prosperity." <i>Canadian Journal of Economics</i>, 41(4): 1156-84. Canadian policy makers operate in the fog of myth, a myth that has been repeated so often it is mistaken for truth. According to this myth there is only one path to prosperity, and if we are to successfully travel this path, first charted by Americans, then we must abandon our most disadvantaged. We must sacrifice our core Canadian values of community and caring on the altar of competitiveness. Yet the facts of the last three decades scream out against this myth. Over that time Canada's per capita GDP fell by almost 20% relative to the United States. And this sacrifice of prosperity did not make us a more caring society. Instead, it

Year	DE	Title and Abstract
		depleted our fiscal resources by a staggering \$68 billion per year and left us without the wherewithal to take care of our most disadvantaged. In this paper I debunk the myth that there is a trade-off between a prosperous society and a caring society. In place of the myth I offer up a cohesive picture of what ails Canada and how we can cure it.
2008	I15	Akram, Naem, Ihtsham ul Haq Padda, and Mohammad Khan. 2008. "The Long Term Impact of Health on Economic Growth in Pakistan." <i>Pakistan Development Review</i>, 47(4): 487-500. The paper investigates the impacts of different health indicators on economic growth in Pakistan. Cointegration and Error Correction techniques have been applied on the time series data of Pakistan for the period of 1972-2006. We find that per capita GDP is positively influenced by health indicators in the long run and health indicators cause per capita GDP. However, in short run the health indicators fail to put significant impact on per capita GDP. It reveals that health indicators have a long run impact on economic growth. It also suggests that impact of health is only a long run phenomenon and in the short run there is no significant relationship exists between health variables and economic growth. The major policy implication of the study is that if we desire high levels of per capita income, we can achieve it by increasing and improving stock of health human capital, especially when current stocks are at lower end. Moreover, study also points out a rather diminutive role of public health expenditure in determining the per capita GDP.
2008	I23	Nezhad, Mansour Zarra, and Elahe Ansari. 2008. "Higher Education and Gross Domestic Product (GDP) in Iran. (In Farsi. With English summary.)." <i>Quarterly Iranian Economic Research</i>, 37(0): 61-79. Higher education is important to the socio-economic development. This paper examines the causality between investment in higher education and gross domestic product (GDP) in Iran. To this end, standard Granger causality test, Hsiao test, and ARDL method have been applied to test the hypothesis that investment in higher education causes GDP to rise. The period of the study is 1974-2004. The findings of the research show that investment in higher education neither causes GDP, nor is caused by GDP. All three methods confirm this result.
2008	I23 K11	Villa, Stefania. 2008. "Do Incentives Matter for Growth in Italy?" <i>Review of Economic Conditions in Italy</i>, 0(1): 101-19. This paper analyzes the role of incentives in stimulating growth in a microfounded model with three sectors. Incentives take two forms: patents, which stimulate innovation, and incentives for enrolling in post-secondary education. Inventive activity and the decision to enroll in post-secondary education are considered as investment decisions. Incentives that either increase the benefits of these activities or reduce their costs affect private decision-making, stimulating investment and, consequently, economic growth. Empirical investigation of the model for Italy demonstrates that incentives may have real effects. A new database covering more than 400 patents filed by public research organizations shows that invention responds to changes in the intellectual property rights regime. And enrolment rates in post-secondary education have trended upward since the enactment of three policy measures designed to increase the return on an individual's investment in university training. The conclusion is that incentives do in fact matter for growth in Italy.
2008	J26	Mencinger, Joze. 2008. "Do Pensioners Endanger Fiscal Stability in EU Countries?" <i>Pensions: An International Journal</i>, 13(4): 227-35. One of the rarely questioned 'truths' in the present cycle of conventional economic thinking is that ageing and pensioners are endangering the fiscal stability of EU countries. Yet, the data indicate that despite a considerable increase of the debatable old age dependency ratio, the shares of pensions in gross domestic product in EU countries stabilised due to the developments in their determinants: the retirement age, the replacement rate, the old age ratio and the development level. This indicates that the threats of 'greedy' pensioners to fiscal stability are highly exaggerated and that solutions for the ageing of the EU population can be found within the existing pay-as-you-go systems, provided there are jobs available. The demographic, 'Lisbon' and financial directions of the European Commission appear to be rather extraneous. Indeed, increased birth rates and migrations might produce more problems than solutions: job creation by the Lisbon strategy seems to consist of empty talks, while changing financing patterns and privatisation would only create redistribution without increasing the funding.
2008	J30 N34	Dew-Becker, Ian, and Robert J. Gordon. 2008. <i>The Role of Labour Market Changes in the Slowdown of European Productivity Growth</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 6722. Throughout the post-war era until 1995 labour productivity grew faster in Europe than in the United States. Since 1995, productivity growth in the EU-15 has slowed while that in the United States has accelerated. But Europe's productivity growth slowdown was largely offset by faster growth in employment per capita, leaving little difference in growth of output per capita between the EU and US going back to 1980. This paper is about the strong negative trade-off between productivity and employment growth within Europe. We document this trade-off in the raw data, in regressions that control for the two-way causation between productivity and employment growth, and we show that there is a robust negative correlation between productivity and employment growth across countries and time. Our primary explanatory variables to explain both the revival of EU employment growth and the slowdown in productivity growth include six policy and institutional variables. We find that several of these variables have significant negative effects on employment per capita, with policy changes that raised labour costs reducing employment both before and after 1995. These variables, together with employment per capita, are then used to explain productivity growth, using several alternative treatments with instrumental variables. We also find a significant time effect, and we link this to an increase in labour force participation by women, particularly in southern European countries. We find that the negative effect of changes in employment per capita on changes in productivity is robust to alternative instruments and to the inclusion or exclusion of particular countries like the US or Spain. We conclude by suggesting that evaluations of alternative policy reforms in Europe should take into account any offsetting effects on employment and productivity by examining the ultimate impact on changes in income per capita.

2008	K23	Arnold, Jens, Giuseppe Nicoletti, and Stefano Scarpetta. 2008. <i>Regulation, Allocative Efficiency and Productivity in OECD Countries: Industry and Firm-Level Evidence</i>. OECD Economics Department, OECD Economics Department Working Papers: 616. This paper relates diverging productivity performances across OECD countries over the past fifteen years to differences in the stringency of regulations in the product market. We first summarize industry-level evidence linking these diverging patterns to delays in service markets reforms in the wake of the ICT shock. The evidence we survey suggests that, especially in continental EU countries, tight regulation of services has slowed down growth in ICT-using sectors, which use intermediate service inputs intensively. Based on harmonised cross-country firm-level data, we then provide new evidence that one of the key channels through which inappropriate service regulations affect productivity growth is by hindering the allocation of resources towards the most dynamic and efficient firms. At the industry level, resources were allocated less efficiently across firms in countries where service regulations are less market-friendly. Firmlevel econometric estimates confirm that anti-competitive service regulations hamper productivity growth in ICT-using sectors, with a particularly pronounced effect on firms that are catching up to the technology

Year	DE	Title and Abstract
		frontier and that are close to international best practice. In other words, regulations hurt in particular those firms that have the potential to excel in domestic and international markets.

2008	L93 R48	Almeida, Antonio, and Vera Barros. 2008. "A Study on the Economic Impact of the 2001 Madeira Airport Enlargement." <i>Revista Portuguesa de Estudos Regionais</i> , 0(19): 89-110. The expansion works at the Madeira Airport in 2001 were expected to foster tourist demand and to structurally change the tourism industry in Madeira, thereby reinforcing the dynamics of regional development. Seven years on, it is now important to assess the various areas where it impacted, namely with regards to the creation of new tourist destinations and the expansion of demand. Using data on passengers' travels and tourism demand, and making use of a simplified econometric model, we have estimated the impact of the expansion both in terms of demand and GDP. The results show a decreasing rate of growth from 2001 on, although a concession must be made to allow for the fact that, without the expansion, a not so favourable result might have emerged. The proposed methodology is, however, a starting point for the approach to the transport sector in general and the supply of air transport within the context of regional development in particular.
2008	L93	Ying, Yung-Hsiang, Chun-Ping Chang, and Meng-Chi Hsieh. 2008. "Air Cargo as an Impetus for Economic Growth through the Channel of Openness: The Case of OECD Countries." <i>International Journal of Transport Economics</i> , 35(1): 31-44. Against the backdrop of increased international market integration, an ever expanding openness in trade policy as well as a steep rise in the volume of air cargo, an empirical model is developed here to examine the relationships between openness in trade policy, air freight volume and per capita GDP. It uses Pedroni's panel cointegration test and the fully modified OLS techniques are employed for the sample consisting of OECD member countries during the 1970-2002 period. The empirical findings fully support cointegrated relationships among these variables, with positive trade and air freight shocks accounting for marked contributions to real per capita GDP. In addition, a panel Seemingly Unrelated Regression (hereafter SUR) estimation confirms that air cargo is indeed an engine that stimulates economic growth via the channel of openness. From the concrete evidence, important policy implications emerge for policymakers in our sample countries.
2008	M10	Done, Ioan, and Andreea Gagea. 2008. "Correlation of Economic Indicators--Basis for Strategic Management Decisions." <i>Petroleum-Gas University of Ploiesti Bulletin: Economic Sciences Series</i> , 60(2): 27-34. Strategic management aims to increase the economic and financial performances, an objective whose achievement implies the correlation of economic indicators. We consider that the macroeconomic indicators must be found at the company level, as well, both in a physical state and in value. Moreover, the correlation of indicators must also be encountered in the contracts signed by the shareholders with the managerial team.
2008	M15	Chun, Hyunbae, Jung-Wook Kim, Randall Morck, and Bernard Yeung. 2008. "Creative Destruction and Firm-Specific Performance Heterogeneity." <i>Journal of Financial Economics</i> , 89(1): 109-35. Traditional U.S. industries with higher firm-specific stock return and fundamentals performance heterogeneity use information technology (IT) more intensively and post faster productivity growth in the late 20th century. We argue that this mechanically reflects a wave of Schumpeter's creative destruction disrupting a wide swath of industries, with successful IT adopters unpredictably undermining established firms. This validates endogenous growth theory models of creative destruction and suggests intensified creative destruction as explaining findings associating greater firm-specific performance variation with higher per capita GDPs, economy growth rates, accounting standards, financial system development, and property right protection.
2008	N23	THE SAME AS G20 Della Torre, Giuseppe, Mimi Coccia, Valentina De Leonardis, and M. Carmela Schisani. 2008. "Growth of the Italian Financial System after Political Unification, 1861-1914: Financial Deepening and/or Statistical and Methodological Biases?" <i>Rivista di Storia Economica, N.S.</i> , 24(2): 135-73.
2008	N23 N24	Spinelli, Franco, and Carmine Trecroci. 2008. "The Lira's Purchasing Power from Italy's Unification to the Single European Currency." <i>Journal of European Economic History</i> , 37(2-3): 497-522. This article analyses the behaviour of several price indexes over the whole life of the Italian lira (1861-1998), and for various sub-periods defined by the exchange-rate regimes of the Italian monetary history. We focus on the persistence and stationarity properties of the inflation process and their dependence on the real cycle. An international comparison with the United States and the United Kingdom further supports the conclusion that Italian inflation was abnormal as far as its mean value, degree of persistence, and relationship to the real cycle are concerned. In particular, we find that the output-inflation relationship had a textbook-like, positive slope only during periods of low inflation and low production volatility.

2008	N72	Field, Alexander J. 2008. "The Impact of the Second World War on US Productivity Growth." <i>Economic History Review</i> , 61(3): 672-94. This paper considers the productivity impact on the US economy of the period of war mobilization and demobilization lasting from 1941 to 1948. Optimists have pointed to learning by doing in military production and spin-offs from military R & D as the basis for asserting a substantial positive effect of military conflict on potential output. Productivity data for the private non-farm economy are not consistent with this view, as they show slower total factor productivity (TFP) growth between 1941 and 1948 than before or after. The paper argues for adopting a less rosy perspective on the supply side effects of the war.
2008	O22	Harvie, Charles, and Ali Salman Saleh. 2008. "Lebanon's Economic Reconstruction after the War: A Bridge Too Far?" <i>Journal of Policy Modeling</i> , 30(5): 857-72. Since the onset of the Civil War in 1975 Lebanon has experienced burgeoning fiscal deficits and an unsustainable public debt overhang. Much of this arose from the loss of revenues during the period of the Civil War 1975-1990 and attempts to maintain basic public expenditure, while from 1990 to 2006 this reflected post-Taif rebuilding and reconstruction

Year	DE	Title and Abstract
		of key infrastructure with limited revenue capacity. Considerable progress from the 1990s had been achieved in rebuilding the shattered economy from both public and private international and domestic sources, but its legacy is a huge public debt and a servicing requirement that currently absorbs alone almost 30 per cent of total government revenue and is the highest in the world on a per capita basis. While the need to reduce this debt to a sustainable level would be daunting enough in itself, Lebanon's fiscal predicament was further compounded by the outbreak of war with Israel during July-August 2006. The consequence of this 34-day war was the devastation of residential property, vital infrastructure, loss of agricultural production, industrial production, exports, environmental damage, the collapse of tourism and a further erosion of the influence and power of the central government. Estimates of the direct and indirect costs for Lebanon of this relatively brief but devastating war conservatively vary from US\$ 10-15 billion. The implications of such reconstruction and rebuilding costs for the budget and public debt are potentially calamitous for Lebanon which is already struggling under the weight of debt overhang and its servicing. A key question is whether Lebanon can tackle this enormous task in isolation. This paper explores the background to the fiscal crisis, identifies from available literature the extent, nature and cost of the war damage, analyses the options available to the authorities in rebuilding the economy and highlights key policy issues and measures that will be required if a sustainable economic recovery is to be achieved. Despite its demonstrated and remarkable resilience to past trauma the paper concludes that the fiscal crisis makes it impossible for Lebanon to tackle the reconstruction and rebuilding task on its own and particularly in the wake of the events of summer 2006. The country will require substantial and ongoing financial support from international lenders and donors. The success of these efforts in the case of Lebanon is of particular interest as it could well be a microcosm of possible future outcomes for the region more generally.
2008	O25	Zilibotti, Fabrizio. 2008. "Economic Growth through the Development Process." <i>CESifo Economic Studies</i> , 54(3): 325-57. In this article, I discuss some recent research in the area of economic growth and development emphasizing the endogenous dynamics of policies and organizational forms in a world characterized by credit-market and labor-market imperfections. I present a simple model of technological convergence featuring an endogenous evolution of contractual arrangements. The key assumption is that economic growth is associated with investments as well as with the adoption and imitation of existing technologies in economies lying far from the technology frontier. In contrast, growth is increasingly driven by innovation as economies approach the technological frontier. The theory predicts that contractual arrangements evolve and adapt spontaneously to the changing needs of technological progress. However, this evolution is neither necessary nor serendipitous. Economies that fail to introduce economic reforms as they advance may become stuck in non-convergence traps. I discuss a number of empirical applications, including the wave of reforms of industrial policy in India in the 1980s and 1990s.
2008	P36	Easterlin, Richard A., and Anke C. Plagnol. 2008. "Life Satisfaction and Economic Conditions in East and West Germany Pre- and Post-unification." <i>Journal of Economic Behavior and Organization</i> , 68(3-4): 433-44. Economic disruption in East Germany at the time of unification resulted in a noticeable drop in life satisfaction. By the late 1990s East Germany's life satisfaction had recovered to about its 1990 level, and its shortfall relative to West Germany was slightly less than that before unification. In West Germany life satisfaction was fairly constant before unification, but subsequently trended moderately downward, with Turkish life satisfaction declining noticeably relative to Germans. Changes in life satisfaction in East and West Germany both for Germans and foreigners are most closely associated with relative income variables, not absolute income.
2008	P36	Biggeri, Mario, and Giovanna Hirsch. 2008. "L'altra Cina. (With English summary)." <i>Studi e Note di Economia</i> , 13(2): 265-98. People's Republic of China has recorded an impressive economic growth since the beginning of the 1980s. There is no doubt about these outstanding economic results. However, we argue that this outstanding economic growth is not translated into human development as it could. Indeed, since 1990s, large part of the rural population is marginalized and the temporary workers (140 million of floating population), that 'nourish' the high rates of GDP growth, are clearly not taking advantage from it. These are central issues for the future of Chinese people well-being and, considering the 'size' of the country and its challenges in the globalised competition, for the rest of the world. The aims of this paper are threefold. The first aim is to discuss some problematic aspects of the impressive Chinese economic growth in terms of increasing inequality and marginalisation of part of the population, looking in particular at the floating population phenomenon. The second aim is to present a model that examines the economic and institutional mechanisms related to the outstanding Chinese economic growth on one side and the scarce human development of large part of its population on the other. The last objective is to draw some policy implications accordingly.
2008	P43	Taghipour, Anoshirvan. 2008. "The Role of Banking System Development in Economic Growth: The Case of Iran. (In Farsi. With English summary)." <i>Quarterly Iranian Economic Research</i> , 37(0): 21-37. This paper empirically investigates the relationship between banks and economic growth emphasizing the transmission channels from financial development to growth in Iran using time series methodologies, namely Johansen's co-integration and Granger causality methods in the context of error correction models (ECM). The results show that in our case study banks affect economic growth mainly through the capital accumulation channel. Because of financial backwards and market imperfections, agents face many borrowing constraints, which may hinder their ability to invest at optimal levels. In this situation, the role of banking system in increasing investment through capital accumulation is expected to be strong. In our study, we do not find an evidence for productivity channel, perhaps reflecting inefficiency of the Iranian banking system, which imposes many restrictions on bank choices such as credit rationing and directed finance under financial repression. Our results strongly support the supply-leading hypothesis. The main policy message of the paper is that banking system development matters for investment and economic growth in Iran. Therefore, policies that affect financial system are also likely to influence investment and economic growth.
2008	P45	Azarbayejani, Karim, Amene Shahidi, and Farzane Mohammadi. 2008. "Estimating Imports Using Aggregate Expenditure Components in Iran. (In Farsi. With English summary)." <i>Quarterly Iranian Economic Research</i> , 37(0): 107-26. In this paper, the behaviour of Iran's imports during the period 1353-1382 is studied using disaggregated expenditure components of total national income. Using disaggregated components of total national income for obtaining import demand is a new approach that differs from traditional approach, which only uses domestic income and relative prices. In this regard, we use ARDL cointegration method and in case of imports demand, error correction model. The study shows inelastic import demand for all the expenditure components and relative price. In the short- and long-run, exports and investment are the major determinants of imports in Iran. Demand for imports is not very sensitive to price changes.
2008	Q48	Research and Information System for Developing Countries. 2008. <i>South Asia Development and Cooperation Report 2008</i> . Oxford and New York: Oxford University Press. Presents an analysis of the macroeconomic performance of the South Asia region, highlights the developmental challenges it faces, and considers proposals for deepening regional economic cooperation in the different areas. Discusses the global economic environment; macroeconomic performance and outlook of South Asia; trade performance and competitiveness; foreign direct investment flows and investment climate; deepening regional economic integration in South Asia--the South Asian Free Trade Agreement and beyond; trade facilitation measures in South Asia; transport infrastructure for deeper regional integration--emerging challenges and policy options; regional cooperation for energy security; and social infrastructure and human development in South Asia--the road ahead.

Year	DE	Title and Abstract
2008	Q48	Scott, Michael J., Joseph M. Roop, Robert W. Schultz, David M. Anderson, and Katherine A. Cort. 2008. "The Impact of DOE Building Technology Energy Efficiency Programs on U.S. Employment, Income, and Investment." <i>Energy Economics</i>, 30(5): 2283-2301. The U.S. Department of Energy's Office of Energy Efficiency and Renewable Energy (EERE) analyzes the macroeconomic impacts of its programs that are designed to increase the energy efficiency of the U.S. residential and commercial building stock. The analysis is conducted using the Impact of Sector Energy Technologies (ImSET) model, a special-purpose 188-sector input-output model of the U.S. economy designed specifically to evaluate the impacts of energy efficiency investments and saving. For the analysis described in the paper, ImSET was amended to provide estimates of sector-by-sector capital requirements and investment. In the scenario of the Fiscal Year (FY) 2005 Building Technologies (BT) program, the technologies and building practices being developed and promoted by the BT program have the potential to save about 2.9 x 10 ¹⁵ Btu in buildings by the year 2030, about 27% of the expected growth in building energy consumption by the year 2030. The analysis reported in the paper finds that, by the year 2030, these savings have the potential to increase employment by up to 446,000 jobs, increase wage income by \$7.8 billion, reduce needs for capital stock in the energy sector and closely related supporting industries by about \$207 billion (and the corresponding annual level of investment by \$13 billion), and create net capital savings that are available to grow the nation's future economy.

2009	A12	Caputo, Michele. 2009. "Planning Output Dynamics with Memory." <i>Economia Politica</i>, 26(1): 85-103. We show that, because of the memory, the output after monetary changes follows as a dynamic hump-shaped path similar as that obtained in the structural VAR literature. We study then the variation caused by two consecutive monetary changes with the same sign and amount and compare it with the case of a single change with double amplitude finding that in the short range the effect of the double amplitude is larger while in the long range is true the opposite implying that a sequence of changes with limited amplitude has the advantage of testing the system with smaller risk without compromising the final result. Finally, the case of two step variations of monetary policy with opposite amounts is considered for the circumstance when a first monetary change does not give the desired result and it is needed to go back to the previous monetary condition; we find that their total effects are reversible only asymptotically, but in a relatively short time the total effect may be negligible. The theory may be applied also to the effect generated by shocks other than monetary changes as a sudden economic development or an international crisis. A first tentative test with the reaction of a market to a shock confirms the theory of the paper, however other tests with data fit to the theory would be required.

2009	C21	Townsend, Robert M., and Sergio S. Urzua. 2009. "Measuring the Impact of Financial Intermediation: Linking Contract Theory to Econometric Policy Evaluation." <i>Macroeconomic Dynamics</i>, 13(0): 268-316. We study the impact that financial intermediation can have on productivity through the alleviation of credit constraints in occupation choice and/or an improved allocation of risk, using both static and dynamic structural models as well as reduced-form OLS and IV regressions. Our goal in this paper is to bring these two strands of the literature together. Even though, under certain assumptions, IV regressions can accurately recover the true model-generated local average treatment effect, this is quantitatively different, in order of magnitude and even sign, from other policy impact parameters (e.g., ATE and TT). We also show that laying out clearly alternative models can guide the search for instruments. On the other hand, adding more margins of decision, that is, occupation choice and intermediation jointly, or adding more periods with promised utilities as key state variables, as in optimal multiperiod contracts, can cause the misinterpretation of IV as the causal effect of interest.
2009	C80	Timmer, Marcel P., and Gaaitzen J. de Vries. 2009. "Structural Change and Growth Accelerations in Asia and Latin America: A New Sectoral Data Set." <i>Cliometrica</i>, 3(2): 165-90. Recent studies of economic growth have moved from explaining average trends in long-term growth to study growth accelerations and decelerations. In this paper we argue that the standard shift-share analysis is inadequate to measure the contribution of sectors to accelerations in productivity. We present a modified shift-share method, which takes account of surplus labour in agriculture and accounts for the contribution to growth from expanding sectors. We apply this novel methodology to the GGDC 10-sector database, which is a new data set with annual time series of value added and persons employed for the ten main sectors of the economy. The data set covers 19 countries in Asia and Latin America spanning the period from 1950 to 2005. We find that growth accelerations are explained by productivity increases within sectors, not by reallocation of employment to more productive sectors. Challenging conventional wisdom, productivity improvement in market services is more important than productivity growth in manufacturing.
2009	D85	Hidalgo, Cesar A., and Ricardo Hausmann. 2009. "The Building Blocks of Economic Complexity." <i>Proceedings of the National Academy of Sciences of the United States of America</i>, 106(26): 10570-75. For Adam Smith, wealth was related to the division of labor. As people and firms specialize in different activities, economic efficiency increases, suggesting that development is associated with an increase in the number of individual activities and with the complexity that emerges from the interactions between them. Here we develop a view of economic growth and development that gives a central role to the complexity of a country's economy by interpreting trade data as a bipartite network in which countries are connected to the products they export, and show that it is possible to quantify the complexity of a country's economy by characterizing the structure of this network. Furthermore, we show that the measures of complexity we derive are correlated with a country's level of income, and that deviations from this relationship are predictive of future growth. This suggests that countries tend to converge to the level of income dictated by the complexity of their productive structures, indicating that development efforts should focus on generating the conditions that would allow complexity to emerge to generate sustained growth and prosperity.
2009	E16	Nunez, Gaspar, and Clemente Polo. 2009. "Una Matriz de Contabilidad Social de Mexico y un analisis estructural de la economia mexicana. (With English summary)." <i>Estudios Sociales</i>, 17(0): 9-52. The central goal of this paper is to present a Social Accounting Matrix of the Mexican economy for the year 1996, detailing the methodology we follow in building it. And, as a second goal, to illustrate its usefulness we carry out a basic structural analysis to study the impact of some exogenous shocks, applying an extension of Leontief's model. Specifically, we compute the Matrix of Generalized Multipliers to analyze the impact on income distribution of an increase in aggregated demand uniformly distributed, of an increase in investment, of an increase in exports, and of an increase of public expenditure in public health or education. On the other hand, besides constituting a useful tool by itself,

Year	DE	Title and Abstract
		and of being the object of study of a wide array of analytical tools of the structural analysis, a SAM also constitutes the base data on which models of applied general equilibrium are designed and implemented.
2009	F52	Choudhury, Muhammad Abdul Mannan, M. Kabir Hassan, and Abdul Waheed. 2009. "Defense Expenditure and Economic Growth in the Countries of Eastern Europe and Central Asia." <i>Global Journal of Finance and Economics</i>, 6(1): 29-45. This study examines the causal relationship between military spending and economic growth by using the more comprehensive panel-data approach within the frame work of the economic growth model, as well as by developing an additional case study of sixteen countries in Eastern Europe and Central Asia. The result of the analysis is inconclusive about the nature of the relationship between military spending and economic growth, as it can either be positive or negative depending upon a country's specific circumstances. Caution is warranted in relating military spending and economic growth, as priorities, goals and national security concerns of nations can vary considerably.
2009	F53	Hemerijck, Anton, Ben Knapen, and Ellen van Doorne, eds. 2009. <i>Aftershocks: Economic Crisis and Institutional Choice</i>, Amsterdam: Amsterdam University Press; distributed by University of Chicago Press. Twenty-five chapters explore the institutional impact, dimensions, and consequences of the global economic crisis of 2007. Papers discuss diagnosing the crisis; exploring domestic policy space under low growth; the culture of discontent that has emerged in the wake of the hegemony of neoliberal doctrines over the past quarter-century; the economic crisis, its challenges to policy repertoires, and the architecture of international organizations; and realigning Europe.
2009	F54	Feyrer, James, and Bruce Sacerdote. 2009. "Colonialism and Modern Income: Islands as Natural Experiments." <i>Review of Economics and Statistics</i>, 91(2): 245-62. Using a new database of islands throughout the Atlantic, Pacific, and Indian Oceans we find a robust positive relationship between the number of years spent as a European colony and current GDP per capita. We argue that the nature of discovery and colonization of islands provides random variation in the length and type of colonial experience. We instrument for length of colonization using variation in prevailing wind patterns. We argue that wind speed and direction had a significant effect on historical colonial rule but do not have a direct effect on GDP today. The data also suggest that years as a colony after 1700 are more beneficial than earlier years. We also find a discernable pecking order among the colonial powers, with years under U.S., British, French, and Dutch rule having more beneficial effects than Spanish or Portuguese rule. Our finding of a strong connection between modern income and years of colonization is conditional on being colonized at all since each of the islands in our data set spent some time under colonial rule.
2009	F62	Younus, Sayera, and Mark Wheeler. 2009. "The Impact of Monetary Policy Changes in a Global Economy: Evidence from Bangladesh." <i>Global Journal of Finance and Economics</i>, 6(2): 113-26. The study examines the impact of changes in monetary policy on Bangladesh's economy. Specifically, we examine the impact of domestic and foreign monetary shocks on Bangladesh's major economic aggregates. In the context of a global economy such as Bangladesh, the conduct of monetary policy becomes increasingly more difficult as globalization proceeds. It becomes important to examine the impact of changes in relevant foreign variables, such as the money supply, when formulating domestic monetary policy. The empirical results of our analysis show that innovations to the foreign money supply have significant impacts on Bangladesh's real exchange rate and, at long time horizons, Bangladesh's price level. However, the foreign money supply does not have an impact on Bangladesh's money supply or output. Our results also indicate that innovations to Bangladesh's money supply have significant impacts on Bangladesh's price level and output. That is, even in this small, open, economy, monetary policy can be used to alter domestic variables.
2009	G17	Morana, Claudio. 2009. "Medium-Term Macroeconomic Determinants of Exchange Rate Volatility." <i>Journal of Financial Transformation</i>, 0(25): 55-64. Is there a short- to medium-term linkage between macroeconomic and exchange rate volatility? This paper provides a clear-cut answer to the above question, pointing to significant linkages and trade-offs between macroeconomic and exchange rate volatility, particularly involving output volatility. Evidence of bidirectional causality is also found, with macroeconomic volatility showing a stronger causal power than exchange rate volatility. Many tasks in finance, such as option pricing, risk analysis, and portfolio allocation, rely on the availability of good forecasting models. The paper points to new directions for the construction of improved medium-term volatility models.
2009	G18	Haidar, Jamal Ibrahim. 2009. "Investor Protections and Economic Growth." <i>Economics Letters</i>, 103(1): 1-4. Using objective measures of investor protections in 170 countries, I establish that the level of investor protection matters for cross-country differences in GDP growth: countries with stronger protections tend to grow faster than those with poor investor protections.
2009	G18	Iwata, Shigeru, and Shu Wu. 2009. "Stock Market Liberalization and International Risk Sharing." <i>Journal of International Financial Markets, Institutions and Money</i>, 19(3): 461-76. This paper empirically examines what macroeconomic risks are shared (or not shared) internationally after stock market liberalization in several developing countries. To address this issue, we incorporate an international asset pricing model into a non-linear structural vector autoregression (VAR) system that identifies various sources of macroeconomic risks. We find that most of the risks corresponding to exogenous financial market shocks are surprisingly well shared, although other macroeconomic risks associated with exogenous shocks to output, inflation, and monetary policies are not fully shared across countries. Our results suggest that one of the main benefits from stock market liberalization is to allow the countries studied in this paper to better hedge against exogenous and idiosyncratic financial market risks, and stock market liberalization needs to be accompanied by other measures of economic integration in order to achieve the full benefits of international risk sharing.
2009	H53	Beraldo, Sergio, Daniel Montolio, and Gilberto Turati. 2009. "Healthy, Educated and Wealthy: A Primer on the Impact of Public and Private Welfare Expenditures on Economic Growth." <i>Journal of Socio-Economics</i>, 38(6): 946-56. In this paper, we provide first evidence of the impact of public and private expenditures in health and education on economic growth, via their influence on people's health, skills and knowledge. We consider a growth accounting framework in order to test whether countries that devote a larger amount of resources to the consumption of health and educational services experience higher growth rates. We also test whether the effects on economic growth of public expenditure in health and education differ from those of private expenditure. Our empirical analysis is based on a panel of 19 OECD countries observed between 1971 and 1998. The results are consistent with the hypothesis that health and education expenditure affects positively growth. The estimated impact is stronger for health than for education. More importantly, we find some evidence that public expenditure influences GDP growth more than private expenditure.
2009	H53	Gorg, Holger, Hassan Molana, and Catia Montagna. 2009. "Foreign Direct Investment, Tax Competition and Social Expenditure." <i>International Review of Economics and Finance</i>, 18(1): 31-37. The aim of this paper is to make a first step towards studying the role of social expenditure and its interaction with corporate taxation in determining the destination of foreign direct investment (FDI) flows. Using panel data for 18 OECD countries and measuring the extent of social welfare policies by the (public social expenditure)/GDP ratio, we find strong support for the conjecture that redistributive social welfare state policies are valued by multinationals as, for instance, they may signal a government's commitment to social stability.

Year	DE	Title and Abstract
2009	J42	Mattesini, Fabrizio, and Lorenza Rossi. 2009. "Optimal Monetary Policy in Economies with Dual Labor Markets." <i>Journal of Economic Dynamics and Control</i> , 33(7): 1469-89. We present a dynamic stochastic general equilibrium (DSGE) New Keynesian model with indivisible labor and a dual labor market: a Walrasian one where wages are fully flexible and a unionized one characterized by real wage rigidity. We show that the negative effect of a productivity shock on inflation and the positive effect of a cost-push shock are crucially determined by the proportion of firms that belong to the unionized sector. The larger this number, the larger are these effects. Consequently, the larger the union coverage, the larger should be the optimal response of the nominal interest rate to exogenous productivity and cost-push shocks. The optimal inflation and output gap volatility increases as the number of the unionized firms in the economy increases.
2009	J52	CV: Fregert, Klas, and Jaakko Pehkonen. 2009. "The Crisis of the 1990s and Unemployment in Finland and Sweden." In <i>The Great Financial Crisis in Finland and Sweden: The Nordic Experience of Financial Liberalization</i> , ed. Lars Jonung, Jaakko Kiander and Pentti Vartia, 131-57. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2009	J52	Terraz, Isabelle. 2009. "Negociations salariales et croissance: Une application empirique aux pays de l'OCDE apres la Seconde Guerre mondiale. (Wage Bargaining and Economic Growth: An Empirical Application to OECD Countries after World War II. With English summary.)." <i>Economies et Societes</i> , 43(5): 833-55. This article deals with collective bargaining and economic growth both from a theoretical and an empirical point of view. In a case of investment irreversibility, bargaining can appropriate the capital rent and hence reduce the rate of growth. This effect obtained in an endogenous growth model with investment externality is then tested on 15 OECD countries between 1960 and 2000. We show that the unionization rate has a significant negative effect on the growth rates of these countries.
2009	J52	Ciccarone, Giuseppe. 2009. "Equita distributiva e produttività programmata: Una proposta per la riforma della contrattazione. (Redistributive Equity and Programmed Productivity: A Proposal for Wage Bargaining Reform. With English summary.)." <i>Economia e Lavoro</i> , 43(2): 15-24. The Italian economy has experienced a long period of low growth, of income and of labour productivity. At the same time, income distribution has moved in favor of profits, but wage moderation and greater flexibility in the labour market have been accompanied by insufficient dynamics of technical progress. These crucial issues for the future of the Italian economy are not properly addressed by the recent debate on the reform of wage bargaining. In order to overcome this shortcoming, the paper proposes to adopt a procedure of variation of the "first level" wage which takes into account the functional distribution of income and which aims at achieving a "programmed" rate of productivity growth.
2009	J54 P13	Clemente Lopez, Jesus, Millan Diaz Foncea, and Carmen Marcuello Servos. 2009. "Sociedades cooperativas y sociedades laborales en Espana: Estudio de su contribucion a la creacion de empleo y al crecimiento economico. (Entities of the Social Economy in Spain: Study of Their Contribution to the Employment and Economic Growth. With English summary.)." <i>Revista de Estudios Cooperativos</i> , 0(98): 35-69. The goal of this paper is analyzing the evolution of cooperatives and "sociedades laborales" in Spain, as well as to relate the economic context in which these entities developed their activities and their contribution to economic development and job creation. The used methodology is the analysis of convergence, which explains that the Social Economy is more established in those "Autonomous Communities" with greater numbers of employees and in those with higher income per capita.
2009	K10	Oh, Yonghyup. 2009. "International Capital Market Imperfections: Evidence from Geographical Features of International Consumption Risk Sharing." <i>Applied Economics</i> , 41(7-9): 1043-53. This article attempts to rationalize the validity of gravity variables to explain the degree of international consumption risk sharing. We find that for a panel of 54 countries during 1950-2000, variables such as distance, affluence, a common language and the type of legal system are relevant in explaining not only cross-country consumption and output correlations, but consumption risk sharing. Common law countries share consumption risks more than civil law countries. English speaking countries turn out to share consumption risks more than other language groups, and show significantly higher consumption risk sharing even within the group of common law countries.
2009	K10 K40 N40	Roe, Mark J., and Jordan I. Siegel. 2009. "Finance and Politics: A Review Essay Based on Kenneth Dam's Analysis of Legal Traditions in The Law-Growth Nexus." <i>Journal of Economic Literature</i> , 47(3): 781-800. Strong financial markets are widely thought to propel economic development, with many in finance seeing legal tradition as fundamental to protecting investors sufficiently for finance to flourish. Kenneth Dam finds that the legal tradition view inaccurately portrays how legal systems work, how laws developed historically, and how government power is allocated in the various legal traditions. Yet, after probing the legal origins' literature for inaccuracies, Dam does not deeply develop an alternative hypothesis to explain the world's differences in financial development. Nor does he challenge the origins core data, which could be origins' trump card. Hence, his analysis will not convince many economists, despite that his legal learning suggests conceptual and factual difficulties for the legal origins explanations. Yet, a dense political economy explanation is already out there and the origins-based data has unexplored weaknesses consistent with Dam's contentions. Knowing if the origins view is truly fundamental, flawed, or secondary is vital for financial development policy making because policymakers who believe it will pick policies that imitate what they think to be the core institutions of the preferred legal tradition. But if they have mistaken views, as Dam indicates they might, as to what the legal traditions' institutions really are and which types of laws are effective, or what is really most important to financial development, they will make policy mistakes--potentially serious ones.
2009	K32	Aiken, Deborah Vaughn, Rolf Fare, Shawna Grosskopf, and Carl A. Pasurka Jr. 2009. "Pollution Abatement and Productivity Growth: Evidence from Germany, Japan, the Netherlands, and the United States." <i>Environmental and Resource Economics</i> , 44(1): 11-28. The passage of environmental legislation was accompanied by concerns about its potential detrimental effect on productivity. We assume inputs can be assigned to either abatement activities or good output production. This allows us to specify regulated and unregulated production frontiers to determine the association between pollution abatement and productivity growth. We then employ our "assigned input" model to determine the association between productivity and abatement activities for manufacturing industries in Germany, Japan, the Netherlands and the United States.
2009	K40	Yao, Yang, and Linda Yueh. 2009. "Law, Finance, and Economic Growth in China: An Introduction." <i>World Development</i> , 37(4): 753-62. China has experienced remarkable economic growth for three decades despite having a weak legal system and underdeveloped financial markets thought to be crucial for economic development. An assessment of the relationship among the legal and financial systems and economic growth reveals a complex set of institutional factors that have underpinned China's marketization, and which is not premised on the establishment of a legal or financial system before development takes off. China's experience holds lessons for other developing countries struggling with imperfect legal systems and nascent financial markets, which are not uncommon features of economies at an early stage of development.
2009	K40	Feng Lu, Susan, and Yang Yao. 2009. "The Effectiveness of Law, Financial Development, and Economic Growth in an Economy of Financial Repression: Evidence from China." <i>World Development</i> , 37(4): 763-77. In an economy characterized by financial repression, enhancing the legal system may hinder the development of some aspects of the financial sector, especially informal

Year	DE	Title and Abstract
		arrangements aiming at circumventing the repression. Using Chinese provincial data in the 1990s, we find that enhanced legal system suppresses private investment and has no effect on financial depth although it increases the private share of bank credits and bank competition. We interpret these findings as evidence showing the existence of the leakage effect that moves financial resources from the privileged state sector to the rationed private sector. In addition, we find that enhanced legal system does not have a significant effect on the average GDP growth rate. We conclude that the smooth functioning of the legal system requires other institutions to complement.
2009	K40	THE SAME AS K10 Roe, Mark J., and Jordan I. Siegel. 2009. "Finance and Politics: A Review Essay Based on Kenneth Dam's Analysis of Legal Traditions in The Law-Growth Nexus." <i>Journal of Economic Literature</i> , 47(3): 781-800.
2009	L43	Glomm, Gerhard, and Fabio Mendez. 2009. "Privatization, Deregulation, and Capital Accumulation." <i>Southern Economic Journal</i> , 75(4): 976-95. In this paper, we study how the privatization and deregulation of intermediate goods industries influence capital accumulation. Our model is solved under three alternative scenarios: (i) the intermediate sector is composed of a public monopoly under government control; (ii) the intermediate sector is dominated by a private monopoly; and (iii) the intermediate sector is competitive. The comparison of these models suggests that the income benefits of state-to-market transitions are mostly due to increased competition on the deregulated market and that the privatization of state enterprises is not likely to generate significant changes in the economy when the public monopoly is replaced by a private monopoly. We find that elimination of monopoly rights can increase aggregate income significantly.
2009	L73	Hujala, Maija, and Olli-Pekka Hilmola. 2009. "Forecasting Long-Term Paper Demand in Emerging Markets." <i>Foresight</i> , 11(6): 56-73. Typically, the graphic paper demand is being forecasted with the development of GDP, population, and the price of paper. Recently, diffusion of information and communication technologies (ICT) has been identified as one possible driver of its consumption. It could be assumed that in emerging markets paper demand is a combination of these classical and new factors. The research examines the situation in the emerging Russian market with panel data regression analysis, accompanied with system dynamics simulation using Monte Carlo sensitivity analysis. So, the paper integrates different quantitative approaches to sketch long-term paper demand forecasts through different alternative scenarios. Results show that mobile telephones are complementary to both newsprint and magazine paper demand and the internet is a substitute, but these two factors are still relatively small compared to the effect of GDP per capita.
2009	L88	Torres, Angel, and Alvaro Lopez Barcelo. 2009. "La Directiva de Servicios como instrumento de mejora regulatoria en el sector terciario. (With English summary.)" <i>Papeles de Economia Espanola</i> , 0(120): 236-49. Spain's services sector presents several structural flaws. The regulatory framework in which services activities operate may well be one of the main reasons of those weaknesses. According to the empirical literature, there is a link between regulation and the performance of variables such as productivity or prices in the tertiary sector. In this context, the better regulation exercise associated with the implementation of the Services Directive constitutes an opportunity to give a new direction to the most important sector of the Spanish economy towards a more efficient and competitive model. Some recent papers expect significant effects on macroeconomic aggregates as a result of this process.
2009	L92	Islam, Faridul, Saleheen Khan, Anisul M. Islam, and Syed Mushtaque Ahmed. 2009. "Persistence of Shock in a Time Series: An Empirical Analysis of Bangladesh Railway Earnings." <i>South Asia Economic Journal</i> , 10(2): 429-49. Services provided by Bangladesh Railway (BR), a popular mode of transportation, have been vital to the growth and development of the economy since their inception. However, the declining share of its revenue to the gross domestic product (GDP) remains a major policy concern which needs to be addressed. Public policy, particularly short-term stabilization policy, aimed at dealing with this concern would be effective if the series (share of revenue to GDP) is trend stationary. However, if the series is found to be stochastically non-stationary, such stabilization policy would be ineffective and would signal the need for long-term restructuring and reforms. Given this perspective, the article examines if the relevant time series (in this case, railway revenue as per cent of GDP) contains a deterministic or stochastic trend to assess whether short-term public stabilization policy would be effective or long-term structural adjustments and reforms would be necessary. In addition, the article also provides a measure of persistence in the above mentioned time series following Cochrane (1988). Loss of railway's share appears to be due to long-term shifts in demand due to inter-modal competition as well as supply and capacity constraints.
2009	L92	Guerrero C., Alejandro, and Cesar Rivera T. 2009. "Mexico: Total Productivity Changes at the Principal Container Ports." <i>CEPAL Review</i> , 0(99): 173-85. Port performance is commonly measured using partial productivity indicators obtained by relating an output to an input. To ascertain the overall productivity of a port, however, it is more helpful to employ the concept of total productivity, which considers all the inputs employed to obtain the totality of outputs. This factor has been measured using the Malmquist index, which gives the change in total factor productivity (TFP). The present study uses this index to determine the change in the TFP of the principal container ports in Mexico. According to the results obtained, productivity gains were greater at medium-sized terminals such as Progreso and Ensenada than at hubs such as Veracruz and Altamira, even though the latter are more efficient.
2009	L92 R40	Tobon A., Alexander, and Diana Galvis. 2009. "Análisis sobre la evolución reciente del sector de transporte en Colombia. (With English summary.)" <i>Perfil de Coyuntura Económica</i> , 0(13): 147-63. The public transportation sector plays an important role in the consolidation of globalization and competitiveness processes in Colombia. In this sense, there is an internal transformation of the sector accentuated by the growth of the urban population. This article simulates a descriptive analysis of the transportation sector in Colombia in the past few years, using the methodology applied by DANE. Some of the conclusions are: that there is cyclical behavior between national GDP and private consumption with respect to the transportation sector, and also that the traditional public transportation sector and the mass transportation system are non-complementary.
2009	L95	Cabalu, Helen, and Chassty Manuhutu. 2009. "Vulnerability of Natural Gas Supply in the Asian Gas Market." <i>Economic Analysis and Policy</i> , 39(2): 255-70. Gas supply interruptions, increasing gas prices, transportation and distribution bottlenecks, and a growing reliance on imports over longer distances have renewed interest on gas vulnerability in Asia. Japan, Korea, and Taiwan are heavily reliant on LNG imports for their gas supplies from Malaysia, Brunei, Indonesia, Australia, and the Middle East. Countries like Malaysia, Thailand, and Singapore import gas via trans-border pipelines. This paper examines the relative vulnerability of eight gas-importing countries in Asia for the year 2006 using four market risk indicators (ratio of value of gas imports to GDP; ratio of gas consumed to GDP; ratio of gas consumed in an economy to population; and ratio of gas consumption to total primary energy consumption) and two supply risk indicators (ratio of domestic gas production to total domestic gas consumption and geopolitical risk). Using principal component analysis, a composite index of gas vulnerability is estimated by combining the individual indicators. The results demonstrate that there are significant differences in the values of individual and overall indicators of gas vulnerability among countries. This implies that policy measures to address gas vulnerability in one country could differ in another country.
2009	N20	Reinhart, Carmen M., Kenneth S. Rogoff, and Miguel A. Savastano. 2009. "La intolerancia a la deuda. (With English summary.)" <i>El Trimestre Económico</i> , 76(4): 811-84. This paper introduces the concept of "debt intolerance", which manifests

Year	DE	Title and Abstract
		itself in the extreme duress many emerging markets experience at debt levels that would seem manageable by advanced country standards. We argue that "safe" external debt-to-GNP thresholds for debt intolerant countries are low, perhaps as low as 15 percent in some cases. These thresholds depend on a country's default and inflation history. Debt intolerance is linked to the phenomenon of serial default that has plagued many countries over the past two centuries. Understanding and measuring debt intolerance is fundamental to assess the problems of debt sustainability, debt restructuring, capital market integration, and the scope for international lending to ameliorate crises. Our goal is to make a first pass at quantifying debt intolerance, including delineating debtors' clubs and regions of vulnerability, on the basis on a history of credit events going back to the 1820s for over 100 countries.

2009	N30	Kenny, Charles. 2009. "There's More to Life Than Money: Exploring the Levels/Growth Paradox in Income and Health." <i>Journal of International Development</i> , 21(1): 24-41. This paper discusses historical and recent cross-country evidence relating income to measures of health. After a review of the literature on income and the quality of life, the paper looks at long-term historical evidence on the link between income change and health indicators. Using data on life expectancy, infant mortality and income for a small subset of largely wealthy countries over the 1913-1999 period, the paper examines correlations between income and health at period start and end as well as using the growth of the variables. Using a larger set of data over the period 1975-2000, the paper repeats these tests, as well as looking for any evidence of a larger impact of income, when different data are used or the sample is split. Results suggest a strong cross-country link between income and health and considerable evidence of global improvements over time, but a comparatively weak relationship between improvements in income and improvements in health, even over the very long term. The paper discusses a model based on technology and institutions that might account for such results as well as some preliminary evidence in favour of such a model.

2009	N30 N50	Krausmann, Fridolin, Simone Gingrich, Nina Eisenmenger, Karl-Heinz Erb, Helmut Haberl, and Marina Fischer-Kowalski. 2009. "Growth in Global Materials Use, GDP and Population during the 20th Century." <i>Ecological Economics</i> , 68(10): 2696-2705. The growing industrial metabolism is a major driver of global environmental change. We present an assessment of the global use of materials since the beginning of the 20th century based on the conceptual and methodological principles of material flow accounting (MFA). On the grounds of published statistical data, data compilations and estimation procedures for material flows not covered by international statistical sources, we compiled a quantitative estimate of annual global extraction of biomass, fossil energy carriers, metal ores, industrial minerals, and construction minerals for the period 1900 to 2005. This period covers important phases of global industrialisation and economic growth. The paper analyses the observed changes in the overall size and composition of global material flows in relation to the global economy, population growth and primary energy consumption. We show that during the last century, global materials use increased 8-fold. Humanity currently uses almost 60 billion tons (Gt) of materials per year. In particular, the period after WWII was characterized by rapid physical growth, driven by both population and economic growth. Within this period there was a shift from the dominance of renewable biomass towards mineral materials. Materials use increased at a slower pace than the global economy, but faster than world population. As a consequence, material intensity (i.e., the amount of materials required per unit of GDP) declined, while materials use per capita doubled from 4.6 to 10.3 t/cap/yr. The main material groups show different trajectories. While biomass use hardly keeps up with population growth, the mineral fractions grow at a rapid pace. We show that increases in material productivity are mostly due to the slow growth of biomass use, while they are much less pronounced for the mineral fractions. So far there is no evidence that growth of global materials use is slowing down or might eventually decline and our results indicate that an increase in material productivity is a general feature of economic development.
2009	N30	Cette, Gilbert, Yusuf Kocoglu, and Jacques Mairesse. 2009. "La productivite en France, au Japon, aux Etats-Unis et au Royaume-Uni au cours du XXe siecle. (Productivity Growth and Level in France, Japan, the United Kingdom and the United States over the Past Century and in Recent Years. With English summary)." <i>Revue de L'OFCE</i> , 0(111): 5-37. The past 120 years have been characterised by: (i) rapid economic growth and large productivity gains in the four countries; (ii) a decline in productivity in the United Kingdom relative to the United States, and to a lesser extent also relative to France and Japan until the second world war (WW2), and its subsequent come-back; (iii) the remarkable catching-up of the United States by France and Japan after WW2, which was, however, interrupted in the case of Japan during the 1990s. The contribution of capital deepening accounts for a large share of these different performances, with an increasing share of ICT capital in the last 25 years. In 2006, before the current world crisis, hourly labour productivity levels are slightly higher in France than in the United States, and significantly lower in the United Kingdom and even more in Japan, while TFP levels are very close in France, the United Kingdom, and the United States, but much lower in Japan.
2009	N31	Dennis, Benjamin N., and Talan B. Iscan. 2009. "Engel versus Baumol: Accounting for Structural Change Using Two Centuries of U.S. Data." <i>Explorations in Economic History</i> , 46(2): 186-202. In the last two centuries, the reallocation of labor out of agriculture has been a dominant feature of structural change and economic growth in the United States. This paper uses an accounting framework founded in economic theory to decompose this reallocation into three components: a demand-side effect due to the low income elasticity of demand for agricultural goods (Engel effect), and two supply-side effects, one due to differential sectoral productivity growth rates (Baumol effect), and the other to differential capital deepening. The results show that the Engel effect accounts for almost all labor reallocation until the 1950s, after which the Baumol effect becomes a key determinant. Our framework provides a unified account of long-run structural change, and demonstrates that historical interpretations and theoretical

Year	DE	Title and Abstract
		models that emphasize only one dimension of this process cannot properly account for the dramatic history of labor reallocation in the United States.
2009	N35	Settsu, Tokihiko. 2009. "Revision of National Income Estimates on the Tertiary Industry in Pre-war Japan--An Approach to Reexamining Long-Term Economic Statistics. (In Japanese. With English summary)." <i>Economic Review (Keizai Kenkyu)</i> , 60(2): 97-111. It has been known that there are some inconsistencies in Long-Term Economic Statistics (LTES) series edited by Okawa et al. In regard to the estimates on the tertiary industry, Y. Yasuba has already pointed out that the number of labour force used for estimating total income of this industry is quite different from the one in the other volume of LTES. This paper provides new national income estimates on the tertiary industry in pre-war Japan by not only resolving this serious inconsistency on the labour force but also recalculating the per-capita income and the income of workers who have subsidiary works in this industry.
2009	N35	Hickson, Kerry Jane. 2009. "The Contribution of Increased Life Expectancy to Economic Development in Twentieth Century Japan." <i>Journal of Asian Economics</i> , 20(4): 489-504. This paper estimates the value of improved health in Japan over the twentieth century. By valuing the decline in the death rate and appending this to existing measures of GDP per capita it is possible to calculate health augmented GDP per capita growth and generate original results about the monetary value of improved life expectancy over the twentieth century in Japan. The findings of the paper indicate that this is a pertinent exercise because GDP per capita growth approximately doubles when it is extended to include increases in the life expectancy of the population of Japan. These results also provide a justification for the increase in health care service spending that was evident at the close of the twentieth century.
2009	N36	Gadelha, Sergio Ricardo de Brito. 2009. "Crescimento economico, imigracao e salarios reais no Brasil, 1880-1937. (With English summary)." <i>Historia Economica e Historia de Empresas</i> , 12(1): 71-100. This paper demonstrates that in Brazil, 1880-1937, changes in the per capita real income growth rate always preceded changes in the levels of both immigration and the real wage, and so it is highly likely that it was the growth of the economy which induced the immigration and changes in the real wage, and not the other way around. Formally, there was a unidirectional Granger causality relationship from economic growth, in both a bivariate and multivariate framework, to immigration and the real wage. There was no causality, in either direction, between immigration and the real wage.
2009	N40	Feyrer, James, and Bruce Sacerdote. 2009. "Colonialism and Modern Income: Islands as Natural Experiments." <i>Review of Economics and Statistics</i> , 91(2): 245-62. Using a new database of islands throughout the Atlantic, Pacific, and Indian Oceans we find a robust positive relationship between the number of years spent as a European colony and current GDP per capita. We argue that the nature of discovery and colonization of islands provides random variation in the length and type of colonial experience. We instrument for length of colonization using variation in prevailing wind patterns. We argue that wind speed and direction had a significant effect on historical colonial rule but do not have a direct effect on GDP today. The data also suggest that years as a colony after 1700 are more beneficial than earlier years. We also find a discernable pecking order among the colonial powers, with years under U.S., British, French, and Dutch rule having more beneficial effects than Spanish or Portuguese rule. Our finding of a strong connection between modern income and years of colonization is conditional on being colonized at all since each of the islands in our data set spent some time under colonial rule.

2009	N41	Martin, Fernando M. 2009. "A Positive Theory of Government Debt." <i>Review of Economic Dynamics</i> , 12(4): 608-31. A government that cannot commit to future policy choices faces a trade-off that explains the level of debt. On the one hand, there is an incentive to increase debt and delay taxation, so as to reduce current distortions. On the other hand, inflating current prices lowers the real value of nominal debt and so there is a motive to reduce it now. The size of long-run debt will depend on the interaction of these two opposing incentives. The critical determinant is the willingness of households to substitute away from goods being taxed by inflation. Numerical simulations show that the model matches some qualitative and quantitative properties of U.S. policy variables, including the fact that wars are frequently financed with a mix of instruments. The theory interprets the unusual post-World War II inflation and fast liquidation of accumulated debt as being due to higher long-run debt and expenditure in the period leading up to the war.
2009	N50	THE SAME AS N30 Krausmann, Fridolin, Simone Gingrich, Nina Eisenmenger, Karl-Heinz Erb, Helmut Haberl, and Marina Fischer-Kowalski. 2009. "Growth in Global Materials Use, GDP and Population during the 20th Century." <i>Ecological Economics</i> , 68(10): 2696-2705.
2009	N60 N70	La Croix, Sumner, and Ming Liu. 2009. "The Effect of GDP Growth on Pharmaceutical Patent Protection, 1945-2005." <i>Brussels Economic Review/Cahiers Economiques de Bruxelles</i> , 52(3-4): 355-75. We investigate whether there is a U-shaped relationship between GDP per capita and country patent protection for pharmaceuticals. Using the Pharmaceutical Intellectual Property Protection (PIPP) Index, we find no evidence of a U-shaped relationship for any of the 154 countries in our sample or for global aggregates. There is, however, evidence for a U-shaped relationship in some annual cross-section scatter plots and Tobit regressions. Using a random-effects Tobit estimator and cubic as well as quadratic GDP per capita variables, we find evidence both for and against a monotonically increasing relationship between GDP and the predicted PIPP Index.
2009	N70	THE SAME AS N30 CV: Calomiris, Charles W. 2009. "A Globalist Manifesto for Public Policy: The Tenth Annual IEA Hayek Memorial Lecture, Delivered at One, Great George Street, London, SW1, 5 July 2001."
2009	N73	Ortiz-Villajos, Jose M. 2009. "Patents and Economic Growth in the Long Term: A Quantitative Approach." <i>Brussels Economic Review/Cahiers Economiques de Bruxelles</i> , 52(3-4): 305-40. The work is a quantitative analysis on the relationship between technology and economic development from data on patents from over twenty countries from the beginning of the 19th century till the end of the twentieth century. The cross section regressions between patents and per capita income show a high correlation between both variables and allow the positive effect of technological innovation on economic development to be seen. The regressions between the time series of patent applications in Spain between 1826 and 1985 and some economic variables indicate in similar fashion that there is a positive correlation between both variables, especially between patents and gross fixed capital formation.
2009	N91	Yuan, Tangjun, Tokihiko Settsu, Jean-Pascal Bassino, and Kyoji Fukao. 2009. "Gross Prefectural Domestic Product and Industrial Structure in Pre-war Japan. (In Japanese. With English summary)." <i>Economic Review (Keizai Kenkyu)</i> , 60(2): 163-89. Studies comparing regional income in Japan before and after World War II have frequently drawn a picture of radical change from an economy characterized by large regional disparities to one characterized by small regional disparities. This paper comes to a very different conclusion. Based on estimates of prefecture-level value added for five benchmark years from 1890 to 1940 (a detailed description of our estimation methodology is provided), we examine trends in the gap of economic development between prefectures during the pre-war period and find that this gap was much smaller than claimed in preceding studies and, in fact, not much greater than during the post-war period. Observing, moreover, a decline in inter-prefectural differences in terms of per-capita

Year	DE	Title and Abstract
		gross value added during the pre-war period, we conduct a factor analysis and find that a major reason for this decline was a decline in inter-prefectural differences in same-industry labor productivity. Thus, the picture of modern Japan's economic development presented here is very different from the one painted by preceding studies.
2009	O44	Lee, Chew Ging. 2009. "Foreign Direct Investment, Pollution and Economic Growth: Evidence from Malaysia." <i>Applied Economics</i>, 41(13-15): 1709-16. The bounds test developed by Pesaran et al. (2001) is applied to examine the existence of a long-run relationship between foreign direct investment (FDI) inflows, pollution and output of Malaysia. Granger causality tests are also utilized to test for the presence of the short-run and long-run causal relationship between these variables. Both FDI inflows and pollution have short-run causal relationship on output. Output only has long-run causal relationship on FDI inflows.

2009	P14	Sakaki, Shungo. 2009. "Where Do We Stand on the Intellectual Property Rights System between "Open Access and Reinforcing Private Ownership"?" <i>Evolutionary and Institutional Economics Review</i>, 5(2): 225-58. There are currently two main arguments with regard to how to handle technological knowledge (stock). One argument holds that emphasis should be placed on steps to reinforce private ownership of such knowledge and to issue incentives which encourage its development or creation. The other argument holds that technological and institutional restrictions governing access to intellectual property should be relaxed to enable more widespread public access. The results of our simulations show that, when evaluating the management of technological knowledge circulation based on long-term economic growth as the criterion, it is first necessary to increase the open access ratio for society as a whole. This is one of the conditions for driving growth forward during periods in which there is a single technological paradigm. However, an alternative approach is to secure private ownership by a minority percentage of society as a whole through means such as patents. This approach effectively encourages a shift away from technological knowledge that has fallen in productivity in favor of new technological knowledge. In this sense, it is possible to point to a new function and significance for the intellectual property rights system in terms of shouldering responsibility for shifts in favor of new technological knowledge.
2009	Q18	CV; Alfieri, Andrea, Channing Arndt, and Xavier Cirera. 2009. "Distortions to Agricultural Incentives in Africa: Mozambique." In <i>Distortions to Agricultural Incentives in Africa</i>, ed. Kym Anderson and William A. Masters, 127-46. Washington, D.C.: World Bank.
2009	Q18	Byerlee, Derek, Alain de Janvry, and Elisabeth Sadoulet. 2009. "Agriculture for Development: Toward a New Paradigm." <i>Annual Review of Resource Economics</i>, 1(1): 15-31. The fundamental role that agriculture plays in development has long been recognized. In the seminal work on the subject, agriculture was seen as a source of contributions that helped induce industrial growth and a structural transformation of the economy. However, globalization, integrated value chains, rapid technological and institutional innovations, and environmental constraints have deeply changed the context for agriculture's role. We argue that a new paradigm is needed that recognizes agriculture's multiple functions for development in that emerging context: triggering economic growth, reducing poverty, narrowing income disparities, providing food security, and delivering environmental services. Yet, governments and donors have neglected these functions of agriculture with the result that agriculture growth has been reduced, 75% of world poverty is rural, sectoral income disparities have exploded, food insecurity has returned, and environmental degradation is widespread, compromising sustainability. Mobilizing these functions requires shifting the political economy to overcome antiagriculture policy biases, strengthening governance for agriculture, and tailoring priorities to country conditions.
2009	Q22	Cunningham, Stephen, Arthur E. Neiland, Michael Arbuckle, and Tim Bostock. 2009. "Wealth-Based Fisheries Management: Using Fisheries Wealth to Orchestrate Sound Fisheries Policy in Practice." <i>Marine Resource Economics</i>, 24(3): 271-87. The importance of resource rent in fisheries has long been acknowledged. By generating such rents, economically efficient management systems increase value added and the sector's contribution to the gross domestic product (GDP) and growth. However, despite the successful adoption of such systems in some countries around the world, economics continues to have relatively little influence on fisheries policy. This lack of influence is particularly noticeable in developing countries, precisely where the contribution that effectively managed fish resources might make to the GDP is most urgently needed. The key requirement to increase the adoption of economically rational fisheries management is to convince policymakers to focus explicitly on the wealth-generating potential of fish resources. Such a focus provides a general policy framework within which other approaches, such as rights-based, incentive-based, and ecosystem-based, may be nested. This approach is likely to prove more effective in influencing policy, especially in situations where rights-based systems either will not work or are politically unacceptable.
2009	Q24	Pattanayak, Subhrendu K. 2009. "Climate Change and Conservation in Brazil: CGE Evaluation of Health and Wealth Impacts." <i>B.E. Journal of Economic Analysis and Policy: Contributions to Economic Analysis and Policy</i>, 9(2): . Ecosystem services are public goods that frequently constitute the only source of capital for the poor, who lack political voice. As a result, provision of ecosystem services is sub-optimal and estimation of their values is complicated. We examine how econometric estimation can feed computable general equilibrium (CGE) modeling to estimate health-related ecosystem values. Against a backdrop of climate change, we analyze the Brazilian policy to expand national forests (FLONAS) by 50 million hectares. Because these major environmental changes can generate spillovers in other sectors, we develop and use a CGE model that focuses on land and labor markets. Compared to climate change and deforestation in the baseline, the FLONAS scenario suggests relatively small declines in GDP, output (including agriculture), and other macro indicators. Urban households will experience declines in their welfare because they own most of the capital and land, which allows them to capture most of the deforestation benefits. In contrast, even though rural households have fewer opportunities for subsistence agriculture and face additional competition with other rural agricultural workers for more limited employment, their welfare improves due to health benefits from conservation of nearby forests. The efficiency vs. equity tradeoffs implied by the FLONAS scenario suggests that health-related ecosystem services will be underprovided if the rural poor are politically weaker than the urban rich. In conclusion, we briefly discuss the pros and cons of the CGE strategy for valuing ecosystem-mediated health benefits and evaluating contemporary policies on climate change mitigation.
2009	Q26	Southwick, Rob, John Bergstrom, and Clint Wall. 2009. "The Economic Contributions of Human-Powered Outdoor Recreation to the US Economy." <i>Tourism Economics</i>, 15(4): 709-33. This paper presents a comprehensive assessment of the economic contributions of the major forms of human-powered outdoor recreation, including trail-based recreation, bicycle-based recreation, paddle-based recreation, snow-based recreation, and camp-based recreation. The results show that the combined economic contributions of human-powered recreation to the US economy exceed US\$ 590 billion annually in total gross output, supporting over five million jobs. Other studies estimate that wildlife-based recreation contributes another US\$ 140 billion annually in total

Year	DE	Title and Abstract
		gross output to the US economy, making a total contribution of US\$ 730 billion from both human-powered and wildlife-based recreation. Active outdoor recreation not only strengthens the US economy but also improves the quality of life for participants.
2009	R10	McCormick, Matthew J., Sharon D. Panek, and Ralph M. Rodriguez. 2009. "Gross Domestic Product by Metropolitan Area: Accelerated Statistics for 2008, New Statistics for 2007, and Revised Statistics for 2005-2007." <i>Survey of Current Business</i> , 89(10): 100-131. Growth in real GDP by metropolitan area slowed in 220 of the nation's 366 metropolitan areas, reflecting downturns in construction, manufacturing, and finance and insurance in many areas.
2009	R22	Lindgren, Eva, and Thomas Pettersson. 2009. "Two Sides of the Same Coin? Private Car Ownership in Sweden and Norway since 1950." <i>Scandinavian Economic History Review</i> , 57(2): 172-90. Norwegian private car density has lagged behind the Swedish and did not reach same national levels until the late 1980s, despite the same GDP per capita levels. Can both the time lag and the diffusion process be explained with national differences in income, institutions, infrastructure and population settlements? Or have regional differences in income and population density affected the outcome? The aim of this article is to compare car diffusion in Norway and Sweden in order to find explanations for the national and regional patterns of car diffusion. The conclusion is that car diffusion in Norway and Sweden displays two sides of same coin; the national levels converged, but the process did not follow the same regional pattern. Regional differences in income and population density have in general been a significant explanation for car density in Sweden, but not in Norway.
2009	R40	THE SAME AS L92 Tobon A., Alexander, and Diana Galvis. 2009. "Análisis sobre la evolución reciente del sector de transporte en Colombia. (With English summary.)." <i>Perfil de Coyuntura Económica</i> , 0(13): 147-63.
2009	R40	Wang, Jinbo. 2009. "An Empirical Study of the Relationship between Transportation and Economic Growth in Xinjiang Province." <i>International Business Research</i> , 2(2): 110-14. Along with the development of socialist market economy and the improvement of transportation facilities, the driving effect of transportation industry on economic growth tends to be more significant. The transportation industry is the lifeline of national economic growth and the backbone of material activities and community communication, signaling the development of national economy. Highly-developed transportation industry has important strategic meanings for a country's economic prosperity, cultural development, strong defense, and people's well-off life. Based on the grey system theory and econometrics, this paper analyzes the contributing effect of the transportation industry on Xinjiang's regional economic growth, and studies the relationship between indexes of Xinjiang's transportation industry and economic growth, supplying references for researching Xinjiang's regional economic development.
2009	R52	Holod, Dmytro, and Robert R. Reed. 2009. "Regional External Economies and Economic Growth under Asymmetry." <i>Southern Economic Journal</i> , 75(4): 1123-40. In this article, we explore the impact of regional external economies from human capital accumulation on economic growth. In particular, we allow the extent of local and regional spillovers to vary between the home and foreign economies. Our analysis yields novel insights regarding the diffusion of knowledge across countries. In contrast to the standard, closed-economy Lucas (1988) model, spillovers within the home country may adversely affect growth in the presence of substantial knowledge flows from the foreign country.
2010		
2010	A11	Friedman, Gerald. 2010. "The Crisis and the Economists: A Guide to the Perplexed." <i>Labor History</i> , 51(3): 345-62. Few economists anticipated the current economic crisis and economists continue to stand in the way of effective economic policy. Over a century after Karl Marx and nearly 75 years after John Maynard Keynes, orthodox economists continue to believe in a version of Say's Law where production is for consumption and economic crises originate in bad monetary policy. In the orthodox view, proper monetary policy is not only necessary but is sufficient for recovery; once governments have restored liquidity to the banking system, there is no need for further intervention or stimulus spending. Based on a pre-capitalist, even pre-social, image of economic activity, the orthodox approach is inadequate to understand modern economic conditions. Should its prescriptions be followed, we risk compounding the current economic crisis and dragging the economy into a long term malaise comparable with the economic crisis of the 1930s.
2010	A11	Brownlow, Graham. 2010. "Fabricating Economic Development." <i>Economic and Social Review</i> , 41(3): 301-24. Much of the literature, regardless of academic discipline, presents the publication of Economic Development in 1958 as analogous to a "big bang" event in the creation of modern Ireland. However, such a "big bang" perspective misrepresents the sophistication of economic debates prior to Whitaker's report as well as distorting the interpretation of subsequent developments. This paper reappraises Irish economic thinking before and after the publication of Economic Development. It is argued that an economically "liberal" approach to Keynesianism, such as that favoured by T. K. Whitaker and George O'Brien, lost out in the 1960s to a more interventionist approach: only later did a more liberal approach to macroeconomic policy triumph. The rival approaches to academic economics were in turn linked to wider debates on the influence of religious authorities on Irish higher education. Academic economists were particularly concerned with preserving their intellectual independence and how a shift to planning would keep decisions on resource allocation out of the reach of conservative political and religious leaders. 2010	C13	Diss: Donayre, Luigi Alfredo. 2010. Inferences about Threshold Effects in Macroeconomic Relationships. PhD diss. Washington University in St. Louis. First Chapter (Job Market Paper): "Estimated Thresholds in the Response of Output to Monetary Policy: Are Large Policy Shocks Less Effective? This paper investigates asymmetries in the response of output to monetary policy shocks of different magnitude. Traditionally in the literature, the threshold determining which shocks are 'large' and which are 'small' has been imposed exogenously. In this context, an unobserved components (UC) model of output with a TAR-driven transitory component augmented by a monetary policy variable is estimated. This framework makes it possible to introduce the threshold determining the size of monetary policy shocks as an additional parameter, instead of imposing an ad hoc definition. Second Chapter: "Fiducial Distribution Confidence Intervals for Threshold Models with an Application to Credit-Market Crises" (with Yunjong Eo and James Morley) We construct confidence intervals for threshold parameters of TAR processes. Following Eo and Morley (2009), we propose a new method to construct confidence intervals for threshold parameters based on simulation of their marginal fiducial distributions (FD) from the likelihood function, by means of Markov-Chain Monte Carlo methods. Third Chapter: "Firm Heterogeneity, Imperfect Information and the Role of Aggregation in the Nonlinear Relationship Between Money and Output" This paper addresses deeper empirical issues related to the role of aggregation in determining the nature of the nonlinear relationship between output and monetary policy variables. This paper argues that this difference between theory and empirical evidence might be caused by an aggregation problem.
2010	C54	Onatski, Alexei, and Noah Williams. 2010. "Empirical and Policy Performance of a Forward-Looking Monetary Model." <i>Journal of Applied Econometrics</i> , 25(1): 145-76. In this paper we consider the implications of a fully specified dynamic general equilibrium model, developed by Smets and Wouters (2003). This is a relatively large-scale forward-looking model, which was shown to provide a good fit to the data. We show that systematically accounting for prior uncertainty may lead to substantially different

Year	DE	Title and Abstract
		parameter estimates. However many of the qualitative features of the model remain similar under the alternative estimates that we find. We then formulate and analyze optimal policy rules in the model, focusing on a simple loss function which is commonly used and is independent of the estimates. We determine the optimal equilibrium dynamics for our estimates as well as those of Smets and Wouters, and find that they imply largely similar behavior. We then analyze simple policy rules, finding that these rules perform relatively well and are robust to our different sets of parameter estimates. Overall, our results suggest that the model may be relatively robust in its ability to capture certain aspects of the data. However some caution should be exercised in basing inference on the structural estimates, as these seem to be only weakly identified.
2010	C58	Rodriguez, Abel, and Gavino Puggioni. 2010. "Mixed Frequency Models: Bayesian Approaches to Estimation and Prediction." <i>International Journal of Forecasting</i>, 26(2): 293-311. We describe Bayesian models for economic and financial time series that use regressors sampled at higher frequencies than the outcome of interest. The models are developed within the framework of dynamic linear models, which provides a high level of flexibility and allows direct interpretation of the results. The problem of the collinearity of intraperiod observations is solved using model selection and model averaging approaches. Bayesian approaches to model selection automatically adjust for multiple comparisons, while predictions based on model averaging allow us to account for both model and parameter uncertainty when predicting future observations. A novel aspect of the models presented here is the introduction of new formulations for the prior distribution on the model space that allow us to favor sparse models where the significant coefficients cluster on adjacent lags of the high frequency predictor. We illustrate our approach by predicting the gross national product of the United States using the term structure of interest rates.
2010	C58	Cagli, Efe Caglar, Umut Halac, and Dilvin Taskin. 2010. "Testing Long-Run Relationship between Stock Market and Macroeconomic Variables in the Presence of Structural Breaks: The Turkish Case." <i>International Research Journal of Finance and Economics</i>, 0(48): 49-60. In this paper, the relationship between macroeconomic variables and stock market level is investigated. In the empirical analysis, well-known (Zivot Andrews, 1992; Lumsdaine Papell, 1997) unit root tests are conducted to determine the order of integration of the time series. Gregory-Hansen test which allows for structural breaks in the data is employed to examine the cointegration between macroeconomic fundamentals and stock market prices. As a result, Istanbul Stock Exchange National-100 (ISE-100) index is found as cointegrated with the variables, namely gross domestic product, U.S. crude oil price, and industrial production.
2010	C58	Nwezeaku, N. C., and G. C. Okpara. 2010. "The Effects of Financial Deepening on Stock Market Returns and Volatility: Evidence from Nigeria." <i>International Research Journal of Finance and Economics</i>, 0(40): 67-73. This paper investigates the effects of financial deepening on the stock market returns and volatility in Nigeria using the generalized autoregressive conditional heteroscedasticity (GARCH) model. Two different measures of financial deepening namely the ratio of money supply to gross domestic product (FD ₁) and the ratio of domestic credits to GDP (FD ₂) were used, leading to the building of two GARCH models. Our results show that in both models, a high degree of financial deepening reduces significantly the level of risk (volatility) in the stock market and that conditional volatility of returns is fairly persistent. Employing a diagnostic test, we verified whether the GARCH model is misspecified and found that apart from recording improvement in the descriptive statistics, all the estimation pass the Ljung-Box Q ₁₂ and Q ₂ ² ₁₂ to check the autocorrelation and heteroscedasticity in the normalized residual of the model. The models were therefore found to be well specified and can be used for forecasting. The policy implication of the results is that the reduction or presence of low degree of volatility suggests that investors will demand for less risk premium in the stock market thereby creating lower cost of capital which is synonymous with increase in investment and hence economic development. The government should therefore gear its efforts towards deepening finance in the economy in order to achieve economic development and growth of the country.
2010	C58	Elder, John, and Apostolos Serletis. 2010. "Oil Price Uncertainty." <i>Journal of Money, Credit, and Banking</i>, 42(6): 1137-59. The theories of investment under uncertainty and real options predict that uncertainty about, for example, oil prices will tend to depress current investment. We reinvestigate the relationship between the price of oil and investment, focusing on the role of uncertainty about oil prices. We find that volatility in oil prices has had a negative and statistically significant effect on several measures of investment, durables consumption, and aggregate output. We also find that accounting for the effects of oil price volatility tends to exacerbate the negative dynamic response of economic activity to a negative oil price shock, while dampening the response to a positive oil price shock.
2010	D71	Moore, James C. 2010. "On Aggregation and Welfare Analysis." <i>Review of Economic Design</i>, 14(1-2): 95-129. In this article, the beginnings of a new approach to the theory of aggregation are developed. The basic idea is that aggregation should involve two things: (a) data over which social preferences are defined should be mapped into a smaller-dimensional space, and (b) there should exist an ordering on that lower-dimensional space such that an improvement in this criterion implies an improvement for any of a class of social preference functions and of a class of individual preference relations defined over the original space. Results are developed which show that this conception of aggregation can yield meaningful results; particularly with respect to comparisons of 'real national income' in two situations, for a given economy.
2010	D78	Bhattacharjee, Arnab, and Sean Holly. 2010. "Rational Partisan Theory, Uncertainty, and Spatial Voting: Evidence for the Bank of England's MPC." <i>Economics and Politics</i>, 22(2): 151-79. The transparency and openness of the monetary policy-making process at the Bank of England has provided very detailed information on both the decisions of individual members of the Monetary Policy Committee (MPC) and the information on which they are based. In this paper, we consider this decision-making process in the context of a model in which inflation forecast targeting is used, but there is heterogeneity among the members of the committee. We find that rational partisan theory can explain spatial voting behavior under forecast uncertainty about the output gap. Internally generated forecasts of output and market-generated expectations of medium-term inflation provide the best description of discrete changes in interest rates, in combination with uncertainty in the macroeconomic environment. There is also a role for developments in asset, housing and labor markets. Further, spatial voting patterns clearly differentiate between internally and externally appointed members of the MPC. The results have important implications for committee design and the conduct of monetary policy.
2010	E02	Mahmood, Khalid, Toseef Azid, Imran Sharif Chaudhry, and Muhammad Zahir Faridi. 2010. "Impact of Economic Freedom on Economic Growth: The Case of Some Selected SAARC Member Countries." <i>International Research Journal of Finance and Economics</i>, 0(52): 7-16. This research paper in general focuses on the significance of economic freedom for growth in South Asian countries using the panel data of five SAARC member countries. The study employs econometric technique like Auto Regressive Distributive Lag (ARDL) Model to investigate the long run relationship between concerned variables. The analysis shows that the level of economic freedom robustly, positively and significantly affects the GDP per capita of five SAARC member countries; the impact of two control variables openness and foreign direct investment on growth of five SAARC member countries are also positive and statistically significant. Empirical evidences suggest that existence of free private markets where individuals make decision on their behalf is very conducive to growth in five SAARC countries.

2010	F51	<p>Wijeweera, Albert, and Matthew J. Webb. 2010. "A Peace Dividend for Sri Lanka: The Case for a Return to Prosperity Following the End of Hostilities." <i>Global Economy Journal</i>, 10(2): . Throughout its long years of civil war, Sri Lanka maintained a healthy rate of GDP growth and increasing levels of military spending. Now that the war has ended, Sri Lanka faces the challenge of rebuilding and switching to a peace-time economy with potentially lower levels of defense spending. We employ a cointegration analysis and an error correction model to examine the relationship between non/military spending in Sri Lanka and identify the possible economic benefits of decreased military spending. We find that GDP growth in Sri Lanka is generally not responsive to military spending, but responds positively to non-military spending. Although non-military spending exerts a positive effect upon economic growth compared to military spending, the outcome is still sub-optimal due to the absence of an income multiplier effect. This prefaces potentially good economic news for Sri Lanka in the coming years assuming that hostilities do not resume, that the government can successfully divert resources from the military to the non-military sector and that private sector investment can be effectively encouraged to exert a crowding in effect.</p>
2010	F51	<p>Brauer, Jurgen, and John P. Dunne. 2010. "On the Cost of Violence and the Benefit of Peace." <i>Peace Economics, Peace Science and Public Policy</i>, 16(2): . Among economists, there seems to exist an unfortunate lack of understanding of the complexities of war and violence and the effects on economy and society. The cost of the 2008/9 world economic and financial crisis, for example, amounted to a world GDP decline of much less than one percent in 2009--far smaller than the cost that violence imposes. This lack of understanding has created problems in the design of preconflict-, conflict-, and postconflict policies, leaving a sometimes unrecognized legacy of violence and loss. This essay deals with some of the economic issues involved.</p>
2010	G00	<p>Favilukis, Jack, Sydney C. Ludvigson, and Stijn Van Nieuwerburgh. 2010. <i>The Macroeconomic Effects of Housing Wealth, Housing Finance, and Limited Risk-Sharing in General Equilibrium</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 15988. We study a two-sector general equilibrium model of housing and non-housing production where heterogeneous households face limited opportunities to insure against aggregate and idiosyncratic risks. The model generates large variability in the national house price-rent ratio, both because it fluctuates endogenously with the state of the economy and because it rises in response to a relaxation of credit constraints and decline in housing transaction costs (financial market liberalization). These factors, together with a rise in foreign ownership of U.S. debt calibrated to match the actual increase over the period 2000-2006, generate an increase in the model price-rent ratio comparable to that observed in U.S. data over this period. The model also predicts a sharp decline in home prices starting in 2007, driven by the economic contraction and by a presumed reversal of the financial market liberalization. Fluctuations in the model's price-rent ratio are driven by changing risk premia, which fluctuate endogenously in response to cyclical shocks, the financial market liberalization, and its subsequent reversal. By contrast, we show that the inflow of foreign money into domestic bond markets plays a small role in driving home prices, despite its large depressing influence on interest rates. Finally, the model implies that procyclical increases in equilibrium price-rent ratios reflect rational expectations of lower future housing returns, not higher future rents.</p>
2010	H12	<p>Hutchison, Michael M., Ilan Noy, and Lidan Wang. 2010. "Fiscal and Monetary Policies and the Cost of Sudden Stops." <i>Journal of International Money and Finance</i>, 29(6): 973-87. This article investigates the effects of monetary and fiscal policies on output growth during sudden-stop balance of payments crisis in emerging markets and developing countries. Sudden stops in capital flows, and subsequent deep recessions, are a frequent occurrence in these countries but there is no professional consensus, and little systematic empirical evidence, shedding light on the macroeconomic policy mix most likely to limit output losses during these episodes. To address this issue, we investigate 83 sudden-stop crisis in 66 countries using a baseline empirical model to control for the various determinants of output losses during sudden stops. We measure the marginal effects of policy on output losses, and find strong evidence that monetary tightening (rise in the discount rate or unsterilized rise in international reserves) and discretionary fiscal contraction are significantly correlated with larger output losses following a sudden stop. Fiscal expansion is associated with smaller output losses following a sudden stop, but monetary expansion has no discernable effect. The macroeconomic policy mix associated with the least output loss during a sudden-stop financial crisis is a discretionary fiscal expansion combined with a neutral monetary policy.</p>
2010	H44	<p>Diewert, Erwin. 2010. <i>Decompositions of Profitability Change using Cost Functions</i>. UBC Department of Economics, UBC Departmental Archives. Profitability at a period of time is defined as the value of outputs produced by a production unit divided by the corresponding cost. Using some earlier work by O'Donnell, the paper provides a decomposition of profitability growth over two periods into various explanatory factors. The explanatory factors are: the change in the production unit's cost efficiency, an index of output price growth, returns to scale, technical progress and an index of input price growth. If output prices for the production unit are not available, the paper suggests that marginal costs could be used as prices to weight outputs in each period. Using marginal or average costs to weight outputs leads to a methodology for evaluating the productivity performance of nonmarket production units that is similar to the methodology suggested in the Atkinson report.</p>
2010	H83	<p>Hardiman, Niamh, and Muiris MacCarthaigh. 2010. "Organising for Growth: Irish State Administration 1958-2008." <i>Economic and Social Review</i>, 41(3): 367-93. This paper analyses some key features of Irish public administration as it has developed since the foundation of the state, paying particular attention to the period from the late 1950s onward. During these decades, notwithstanding successive waves of concern expressed over the need for public sector reform, the evidence suggests an underlying lack of coherence in the evolution of the public administration system that resulted in a poor capacity for effective policy coordination. Yet the drive toward economic modernisation also resulted in the creation of new state competence to support industrial development both directly and indirectly. These changes can be tracked organisationally, drawing on the database of the IRCHSS-funded Mapping the Irish State project.</p>
2010	H83	<p>Boulat, Regis. 2010. "La via europea alla produttività: Jean Fourastie tra piano Monnet e piano Marshall (1945-1953). (The European Way to Productivity: Jean Fourastie between the Monnet Plan and the Marshall Plan [1945-1953]. With English summary.)" <i>Imprese e Storia</i>, 0(39): 9-40. Now recognized as the primary source of growth and employment, the notion of productivity becomes an issue in French economic policy-making after World War II. When efforts are made to rebuild and modernize the French economy in order to catch up with America's high living standards, productivity is at the core of the strategies implemented by entrepreneurs and modernizers. Productivity is also used as an "ambiguous speech" by the so-called Bataillon sacre de la productivite, a group led by Jean Fourastie within the public administration structure in charge of economic planning: with the help of Fourastie's conceptual elaboration and thanks to the "psychological shock" of productivity missions, this small but influential group sought to convince the French of the need to import new working methods and to pacify social relations. Fourastie's interpretation of the notion of productivity also contributed to the harmonization, across Europe, of the tools for conceptualizing economic development.</p>

With English summary.)" <i>Jingji Yanjiu/Economic Research Journal</i>, 45(6): 4-16. Based on a theory model which distinguish the native city labors, the rural migrant workers and the farmers,</p>

Year	DE	Title and Abstract
		this paper analyzes how the current pattern of urbanization is harmful to the economic growth. The model shows that citizenization of rural migrant workers will increase the scale of the city, narrow the income disparity between urban and rural labor, and accelerate the accumulation of the human capital. As a result, it is helpful for attaining higher level of economic growth. Then we simulate the effect by using a CGE model. The simulation results show that citizenization of 10 million migrant workers can increase the GDP growth rate at about 1 per cent. It also shows that citizenization of migrant workers can promote consumption and investment, which will expand domestic demand significantly and decrease the degree of dependence on foreign trade. In addition, citizenization can increase the share of service sector and optimize the economic structure.
2010	J80	CV: Melendez, Edwin, Nik Theodore, and Abel Valenzuela Jr.. 2010. "Day Laborers in New York's Informal Economy." In <i>Informal Work in Developed Nations</i> , ed. Enrico Marcelli, Colin C. Williams and Pascale Joassart, 135-52. Routledge Advances in Heterodox Economics. London and New York: Taylor and Francis, Routledge.
2010	K22	Loayza, Norman V., and Luis Serven, eds. 2010. <i>Business Regulation and Economic Performance</i> , Washington, D.C.: World Bank. Six papers explore the patterns of business regulation across the world and review their impact on aggregate economic performance, focusing on Latin America. Papers discuss product market regulation and macroeconomic performance--a review of cross-country evidence (Fabio Schiantarelli); regulation and macroeconomic performance (Norman V. Loayza, Ana Maria Oviedo, and Luis Serven); regulation and macroeconomic dynamics (Loayza, Oviedo, and Serven); informality in Latin America and the Caribbean (Loayza, Serven, and Naotaka Sugawara); slow recoveries (Raphael Bergoing, Loayza, and Andrea Repetto); and market reforms, factor reallocation, and productivity growth in Latin America (Marcela Eslava, John Haltiwanger, Adriana Kugler, and Maurice Kugler).
2010	K31	Damiani, Mirella, and Fabrizio Pompei. 2010. "Labour Protection and Productivity in EU Economies: 1995-2005." <i>European Journal of Comparative Economics</i> , 7(2): 373-411. The present study examines cross-national and sectoral differences in multifactor productivity growth in sixteen European countries from 1995 to 2005. The main aim is to ascertain the role of flexible employment contracts and collective labour relationships in explaining the ample differentials recorded in the European economy. We use the EU KLEMS database for growth accounting and a broad set of indicators of labour regulations, covering two distinct 'areas' of labour regulation: employment laws and collective relations laws. This comprehensive approach allows us to consider arrangements that regulate allocation of labour inputs (fixed-term and part-time contracts, hours worked) and the payoff and decision rights of employees. We find that, since 1995, European countries have not followed similar patterns of growth. A large number of variations between European economies are caused by marked differentials in multifactor productivity and part of this heterogeneity is caused by sectoral diversities. We show that, in labour-intensive sectors such as services, fixed-term contracts, which imply shorter-term jobs and lower employment tenures, may discourage investment in skills and have detrimental effects on multifactor productivity increases. Employment protection reforms which slacken the rules of fixed-term contracts cause potential drawbacks in terms of low productivity gains. We also find that more stringent regulation of these practices, as well as a climate of collective relations, sustain long-term relationships and mitigate these negative effects.
2010	K31	CV: Saltari, Enrico, Giuseppe Travaglini, and Clifford R. Wymer. 2010. "Investment, Productivity and Employment in the Italian Economy." Heidelberg and New York: Springer, Physica.
2010	L21	Holmes, Mark J., and Brian Silverstone. 2010. "Business Confidence and Cyclical Turning Points: A Markov-Switching Approach." <i>Applied Economics Letters</i> , 17(1-3): 229-33. Markov regime-switching analysis is used to consider the relationship between business confidence and the probability of turning points in cyclical GDP. We find, in an application to New Zealand, that confidence is related to both the deepness and duration of the business cycle and is asymmetric regarding the probability of the economy remaining in a given regime. Overall, the New Zealand business confidence series is a useful indicator of cyclical turning points.
2010	L21	Kaplan, David S., and Vikram Pathania. 2010. "What Influences Firms' Perceptions?" <i>Journal of Comparative Economics</i> , 38(4): 419-31. Perceptions-based indicators are sometimes used to measure the quality of the business environment. For instance, firms are asked about the major constraints on business operations and expansion. Little is known, however, about what shapes their responses. In this paper, using perceptions-based indicators from 38 countries (84 country-year pairs) from the World Bank Enterprise Surveys, we argue that firm responses are critically influenced by macroeconomic conditions. Paradoxically, we find that perceptions worsen during periods of high GDP growth. We also examine other indicators from the Enterprise Surveys that are objective measures of constraints, and find mixed evidence on how business constraints vary with the business cycle. Finally, we find that firms that introduce new product lines, which are likely those with the most interactions with regulatory agencies, have particularly bad perceptions of the business environment. We conclude that changes in firms' perceptions over time may not reflect changes in the business environment.
2010	L97	Mc Morrow, Kieran, Werner Roger, and Alessandro Turrini. 2010. "Determinants of TFP Growth: A Close Look at Industries Driving the EU-US TFP Gap." <i>Structural Change and Economic Dynamics</i> , 21(3): 165-80. This paper explores the determinants of the EU-US TFP growth gap using EU KLEMS. As found in previous analyses, TFP growth appears to be driven by catching-up phenomena associated with the gradual adoption of new technologies. TFP growth is also significantly driven by developments at the "technological frontier", especially since the mid-1990s. Industries with higher R&D expenditures and higher adoption rates for ICT-intensive technologies appear to exhibit higher TFP growth rates, whilst human capital has mostly a significant effect across countries. Regarding determinants in industries relevant for the different TFP performance of the EU versus the US, ICT-producing industries appear to benefit from R&D in terms of stronger spillovers from TFP gains at the frontier, network utilities are strongly affected by product market regulations, whilst the retail and wholesale trade industry is significantly influenced by consumption dynamics which permit a better exploitation of scale economies.

2010	N92	Partridge, Mark D. 2010. "The Duelling Models: NEG vs Amenity Migration in Explaining US Engines of Growth." <i>Papers in Regional Science</i> , 89(3): 513-36. The new economic geography (NEG) has become a mainstay of regional science in the last two decades, as signified by the awarding of Paul Krugman, the Nobel Prize. Yet, most American regional scientists and urban/regional economists do not use NEG in determining regional growth patterns. Instead, they rely on factors such as natural amenity migration, whose roots lie back to the work of Philip Graves in the mid 1970s. Conversely, two of the world's leading economic geographers--Allen Scott and Michael Storper--have strongly argued that job availability not household amenities have determined US regional dynamics. Given the disparity of views over the largest developed economy in the world, we hold a competition to determine which of these leading contenders accurately predict US interregional growth dynamics over the last 40-60 years. The runaway winner of the duel is natural amenity led growth with the crown going to Graves. Implications are drawn for both empirical research and EU economic integration.
2010	N93 N94	Buyst, Erik. 2010. "Reversal of Fortune in a Small, Open Economy: Regional GDP in Belgium, 1896-2000." <i>Rivista di Storia Economica, N.S.</i> , 26(1): 75-92.
2010	O50	Webber, Michael. 2010. "Re-emerging China and Consequences for Economic Geography." <i>Eurasian Geography and Economics</i> , 51(5): 583-99. A noted specialist on the spatial dimensions of China's economy surveys questions and opportunities for economic geography raised by the re-emergence of China. He explores the ways in which the rise of China may alter economic geography's object of study (the organization of the world economy), force re-conceptualization of some fundamental concepts and theories, and affect the way the discipline conducts its work. The paper argues that cooperation of Western and Chinese scholars in forging a new economic geography is contingent on a redirected focus away from concerns relevant only to the West and the discarding of research frameworks that bracket China off from experiences in the West.
2010	O56	Gibson, John. 2010. "Recent Shocks and Long-Term Change in the Samoan Economy." <i>Pacific Economic Bulletin</i> , 25(3): 7-23. The strengths exhibited by the Samoan economy during the period of steady growth from 1998 to 2007 have since been tested by considerable volatility in economic activity, declining employment, rapidly rising prices, the global financial crisis, and the September 2009 tsunami. The economy has done reasonably well in the face of these challenges with key economic support in the form of aid, remittances and tourism. Questions are raised about the future viability of these forms of support.
2010	P32	Evangelos, Nikolaidis. 2010. "Agriculture in Post-transition CEECs: Reconstruction or Deconstruction?" <i>East-West Journal of Economics and Business</i> , 13(1): 11-35. In the CEECs, the share of agriculture in GDP declined during the early years of transition to a level that characterizes countries with a higher level of economic development. This was accompanied by a significant and prolonged deterioration of key agricultural indicators. The crisis in the agricultural sector, which has lasted for almost two decades, reveals structural weaknesses that can hardly fall under the label of transformational recession. Accordingly, it has led to restructuring without the expected developmental content, and reflects strong elements of deconstruction, which at the end resembles a quasi-development process.
2010	P51	Schiffbauer, Marc, and Ling Shen. 2010. "Democracy vs. Dictatorship: Comparing the Evolution of Economic Growth under Two Political Regimes." <i>Economics of Transition</i> , 18(1): 59-90. A democratic society is often regarded as a prerequisite for economic growth and development. Yet, most empirical studies are not capable of identifying a positive link between GDP growth and democracy indexes. In addition, it is a stylized empirical fact that: (i) most developing countries are dictatorships; and (ii) many poor dictatorships have experienced high growth performances and emerged from poverty such as South Korea, China, and Egypt. Against this background, it is of interest to analyse in which ways the growth performance between autocratic and democratic economies may differ, in particular among low-income countries. To answer this question, we compare the endogenous growth paths of two economies that differ only in their political regimes in the context of an overlapping generations model. The key features of the model are: (i) a positive bequest motive in the form of investments in education or productive public capital (infrastructure); (ii) a higher marginal (inter-temporal) utility of consumption today versus consumption tomorrow in low-income countries (for example, subsistence level of consumption); and (iii) a dictator that cares about her income or the income of her dynasty tomorrow. In this framework, we demonstrate that poor but large and stable dictatorships exhibit a higher equilibrium growth rate than comparable (equally poor) democracies. Moreover, there exists a particular threshold value in income such that the growth-reducing impact of dictatorial consumption (corruption) outweighs the higher (initial) public investments. Above this, the growth rate under democracy dominates the one in dictatorship.
2010	Q13	Mahadevan, Renuka, and John Asafu-Adjaye. 2010. "The Implications of European Union Sugar Price Cuts, Economic Partnership Agreement, and Development Aid for Fiji." <i>Contemporary Economic Policy</i> , 28(1): 52-64. The objective of this paper is to use a set of varied scenarios related to the Economic Partnership Agreement (EPA) and the loss of European Union (EU) sugar preferences (in the form of partial and full price liberalization) in combination with the recently committed EU development aid to examine the impact on Fiji using a dynamic computable general equilibrium model. It is shown that without aid, the loss of sugar preferences has devastating impact on real output, exports, rural employment, and other macroeconomic indicators. Without aid, the EPA scenarios, on the other hand, lead to some growth in real output but depress rural employment and non-sugar agricultural exports. Although improvements are observed across the scenarios with aid, it is argued that aid would be more effective if it directly addresses the supply-side constraints in Fiji instead of focusing on the sugar sector.
2010	Q42	Apergis, Nicholas, and James E. Payne. 2010. "Renewable Energy Consumption and Economic Growth: Evidence from a Panel of OECD Countries." <i>Energy Policy</i> , 38(1): 656-60. This study examines the relationship between renewable energy consumption and economic growth for a panel of twenty OECD countries over the period 1985-2005 within a multivariate framework. Given the relatively short span of the time series data, a panel cointegration and error correction model is employed to infer the causal relationship. The heterogeneous panel cointegration test reveals a long-run equilibrium relationship between real GDP, renewable energy consumption, real gross fixed capital formation, and the labor force with the respective coefficients positive and statistically significant. The Granger-causality results indicate bidirectional causality between renewable energy consumption and economic growth in both the short- and long-run.
2010	Q42	Figueira, Sergio Rangel, Heloisa Lee Burnquist, and Mirian Rumenos Piedade Bacchi. 2010. "Forecasting Fuel Ethanol Consumption in Brazil by Time Series Models: 2006-2012." <i>Applied Economics</i> , 42(7-9): 865-74. This article analysed scenarios for Brazilian consumption of ethanol for the period 2006 to 2012. The results show that if the country's GDP sustains a 4.6% a year growth, domestic consumption of fuel ethanol could increase to 25.16 billion liters in this period, which is a volume relatively close to the forecasted gasoline consumption of 31 billion liters. At a lower GDP growth of 1.22% a year, gasoline consumption would be reduced and domestic ethanol consumption in Brazil would be no higher than 18.32 billion liters. Contrary to the current situation, forecasts indicated that hydrated ethanol consumption could become much higher than anhydrous consumption in Brazil. The former is being consumed in cars moved exclusively by ethanol and flex-fuel cars, successfully introduced in the country at 2003. Flex cars allow Brazilian consumers to choose between gasoline and hydrated ethanol and immediately switch to whichever fuel presents the most favourable relative price.

2010	Q42	Tellado Larraudogoitia, Nagore. 2010. "Retos y oportunidades para la transición de la edificación hacia la sostenibilidad en la CAPV. (With English summary.)." <i>Ekonomia</i>, 0(75): 222-52. In terms of its share of GDP, the number of jobs that it provides and its environmental repercussions, building is a key industry in the current transition towards sustainability in society. The challenges of climate change translate in the building industry as a need to drastically reduce energy consumption in buildings and incorporate renewables. The huge number of players involved in the process and the close interdependence between them mean that the problem must be tackled from the viewpoint of building industry clusters. Although the industry has traditionally been conservative in its view of innovation, it has begun to realise the importance of eco-innovation in recent years. There is now a wide range of products, construction systems, and lines of technological research that may in the medium term result in zero carbon buildings. To reinforce the competitiveness of the industry in the Autonomous Community of the Basque Country the public authorities need to create a favourable context through policies to foster eco-innovation.
2010	Q42	Kiran, Burcu. 2010. "New Evidence on the Linkage between Energy Consumption and Economic Growth in the United States." <i>Journal of Energy and Development</i>, 36(1-2): 227-41. In this article, the author uses annual data over the period from 1949 through 2009 to investigate the linkage between energy consumption by resource (coal, renewable energy, electricity, and natural gas) and economic growth in the United States within a fractional cointegration approach. The obtained results indicate that the only evidence of fractional cointegration is found between coal consumption and economic growth of the United States.
2010	Q42	Apergis, Nicholas, and James E. Payne. 2010. "A Panel Study of Nuclear Energy Consumption and Economic Growth." <i>Energy Economics</i>, 32(3): 545-49. This study examines the relationship between nuclear energy consumption and economic growth for sixteen countries within a multivariate panel framework over the period 1980-2005. Pedroni's (1999, 2004) heterogeneous panel cointegration test reveals there is a long-run equilibrium relationship between real GDP, nuclear energy consumption, real gross fixed capital formation, and the labor force with the respective coefficients positive and statistically significant. The results of the panel vector error correction model finds bidirectional causality between nuclear energy consumption and economic growth in the short-run while unidirectional causality from nuclear energy consumption to economic growth in the long-run. Thus, the results provide support for the feedback hypothesis associated with the relationship between nuclear energy consumption and economic growth.
2011		
2011	A20	Levy, David M., and Sandra J. Peart. 2011. "Soviet Growth and American Textbooks: An Endogenous Past." <i>Journal of Economic Behavior and Organization</i>, 78(1-2): 110-25. Between 1960 and 1980 American economics textbooks overestimated Soviet growth. They held that the Soviet economy was growing faster than the US economy and yet they kept the ratio of Soviet-US output constant over two decades. The textbooks downplayed any uncertainty associated with such growth estimates. We offer evidence that the optimistic portrait of the Soviet economy in the textbooks was in part driven by an assumption of efficiency and abstraction from institutional concerns.
2011	C35	Chang, Yongsung, and Sunoong Hwang. 2011. <i>Asymmetric Phase Shifts in the U.S. Industrial Production Cycles</i>. University of RochesterSPACE-SPACECenter for Economic Research (RCER), RCER Working Papers: 564. We identify the cyclical turning points of 74 U.S. manufacturing industries and uncover new empirical regularities: (i) Cyclical phase shifts are highly concentrated around the aggregate turning points; (ii) In contrast to the conventional notion of a sudden stop and slow recovery, troughs are much more concentrated than peaks; (iii) Occurrences of phase shifts across industries support the spillovers through input-output linkages; (iv) The common macroeconomic shocks, such as exogenous changes in the federal funds rate, government spending, and oil prices, are significant drivers of industrial phase shifts; (v) Both monetary and fiscal policy shocks are more effective in recessions.
2011	C38	Bueno, Jose Luis Cendejas, Sonia de Lucas Santos, M. Jesus Delgado Rodriguez, and Inmaculada Alvarez Ayuso. 2011. "Testing for Structural Breaks in Factor Loadings: An Application to International Business Cycle." <i>Economic Modelling</i>, 28(1-2): 259-63. This paper proposes the implementation of the SupWald test of Andrews (1993) to detect structural breaks in the loadings of a static factor model. The procedure is illustrated by testing for structural breaks in the common factors of GDP growth series for a sample of advanced countries from 1950 until 2006.
2011	C46	Manas, Arnaud. 2011. "The Paretian Ratio Distribution--An Application to the Volatility of GDP." <i>Economics Letters</i>, 111(2): 180-83. Recently, Gabaix suggested that the volatility of GDP could come from the Pareto distribution of the firm sizes. This paper describes and gives an approximation of the Paretian Ratio Distribution (PRD), which represents the weight of the firm in GDP.
2011	C46	Barro, Robert J., and Tao Jin. 2011. "On the Size Distribution of Macroeconomic Disasters." <i>Econometrica</i>, 79(5): 1567-89. The coefficient of relative risk aversion is a key parameter for analyses of behavior toward risk, but good estimates of this parameter do not exist. A promising place for reliable estimation is rare macroeconomic disasters, which have a major influence on the equity premium. The premium depends on the probability and size distribution of disasters, gauged by proportionate declines in per capita consumption or gross domestic product. Long-term national-accounts data for 36 countries provide a large sample of disasters of magnitude 10% or more. A power-law density provides a good fit to the size distribution, and the upper-tail exponent, alpha, is estimated to be around 4. A higher alpha signifies a thinner tail and, therefore, a lower equity premium, whereas a higher coefficient of relative risk aversion, gamma, implies a higher premium. The premium is finite if alpha > gamma. The observed premium of 5% generates an estimated gamma close to 3, with a 95% confidence interval of 2 to 4. The results are robust to uncertainty about the values of the disaster probability and the equity premium, and can accommodate seemingly paradoxical situations in which the equity premium may appear to be infinite.
2011	D11	Chiappori, Pierre Andre, and Ivar Ekeland. 2011. "New Developments in Aggregation Economics." <i>Annual Review of Economics</i>, 3(1): 631-68. : The goal of this article is to provide a general characterization of the aggregate behavior of a group in a market environment. We allow for public and private consumption, intragroup production, and consumption externalities within a group; we only assume that the group always reaches Pareto-efficient decisions. We show that aggregation problems involve a simple mathematical structure: the aggregate demand of the group, considered as a vector field, can be decomposed into a sum of gradients. We briefly introduce exterior differential calculus as a tool to study this structure. We analyze two main issues. One is testability: What restrictions (if any) on the aggregate demand function characterize the efficient behavior of the group? The second issue relates to identifiability; we investigate the conditions under which it is possible to recover the underlying structure--namely, individual preferences, the decision process, and the resulting intragroup transfers--from the group's aggregate behavior.
2011	D22	Basdas, Ulkem. 2011. "What Do Business Sentiments Signal: Growth or Nothing?" <i>Middle Eastern Finance and Economics</i>, 0(9): 100-108. Business sentiment surveys are conducted to provide information on the economic agents' perceptions of the current situation and future expectations, hence the economic growth. Therefore, this paper aims to test whether there is a long term relationship between the business sentiment index and growth in the selected 16 countries over 1985-2009. Business sentiment

Year	DE	Title and Abstract
		survey questions are decomposed according to their forward-looking and backward-looking characteristics in order to compute "current conditions" and "expectations" sub-indices. ARDL model results indicate that business sentiment indices have a long term relationship with the growth in most of the countries. Nevertheless, there is not a significant difference between "current conditions" and "expectations" sub-indices. Panel ARDL results also confirm the complementary role of sub-indices.
2011	D80	CV: Holcombe, Randall G. 2011. "Are Current Economic Activities Undermining Future Prosperity?." In <i>The Annual Proceedings of The Wealth and Well-Being of Nations 2010-2011. Volume 3</i> , ed. Emily Chamlee-Wright, 141-57. Beloit, Wisc.: Beloit College Press.

Frankfurt am Main: Peter Lang. Eleven previously published papers explore market constellations at the policy, polity, and politics levels. Papers discuss the post-Keynesian theory of economic policy--filling a void (Arne Heise); market constellations and macroeconomic policy making--institutional impacts on economic performance (Heise); macroeconomic "regimes" for growth and stagnation in developing countries (Hansjorg Herr and Jan Priewe); the political economy of meritocracy (Heise); central banks, trade unions, and reputation--whether there is room for an expansionist maneuver in the European Union (Toralf Pusch and Heise); whether Germany is heading for a new "economic miracle" (Heise); macroeconomic regime and economic development--the case of the United States (Ulrich Fritsche, Michael Heine, Herr, Gustav Horn, and Cornelia Kaiser); the autonomy of national policy in a globalized world--the experience in the Scandinavian EU countries Denmark, Finland, and Sweden (Thomas Sauer and Lena Drager); growth engines of the South--South Africa, Brazil, and Turkey in comparison (Alper Duman and Heise); Belarus--reform laggard, repressed growth, high dollarization (Herr and Jan Priewe); and Vietnam--high growth, Asian style, with risks (Herr and Priewe).
2011	F61	Bussolo, Maurizio, Rafael E. de Hoyos, Denis Medvedev, and Dominique van der Mensbrugge. 2011. "Global Growth and Distribution: China, India, and the Emergence of a Global Middle Class." <i>Journal of Globalization and Development</i>, 2(2): . Over the past two decades, global inequality changed little despite significant structural shifts. Sustained growth in China and India lifted millions out of poverty, while many African countries fell behind. This paper assesses the distribution effects of a continuation of these trends. Growth in China and India will still drive the convergence of per capita incomes at the global level. Millions of Chinese and Indian consumers will join the global middle class. However, these positive developments will be somewhat offset by widening income disparities within countries, as fast growth is often characterized by high urbanization and growing demand for skills.
2011	F65	Choudhury, Masudul Alam. 2011. "A Knowledge--Induced Measure of Financial Volatility: Theoretical Exploration." <i>Finance India</i>, 25(2): 405-14. A theoretical measure of financial volatility in connection with real economic variables is formulated in view of the extensively interactive, integrative, and dynamic circular causation (evolutionary) interrelationships (also referred to as HE) between economic variables and policies. The perspective of long-term sustainability of the financial and real economic linkages as positive and normative issues of globalization is reflected in this measure of volatility. The interactive, integrative, and dynamic circular causation means the recursive feedback and evolution continue on in the simulated model, involving the normative and positive variables underlying the formulation of the measure of financial volatility. The IIE methodology in the financial volatility model has important implications for the ARCH model. This is discussed and formulated.

2011	I24	Akbarian, Reza, and Mahsa Famkar. 2011. "The Association between Income Inequality, Education Expenditures and Economic Growth. (In Farsi. With English summary)." <i>Quarterly Journal of Economic Growth and Development Research</i>, 1(1): 161-85. This paper examines the association of income inequality and economic growth with public expenditures on education as an intermediary factor in Iran. Time series data from 1974-2005 and two stage least squares (2SLS) method are used to estimate a simultaneous equation system. Public expenditures on education and economic growth are dependent variables and population density, human capital, past public expenditures on education, and income inequality are considered as explanatory variables in the model. The results are as follows: 1. there is a negative association between income inequality and economic growth with or without public expenditures on education as an intermediary factor; 2. public expenditures on education are negatively associated with economic growth; and 3. although the sign of past public expenditures on education with public expenditures as an intermediary factor is positive, but the coefficient of past public expenditures on education is not significant in the growth rate equation. So a judgement can not be made about its relationship with economic growth.
2011	J71	Nallari, Raj, and Breda Griffith. 2011. <i>Gender and Macroeconomic Policy</i>, Washington, D.C.: World Bank. Examines gender and economics, focusing on how macroeconomic policies create differential opportunities for women and men. Discusses gender in an economic context; measuring gender inequalities; gender and macroeconomic aggregates; gender and economic growth; gender and the labor market; globalization, gender relations, and the labor market; gender and finance; and gender budgeting.

"A Survey of New Keynesian Theories of Aggregate Supply and Their Relation to Industrial Organization." <i>Journal of Money, Credit, and Banking</i>, 43(0): 87-110. : I survey the recent literature on the Phillips curve. Along the way, I will try to relate this literature to topics of interest to industrial organization. I will also point out the gaps in our understanding and places where more careful micro-economic analysis would be helpful to macroeconomists. In the conclusion, I summarize what an industrial organization economist might take away from this literature.
2011	L50 N75	Herd, Richard, Paul Conway, Sam Hill, Vincent Koen, and Thomas Chalaux. 2011. <i>Can India Achieve Double-digit growth ?</i> OECD Publishing, OECD Economics Department Working Papers: 883. In recent years, India has enjoyed one of the highest growth rates worldwide, weathering the global financial crisis better than many other countries. Prudent macroeconomic policies will be critical to prolonging the current expansion, given the risks associated with high inflation and volatile capital flows. A steadfast commitment to fiscal consolidation is needed to continue to reduce the large deficit that emerged in the aftermath of the slowdown and avoid crowding out private investment. Stepping up structural reforms will also be necessary if double-digit growth rates are to be achievable over the coming decade or so. Indeed, the operating environment for private business remains challenging. While infrastructure is improving in key sectors, partly thanks to greater private investment, bottlenecks endure and efforts to intensify competition and ensure continued strong investment are required. Labour market reforms are also required to promote

Year	DE	Title and Abstract
		job creation. Rapid economic development has boosted living standards and reduced poverty but poverty remains high. There is a need to strengthen social welfare systems and access to health and education to ensure widespread benefits from continued high growth. This Working Paper relates to the 2011 OECD Economic Survey of India (www.oecd.org/eco/surveys/india)
2011	L81	Mermod, Asli Yuksel, and Gitana Dudzeviciute. 2011. "Frequency Domain Analysis of Consumer Confidence, Industrial Production and Retail Sales for Selected European Countries." <i>Journal of Business Economics and Management</i>, 12(4): 589-602. This paper examines the relationship between consumer confidence, economic growth, and retail sales for selected countries employing frequency domain analysis. Our methodology includes the causality test developed by Breitung and Candelon (2006) which improves the methodology of Geweke (1982) and Hosoya (1991). We focus on the causality tests across frequency bands as well as the usual Granger causality tests. Especially for the emerging countries the causality goes from the economic growth to consumer confidence but not vice versa. This argument basically supports the findings of Gunes and Uzun (2010) as well as Balkyte and Tvaronaviciene (2010), which claim that in emerging countries consumers are not able to trigger the economic growth with their confidence due to their subsistence level of income. Besides, causality from consumer confidence to retail sales, which is a proxy for the consumer expenditures, is detected. As in Basdas and Celik (2010), we also obtain significant differences whenever the frequency domain causality tests are employed instead of usual Granger causality tests in time domain.
2011	L81	Mukherjee, Subhadip. 2011. "An Econometric Analysis on Organized and Unorganized Retail Share." <i>Economic Research Guardian</i>, 1(1): 34-41. The present study strives to find the various determinants of the relative share of organized and unorganized retail sector of a country. A multiple regression model has been used in this study to find these determinants. Results from the analysis reveal that GDP, women's participation rate, foreign investment freedom and urbanization rate of a country, positively influence the growth of the relative share of organized retail sector. The results obtained in this study would very helpful in understanding the growth patterns of Indian organized retail sector in the future.
2011	L81	McCall, Michael D. 2011. "Deep Drop in Retail Trade Employment during the 2007-09 Recession." <i>Monthly Labor Review</i>, 134(4): 45-48. The 2007-09 recession had a more negative impact on employment in retail trade than did previous recessions; job losses accelerated during the second half of the 18-month recession. Retail trade lost 1 million jobs during the recession which began December 2007 and ended June 2009. The 6.7 percent decline in retail trade employment exceeded the rate of job loss for total nonfarm employment by 1.3 percentage points but was consistent with the 6.6 percent decline in private industry employment over the same period. Employment in retail trade peaked in December 2007, coinciding with the start of the recession; the peak in total nonfarm employment took place a month later. Between the retail trade employment trough in July 2003 and its peak in December 2007, retail trade had added 697,000 jobs; thus, job losses during the recession more than offset job gains during the previous.
2011	M50	Madsen, Jakob B., and Anders Sorensen. 2011. "The Widening Productivity Gap between the EU and the US: An Introduction to the Conference on Productivity and Competitiveness." <i>Nordic Economic Policy Review</i>, 0(0): 7-25. This paper introduces the papers presented at the Nordic Conference on Competitiveness and Productivity and discusses them in relation to the widening productivity gap between Europe and the US since 1995. It is shown that productivity growth is driven by R&D, human capital, and efficiency of production such as human resource management, government regulation, competition, and openness. It is concluded that potential explanations for the widening productivity gap are low investment, inefficient use of information technology, compressed wage structure and deregulation of the otherwise regulated labor market in Europe.
2011	N17 N27	Bordo, Michael, David Hargreaves, and Mizuho Kida. 2011. "Global Shocks, Economic Growth and Financial Crises: 120 Years of New Zealand Experience." <i>Financial History Review</i>, 18(3): 331-55. We identify the timing of currency, banking crises and sudden stops in New Zealand from 1880 to 2008 using methodologies from the international literature and consider the extent to which the empirical models in that literature can explain New Zealand's crisis history. We find that the cross-country evidence on the determinants of crises fits New Zealand experience reasonably well. A number of the risk factors that correlate with crises internationally--such as domestic imbalances, external debt, and currency mismatches--were elevated for New Zealand when the country had more frequent crises and have improved in the recent (more stable) period. However, a time-series analysis of New Zealand growth over 120 years shows that global factors--such as the US growth rate and terms of trade--explain New Zealand growth fairly well, and that crisis-dummy variables do not have substantial additional explanatory power. This suggests that having sound institutions and policies may help avoid severe domestic crises, but will not be sufficient to avoid the domestic economic impact of the global business cycle.
2011	N43	Rossner, Philipp Robinson. 2011. "Das friderizianische Preussen (1740-1786)--Eine moderne Okonomie? (Was Prussia under Frederick the Great a 'Modern' Economy? With English summary.)" <i>Vierteljahrschrift fur Sozial- und Wirtschaftsgeschichte</i>, 98(2): 143-72. Eighteenth-century Prussia under Frederick the Great has been credited with an enormous progress from a second-rate regional power to one of the more powerful continental states of her time. Frederick's success in creating a powerful, partly predatory, and highly militarized state, securing Prussia a place in the European 'concert of power' (however strong this might have been) is undisputed. So are some of the more notable activities in economic planning, such as canal building, draining, and the melioration of wasteland that led to an increase in the areas under cultivation. But did these activities lead to an increase in Prussia's productive potential, such as a rise in total factor productivity or the increase in the productive capital per capita of the population? Even though the available statistical material does not lend itself particularly well to accurate measurement in terms of national income accounting procedures, the following article will nevertheless work out precisely why Prussia under Fredrick the Great failed to emerge as a 'modern' economy (in the same way as the Netherlands and England did). Using basic theory and evidence established in recent years by de Vries and others with regard to early modern England and Holland the Prussian evidence will be placed alongside models of 'modern-ness' in the eighteenth century. It will be argued that the institutional and socio-economic constraints worked particularly effectively against those early traces of 'modernity' that could be found in Prussia, thus keeping the overall performance of the Prussian economy close to the (fairly low) basic continental European average figures.
2011	N43	Durevall, Dick, and Magnus Henrekson. 2011. "The Futile Quest for a Grand Explanation of Long-Run Government Expenditure." <i>Journal of Public Economics</i>, 95(7-8): 708-22. This paper carries out a critical reappraisal of the two contending theories purporting to explain long-run government spending: Wagner's Law and different variants of the ratchet effect. We analyze data spanning from the early 19th century until the present day in Sweden and the United Kingdom. Hence, in contrast to previous studies, we evaluate the validity of Wagner's Law and the ratchet effect hypothesis over a very long time period, starting at the beginning of industrialization. Cointegration analysis is used to investigate the long-run relationships between government expenditure and GDP, focusing on sub-periods and structural breaks. Moreover, we test the ratchet effect hypothesis by estimating models which allow for asymmetric adjustment. According to our main results, Wagner's Law does not hold in the long run, although the data are consistent with Wagner's Law between roughly 1860 and the mid 1970s. This can be traced to the formation of the modern public sector, including the introduction of public education, health care, and so forth. Yet Wagner's Law did not hold during the initial industrialization phase (before 1860), and in recent periods GDP only affects the government spending share

Year	DE	Title and Abstract
		when we control for population age structure. Finally, we find some evidence of asymmetric adjustment in the UK, particularly in the post-WWII period. However, the ratchet effect is not a general cause of the growth of government spending.
2011	N43	Markevich, Andrei, and Mark Harrison. 2011. "Great War, Civil War, and Recovery: Russia's National Income, 1913 to 1928." <i>Journal of Economic History</i> , 71(3): 672-703. The last remaining gap in the national accounts of Russia and the USSR in the twentieth century, 1913 to 1928, includes the Great War, the Civil War, and postwar recovery. Filling this gap, we find that the Russian economy did somewhat better in the Great War than was previously thought; in the Civil War it did correspondingly worse; war losses persisted into peacetime, and were not fully restored under the New Economic Policy. We compare this experience across regions and over time. The Great War and Civil War produced the deepest economic trauma of Russia's troubled twentieth century.
2011	N65	Wu, Harry X. 2011. "The Real Growth of Chinese Industry Debate Revisited: Reconstructing China's Industrial GDP in 1949-2008." <i>Economic Review (Keizai Kenkyu)</i> , 62(3): 209-24. This study revisits the debate about the real growth performance of Chinese industry by investigating two effects that may affect the Laspeyres quantity index that I constructed earlier (Wu, 1997 and 2002), i.e., substitution bias, known as the Gerschenkron effect, and time-variant value added ratio. Based on a substantially revised and updated time series of major industrial commodities in physical measures, the newly constructed indices with three alternative IO Table weights demonstrate a clear Gerschenkron effect, hence lowering the estimate for China's real industrial growth, and the confirmed declining trend in value added ratio has a further downward adjustment effect on the estimated real industrial growth. In addition, a comparison of my results with the official estimates does not reveal any regularity reflecting quality change that may have been under-measured in the commodity approach.
2011	N66	CV: Villela, Andre. 2011. "A Bird's Eye View of Brazilian Industrialization." In <i>The Economies of Argentina and Brazil: A Comparative Perspective</i> , ed. Werner Baer and David Fleischer, 38-65. With the assistance of Lawrence De Geest. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2011	N75	THE SAME AS L50 Herd, Richard, Paul Conway, Sam Hill, Vincent Koen, and Thomas Chalaux. 2011. <i>Can India Achieve Double-digit growth?</i> . OECD Publishing, OECD Economics Department Working Papers: 883.
2011	O55	Ercolani, Marco G., and Zheng Wei. 2011. "An Empirical Analysis of China's Dualistic Economic Development: 1965-2009." <i>Asian Economic Papers</i> , 10(3): 1-29. We analyze China's rapid economic development in the context of the dualistic development theory. Over the period 1965-2009, we find that China's economic growth is mainly attributable to the development of the non-agricultural (industrial and service) sector, driven by rapid labor migration and capital accumulation. We find that the sectoral reallocation of labor plays a significant role in promoting China's economic growth. Further, we find that the marginal productivity of agricultural labor stopped stagnating in 1978, which indicates that China entered quickly into phase two of economic development with the initiation of market reforms. Moreover, by 2009, the marginal productivity of labor has likely exceeded the institutional wage, as defined by the initially low average labor productivity, indicating that China may be now in the process of entering phase three of economic development.
2011	Q47	Limanond, Thirayoot, Sajjakaj Jomnonkwo, and Artit Srikaew. 2011. "Projection of Future Transport Energy Demand of Thailand." <i>Energy Policy</i> , 39(5): 2754-63. The objective of this study is to project transport energy consumption in Thailand for the next 20 years. The study develops log-linear regression models and feed-forward neural network models, using the as independent variables national gross domestic product, population and the numbers of registered vehicles. The models are based on 20-year historical data between years 1989 and 2008, and are used to project the trends in future transport energy consumption for years 2010-2030. The final log-linear models include only gross domestic product, since all independent variables are highly correlated. It was found that the projection results of this study were in the range of 54.84-59.05 million tonnes of oil equivalent, 2.5 times the 2008 consumption. The projected demand is only 61-65% of that predicted in a previous study, which used the LEAP model. This major discrepancy in transport energy demand projections suggests that projects related to this key indicator should take into account alternative projections, because these numbers greatly affect plans, policies and budget allocation for national energy management.
2011	R28 R38	CV: Dynan, Karen, and Ted Gayer. 2011. "The Government's Role in the Housing Finance System: Where Do We Go from Here?." 2012	B15	Cypher, James M. 2012. "Veblen y el origen de la hipotesis del catching-up. (Veblen and the Origin of the Catching-Up Hypothesis. With English summary)." <i>Problemas del Desarrollo</i> , 43(169): 9-26. Economic development as a post-war phenomenon is unprecedented. However, Veblen's contribution to economic development has been previously recognized and disseminated. Veblen's evolutionary economics is based on historical truth and limits applicable to particular cultures. His theory of economic growth is a theory of economic development: quantitative accumulation is important because it involves qualitative change. Veblen's analysis of exploiting economic potential focuses on society's ability to make satisfactory scientific and technological progress, giving rise to increased profits and the investment of surplus in industrial activity. Veblen presented indirect and surprising commentary, which is not presented empirically.
2012	C24	Huang, Mian, and Weixin Yao. 2012. "Mixture of Regression Models with Varying Mixing Proportions: A Semiparametric Approach." <i>Journal of the American Statistical Association</i> , 107(498): 711-24. : In this article, we study a class of semiparametric mixtures of regression models, in which the regression functions are linear functions of the predictors, but the mixing proportions are smoothing functions of a covariate. We propose a one-step backfitting estimation procedure to achieve the optimal convergence rates for both regression parameters and the nonparametric functions of mixing proportions. We derive the asymptotic bias and variance of the one-step estimate, and further establish its asymptotic normality. A modified expectation-maximization-type (EM-type) estimation procedure is investigated. We show that the modified EM algorithms preserve the asymptotic ascent property. Numerical simulations are conducted to examine the finite sample performance of the estimation procedures. The proposed methodology is further illustrated via an analysis of a real dataset.
2012	C25	Giovanis, Eleftherios. 2012. "Study of Discrete Choice Models and Adaptive Neuro-fuzzy Inference System in the Prediction of Economic Crisis Periods in USA." <i>Economic Analysis and Policy</i> , 42(1): 79-95. In this study two approaches are applied for the prediction of the economic recession or the expansion periods in USA. The first approach includes Logit and Probit models and the second is an Adaptive Neuro-Fuzzy Inference System (ANFIS) with Gaussian and Generalized Bell membership functions. The in-sample period 1950-2006 is examined and the forecasting performance of the two approaches is evaluated during the out-of-

Year	DE	Title and Abstract
		sample period 2007-2010. The estimation results show that the ANFIS model outperforms the Logit and Probit model. This indicates that the neuro-fuzzy model provides a better and more reliable signal on whether or not a financial crisis will take place.
2012	C26	Chang, Chia-Lin, Thanchanok Khamkaew, and Michael McAleer. 2012. "IV Estimation of a Panel Threshold Model of Tourism Specialization and Economic Development." <i>Tourism Economics</i>, 18(1): 5-41. The significant impact of international tourism in stimulating economic growth is especially important from a policy perspective. For this reason, the relationship between international tourism and economic growth would seem to be an interesting and topical empirical issue. The paper investigates whether tourism specialization was important for economic development in 159 countries over the period 1989-2008. The results from panel threshold regressions show a positive relationship between economic growth and tourism. Instrumental variable estimation of a threshold regression is used to quantify the contributions of tourism specialization to economic growth, while correcting for endogeneity between the regressors and error term. The significant impact of tourism specialization on economic growth in most regressions is robust to different specifications of tourism specialization, as well as to differences in real GDP measurement. However, the coefficients of the tourism specialization variables in the two regimes are significantly different, with a higher impact of tourism on economic growth found in the low regime. These findings do not alter with changes in the threshold variables. The empirical results suggest that tourism growth does not always lead to substantial economic growth.
2012	C44	Wingrove, Rodney C., and Ronald E. Davis. 2012. "Manual-Control Analysis Applied to the Money Supply Control Task." <i>Computational Economics</i>, 39(1): 99-111. The recent procedure implemented by the Federal Reserve Board to control the money supply is formulated in the form of a tracking model as used in the study of manual-control tasks. Using this model, an analysis is made to determine the effect of monetary control on the fluctuations in economic output. The results indicate that monetary control can reduce the amplitude of fluctuations at frequencies near the region of historic business cycles. However, with significant time lags in the control loop, monetary control tends to increase the amplitude of the fluctuations at the higher frequencies. The study outlines how the investigator or student can use the tools developed in the field of manual-control analysis to study the nature of economic fluctuations and to examine different strategies for stabilization.
2012	C78	Chiang, Hsiu-Yen. 2012. "Bargaining and Inflation. (In Chinese. With English summary.)." <i>Taipei Economic Inquiry</i>, 48(1): 51-79. This paper investigates the time inconsistency issues by considering a bargaining process between a union and a central banker. It is found that an increase in the weight assigned to inflation by the central banker may improve or worsen the social welfare. However, the social welfare is certainly enhanced if: (i) the union raises its concern about inflation; or (ii) the bargaining power of the central banker increases. It is also found that there is no policy trade-off between the inflation and output stability. Moreover, we find that the inflation aversion of the central banker plays no role in the inflation or output fluctuations.
2012	D44	Diss: Huang, Pidong. 2012. Essays in Monetary and Banking Theory. PhD diss. Pennsylvania State University. The thesis consists of the following three essays. The first essay, "A comment on: 'Efficient propagation of shocks and the optimal return on money'" (joint work with Yoske Igarashi), shows that introducing lotteries into Cavalcanti-Erosa (2008) eliminates two prominent features of their optima: over-production and history-dependence. Cavalcanti-Erosa (2008) study optima in a version of Trejos-Wright (1995). We show that if lotteries are allowed, then higher ex ante utility is achieved and neither property holds at an optimum. The second essay, "Suspension in a global-games version of the Diamond-Dybvig model", builds on the model in Goldstein and Pauzner (GP) (2005), a global-games version of the Diamond-Dybvig (DD) (1983) model in which there is uncertainty about the long-run return and in which agents observe noisy signals about that return. GP limited their investigation to a banking contract that makes a noncontingent promised payoff to those who withdraw early until the bank's resources are exhausted. We amend the contract and permit suspension. Essay 3, "Why ten \$1s are not treated as a \$10?", (joint work with Yoske Igarashi) explores, as Zhu (2003) shows, the existence of his full-support steady state implies the existence of non-full-support steady states constructed as follows. Specifically, it is shown that there is no equilibrium path with a constant payment rule that converges to these steady states if the initial distribution has a different support.

2012	H84	Neanidis, Kyriakos C. 2012. "Humanitarian Aid, Fertility and Economic Growth." <i>Economica</i>, 79(313): 27-61. This paper examines the effect of humanitarian aid on fertility and economic growth. In an overlapping generations model, where health status in adulthood depends on health in childhood, adult agents allocate their time to work, leisure, and childrearing activities. Humanitarian aid influences the probability of survival to adulthood, health in childhood, and the time that adults allocate to childrearing, giving rise to an ambiguous effect on both fertility and growth. An empirical investigation for the period 1973-2007 suggests that humanitarian aid has on average a zero effect on the rates of fertility and of per capita output growth.
2012	I13	Jones, Randall S. 2012. "Meeting the Social Policy Challenges Facing Korea." <i>Asian Economic Policy Review</i>, 7(1): 91-108. Korea faces the fastest population aging among Organisation for Economic Cooperation and Development countries and increasing levels of income inequality and relative poverty. While economic growth will help address these challenges, growth alone is not sufficient, making it necessary to introduce policies to promote social cohesion. First, the National Pension Scheme and the National Health Insurance need to be improved. Second, Korea should develop well-targeted social programs and expand the earned income tax credit. Third, it is important to reduce labor market dualism, a major cause of inequality due to the large wage gap between regular and non-regular workers. Fourth, education reform is needed to lower the financial burden of tertiary education, reduce the heavy reliance on hagwon and increase spending on preprimary education. At the same time, it is essential to maintain a sound fiscal position by increasing tax revenues, primarily through indirect taxes and environmental taxes, to cover rising social spending.

2012	I14	Eastwood, Robert. 2012. "Macroeconomic Approaches to Identifying the Effects of Health on Output, Growth and Poverty." <i>African Development Review/Revue Africaine de Développement</i>, 24(4): 279-90. Microeconomic studies cannot, by definition, identify general equilibrium economic effects of changes in health. Macroeconomic analysis is needed for this, and the paper reviews three strands in the empirical literature, based respectively on cross-country regression analysis, computable general equilibrium (CGE) modelling, and a mixture of microeconomic estimation and macroeconomic simulation. The first two strands have important drawbacks. Cross-country regression is beset with the problem of finding valid instruments. CGE models tend to contain a large number of imposed parameters, making it hard to judge the robustness of simulation results. Mixing micro-estimation with aggregative macro-simulation appears most promising as this methodology allows both drawbacks to be avoided, at least in part.

Year	DE	Title and Abstract
2012	J01	Manov, Bogomil. 2012. "Reproduction of the Individual and the Population in Bulgaria and in the European Union under the Contemporary Financial and Economic Crisis." <i>Economic Thought</i>, 57(5): 70-82. : The article clarifies the essence, the specifics and the dynamics of conditions and factors that influence the reproduction of the individual and the population as a whole in Bulgaria and in the European Union. The study is specified for the current financial and economic crisis. The analyzes and assessments in the study show that Bulgaria has the possibility to improve the financial potential for investments in economic growth and that this objective can be reached without encountering major risks.
2012	J53	Zenezini, Maurizio. 2012. "I fallimenti della politica economica e l'impossibilita delle relazioni industriali: Una storia infinita? (The Failure of Economic Policy and the Impossibility of Industrial Relations: An Endless Story? With English summary.)." <i>Economia e Societa Regionale</i>, 115(1): 143-86. Inspired by a debate published in this Journal (2/2011), the paper examines the state and perspectives of industrial relations in the context of the long Italian economic crisis. After recalling the dismal record of the Italian economic growth over the last ten to fifteen years, the paper argues that the inability of policy makers to carry out effective policies to counteract negative shocks and to stimulate recovery originates in the architecture of the European economic policy. In addition to the loss of domestic monetary policy and exchange rates, the developments after the 2009 financial turmoil have shown that also domestic fiscal policy is no longer available for stimulating demand as austerity measures are adopted in response to the pressure from the financial markets. In this context, the only way out of the growth crisis is apparently more internal devaluation through wage squeeze and labour market reforms. The paper concludes that while labour market reforms have long since exhausted their potential for improving employment and have no potential for stimulating growth, they put a great strain on the system of industria.
2012	J62	CV: Boeri, Tito, and Pietro Garibaldi. 2012. "Financial Shocks and the Labor Markets: Should Economic Policy Save Jobs?." In <i>Ascent after Decline: Regrowing Global Economies after the Great Recession</i>, ed. Otaviano Canuto and Danny M. Leipziger, 201-17. Washington, D.C.: World Bank.
2012	K12	Ip, Mary. 2012. "The Global Financial Crisis: Role of Law in China." <i>Chinese Economy</i>, 45(3): 8-23. In general, China's response to the global financial crisis was not very different from that of other countries: a stimulus package worth trillions of renminbi, aimed at encouraging domestic consumption. At the same time, China realized that containing the economic havoc would also require the adoption of new legal measures. Consequently, a series of rules and regulations was promulgated as part of the country's strategic response to the crisis. The objective of this article is to examine the role of law in promoting economic stability in China during the financial crisis. The discussion focuses on contract law and bankruptcy law. How well does the regulatory regime address the economic dislocation of the global downturn? To what extent has the administration of policy contributed to the revitalization of the Chinese economy?
2012	L15	Venturini, Francesco. 2012. "Product Variety, Product Quality, and Evidence of Endogenous Growth." <i>Economics Letters</i>, 117(1): 74-77. Using US manufacturing industry data, we re-examine evidence of first- and second-generation models of R&D-based endogenous growth focusing on innovation (patent) quality. We show that Schumpeterian growth theories perform better than semi-endogenous growth models.
2012	L15	Misevic, Petar, Tonci Lazibat, and Josip Jurcevic. 2012. "Utjecaj primjene NATO standarda na razvoj hrvatskog gospodarstva. (The Influence of NATO Standards Application on Development of Croatian Economy. With English summary.)." <i>Poslovna Izvršnost/Business Excellence</i>, 6(1): 97-114. The purpose of this study was to examine the impact of NATO accession and implementation of NATO standards on the development of national economy. In addition, the NATO standards for quality and ISO 9001 standards were compared and their importance to the economy of the country stressed. Impact of NATO accession and implementation of NATO standards on the economic situation of the country is manifested through the direct and indirect impacts. Direct benefits include reducing the amount needed to defend the country, opening new business opportunities for businesses and the military industry of the acceding countries, the participation of scientists and experts in the projects of NATO, whose competences are developed and updated on the latest technologies. Indirect benefits include the reforms necessary for joining the Alliance, which will result in building a better business environment for domestic and foreign business partners, the risks at the country level has been reduced together with a reduction of interest rates and increased domestic and foreign investment, and consequently influence the development and growth of the overall economy. In this paper, the economic indicators were analyzed on which to evaluate the impact of entry into NATO on the economic situation. Although paper did not show the impact of all indicators and omitted some of the factors, it is possible to conclude that entry into the NATO alliance and the implementation of NATO standards leads to improvement of the economic situation of the acceding country.
2012	L66	Boisvert, Richard N., David Kay, and Calum G. Turvey. 2012. "Macroeconomic Costs to Large Scale Disruptions of Food Production: The Case of Foot-and-Mouth Disease in the United States." <i>Economic Modelling</i>, 29(5): 1921-30. We forecast the economic consequences of a widespread contamination of the food system based on a hypothetical outbreak of foot-and-mouth disease (FMD). Since the immediate effect on the livestock sector could affect the entire supply chain and US livestock, meat, and dairy exports, we measure these impacts using GTAP, a multi-region, multi-sector computable general equilibrium (CGE) model of the global economy. The immediate "shocks" to the US livestock, raw milk, and other animal products sectors indirectly affect all sectors of the economy, as well as international markets and trade. We decompose these effects due to each component of the initial shocks, and estimate the importance of these shocks to the national food system for the Mid-Atlantic Region using IMPLAN. Our GTAP results indicate that losses to the USA economy would be about \$11.7 billion, and with the ripple effect throughout the rest of the world including beneficiary nations (Argentina, Brazil, Latin America, Australia, and New Zealand) and losers (Canada, Mexico, European Union) would be 14.1 billion. We estimate the proportion of the domestic impact affecting the Mid-Atlantic Region. Based on a regional input-output model of that region, we estimate that total losses in value added are nearly \$800 million; losses in labor income total about \$565 million; and there are job losses of just over 12 thousand.
2012	M12	Dimitrova, Mariana. 2012. "Contemporary Practices for Developing Innovation Activity of the Human Resources. (In Bulgarian. With English summary.)." <i>Economic Studies</i>, 21(2): 116-28. In the current economic conditions, the survival and prosperity of organizations more and more depends on the success they have in unlocking the innovation potential of their employees. To the greatest extent, the human resource is capable of contributing to the progress of the Bulgarian economy in the long economic crisis. The paper presents modern approaches from the practice of effective organizations developing their human resources and using their skills for developing and introducing innovations. The article analyzes the characteristics of the small and medium-sized enterprises, dominating in Bulgaria, regarding the opportunities for increasing the innovation activity of the employees. It attempts to study the available statistical information concerning the obstacles to using the approaches in selection, training, and developing the human resources in the organizations for increasing the innovation activity in the Bulgarian organizations.
2012	M16	Bloom, Nicholas, Raffaella Sadun, and John Van Reenen. 2012. "Americans Do IT Better: US Multinationals and the Productivity Miracle." <i>American Economic Review</i>, 102(1): 167-201. US productivity growth accelerated after 1995 (unlike Europe's), particularly in sectors that intensively use information technologies (IT). Using two new micro panel datasets we show that US

Year	DE	Title and Abstract
		multinationals operating in Europe also experienced a "productivity miracle." US multinationals obtained higher productivity from IT than non-US multinationals, particularly in the same sectors responsible for the US productivity acceleration. Furthermore, establishments taken over by US multinationals (but not by non-US multinationals) increased the productivity of their IT. Combining pan-European firm-level IT data with our management practices survey, we find that the US IT related productivity advantage is primarily due to its tougher "people management" practices.
2012	M31	CV: Bertoli, Giuseppe, and Riccardo Resciniti. 2012. "International Marketing and the Country of Origin Effect: Introduction." In <i>International Marketing and the Country of Origin Effect: The Global Impact of 'Made in Italy'</i> , ed. Giuseppe Bertoli and Riccardo Resciniti, 1-20. 2012	M48	Aglietta, Michel, and Sandra Rigot. 2012. "Investisseurs a long terme, regulation financiere et croissance soutenable. (Long-Term Investors, Financial Regulation and Sustainable Growth. With English summary.)" <i>Revue d'Economie Financiere</i> , 0(108): 189-200. To resolve the euro zone crisis, a growth model mobilizing a European-wide generic innovation is needed. Environment conservation and adaptation to climate change nurture such principle if the European Community agrees upon a social value of carbon, enabling the creation of carbon assets. Then potentially profitable investments must be financed. However investors are impeded by risk aversion, regulations, and accounting standards. To overcome the dilemma, we show that regulations and standards must be adjusted so that investors get incentives to buy long-term assets. We also point out that a financial intermediation involving the central bank and a Green Fund may help diversification of investors in financing carbon assets.
2012	N45	Lee, Jongseok, Iain Clacher, and Kevin Keasey. 2012. "Industrial Policy as an Engine of Economic Growth: A Framework of Analysis and Evidence from South Korea (1960-96)." <i>Business History</i> , 54(5): 713-40. The recent financial crisis has raised significant questions about liberal free-markets as a mechanism for generating economic growth compared to those economies where there is greater state intervention. This article develops a theoretical framework for economic development that can explain historical changes in both industrial policy and economic growth where the state actively intervenes to direct economic development. The article then applies this framework to the case of South Korea where there is a strong interventionist government. The results show that economic development can be explained within a sequential framework of policy intervention and that rather than being a static decision, successful state intervention is a dynamic and evolutionary process.
2012	N47	Menyah, Kojo, and Yemane Wolde-Rufael. 2012. "Wagner's Law Revisited: A Note from South Africa." <i>South African Journal of Economics</i> , 80(2): 200-208. The aim of this note is to reassess the validity of Wagner's law for South Africa for the period 1950-2007 using cointegration and causality tests. The evidence shows causality running from income to government expenditure, thus supporting the Wagnerian proposition of an expanding public sector. Using five different long-run estimators, we found that the size of South Africa's public sector was positively and significantly related to South Africa's national income. The elasticity ranges from 1.12 to 1.57, implying that a 1% increase in income leads to a 1.12-1.57% increase in government expenditure.
2012	N54	Stern, David I., and Astrid Kander. 2012. "The Role of Energy in the Industrial Revolution and Modern Economic Growth." <i>Energy Journal</i> , 33(3): 125-52. The expansion in the supply of energy services over the last couple of centuries has reduced the apparent importance of energy in economic growth despite energy being an essential production input. We demonstrate this by developing a simple extension of the Solow growth model, which we use to investigate 200 years of Swedish data. We find that the elasticity of substitution between a capital-labor aggregate and energy is less than unity, which implies that when energy services are scarce they strongly constrain output growth resulting in a low income steady-state. When energy services are abundant the economy exhibits the behavior of the "modern growth regime" with the Solow model as a limiting case. The expansion of energy services is found to be a major factor in explaining economic growth in Sweden, especially before the second half of the 20th century. After 1950, labor-augmenting technological change becomes the dominant factor driving growth though energy still plays a role.
2012	N55	Li, Bozhong, and Jan Luiten van Zanden. 2012. "Before the Great Divergence? Comparing the Yangzi Delta and the Netherlands at the Beginning of the Nineteenth Century." <i>Journal of Economic History</i> , 72(4): 956-89. This article tests recent ideas about the long-term economic development of China compared with Europe on the basis of a detailed comparison of structure and level of GDP in part of the Yangzi delta and the Netherlands in the 1820s. We find that Dutch GDP per capita was almost twice as high as in the Yangzi delta. Agricultural productivity there was at about the same level as in the Netherlands (and England), but large productivity gaps existed in industry and services. We attempt to explain this concluding that differences in factor costs are probably behind disparities in labor productivity.
2012	N61	Bessen, James. 2012. "More Machines, Better Machines . . . Or Better Workers?" <i>Journal of Economic History</i> , 72(1): 44-74. How much of the rapid growth in output per man-hour in nineteenth-century cotton weaving arose from technical change and how much arose from price-driven substitution of capital for labor? Using an engineering production function, I find that factor price changes account for little of the growth in output per man-hour. However, much of the growth and most of the apparent labor-saving bias arose not from inventions, but from improved labor quality--better workers spent less time monitoring the looms. Labor quality played a critical role in the persistent association between economic growth and capital deepening in this important sector.
2012	Q16	CV: Donnellan, Trevor, Frederic Chantreuil, Emil Erjavec, Roberto Esposti, Kevin F. Hanrahan, Myrna van Leeuwen, Petra Salamon, and Guna Salputra. 2012. "EU Market Outlook." 2012	Q16	Cunguara, Bedito, and Joseph Hanlon. 2012. "Whose Wealth Is It Anyway? Mozambique's Outstanding Economic Growth with Worsening Rural Poverty." <i>Development and Change</i> , 43(3): 623-47. Despite rapid economic growth and massive inflows of aid, rural poverty in Mozambique is worsening. Agricultural production and productivity have not increased in the last decade. Use of chemical fertilizers and other modern technology is at a low level and decreasing. The present development model emphasizes that the role of government and donors is to provide human capital and infrastructure, while the private sector is responsible for economic development and ending poverty. The most recent national surveys confirm what is being seen elsewhere in Africa--that this non-interventionist strategy does not raise agricultural productivity or reduce poverty. While 80 percent of Mozambique's population is engaged in agriculture, this sector contributes only 20 percent of GDP. This suggests that investments in agriculture are likely to generate pro-poor growth, both to rural and urban dwellers. This policy failure is increasingly recognized, but donors and government have invested too much political capital in the current policy to change easily.
2012	Q16	Arndt, Channing, Karl Pauw, and James Thurlow. 2012. "Biofuels and Economic Development: A Computable General Equilibrium Analysis for Tanzania." <i>Energy Economics</i> , 34(6): 1922-30. Biofuels could offer new economic opportunities for low-income countries. We use a recursive dynamic computable general equilibrium model of Tanzania to evaluate different biofuels production options and estimate their impacts on growth and poverty. Our results indicate that maximizing the poverty-reducing effects of biofuels production in countries like Tanzania will require engaging and improving the productivity of smallholder farmers. Evidence shows that cassava-based ethanol production is more profitable than other feedstock options. Cassava also generates more "pro-poor" growth than sugarcane-based systems. However, if smallholder yields can be improved rather than

Year	DE	Title and Abstract
		expanding cultivated land, then both sugarcane and cassava out-grower schemes generate similar pro-poor outcomes. We conclude that, in so far as the public investments needed to establish a biofuels industry are consistent with other development needs, then producing biofuels will enhance economic development in countries like Tanzania.
2012	Q34	Savun, Burcu, and Daniel C. Tirone. 2012. "Exogenous Shocks, Foreign Aid, and Civil War." <i>International Organization</i>, 66(3): 363-93. The recent civil war literature suggests that negative economic shocks in low-income countries increase the risk of civil war. Foreign aid can be an effective conflict-prevention tool in times of severe economic conditions. Aid cushions government spending from the downward pressures of economic shocks, providing recipient governments with resources they can use to make rebellion a less attractive option for aggrieved domestic groups. Using Official Development Assistance (ODA) data covering 1990 through 2004, we find that foreign aid appears to be a useful tool for preventing civil wars in the wake of negative economic shocks, and as such aid should be assessed by donors with these conflict-suppressing aspects in mind.
2012	Q52	Vaileanu-Paun, Ingrid, and Sophie Boutillier. 2012. "Economie de la fonctionnalite. Une nouvelle synergie entre le territoire, la firme et le consommateur? (Functional Economy: A New Synergy between the Territory, the Firm and the Consumer. With English summary.)." <i>Innovations</i>, 0(37): 95-125. The subject of this paper is studied in the context of the evolutions of enterprises' strategies towards the contribution to a dematerialized economic growth able to respond to ecological and social issues at the territorial level. Contributing to the debate on the possible responses to the ecological, economic, financial or energy crisis, we analyze the changes in the strategies of value creation and evaluation by companies and regions. We study the emergence of a new production/consumption paradigm that would integrate ex ante the positive and negative externalities in the economic process. Thus, the functional economy takes place in historical dynamics and a new definition of the relationships between the enterprise, the consumer and the territory.
2013		
2013	D04	Kirchgassner, Gebhard. 2013. "Zur Rolle der Okonometrie in der wissenschaftlichen Politikberatung. (With English summary.)." <i>Perspektiven der Wirtschaftspolitik</i>, 14(1-2): 3-30. Because economic theory alone does, in many situations, not provide unambiguous policy advice, most of the time empirical analyses are needed in addition. Thus, today econometric analyses are often parts of reports for political institutions or courts. However, it is not unusual that reports with contradicting evidence are presented by different groups or parties. Using the relation between government size and economic growth as an example, it is shown how such contradicting results are possible even if all scientists involved behave sincerely and adhere to the rules of scientific research. Our second example, studies investigating whether the death penalty serves as a deterrent to homicide, shows that the results of empirical analyses might to a large extent depend on a priori convictions of the scientists. Thus, the process of scientific policy advice has to be organised in a way so that--similar to the genuinely scientific discourse--open discussion and criticisms of methods and results are possible. In order to disclose possible conflicts of interests, this demand transparency of the whole process and, in particular for empirical analyses, that data and programmes are made available for re-estimations.
2013	D10	CV: Clark, Andrew E., Paul Frijters, and Michael A. Shields. 2013. "Relative Income, Happiness, and Utility: An Explanation for the Easterlin Paradox and Other Puzzles." 2013	F20	Kim, Se-Jik, and Hyun Song Shin. 2013. <i>Working Capital, Trade and Macro Fluctuations</i>. Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 235shin.pdf In addressing the precipitous drop in trade volumes in the recent crisis, the real and financial explanations have sometimes been juxtaposed as competing explanations. However, they can be reconciled by appeal to the time dimension of production and the working capital demands associated with offshoring and vertical specialization of production. We explore a model of manufacturing production chains with offshoring where firms choose their time profile of production and where inventories, accounts receivable, and productivity are procyclical and track financial conditions.
2013	H73	Hatfield, John William, and Katrina Kosec. 2013. "Federal Competition and Economic Growth." <i>Journal of Public Economics</i>, 97(0): 144-59. This paper exploits exogenous variation in the natural topography of the United States to estimate the causal impact of inter-jurisdictional competition on income growth. We find that doubling the number of county governments in a metropolitan area leads to a 17% increase in the average annual growth rate of earnings per employee over 1969-2006, and a 10% increase in 2006 income per employee. Decomposing income effects using 2000 Census worker-level data, we find that approximately half of the effect stems from making workers more productive, while the other half comes from changing the composition of the workforce and inducing workers to work more hours. We also present evidence that inter-jurisdictional competition leads local governments to raise more in taxes, spend more, and issue more debt (per capita), but does not help them obtain more inter-governmental transfers. However, the additional cost from this increase in expenditures to a median-wage employee is much smaller than the increase in that employee's wages due to greater inter-jurisdictional competition.
2013	H73	Fang, Ying, Li Qi, and Zhongjian Lin. 2013. "China's Internal Borders: Evidence from Business-Cycle Correlations across Chinese Cities." <i>Chinese Economy</i>, 46(3): 41-60. We measured the business-cycle correlations of the real gross domestic product (GDP) growth rates of two cities to capture the degree of segmentation across China's provincial and regional borders. This type of segmentation can be caused by local protectionism as well as other economic and geographic factors. After controlling the other factors, we zeroed in on the administrative border effect that is due to local protectionism. We found that the interprovincial administrative border effect rose and then gradually declined in the period between 1991 and 2007. Its increase coincided with the introduction of the Tax-Sharing System reform, which started in 1994. Our analysis shows that China's reform path did not create a persistent provincial "administrative border effect" that would debilitate market forces.
2013	I22	Takii, Katsuya, and Ryuichi Tanaka. 2013. "On the Role of Job Assignment in a Comparison of Education Systems." <i>Canadian Journal of Economics</i>, 46(1): 180-207. This paper re-examines how differences in systems for financing education influence GDP by highlighting a neglected function of education policy: it affects the magnitude of gains from job assignment. When more productive jobs demand more skill, privately financed education can increase productivity gains from matching between jobs and skill by increasing the availability of highly educated people. This differs from the standard argument that publicly financed education increases the total amount of human capital by equalizing educational opportunities. It is shown that if job opportunities have large variations in productivity, education policy may face a serious efficiency-equity trade-off. DE: Macroeconomics: Production E23Analysis

Year	DE	Title and Abstract
2013	J44	Sands, Gary, and Laura A. Reese. 2013. "Fair Weather Friends? The Impact of the Creative Class on the Economic Health of Mid-sized US Metropolitan Areas, 1990-2009." <i>Cambridge Journal of Regions, Economy and Society</i> , 6(1): 71-91. This paper considers the relationship between creative class indicators and economic health in mid-sized American metropolitan areas before and during the Great Recession. Our primary research question is whether more creative communities have been able to avoid the widespread downturn at the end of the last decade, or at least suffer a more limited decline than communities with less presence of creative class. We find that highly creative metropolitan areas are as likely to suffer an economic decline that is as severe as that of their less creative peers. Moreover, key creative measures, such as immigrant populations, are negatively related to economic health.
2013	J44	Bound, John, Breno Braga, Joseph M. Golden, and Sarah Turner. 2013. "Pathways to Adjustment: The Case of Information Technology Workers." <i>American Economic Review</i> , 103(3): 203-07. One long-standing hypothesis about science and engineering labor markets is that the supply of highly skilled workers is likely to be inelastic in the short run. We consider the market for computer scientists and electrical engineers (IT workers) and the evolution of wages and employment through two periods of increased demand. Relative to the boom of the 1970s, the demand shock in the 1990s generated relatively greater changes in employment and smaller changes in wages. The growth in the pool of skilled workers abroad, combined with increased immigration in high-skill fields, is central to this story.
2013	J44	Gabe, Todd, Richard Florida, and Charlotta Mellander. 2013. "The Creative Class and the Crisis." <i>Cambridge Journal of Regions, Economy and Society</i> , 6(1): 37-53. The economic crisis contributed to sharp increases in US unemployment rates for all three of the major socio-economic classes. Results from regression models using individual-level data from the 2006-2011 US Current Population Surveys indicate that members of the Creative Class had a lower probability of being unemployed over this period than individuals in the Service and Working Classes and that the impact of having a creative occupation became more beneficial in the 2 years following the recession. These patterns, if they continue, are suggestive of a structural change occurring in the US economy-one that favours knowledge-based creative activities.
2013	J44	Currid-Halkett, Elizabeth, and Kevin Stolarick. 2013. "Baptism by Fire: Did the Creative Class Generate Economic Growth during the Crisis?" <i>Cambridge Journal of Regions, Economy and Society</i> , 6(1): 55-69. Scholars have long argued that creativity drives economic prosperity. Recently, much of this debate has revolved around the creative class. Most of this research, however, has been done during times of strong economic growth. What is the economic effect of the creative class after the financial crisis? Looking at regional unemployment variation in 2007-2011 against baseline unemployment in 2005, we study if specific subgroups within the creative class have different relationships with regional unemployment. Throughout the entire timeframe all of the creative subgroups are associated with lower unemployment. We conclude that creativity matters but the influence of each subsector is dependent on region size.
2013	J46	Gillani, Durdana Qaiser, and Karamat Ali. 2013. "Employment Status and Earning Functions in Urban Informal Sector: A Case of Southern Punjab, Pakistan." <i>Pakistan Journal of Applied Economics</i> , 23(2): 97-113. Importance of the informal sector which provides a large chunk of GDP and employment to the economy has been widely recognized in Pakistan. The objective of the study is to examine the impact of human capital and other socio-economic variables on earnings of self-employed, wage earners, and the workers engaged in trade, services and manufacturing activities, especially in the urban informal sector through descriptive and empirical analysis. The study is based on the primary source of data collected by conducting a field survey selecting three divisions: Bahawalpur, Multan and Dera Ghazi Khan, as major study areas. A sample of 3,000 informal sector workers was collected from urban areas of the Southern Punjab, Pakistan. For this purpose, firstly, the sample has been divided into self-employed and wage earners and then into three groups of activities i.e., trade, services and manufacturing. There is a serious need to provide more opportunities for productive employment to a large number of participants of the urban informal sector.
2013	J58 J83	van Schaik, Ton, and Theo van de Klundert. 2013. "Employment Protection Legislation and Catching-Up." <i>Applied Economics</i> , 45(7-9): 973-81. After World War II (WW II), productivity growth in Europe and Japan was driven by catching up with the US. Institutions in Europe were different too and well suited for economic growth through imitation and adaptation of the technology to local circumstances. Catching up is, however, a self defeating process. It ends when the technology frontier is attained or when in case of conditional convergence institutions set a limit to the process of catching up. Once this situation is reached, the existing institutions may no longer be appropriate. Regression analysis on a panel of 21 Organization for Economic Cooperation and Development countries reveals that employment protection legislations (EPL) had a positive impact on productivity growth in the period of rapid convergence in the sixties and seventies. However, from the eighties onwards, the total effect of EPL on labour productivity growth was negative.

2013	L31	Whitt, Michael D., Nathalie A. L. Duval-Couetil, Rodney G. Handy, Satish C. Boregowda, and Patrick Senarath. 2013. "Value Mitosis--A Methodology to Develop Community Empowerment." <i>Journal of International Business and Economics</i> , 13(3): 97-110. The value mitosis initiative (VMI) is a concept through which any community's socioeconomic status can be improved by leveraging the latent and visible entrepreneurial competencies already present within it. The basis for the model is the physiological cellular mitosis process through which a single cell is able to replicate itself numerous times without an external stimulus. VMI effectiveness can be quantitatively observed through either third order polynomial or four parameter symmetric power mathematical relationships between Total Entrepreneurial Activity (TEA) Rate and Gross Domestic Product (GDP) per capita or through changes in any state's Robin Hood Index. The success of the first concept within any community and VMI entity structure are of significant importance to the initiative's success. Many successful products in the marketplace have resulted from lead user development. Harnessing the latent abilities of the entrepreneurial pioneers within a community can not only provide a source of wealth creation, but can also achieve an important social mission.

2013	M52	Diss: Barlas, Mirza Jahiz. 2013. <i>Essays in Intangible Capital Reallocation, Mergers and Acquisitions and Financial Frictions</i> . PhD diss. University of Minnesota. This dissertation consists of three essays. In the first essay, I document novel empirical facts at the aggregate and the firm level on the reallocation of tangible and intangible capital. First, at the aggregate level, I interpret firm physical capital sales data as tangible capital reallocation and data on mergers and acquisitions (M&As) data on intangible capital reallocation. I document the cyclical patterns of the reallocation of both forms of capital. I show that in recessions, the correlation of intangible capital reallocation with GDP is greater than the correlation of tangible capital reallocation with GDP but in booms, the correlation of both types of capital reallocation with GDP are the same. I interpret this result as suggestive evidence that tangible

Year	DE	Title and Abstract
		capital serves a collateral motive which intangible capital does not since in recessions, firms choose to reallocate intangible capital over tangible. I also show that in the last decade the correlation of tangible capital reallocation with GDP has decreased to a quarter of its 1980s level. However, the correlation of intangible capital reallocation with GDP has remained the same in the last decade as in the 1980s. This result indicates that tangible capital collateralizability has become more important over time. Both these results show the distinctive cyclicity of the reallocation of both forms of capital. Second, at the firm level, I use data on M&As to document the effects of capital reallocation on firm productivity and the importance of including intangible capital when evaluating the effects of capital reallocation. I document that after an M&A, acquirer's structurally estimated productivity increases on average 4% annually, and this productivity is 45% higher when intangible capital is excluded from the estimation. This serves as evidence that capital reallocation is beneficial for the acquirers and intangible capital reallocation can account for measured productivity gains. In the second essay, I contribute to the recent macroeconomics literature on financial frictions at a theoretical and a quantitative level. This literature attempts to quantify the magnitude of output fluctuations attributable to financial market disturbances through frictions on the reallocation of capital among firms. At the theoretical level, I build a model in which heterogeneous firms use two forms of capital, tangible and intangible capital, to produce output. These firms are subject to idiosyncratic productivity shocks. I assume that only tangible capital is collateralizable and that both forms of capital are reallocatable across firms post-shock. I show that a financial market disturbance in the form of a tighter collateral constraint leads to a decline in output in the model with both forms of capital that is 2.8 times greater than the decline in output in the model with only tangible capital, in the sense, allowing for intangible capital magnifies the effects of financial market disturbances on output. A tighter collateral constraint causes tangible capital reallocation to decline sharply because firms are more constrained and leads to a fall in intangible capital reallocation because both types of capital are complementary in production. In the third essay, I present novel empirical observations about mergers and acquisitions. I show that acquirer productivity increases after a merger or an acquisition and that these the ex-post productivity gains are an inverse function of the productivity difference between the acquirer and target at the time of the merger or an acquisition. I also note that the higher the ex-post productivity gains for an acquirer, the bigger the decline in acquirer announcement returns and smaller the increase in target announcement returns. Lastly, I show that the executive compensation increase does not account for most of the ex-post productivity gains. These findings show that gains after a merger or an acquisition are not accruing towards shareholders or executives. Thus, I find suggestive evidence that labor obtains the most benefit associated with a merger or an acquisition in the form of increased wages and benefits.
2013	N83	CV: Humair, Cedric. 2013. "The Genesis of Swiss Business Interest Associations (1860-1914)." In <i>Historical and International Comparison of Business Interest Associations (19th-20th Centuries)</i> , ed. Daniele Fraboulet, Andrea M. Locatelli and Paolo Tedeschi, 31-42. 2013	N96	Brida, Juan Gabriel, Juan S. Pereyra, Martin Puchet Anyul, and Wiston Adrian Risso. 2013. "Regimenes de desempeno economico y dualismo estructural en la dinamica de las entidades federativas de Mexico, 1970-2006. (Regimes of Economic Performance and Structural Dualism in the Dynamics of the Mexican Federal Entities, 1970-2006. With English summary.)" <i>Economia Mexicana, Nueva Epoca</i>, 22(1): 101-49. This paper describes the dynamics of economic performance for the sub-national Mexican states from 1970 to 2006; the state variables used are the levels and the growth rates of per capita GDP. The authors situate this approach in a conceptual and methodological panorama of the existent literature. Starting from the regime concept, the paper introduces a distance notion to compare the observed paths and the clustering of the economies whose evolution is studied. The analysis shows that two fundamental clusters have existed: one of high and another of low performance, in addition to other transitory groups. In the high performance cluster the member's number increases, while in the low performance cluster this number diminishes. At the same time, the article shows that the sub-national states that belong to the first cluster have had an increasingly similar performance. Also, it confirms that the sub-national states move from the low to the high performance cluster, and that the distance between both clusters has increased. The interpretation of these facts is based on the dual economy concept proposed by the development theory.
2013	Q37	Hernandez, Gonzalo. 2013. "Terms of Trade and Output Fluctuations in Colombia." <i>CEPAL Review</i>, 0(110): 109-31. This paper explores the impact of the terms of trade on output fluctuations in Colombia, a developing country where as much as 62% of export earnings come from just four commodities: oil (42%), coal (14%), coffee (5%), and nickel (1%). This research was prompted by: the particular role of short-run fluctuations in developing economies, the fact that the Colombian terms of trade are procyclical, and the discussion on economic policies towards sterilization of the effects of commodity prices. Following time series analysis for the period 1994 -2011, robust evidence was found indicating that around one third of Colombia's quarterly growth is attributable to changes in the terms of trade.

NL(J)	15	19	14	24	13	16	14	17	132

NL(J) — number of new links in the year J (J = 2006, ..., 2013).

Table E24.F Examples of Publications according to New Links in 2006—2013

Year	DE	Title and Abstract
2006		
2006	A14	Rothschild, Kurt. 2006. "Reality and Response: Unemployment 1970-2005 in Two Core Journals." <i>Banca Nazionale del Lavoro Quarterly Review</i>, 59(238): 293-305.
2006	A14	Rothschild, Kurt. 2006. "Realtà e risposta: La disoccupazione tra il 1970 e il 2005 in due importanti riviste. (Reality and Response: Unemployment 1970-2005 in Two Core Journals. With English summary.)." <i>Moneta e Credito</i>, 59(236): 363-76. The Seventies of last century saw a decisive break with the earlier tendencies of the 'golden age'. Particularly important was the return of persistent unemployment. The present paper gives an overview of the effects of this change on subsequent publications in the two core journals American Economic Review and Economic Journal. It turns out that both with regard to frequency and contents there had been a notable impact of real events and theoretical controversy.

Year	DE	Title and Abstract
2006	B11	CV: Gnos, Claude. 2006. "French Circuit Theory." In <i>A Handbook of Alternative Monetary Economics</i> , ed. Philip Arestis and Malcolm Sawyer, 87-104. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2006	D64	Decreuse, Bruno, and Bertrand Wigniolle. 2006. "Schizophrenie intergénérationnelle. (With English summary)." <i>Recherches Economiques de Louvain/Louvain Economic Review</i> , 72(1): 49-74. Love pushed beyond its paroxysm leads to suffocation. That is the moral of this article, which depicts an altruistic parent setting her labour supply to offer the best living conditions to her child. When parents and children are perfectly substitutable in production, this behaviour pushes all wages down. If hourly wages are rigid, employment is rationed and the youth are the primary victims of such rationing. We show this mechanism may originate endogenous fluctuations between under and full employment when the older workers' productivity negatively responds to past unemployment. We also analyse the political support for the minimum wage. When the youth productivity is random, the minimum wage, the older workers' labour supply and youth unemployment together rise with the intensity of parental altruism.
2006	I23	Guisan, Maria Carmen, and Maria Teresa Cancelo. 2006. "Indicadores de producción científica en Economía, Ciencia y Tecnología: Análisis Comparativo de España, Unión Europea y Estados Unidos, 2001-2006. (With English summary)." <i>Estudios Económicos de Desarrollo Internacional</i> , 6(2): 37-54. Spanish universities have reached in the period 2001-2005 an outstanding increase in scientific production, and occupy a relevant position at European and World level, in Economics and other subjects. In this study we analyze the Spanish situation in comparison with the EU. We find a very low support to RD activities in Spain in comparison with EU average, as well as a low value of the European average in comparison with the United States. We point to the priorities demanded by Spanish and European researches in order to improve institutional support and to favor the positive impact of RD activities on economic development and employment.
2006	I24	Lkhagvasuren, Damba. 2006. <i>Education, Mobility and the College Wage Premium</i> . Concordia University, Department of Economics, Working Papers: 14001. Motivated by large educational differences in geographic mobility, this paper considers a simple dynamic extension of Roy's (1951) model and analyzes it using new evidence on net versus excess mobility and the individual-level relationship between mobility and wages. According to the model, the dispersion of a labor income shock specific to a worker-location match is greater for more educated workers and accounts for large educational differences in mobility. In the model, labor mobility raises both the average wage and the college wage premium, a prediction consistent with differences between Europe and the U.S.
2006	K35	Athreya, Kartik B., and Nicole B. Simpson. 2006. "Unsecured Debt with Public Insurance: From Bad to Worse." <i>Journal of Monetary Economics</i> , 53(4): 797-825. In U.S. data, income interruptions, the receipt of public insurance, and the incidence of personal bankruptcy are all closely related. The central contribution of this paper is to evaluate bankruptcy protection and public insurance in a unified setting where each program alters incentives in the other. Our analysis delivers two striking conclusions. First, we find that U.S. personal bankruptcy law is an important barrier that prevents the public insurance system from improving welfare. Second, contrary to popular belief, we find that increases in the generosity of public insurance will lead to more, not less, bankruptcy.
2006	K41	Berger, Helge, and Michael Neugart. 2006. <i>Labor Courts, Nomination Bias, and Unemployment in Germany</i> . CESifo GmbH, CESifo Working Paper Series: CESifo Working Paper No. 1752. Labor courts play an important role in determining the effective level of labor market regulation in Germany, but their application of law may not be even-handed. Based on a simple theoretical model and a new panel data set, we identify a nomination bias in labor court activity - that is, court activity varies systematically with the political leaning of the government that has appointed judges. In an extension, we find a significant positive relation between labor court activity and unemployment, even after controlling for the endogeneity of court activity. The results have potentially important policy implications regarding the independence of the judiciary and labor market reforms.
2006	L26	CV: Audretsch, David B. 2006. "The Climate for Business Development and Employment Growth: Comment." In <i>The Economy of Puerto Rico: Restoring Growth</i> , ed. Susan M. Collins, Barry P. Bosworth and Miguel A. Soto-Class, 308-12. Washington, D.C.: Brookings Institution Press; San Juan, Puerto Rico: Center for the New Economy.
2006	L26	CV: Aponte, Marines. 2006. "The Climate for Business Development and Employment Growth: Comment." In <i>The Economy of Puerto Rico: Restoring Growth</i> , ed. Susan M. Collins, Barry P. Bosworth and Miguel A. Soto-Class, 305-08. Washington, D.C.: Brookings Institution Press; San Juan, Puerto Rico: Center for the New Economy.
2006	L26	CV: Baptista, Rui, Andre van Stel, and A. Roy Thurik. 2006. "Entrepreneurship, Industrial Restructuring and Unemployment in Portugal." In <i>Entrepreneurship, Growth, and Innovation: The Dynamics of Firms and Industries</i> , ed. Enrico Santarelli, 223-41. International Studies in Entrepreneurship, vol. 12. New York: Springer.
2006	L26	Verheul, Ingrid, Andre Van Stel, Roy Thurik, and David Urbano. 2006. "The Relationship between Business Ownership and Unemployment in Spain: A Matter of Quantity or Quality?" <i>Estudios de Economía Aplicada</i> , 24(2): 435-57. This paper examines the interrelations between self-employment and unemployment rates for Spain in the period 1972-2004, comparing them with the general pattern observed for OECD countries. We apply the model as proposed by Audretsch, Carree, van Stel and Thurik (2005) to Spain. The divergence between predicted and actual unemployment levels in Spain are explained by country-specific shocks in the period under study, which are outside the scope of the model. This indicates that the general mechanism of employment generation by the self-employed may also be applicable to Spain, at least in the long run. The Spanish industrial structure is characterized by a relatively high and fluctuating unemployment level and a relatively high and stable business ownership rate, suggesting that the quantity of business ownership in Spain does not have a particularly large contribution to bringing down unemployment. In recent years we see that the unemployment rate decreases and stabilizes. We argue that, in addition to several labor market reforms, an increase in the quality of business ownership in Spain may also have contributed to the recent decrease in the unemployment rate.
2006	L26	CV: Aidis, Ruta. 2006. "From Business Ownership to Informal Market Traders: The Characteristics of Female Entrepreneurship in Lithuania." In <i>Enterprising Women in Transition Economies</i> , ed. Friederike Welter, David Smallbone and Nina Isakova, 119-42. Aldershot, U.K. and Burlington, Vt.: Ashgate.
2006	L26	CV: Audretsch, David B., and Max Keilbach. 2006. "Entrepreneurship, Growth and Restructuring." In <i>The Oxford Handbook of Entrepreneurship</i> , ed. Mark Casson, Bernard Yeung, Anuradha Basu and Nigel Wadeson, 281-310. Oxford and New York: Oxford University Press.
2006	L70	CV: Samuels, Warren J. 2000. "Regulating Private Power: Wage-Price Controls Are Not Enough." In <i>Research in the history of economic thought and methodology: Twentieth-century economics</i> , ed. Warren J. Samuels, 205-11. Research in the History of Economic Thought and Methodology, vol. 18-C. Amsterdam; New York and Tokyo: Elsevier Science, JAI.
2006	L73	Ferrao, Vincent. 2006. "Recent Changes in Employment by Industry." <i>Perspectives on Labour and Income</i> , 18(1): 31-36. Over the last three years, low interest rates have spurred a surge in home construction, and strong world demand has stimulated natural

Year	DE	Title and Abstract
		resource industries. At the same time, a soaring loonie has created challenges for Canadian manufacturing. This article examines these three industries, looking at the labour market impact in the resource-rich western provinces and the large manufacturing base in central Canada.
2006	N66	Berni, Duilio de Avila. 2006. "Mudancas no padrao de uso da mao-de-obra no Brasil entre 1949 e 2010. (With English summary)." <i>Nova Economia</i> , 16(1): 139-72. This article examines the evolution of sectoral employment in Brazil between 1949 and 2010, using structural decomposition analysis of the input-output model. The data base was selected from the decennial matrices for the 1959/2000 period and from figures referring to 1949 and 2010; these were obtained using the Delphi Method. Those sectors in which labour productivity rose simultaneously with employment increases were defined as virtuous sectors. The only sectors that fit this description for the entire period were the manufacturing of capital goods and services. Virtuosity was observed in a number of cases over the sub-periods, however, mainly concentrated between 1949 and 1970. However, between 1970 and 1980, simultaneous growth in employment and in labour productivity was not observed in any sector.

2006	Q42	Pintor Borobia, Jesus M., Fernando Lera Lopez, Justo Garcia Ortega, and Javier Faulin Fajardo. 2006. "Energia eolica y empleo: El caso de Navarra como paradigma. (Wind Energy and Employment: The Navarran Paradigm. With English summary)." <i>Informacion Comercial Espanola Revista de Economia</i> , 0(829): 253-71. The paper analyzes the experience of one of the regions that pioneered wind energy, the Autonomous Community of Navarre, where a competitive industry with a substantial impact on highly skilled employment was generated on the back of a specific energy policy. The findings prove that environmental concerns are compatible with regional economic growth and job creation, making Navarre a model to be copied in other European regions. Nonetheless, in light of the labour market shortcomings identified in the prognosis, the authors suggest that traditional support measures should be reinforced with policies to improve wind energy training among the related segments of the workforce.
2006	R33	Honohan, Patrick, and Anthony J. Leddin. 2006. "Ireland in EMU: More Shocks, Less Insulation?" <i>Economic and Social Review</i> , 37(2): 263-94. Despite anchoring the Irish monetary system to a common zone-wide exchange rate and interest rate, EMU has triggered sizeable exchange rate and especially interest rate shocks to the Irish economy (albeit not appreciably greater than those experienced under previous exchange rate regimes). Interest rate movements have deviated widely from what a standard Taylor monetary policy rule would have counselled--though here again the deviations have been no worse in this regard than those of the previous regime. The most important shock has been associated with the large and sustained initial fall in nominal interest rates as EMU began. Through mechanisms which we formally model, the interest rate fall has had a lasting effect on property prices, construction activity and the capacity of the labour market to absorb sizeable net immigration, despite a sharp deterioration in wage competitiveness since 2002. As the long drawn-out impact of this shock subsides, the failure of the wage-bargaining system promptly to claw back the loss of competitiveness resulting from exogenous exchange rate movements is increasingly likely to show up in weaker aggregate employment performance.
2006	R38	Bassanini, Andrea, and Romain Duval. 2006. "The Determinants of Unemployment across OECD Countries: Reassessing the Role of Policies and Institutions." <i>OECD Economic Studies</i> , 0(42): 7-86. This paper explores the impact of policies and institutions on unemployment in OECD countries over the past decades. Reduced-form unemployment equations, consistent with standard wage setting/price-setting models, are estimated using cross-country/time-series data from 21 OECD countries over the period 1982-2003. In the "average" OECD country, high and long-lasting unemployment benefits, high tax wedges and stringent anti-competitive product market regulation are found to increase aggregate unemployment. By contrast, highly centralised and/or coordinated wage bargaining systems are estimated to reduce unemployment. These findings are robust across specifications, datasets and econometric methods. The paper also finds evidence of interactions across policies and institutions, as well as between institutions and shocks. Some specify interactions across policies and institutions are found to be particularly robust, notably between unemployment benefits and public spending on active labour market programmes as well as between statutory minimum wages and the tax wedge. Finally, it is shown that macroeconomic conditions also matter for unemployment patterns, with their impact being shaped by policies.

2007	C31	Guell, Maia, Jose V. Rodriguez Mora, and Chris Telmer. 2007. <i>Intergenerational Mobility and the Informative Content of Surnames</i> . Centre for Economic Performance, LSE, CEP Discussion Papers. We propose an alternative method for measuring intergenerational mobility. Traditional methods based on panel data provide measurements that are scarce, difficult to compare across countries and almost impossible to get across time. In particular this means that we do not know how intergenerational mobility is correlated with growth, income or the degree of inequality. Our proposal is to measure the informative content of surnames in one census. The more information does the surname have on the income of an individual, the more important is background in determining outcomes; and thus, the less mobility there is. The reason for this is that surnames inform on family relationships because the distribution of surnames is necessarily much skewed. A large percentage of the population is bound to have a very unfrequent surname. For them the partition generated by surnames is very informative on family linkages. First, we develop a model whose endogenous variable is the joint distribution of surnames and income. Then we explore the relationship between mobility and the informative content of surnames. We allow for assortative mating to be a determinant of both. Then, we use our methodology to show that in a large Spanish region the informative content of surnames is large and consistent with the model. We also show that it has increased over time, indicating a substantial drop in the degree of mobility. Finally, using the peculiarities of the Spanish surname convention we show that the degree of assortative mating has also increased over time, in such a manner that might explain the decrease in mobility observed. Our method allows us to provide measures of mobility comparable across time. It should also allow us to study other issues related to inheritance.
2007	C67	Garrett-Peltier, Heidi, and Robert Pollin. 2007. <i>The Employment Effects of Downsizing the U.S. Military</i> . Political Economy Research Institute, University of Massachusetts at Amherst, Working Papers. This study focuses on the employment effects of military spending versus channeling some significant part of the military budget into alternative purposes. We begin by introducing the basic input-output modeling technique for considering issues such as these in a systematic way. We then present some simple alternative spending scenarios, namely devoting \$1 billion to the military versus the same amount of money spent for five alternatives: tax cuts which produce increased levels of personal consumption; health care; education; mass transit; and construction targeted at home weatherization and infrastructure repair. Our first conclusion in assessing such relative employment impacts is straightforward: \$1 billion spent on personal consumption, health care, education, mass transit, and construction for home weatherization and infrastructure will all create more jobs within the U.S. economy than would the same \$1 billion spent on

Year	DE	Title and Abstract
		the military. We then examine the pay level of jobs created through these alternative spending priorities and assess the overall welfare impacts of the alternative employment outcomes. We then consider what would be the impact on employment of transferring all \$138 billion in funding that went to the Iraq war in 2007 into alternative peaceful purposes. As we show, a transfer of funds of this magnitude would enable the U.S. government to provide, for example, health insurance for the 45 million U.S. residents who are now uninsured, and still provide funds for significant investments in education and energy conservation. A transfer of the Iraq budget into these alternative purposes would also expand employment in the U.S. by between 600,000--1 million jobs, depending on how exactly the \$138 billion were allocated.
2007	F24	Hanson, Gordon H. 2007. "Emigration, Remittances and Labor Force Participation in Mexico." <i>Integration and Trade</i>, 11(27): 73-103. In this paper, I examine emigration, remittances, and labor-force participation in Mexico during the 1990s. I use two samples of households for the analysis: (a) rural households in Mexico in 2000, which vary according to whether they have sent migrants to the United States (US) or received remittances from the US, and (b) individuals in Mexico in 1990 and 2000 born in states with either high-exposure or low-exposure to US emigration. In the first sample, controlling for observable characteristics, individuals are less likely to participate in the labor force if their household either has sent migrants abroad or received remittances from abroad. Surprisingly, this result holds for both women and men. These cross-sectional results are potentially contaminated by unobserved household characteristics that may be correlated with both household migration behavior and household labor supply. In the second sample, which is less subject to concerns about self-selection into migration, I find that over the 1990s women (but not men) from high-migration states become less likely to work outside the home (relative to women from low-migration states). These results are consistent with migration abroad, and the accompanying return flow of remittances, leading to greater intra-household specialization. Results for labor hours are similar.
2007	F24	Kugler, Maurice, and Emanuela Lotti. 2007. "Migrant Remittances, Human Capital Formation and Job Creation Externalities in Central America." <i>Integration and Trade</i>, 11(27): 105-34. In this paper, we model the effect of migrant remittances on job creation and human capital formation, given migration prospects. Model calibration of deep parameters was performed with data from the AMCO survey on migration and remittances. The simulations based on the model show that remittances can have offsetting effects on equilibrium human capital and labor market outcomes in the country of origin of migrants. First, remittances enhance schooling opportunities for recipient households, and human capital formation can be augmented. Second, an increase in human capital supply by recipient households induces job creation as labor demand increases in the origin country. If a sufficiently large share of remittance recipients do not migrate, then the net effect is brain gain rather than brain drain ensuing remittances. The job creation spillover in local labor markets increases the rate of return to schooling for nonrecipient households, whose members are less likely to migrate. As a result, there are more incentives to substitute consumption for human capital investment. At the same time, the rise in expected income due to the spillover induces higher desired consumption. If the "substitution effect" outweighs the "income effect", then remittances will increase overall human capital and reduce the unemployment rate. The calibration and simulation analyses suggest that the net effect of remittances depends upon the accessibility of education and the degree and labor market frictions in the origin country as well as the immigration policy in the destination country of migrants.
2007	F24	Agenor, Pierre-Richard, Mustapha K. Nabli, Tarik Yousef, and Henning Tarp Jensen. 2007. "Labor Market Reforms, Growth, and Unemployment in Labor-Exporting Countries in the Middle East and North Africa." <i>Journal of Policy Modeling</i>, 29(2): 277-309. A general equilibrium model is used to study the impact of labor market policies on growth, employment, urban inequality, and rural welfare in labor-exporting countries in the Middle East and North Africa. Various experiments are conducted, such as a reduction in payroll taxation, cuts in public sector wages and employment, and a reduction in trade unions' bargaining power. We find that overseas employment may, under certain circumstances, substitute for domestic informal sector employment as the main buffer in labor market adjustment. In addition, we argue that to foster broad-based welfare-enhancing job creation in the region, labor market reforms must take account of general equilibrium effects, including crowding-in effects on private investment and variations in income remittances and international migration patterns. Finally, we argue that labor market reforms should be viewed as a component of a more comprehensive program of structural reforms aimed at spurring growth and employment.

2007	I22	van Ewijk, Casper, and Paul J. G. Tang. 2007. "Unions, Progressive Taxes, and Education Subsidies." <i>European Journal of Political Economy</i>, 23(4): 1119-39. Progressive income taxes moderate distortionary wage demands by trade unions and thereby reduce unemployment, and at the same time underlie disincentives to acquire skills and decrease labour productivity. Governments can respond by combining progressive taxes with subsidies to investment in human capital. A system of generous education subsidies and steep progressive tax rates is more likely to emerge, the greater the market power of trade unions and the better the ability of governments to influence private education decisions. Empirical analysis for several OECD countries provides results consistent with these propositions. A policy mix of high education subsidies and relatively progressive income taxes is found in countries where union membership is significant.
2007	J82	Moniz, Antonio B., and Tobias Woll. 2007. <i>Main features of the labour policy in Portugal</i>. Universidade Nova de Lisboa, IET-Research Center on Enterprise and Work Innovation, Faculty of Science and Technology, IET Working Papers Series: 02/2007. In this working paper is presented information on the Portuguese labour market developed with the support of the European project WORKS-"Work organisation and restructuring in the knowledge society". It is still a on the process article and thus commentaries are welcome. The structure is based on the following topics: a) The employment policy (Time regimes--time use, flexibility, part-time work, work-life balance -, and the work contracts regimes--wages, contract types, diversity); b) Education and training (skilling outcomes, rules on retraining and further training, employability schemes, transferability of skills); c) Equal opportunities (relevance of equal opportunity regulation for restructuring outcomes, the role of gender and age regulation); d) Restructuring effects (policy on transfer of personnel, policy on redundancies, and participation or voice in restructuring).

2007	L84	Sforzi, Fabio. 2007. "The Industrial Districts' Contribution to Change in the Italian Economy." <i>Review of Economic Conditions in Italy</i>, 0(1): 69-91. Between 1981 and 2001 Italy became a services-oriented economy. The loss of jobs in manufacturing was less pronounced in Italy's organized industrial districts than in the rest of the country. The branches of manufacturing that typify the districts outperformed the others in terms of employment trends. In addition, the districts recorded larger employment gains in business services, including ICT-related services. In more recent years (2001-2004) these trends have weakened in the industrial districts, which now seem vulnerable to the repercussions of global economic transformation. Whatever the causes of this vulnerability, they do not include the size of district firms. The district mode of production is the one best able to cope with fragmented and variable demand, but it is not equally well suited to competing on mass markets. If market developments are one cause of the districts' more recent problems, institutional factors also must be considered, in the light of the fact that after fifteen years of targeted industrial policy measures the districts are weaker, not stronger.
2007	M31	Shugan, Steven M. 2007. "Editorial: Does Good Marketing Cause Bad Unemployment?" <i>Marketing Science</i>, 26(1): 1-17. Questionable methods for increasing nominal wages reduce real wages (i.e., buying power) by creating inflation, shortages, lower quality, and long-term unemployment. To increase real wages (i.e., the ability to buy more), economic principles prescribe increasing productivity (i.e., greater output from less input). In contrast, marketing principles prescribe increasing the value of output (i.e., greater customer benefits) through innovation. Beyond increasing real wages, innovation spawns new occupations better matching individuals with skills and providing greater nonmonetary benefits (i.e., job satisfaction). Unfortunately, threatened entrenched incumbents often solicit protectionist legislation claiming negative externalities (e.g., short-term unemployment, lower wages, and burdens on society). Innovation does require labor to move from inferior to superior organizations (i.e., unemployment). However, protectionism only delays and dramatically aggravates the inevitable trauma associated with progress, as worker skills, firm practices, and buyer welfare fall further behind. Recent attacks demonizing Wal-Mart (e.g., the dubious Vlasic pickle claim) epitomize this situation—they are archaic vanilla protectionism, menacing both imperiled consumers and every consumer-driven business.
2007	N26	Ronchi, Veronica. 2007. <i>The Neoliberal Myth in Latin America: The Cases of Mexico and Argentina in the '90s</i>. Fondazione Eni Enrico Mattei, Working Papers: 2007.42. During the '90s most Latin American countries were submitted to neoliberal structural reform policies. Neoliberal policies imposed market supremacy, reduced the State's role in the economy and deregulated the markets. This paper aims at describing how these policies affected the most important macroeconomic indexes, with special emphasis on Argentina and Mexico, the two countries that suffered most from the economic crises of the '80s and '90s, and where the neoliberal policies were applied with greater orthodoxy. In spite of a slight improvement in some macroeconomic indexes, in Latin America neoliberalism failed to reduce poverty and unemployment, and was unable to guarantee a fair distribution of the wealth and improve welfare.

2007	O39	Michau, Jean-Baptiste. 2007. <i>Creative Destruction with On-the-Job Search</i>. Centre for Economic Performance, LSE, CEP Discussion Papers. This paper is about the labour market consequences of creative destruction with on-the-job search. We consider a matching model in an economy with embodied technological progress and show that its dynamics are profoundly affected by allowing on-the-job search. We obtain that the elasticity of unemployment with respect to growth shrinks from 1.63 to 0.13. Moreover, the underlying transmission channels change as the flow of obsolete jobs practically disappears and is replaced by a flow of job-to-job transitions. These effects persist even if employed job seekers are significantly less efficient in the search process than the unemployed. Thus, we show that, rather than contributing to unemployment, creative destruction induces a direct reallocation of workers from low to high productivity jobs. These results could be strengthened by assuming that search efforts are unobservable by firms which induces more on-the-job search. However, the action of worker is no longer surplus maximizing and, hence, the worker's welfare is increasing in the cost of search which acts as a commitment device. Finally, we show that the model could be extended by allowing for variable search intensity.
2007	O43	Strommer de Farias Godoi, Alexandra. 2007. "O milagre irlandês como exemplo da adoção de uma estratégia nacional de desenvolvimento. (The Irish Miracle as an Example of the Adoption of a National Development Strategy. With English summary.)" <i>Revista de Economia Política/Brazilian Journal of Political Economy</i>, 27(4): 546-66. This paper discusses the Irish experience in the 1990s, and details the main aspects of the impressive and rapid transition from a situation of excessive indebtedness, economic stagnation and high unemployment to sustainable growth. The presence of a national development strategy seems to be the crucial institutional tool that allowed this transition.

2007	P14	Feldmann, Horst. 2007. "Economic Freedom and Unemployment around the World." <i>Southern Economic Journal</i>, 74(1): 158-76. Using data from 87 countries and the years 1980-2003, this paper empirically analyzes whether and to what extent economic freedom affects unemployment. According to the regression results, economic freedom is likely to substantially reduce unemployment, especially among women and young people. A small government sector and a legal system characterized by an independent judiciary, impartial courts, and an effective protection of property rights most clearly seem to have beneficial effects. In addition, there are indications that freedom to trade across national boundaries and a light regulatory burden may also lower unemployment, though apparently in the long term only.
2007	Q12	Reddy, V. Ratna, and P. Prudhvikar Reddy. 2007. "Increasing Costs in Agriculture: Agrarian Crisis and Rural Labour in India." <i>Indian Journal of Labour Economics</i>, 50(2): 273-92. This paper attempts to examine the viability of agriculture and the relative shares of farmers and labourers over the last three decades in order to understand the critical factors contributing to the crisis. By using the cost of cultivation data for major states over a period of three decades, this paper examines the changes in profitability and factor shares for important crops. It is argued that the declining viability of agriculture and the ongoing crisis is apparently technological, as it is critical for improving land productivity. Even the marginal growth in productivity would have been achieved at an increasingly higher input costs, thereby adversely affecting the profit margins of the producers. Labour costs are rising due to higher wages as well as higher labour use per unit of land. One reason for this could be the increased interventions of labour-based programmes like Watershed Development, Food for Work, etc., which have mandated minimum wage implementation. While it is difficult to pinpoint the cause and effect, the increasing labour costs are a reality and unlikely to decline. This implies that while increasing labour costs hurt the interests of the farmers, the promotion of labour-saving technologies would adversely affect the labourers. The policies should thus strive to safeguard the interests of both farmers and labourers, i.e., the entire rural community.

2008	D86	Engelhardt, Bryan, Guillaume Rocheteau, and Peter Rupert. 2008. "Crime and the Labor Market: A Search Model with Optimal Contracts." <i>Journal of Public Economics</i> , 92(10-11): 1876-91. This paper extends the Pissarides [Pissarides, Christopher A. Equilibrium Unemployment Theory. Cambridge: MIT (2000)] model of the labor market to include crime and punishment a la Becker [Becker, Gary S. "Crime and punishment: an economic approach." <i>Journal of Political Economy</i> 76 (1968): 169-217]. All workers, irrespective of their labor force status, can commit crimes and the employment contract is determined optimally. The model is used to study, analytically and quantitatively, the effects of various labor market and crime policies. For instance, a more generous unemployment insurance system reduces the crime rate of the unemployed but its effect on the crime rate of the employed depends on job duration and jail sentences. When the model is calibrated to U.S. data, the overall effect is to decrease crime, but is quantitatively small. Small wage subsidies reduce unemployment and crime rates of employed and unemployed workers, and raise society's welfare. Hiring subsidies reduce unemployment but they can raise the crime rate of employed workers. Crime policies (police technology and jail sentences) affect crime rates significantly but have only negligible effects on the labor market.
2008	D86	Diss: Ordonez, Guillermo Luis. 2008. Essays on Learning and Macroeconomics. PhD diss. University of California, Los Angeles. This dissertation contains four essays that apply techniques of learning and implicit contracts to the analysis of macroeconomic problems. The first essay explores the role of borrowers' reputation concerns in the magnification of macroeconomic crises. The second essay investigates the importance of financial frictions in delaying the recovery of economies after crises. The third essay (coauthored with David Lagakos) develops an implicit contract model to understand the differences in wage smoothing across industries. The fourth essay studies the effects of different signalling technologies in the efficiency of organizations with career concerned managers.
2008	F52	Lee, Cheng-Te, and Yo-Yi Huang. 2008. "Military Threats, Defense Resources, and Labor Adjustment. (In Chinese. With English summary)." <i>Journal of Economics and Management</i> , 4(1): 1-24. We observe that the period between Cold War era and the event of 911, variation in foreign military threats leads to variation in defense resources and fluctuations in the labor market. Using an intertemporal optimization dynamic model, this paper explores the impacts of foreign military threats on the civilian consumption sector and on labor allocation. We show that an increase in foreign military threats could lead to a migration of labor from the civilian sector to the defense sector.

2008	F63 F66	Majumder, Rajarshi. 2008. "Globalisation and Employment: A Prelude." <i>Indian Journal of Labour Economics</i> , 51(4): 505-15. Globalisation has proceeded at an unimagined pace in the last few decades. While it has resulted in a high growth of global income, questions are being raised about the equity of such growth. Disparity seems to be aggravating, as globalisation seems to be depressing the labour market. Unemployment is rising, both absolutely and as a proportion of the labour force, especially in the developing regions. Elasticity of employment is low and is falling further. Whatever little employment expansion is occurring is mostly vulnerable in nature, remuneration levels are scanty, and working poverty is substantially high. Using a Globalisation Index, it is observed that except in the developed countries, the pace and levels of globalization are affecting the labour market negatively. Employment growth and elasticities are lower in regions that have effected rapid globalisation. The institutional mechanism and improving social security for workers must, therefore, precede global integration of the economy.
2008	F63 F66 J46	Nath, G. B. 2008. "Globalisation and Growth of Precarious Jobs in the Indian Labour Market: Implication for Economic Policy." <i>Indian Journal of Labour Economics</i> , 51(4): 533-44. There has been a surge in the GDP growth in India after the advent of globalization and liberalisation of its economy. However, despite growth in GDP during the reform period, it is not commensurate with growth in employment opportunities in the organised industrial sector, in general, and the manufacturing sector, in particular. Rather, this has made a section of the working class redundant, encouraged labour market flexibility, informalised the labour market, increased the work load, lengthened the working hours, feminised the labour force, suspended the trade union rights, etc. It is also exclusionary in nature, since it excludes a sizable section of the working class from the social security network. Hence, there is a need for the observance of all core labour standards including all types of freedoms, equality and social security, basic human rights and trade union rights. This would make indecent, non-standard works of a decent standard and less precarious. All these need the 'visible' hand of the state.
2008	F63 F66	Chatterjee, Biswajit. 2008. "Globalisation, Growth and Employment: An Analytical Enquiry." <i>Indian Journal of Labour Economics</i> , 51(4): 517-32. Globalisation in the sense of the opening up of domestic economies to international trade and factor mobility has led to acceleration of the growth profile of many countries including the developing ones. But such growth acceleration has been accompanied by falling employment elasticities in many of the developing countries and there is greater flexibilisation of the labour market behaviour and increasing informalisation of the employment, which is a serious consequence of the globalization process unleashed on the world economy. The present paper provides an explanation of such employment contraction and labor market flexibilisation in developing countries in terms of a North-South framework of free trade and capital mobility involving economies of scale and structural specifications in developing countries.
2008	F66	Nanda, Paramjit, and Veerpal Kaur. 2008. "Impact of Globalisation on the Labour Market in India: Evidence from the Manufacturing Sector." <i>Indian Journal of Labour Economics</i> , 51(4): 545-57. : This paper seeks to examine the impact of trade liberalization on the labour market in terms of wage inequalities in the 'Manufacturing Sector' and its constituent industries during the post-reform period (1990-91 to 2005-2006). The study reveals that wages have increased at a lower rate as compared to exports and imports in all manufacturing industries during the post-reform period. The analysis supported the hypothesis that exports exert upward pressure on wages but rejected the hypothesis that imports exert downward pressure on wages. The hypothesis that export-intensive firms pay more wages as compared to import-competing firms has also been rejected. The inter-industry openness ratio has positively as well as significantly increased while wage inequalities have decreased significantly. However, the trade liberalization has further reduced wage inequalities, though insignificantly. However, the trade liberalisation has further reduced wage inequalities, though insignificantly, during the post-reform period. Import-competing industries have gained in terms of a wage increase as a result of trade liberalization. These industries are found to be intermediate capital-using technology technology-intensive and skilled labour industries.

Hence, there is a need for the observance of all core labour standards including all types of freedoms, equality and social security, basic human rights and trade union rights. This would make indecent, non-standard works of a decent standard and less precarious. All these need the 'visible' hand of the state.
2008	F66	Chatterjee, Biswajit. 2008. "Globalisation, Growth and Employment: An Analytical Enquiry." <i>Indian Journal of Labour Economics</i>, 51(4): 517-32. Globalisation in the sense of the opening up of domestic economies to international trade and factor mobility has led to acceleration of the growth profile of many countries including the developing ones. But such growth acceleration has been accompanied by falling employment elasticities in many of the developing countries and there is greater flexibilisation of the labour market behaviour and increasing informalisation of the employment, which is a serious consequence of the globalization process unleashed on the world economy. The present paper provides an explanation of such employment contraction and labor market flexibilisation in developing countries in terms of a North-South framework of free trade and capital mobility involving economies of scale and structural specifications in developing countries.
2008	J46	THE SAME AS F63 Nath, G. B. 2008. "Globalisation and Growth of Precarious Jobs in the Indian Labour Market: Implication for Economic Policy." <i>Indian Journal of Labour Economics</i>, 51(4): 533-44.
2008	F66 J46	Ghose, Ajit K. 2008. "Globalisation and Employment in Developing Countries." <i>Indian Journal of Labour Economics</i>, 51(4): 497-504. : Globalisation has not had a systematic effect on formal sector employment in emerging developing countries. In some countries, it stimulated employment growth and depressed productivity; in others it stimulated productivity growth and depressed employment. On the other hand, globalisation seems to have had a systematically adverse effect on employment conditions outside the formal sector; growth of output per worker in the non-formal part of the economy slowed down in most developing countries during the globalisation period. This resulted from the fact that the growing trade orientation induced a reallocation of investment from the non-formal to the formal part of the economy. Overall, even in those developing countries that have derived growth benefits from globalisation, the employment effect has tended to be negative.
2008	F66 J46	Neethi, P. 2008. "Contract Work in the Organised Manufacturing Sector: A Disaggregated Analysis of Trends and Their Implications." <i>Indian Journal of Labour Economics</i>, 51(4): 559-73. : The employment structure of the Indian economy has been undergoing certain changes with globalisation. It has made competition an important component for the development, expansion and growth of industry. In this context, low labour cost, along with flexibility in labour use, inter alia, have become key sources of competitive advantage for firms. Moreover, location decisions of international investors are increasingly guided by the availability of cheap labour and the scope for informal employment arrangements. These developments have had varied implications for labour, employment and industrial relations. The nature of employment is changing, with new employment created in the economy being largely contractual, that is, in the nature of a client-supplier relationship, where employment is offered not as an appointment but as an assignment. The present paper, therefore, examines the implications of a more flexible labour market on the quantity and quality of employment by taking the case of India's manufacturing sector.
2008	J46	Bhattacharya, Saumyajit. 2008. "The Changing Discourse of Neo-liberal Labour Reforms: From Labour Suffering Temporarily for Transition to Labour Creating the Obstacles to Transition." <i>Indian Journal of Labour Economics</i>, 51(4): 575-86. This paper discusses the continuous crucial shifts in the neoliberal discourse on labour reforms. It argues that initially labour reforms did not occupy any central position in the economic reform literature and prescriptions but later the failure of the reform process prompted the shift to consider labour reforms as a complementary but vital measure to enable the core reforms to work. With further continuing problems with the reform experience labour reforms came to occupy the centre stage of the neoliberal discourse manifesting in a major paradigmatic shift from "labour reforms as a cost of transition" to "labour reforms to maintain low cost production and flexibility of capital".
2008	K36	Saint-Paul, Gilles. 2008. <i>Genes, Legitimacy and Hypergamy: Another Look at the Economics of Marriage</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 6828. In order to credibly "sell" legitimate children to their spouse, women must forego more attractive mating opportunities. This paper derives the implications of this observation for the pattern of matching in marriage markets, the dynamics of human capital accumulation, and the evolution of the gene pool. A key consequence of the trade-off faced by women is that marriage markets will naturally tend to be hypergamous--that is, a marriage is more likely to be beneficial to both parties relative to remaining single, the greater the man's human capital, and the lower the woman's human capital. As a consequence, it is shown that the equilibrium can only be of two types. In the "Victorian" type, all agents marry somebody of the same rank in the distribution of income. In the "Sex and the City" (SATC) type, women marry men who are better ranked than themselves. There is a mass of unmarried men at the bottom of the distribution of human capital, and a mass of single women at the top of that distribution. It is shown that the economy switches from a Victorian to an SATC equilibrium as inequality goes up. The model sheds light on how marriage affects the returns to human capital for men and women. Absent marriage, these returns are larger for women than for men but the opposite may occur if marriage prevails. Finally, it is shown that the institution of marriage may or may not favour human capital accumulation depending on how genes affect one's productivity at accumulating human capital.

2008	P42	Chemingui, Mohamed Abdelbasset, and Terry Roe. 2008. "Petroleum Revenues in Gulf Cooperation Council, Countries and Their Labor Market Paradox." <i>Journal of Policy Modeling</i>, 30(3): 491-503. Gulf Cooperation Council (GCC) countries have used petroleum revenues to fund employment programs as a main means for supporting the welfare of their populations. The public sector in GCC countries seeks to provide every national labor market entrant with a job, reflecting the policy of guaranteed employment, higher wages and social status. Until the recent increase in world petroleum prices, the sustainability of these programs became problematic, especially in view of a rapidly growing national labor force, and increasing fiscal pressures to fund education, infrastructure and other state responsibilities. While the financial constraint imposed by this means of sharing petroleum revenues with citizens has been alleviated in recent times, the fundamental problem of sustaining income levels is not resolved. The responsibility and burden of income generation in the longer-run must rest on the private non-oil sector. Consequently, the recent rise in petroleum prices provides an opportunity to address this longer-run problem. Using a dynamic computable general equilibrium model for Kuwait, a test of policies to make the private sector more profitable are simulated. These simulations capture "market friendly" policies that encourage private firms to increase investment and to employ first best technologies and management practices. We find that even with first best policies, the capacity of the private sector to employ all nationals seeking employment during the 2001-2015 period is unlikely to be realized. A combination of a safety net and target development of business and technical skills should be part of a longer-term human capital policy.
2008	P42	Elbadawi, Ibrahim, and Norman Loayza. 2008. "Informality, Employment and Economic Development in the Arab World." <i>Journal of Development and Economic Policies</i>, 10(2): 25-75. This paper studies the causes and consequences of informality and applies the analysis to Arab countries. It starts with a review of employment, labor informality and other labor market outcomes in the Arab world; and a discussion on the definition and measures of informality, as well as on the reasons why widespread informality should be of great concern. The paper also analyzes informality's main determinants, arguing that informality is not single-caused but results from the combination of poor public services, a burdensome regulatory regime, and weak monitoring and enforcement capacity by the state. This combination is especially explosive when the country suffers from low educational achievement and features demographic pressures and primary production structures. Finally, using cross-country regression analysis, the paper evaluates the empirical relevance of each determinant of informality. It then applies the estimated relationships to several Arab countries to assess the country-specific relevance of each proposed mechanism. Results suggest that informality has had negative marginal effects for Micro and Small Enterprises' (MSEs') performance in the Arab world. Moreover, informal establishments might have difficulty penetrating regional or international markets; instead, they are likely to specialize in producing for local markets.
2008	P42	Ahsan, Syed, and Xing Fe Liu. 2008. "Understanding Unemployment in the Arab Countries: Towards a Policy Framework." <i>Journal of Development and Economic Policies</i>, 10(2): 117-76. The paper uses a sample of five Arab countries (namely Algeria, Egypt, Jordan, Morocco, and Tunisia) in a dataset covering the period from 1990 to 2006. Two-stage least squares methodology is used to find estimates of growth and human capital variables from a search of deeper instruments, and fitted values from these regressions are then used in a second-stage estimation of unemployment behaviour in the general population and separately for men. Results suggest that while growth, by itself, does tend to achieve significant reduction in unemployment, the lack of sustainability of growth works in the opposite direction raising unemployment so that the net effect is rather modest. Moreover, while educational contribution to lowering of unemployment is likely to be of a modest magnitude for all, the labour market appears to strongly discriminate against women's skills. Rising longevity appears to predict rising unemployment via participation which would call for faster job creation in order to meet the growing aspirations of the public.
2008	Q13	Karwat-Wozniak, Bozena. 2008. "Income Situation of Farmer Families in Poland in the Light of Economic Transformations and European Integration." <i>Journal of International Studies</i>, 1(1): 126-36. The key problem of agriculture in Poland is the excessive employment in this sector. Activation of necessary structural changes is connected, inter alia, with limiting the number of persons employed in individual holdings. That is why an evaluation of changes in the professional activity of the farming population and employment in family farms was needed. The scale of unemployment among farming population constitutes an important element of the paper, especially hidden unemployment--not only for social reasons, but also from the methodological point of view. Therefore the paper presents not only the scale of hidden unemployment, but also ways of estimating the range and impact of the phenomenon. The paper makes use mainly of the results of long-term field research of the IAFE-NRI conducted in the same 76 villages, in all individual farms located in these villages. It has been established that market processes of restructuring the economy have lead to the need to rationalise employment, and in consequence, to the regress of labour needs. Negative effects of these tendencies in individual farming include mainly ineffective employment and structural unemployment. These negative effects have gradually subsided as the processes of the adjustment of the economy to the requirements of a competitive market progressed and as the labour market changed for the better. Still, despite the relatively high diversification of professional activity of the farming population and rationalisation of employment in agricultural holdings, this segment is still characterised by excessive employment and high scale of unused labour resources (the rate of unnecessary workers is 17%).
2008	Q52	Gassebner, Martin, Noel Gaston, and Michael J. Lamla. 2008. "Relief for the Environment? The Importance of an Increasingly Unimportant Industrial Sector." <i>Economic Inquiry</i>, 46(2): 160-78. Deindustrialization, stagnant real incomes of production workers, and increasing inequality are latter day features of many economies. It is common to assume that such developments pressure policymakers to relax environmental standards. However, when heavily polluting industries become less important economically, their political importance also tends to diminish. Consequently, a regulator may increase the stringency of environmental policies. Like some other studies, we find that declining industrial employment translates into stricter environmental standards. In contrast to previous studies, but consistent with our argument, we find that greater income inequality is associated with policies that promote a cleaner environment.
2008	Q57	Forslund, Johanna, Eva Samakovlis, and Maria Vredin Johansson. 2008. "Is It Wise to Combine Environmental and Labour Market Policies? An Analysis of a Swedish Subsidy Programme." <i>Ecological Economics</i>, 65(3): 547-58. In 1998 the Swedish government launched its largest ecological subsidization programme to date, the Local Investment Programme (LIP). By having two political objectives; to step up the pace at which Sweden transforms into an ecologically sustainable society and to reduce unemployment, the programme did not conform to the "one-instrument-per-objective" policy guideline often advocated by economists. Concentrating on a subset of the subsidized projects, the projects for remediation of contaminated sites, we evaluate how effectively the LIP's separate political objectives were fulfilled. Between 1998 and 2002, E 670 million (SEK 6.2 billion) were allocated to over 1800 different projects under the LIP. Twenty-four, i.e. one percent, of the projects aimed at remediation of contaminated sites. These projects received a disproportionate amount, six percent, of the total LIP subsidies. By using data on both accepted and rejected remediation projects, we find that the LIP's ecological sustainability objective could have been achieved better if the most hazardous sites had been prioritized to a greater extent. Furthermore, society's cost for the employment opportunities generated in the remediation projects was higher than society's cost for the equivalent number of employment opportunities generated in traditional labour market policies. Although other subsets of the LIP projects may have been more

Year	DE	Title and Abstract
		successful in achieving the programme's separate objectives, our results illustrate inefficiencies that may arise from a desire to attain several political objectives through a single policy instrument.

2009	C01	Card, David, David Lee, and Zhuan Pei. 2009. <i>Quasi-Experimental Identification and Estimation in the Regression Kink Design</i>. Princeton University, Department of Economics, Industrial Relations Section., Working Papers: 1206. We consider nonparametric identification of the average marginal effect of a continuous endogenous regressor in a generalized nonseparable model when the regressor of interest is a known, deterministic, but kinked function of an observed continuous assignment variable. This design arises in many institutional settings where a policy variable of interest (such as weekly unemployment benefits) is mechanically related to an observed but potentially endogenous variable (like previous earnings). We characterize a broad class of models in which a "Regression Kink Design" (RKD) provides valid inferences for the underlying marginal effects. Importantly, this class includes cases where the assignment variable is endogenously chosen. Under suitable conditions we show that the RKD estimand identifies the "treatment on the treated" parameter (Florens et al., 2009) or the "local average response" (Altonji and Matzkin, 2005) that is identified in an ideal randomized experiment. As in a regression discontinuity design, the required identification assumption implies strong and readily testable predictions for the pattern of predetermined covariates around the kink point. Standard local linear regression techniques can be easily adapted to obtain "nonparametric" RKD estimates. We illustrate the RKD approach by examining the effect of unemployment insurance benefits on the duration of benefit claims, using rich microdata from the state of Washington.
2009	C01	Blinder, Alan, and Alan Krueger. 2009. <i>Alternative Measures of Offshorability: A Survey Approach</i>. Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 190blinder.pdf. This paper reports on a pilot study of the use of conventional household survey methods to measure something unconventional: what we call offshorability, defined as the ability to perform one's work duties (for the same employer and customers) from abroad. Notice that offshorability is a characteristic of a person's job, not of the person himself. We see this research as important for two main reasons. First, one of us has argued previously that offshoring is potentially a very important labor market phenomenon in the United States and elsewhere, perhaps eventually amounting to a third Industrial Revolution. In the first Industrial Revolution, the share of the U.S. workforce engaged in agriculture declined by over 80 percentage points. In the second Industrial Revolution, which is still in progress, the share of American workers employed in manufacturing has declined by almost 25 percentage points so far, with most of the migration going to the service sector. The estimates presented here, like those of Blinder (2009b), suggest that the share of U.S. workers performing what Blinder (2006) called impersonal service jobs (defined precisely below) might shrink significantly while the share performing personal service jobs rises. Second, while readers must judge for themselves, we deem the pilot study to have been successful by several criteria that we will explain later. So we hope our survey methods will be replicated, improved upon, and eventually incorporated into some regular government survey, such as the Current Population Survey (CPS). Doing so would enable the U.S. government to track this important phenomenon over time.
2009	C01	Rothstein, Jesse. 2009. <i>Is the EITC as Good as an NIT? Conditional Cash Transfers and Tax Incidence</i>. Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 184rothstein.pdf. The Earned Income Tax Credit (EITC) is intended to encourage work. But EITC-induced increases in labor supply may drive wages down, shifting the intended transfer toward employers. I simulate the economic incidence of the EITC under a range of plausible supply and demand elasticities. In all of the scenarios that I consider, a substantial portion of the intended transfer to low income single mothers is captured by employers through reduced wages. The transfer to employers is borne in part by low skill workers who are not themselves eligible for the EITC and are therefore made strictly worse off by its existence. I contrast the EITC with a traditional Negative Income Tax (NIT). The NIT discourages work, and so induces large transfers from employers of low skill labor to their workers. With my preferred parameters the EITC increases after-tax incomes by \$0.73 per dollar spent, while the NIT yields \$1.39.
2009	C93 D03	Hogarth, Robin, Natalia Karelaia, and Carlos Andres Trujillo. 2009. <i>Under-achievement and the glass ceiling: Evidence from a TV game show</i>. Department of Economics and Business, Universitat Pompeu Fabra, Economics Working Papers. We use a Colombian TV game show to test gender differences in competitive behavior where there is no opportunity for discrimination and females face no gender-specific external constraints. Each game started with six contestants who had to answer general knowledge questions in private. There were five rounds of questions and, at the end of each, one participant was eliminated. Despite equality in starting numbers, women earn less than men and exit the game at a faster rate. In particular, there are more voluntary withdrawals by women than men. We draw an analogy between the game and the process by which employees rise through the levels of a corporation. As such, we note that "glass ceilings" may result, in part, from women's own behavior and this raises the issue of how women are socialized to behave. At the same time, our results illustrate that maintaining and promoting gender diversity at the lower/middle ranks of organizations is necessary to obtain gender diversity at the top.

2009	D03	THE SAME AS C93 Hogarth, Robin, Natalia Karelaia, and Carlos Andres Trujillo. 2009. <i>Under-achievement and the glass ceiling: Evidence from a TV game show</i>. Department of Economics and Business, Universitat Pompeu Fabra, Economics Working Papers.
2009	D85	Ejarque, Joao Miguel. 2009. <i>A Search Model with a Quasi-Network</i>. University of Copenhagen, Department of Economics, Discussion Papers: 10-23. This paper adds a quasi-network to a search model of the labor market. Fitting the model to an average unemployment rate and to other moments in the data implies the presence of the network is not noticeable in the basic properties of the unemployment and job finding rates. However, the network creates downward sloping reemployment hazards which the basic model does not, and under increasing network returns these hazards are significantly convex as we see in the data. Going into more detail we find that the network gets partially destroyed in periods of high unemployment and generates less job creation per link, while at the same time the jobs it does create, it does so with fewer links.
2009	F59 N20	Palma, Jose G. 2009. <i>The Revenge of the Market on the Rentiers: Why neo-liberal Reports of the end of history turned out to be premature</i>. Faculty of Economics, University of Cambridge, Cambridge Working Papers in Economics. Starting from the perspective of heterodox Keynesian-Minskyian-Kindlebergian financial economics, this paper begins by highlighting a number of mechanisms that contributed to the current financial crisis. These include excess liquidity, income polarisation, conflicts between financial and productive capital, lack of appropriate regulation, asymmetric information, principal-agent dilemmas and

Year	DE	Title and Abstract
		bounded rationalities. However, the paper then proceeds to argue that perhaps more than ever the 'macroeconomics' that led to this crisis only makes analytical sense if examined within the framework of the political settlements and distributional outcomes in which it had operated. Taking the perspective of critical social theories the paper concludes that, ultimately, the current financial crisis is the outcome of something much more systemic, namely an attempt to use neo-liberalism (or, in US terms, neo-conservatism) as a new technology of power to help transform capitalism into a rentiers' delight. In particular, into a system without much 'compulsions' on big business; i.e., one that imposes only minimal pressures on big agents to engage in competitive struggles in the real economy (while doing the opposite to workers and small firms). A key component in the effectiveness of this new technology of power was its ability to transform the state into a major facilitator of the ever-increasing rent-seeking practices of oligopolistic capital. The architects of this experiment include some capitalist groups (in particular rentiers from the financial sector as well as capitalists from the 'mature' and most polluting industries of the preceding techno-economic paradigm), some political groups, as well as intellectual networks with their allies--including many economists and the 'new' left. Although rentiers did succeed in their attempt to get rid of practically all fetters on their greed, in the end, the crisis materialised when markets took their inevitable revenge on the rentiers by calling their (blatant) bluff.
2009	I10	Kalyoncu, Kahraman, and Huseyin Kalyoncu. 2009. "The Empirics of the Imbalance Effect: Per-Capita Income and Human to Physical Capital Ratio." <i>Empirical Economics Letters</i>, 8(2): 119-26. One of the important problems in the theory of economic growth is whether the growth of output per capita depends positively or negatively on the ratio of human to physical capital. Following Duczynski (2003), we apply his approaches for the panel data set. However, we have described the human capital not only with education data but also with the health proxy. This paper provides evidence that this dependence tends to be positive.
2009	I10	Baker, Dean. 2009. <i>Job Sharing: Tax Credits to Prevent Layoffs and Stimulate Employment</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. The unemployment rate is expected to average 10.2 percent for 2010, 9.1 percent for 2011, and 7.3 percent for 2012. With this in mind, this Issue Brief describes a job sharing tax credit, designed to provide a quick and substantial boost to the economy. It would use tax dollars to pay firms to shorten the typical workweek, while keeping pay constant. This should cause employers to want to hire additional workers. A rough estimate of the impact of this tax credit is between 1.3 and 2.7 million jobs created.
2009	I10	Sherman, Matt. 2009. <i>More Budget Belt-Tightening Means More Job Losses for States</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This paper looks at the problem of state budget shortfalls during the recession and calculates the number of jobs that would be lost (nationally and by state) if states utilize pro-cyclical spending cuts in an attempt to balance their budgets. This is an update to an earlier paper from December 2008, "Will Workers Survive State Budget Belt-Tightening?"
2009	I10	Sherman, Matt, and Nathan Lane. 2009. <i>Cut Loose: State and Local Layoffs of Public Employees in the Current Recession</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. In the current recession, millions of Americans have lost their jobs. Unemployment has increased nationwide to levels not witnessed since the 1980s. This issue brief tallies more than 110,000 jobs that have been shed from state and local governments in the last two years and breaks them down by state (and metropolitan area where available). Without the stimulus passed in February of this year, there would have been many more layoffs at the the state and local level.
2009	I10	Baker, Dean, and Rivka Deutsch. 2009. <i>The State and Local Drag on the Stimulus</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This report shows that the \$787 billion included in the 2009 ARRA will not have as much of an immediate effect on the economy as initially anticipated. After subtracting the annual AMT patch and accounting for state level spending and tax cuts, the full effect of federal stimulus will equal a little more than 1 percent of GDP a year, falling far short of what is needed to re-ignite the economy. While the 2009 recovery act was a vital first step towards restoring the nations economic foundation, this paper puts some perspective on the immediate effects of the stimulus.
2009	I10	Baker, Dean. 2009. <i>Pay for Play? Tax Credits for Paid Time Off</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. Economists are increasingly coming to the recognition that the current downturn is likely to be longer and more severe than they had expected at the time the last stimulus package was approved in February. As a result, there is likely to be interest in additional stimulus in order to boost the economy and lower the unemployment rate. This paper briefly outlines a method for Congress to quickly boost demand in the economy, while at the same time promoting important public ends: an employer tax credit for paid time off. This paid time off can take the form of paid family leave, paid sick days, paid vacation, or a shorter workweek. This tax credit can both provide short-term stimulus and also provide an incentive to restructure workplaces in ways that are more family friendly. It is possible that many workplaces may leave in place changes made to take advantage of this tax credit even after it has expired.
2009	I25	Ljungberg, Jonas, and Anders Nilsson. 2009. "Human Capital and Economic Growth: Sweden 1870-2000." <i>Cliometrica</i>, 3(1): 71-95. This paper presents newly constructed series on human capital in Sweden 1870-2000. The estimates are based on enrolment in different forms of education, stretching as far back as 1812, and the size and age distribution of the population within age range 15-65 years. The secular accumulation of human capital has closely matched the long-term trend in aggregate productivity and both grew at a rate of 2.4% annually. Our estimates differ significantly from the data attributed to Sweden in the international short-cut estimates of human capital for the period since 1960. The basic question addressed is about causality: whether human capital causes economic growth or if causality goes in the other direction. We address this problem with modified Granger-causality tests. According to our results, changes in the stock of human capital have in a systematic way preceded changes in aggregate productivity up to the structural crisis in the 1970s. This allows us to conclude that human capital has been a causal factor in Swedish economic growth since the industrialisation. However, after 1975, the growth of human capital has not been able to match the demands of the third industrial revolution.
2009	J29 K40	Lee, David, and Justin McCrary. 2009. <i>The Deterrence Effect of Prison: Dynamic Theory and Evidence</i>. Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 189lee.pdf. Using administrative, longitudinal data on felony arrests in Florida, we exploit the discontinuous increase in the punitiveness of criminal sanctions at 18 to estimate the deterrence effect of incarceration. Our analysis suggests a 2 percent decline in the log-odds of offending at 18, with standard errors ruling out declines of 11 percent or more. We interpret these magnitudes using a stochastic dynamic extension of Becker's (1968) model of criminal behavior. Calibrating the model to match key empirical moments, we conclude that deterrence elasticities with respect to sentence lengths are no more negative than -0.13 for young offenders.
2009	J49	Schmitt, John, and Nathan Lane. 2009. <i>An International Comparison of Small Business Employment</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. Contrary to popular perceptions, the United States has a much smaller small-business sector (as a share of total employment) than other countries at a comparable level of economic development, according to this new CEPR report. The authors observe that the undersized U.S. small business sector is consistent with the view

Year	DE	Title and Abstract
		that high health care costs discourage small business formation, since start-ups in other countries can tap into government-funded health care systems.
2009	K22	Feldmann, Horst. 2009. "Business Regulation, Labor Force Participation and Employment in Industrial Countries." <i>Journal of Economics and Business</i> , 61(3): 238-60. Using data from 19 industrial countries for 5 years in the period 1990-2002, this paper analyzes to what extent anticompetitive business regulations, like price controls and administrative obstacles to start a new business, affect labor force participation and employment rates. According to the regression results, they appear to lower both. Corruption, which is one result of strict business regulation, is also found to lower labor force participation and employment rates. While most effects on the general population seem to be modest, the effects on the low-skilled are likely to be substantial. The results are robust to variations in specification.
2009	K34	Sonedda, Daniela. 2009. "On the Dynamics of Unemployment and Labor Tax Progression: The Case of Italy 1974-1995." <i>FinanzArchiv</i> , 65(3): 271-96. This paper presents some empirical evidence for Italy from 1974 to 1995 on the relationship between the dynamics of unemployment and tax progressivity. To this purpose, the econometric tool is a Bayesian numerical approach based on a three-equation vector autoregression model where the unemployment effects are derived residually from the difference between employment and labor-force participation effects. By simultaneously estimating the labor market effects of changes in labor taxes, the current analysis points to the importance of the supply side of the labor market from a macroeconomic perspective and empirically supports the view that either the individual's or the aggregate labor participation decisions have to be taken explicitly into account when evaluating whether or not tax progressivity is a useful policy device against unemployment.

2009	K40	Feldmann, Horst. 2009. "The Quality of the Legal System and Labor Market Performance around the World." <i>European Journal of Law and Economics</i> , 28(1): 39-65. Using data on 75 countries for six years in the period 1995-2003, this paper analyzes empirically whether and to what extent the quality of the legal system affects the performance of the labor market. According to the regression results, a legal system characterized by a dependent judiciary, biased courts, a lack of intellectual property protection and a lack of integrity increases unemployment and lowers the employment level. The magnitude of the effect seems to be substantial, particularly among young people.

2009	N62 N92	Garrett, Thomas A. 2009. "War and Pestilence as Labor Market Shocks: U.S. Manufacturing Wage Growth 1914-1919." <i>Economic Inquiry</i> , 47(4): 711-25. This paper explores the effect of mortalities from the 1918 influenza pandemic and World War I on wage growth in the manufacturing sector of U.S. states and cities from 1914-1919. The hypothesis is that both events decreased manufacturing labor supply, thereby initially increasing the marginal product of labor and wages. The results reveal that states and cities having had greater influenza mortalities experienced higher wage growth--roughly 2-3 percentage points for a 10% change in per capita mortalities. World War I combat mortalities also had a positive, but smaller, effect on wage growth.
2009	O25	Giraldo Munera, Adriana, Giovanni Bedoya Bermudez, and Carlos Mario Vargas Restrepo. 2009. "Principales limitaciones del empresarismo que afectan el desarrollo economico y social del pais. (With English summary.)." <i>Revista EAN</i> , 0(66): 99-112. The creation of companies have become an important tool to face unemployment rates in Colombia. For this, the Colombian government is making a special effort to develop an entrepreneurial spirit. The entrepreneurial actions impact the economic development of the country, but Colombia doesn't yet reach the required levels due to the low standards in technological innovation, as well as in research and development that result in products showing poor added value and limitations in productivity and competitiveness. Finally, there is another factor that deeply interfere in the development of the country, company informality, based on illegal practice. This aspect is also analyzed in this paper.
2009	Q15	Das, Debarshi. 2009. "An Explanation of Share Tenancy in Terms of Unemployment, Social Norms and Power." <i>Journal of International Trade and Economic Development</i> , 18(4): 527-40. Due to persistent unemployment, peasant families in developing countries tend to employ more labour on the leased in land plots than a capitalist would. In labour surplus societies, therefore, landlords may earn higher surplus from leasing out land than from self-cultivation. By endogenising disguised unemployment this paper shows that greater power and unity of landlords and conservative social norms may explain the persistence of share tenancy in developing economies.

Discusses the role of land markets in economic crises; a new framework for macroeconomics--achieving full employment by increasing capital turnover; and money, credit, and crisis.
2009	Q32	Feldmann, Horst. 2009. "Geography and Labor Market Performance." <i>Eastern Economic Journal</i> , 35(2): 190-208. Using data from 76 countries and a large number of controls, this paper analyses how geographical characteristics affect labor market performance. We find that different geographical characteristics have very different effects. While a larger share of highly fertile soil appears to lower employment and increase unemployment, more abundant mineral resources seem to increase employment without affecting unemployment. A larger share of tropical area is associated with higher employment and lower unemployment rates. Neither proximity to the ocean, or to ocean-navigable rivers, nor elevation appears to affect labor market outcomes.
2009	Q32	Stijns, Jean-Philippe. 2009. "Mineral Wealth and Human Capital Accumulation: A Nonparametric Approach." <i>Applied Economics</i> , 41(22-24): 2925-41. This article uses a nonparametric approach to investigate the nexus between mineral wealth and human capital accumulation across countries. Higher mineral wealth is associated with elevated levels of human capital in a cross-section of countries. Matching the overall level of economic development and political instability and violence, weakens but does not reverse this conclusion. These results are economically significant. Moving up from the bottom to the top quartile for subsoil wealth per capita decreases illiteracy by is approximately equal to 12% among young and adult females. Conversely, moving down from the top to the bottom quartile for subsoil wealth per capita decreases the average years of primary and total education by is approximately equal to 1.5 years for females. Results are consistent with Hirschman's conjecture that enclave economies have weaker production linkages but stronger government revenue linkages than other activities. Most importantly, this article argues that caution should be exercised when discouraging countries from exploiting their mineral wealth, especially for countries where human capital is scarce.
2009	Q54	Faehn, Taran, Antonio G. Gomez-Plana, and Snorre Kverndokk. 2009. "Can a Carbon Permit System Reduce Spanish Unemployment?" <i>Energy Economics</i> , 31(4): 595-604. This paper analyses the impact of carbon policy on unemployment in Spain and whether recycling the public revenues earned from permit auctions can alleviate this problem. While Spain's deviation from

Year	DE	Title and Abstract
		the European Union's intermediate emission goals is more serious than most other member countries' unemployment in Spain is also well above average for the European Union. We use a computable general equilibrium model that includes unemployment in the markets for unskilled and skilled labour. We find that introducing carbon permits does not aggravate Spanish unemployment. In fact, if supplied with revenue recycling schemes, unemployment rates may actually fall. Contrary to other European studies, we find that the best option is to reduce payroll taxes on relatively skilled types of labour. This reform is successful in both increasing labour demand and dampening the supply response to rising wages. However, while all of the recycling schemes generate dividends in terms of aggregate welfare, none entirely offsets the abatement costs.
2009	R20	Baker, Dean. 2009. <i>The Housing Crash Recession and the Case for a Third Stimulus</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This paper makes the case for a third stimulus package to in the face of economic indicators signaling that the economy is in a deeper downturn than was expected based on previous projections. Specifically, the report calls for an employer tax-credit for extending health care coverage and another per worker employer tax credit for increasing paid time off from work. The author also makes the case for a housing policy centered on the stabilization of prices in non-bubble and deflated markets rather than applying the same efforts on markets that remain at bubble inflated levels. Finally, the paper argues that the dollar must be allowed to fall in order to adjust trade imbalances that are compounding the U.S. economic crisis caused by the collapse of the housing market.

CESifo Group Munich, CESifo Working Paper Series: CESifo Working Paper No. 2935. In this paper we propose a novel way to model the labor market in the context of a New-Keynesian general equilibrium model, incorporating labor market frictions in the form of hiring and firing costs. We show that such a model is able to replicate many important stylized facts of the business cycle. The reactions to monetary and real shocks become much more sluggish. Job creation and job destruction are negatively correlated. And the volatility of unemployment is much larger than in the standard search and matching model.
2010	E16	Belegri-roboli, Athena, and Maria Markaki. 2010. "Employment Determinants in an Input-Output Framework: Structural Decomposition Analysis and Production Technology." <i>Bulletin of Political Economy</i>, 4(2): 145-56. The aim of this paper is to examine the impact of structural determinants on employment changes in the Greek economy, over the period 2000-2008. In this context, we apply the Structural Decomposition Analysis (SDA) in an input-output analysis framework. The SDA is a technique which breaks down a variable of interest into the changes of all the relevant determinants. In this study, we apply SDA to express employment changes (employed persons) into changes of employment's determinants. The selected determinants are: labour productivity, Leontief's inverse matrix and final demand. The results of this study show that labour productivity and Leontief's inverse matrix changes produce negative effects on labour changes. In contrast, final demand changes effects are positive. Finally, labour productivity and final demand are found to be the most crucial determinants for the formation of employment, while Leontief's inversed matrix effects are not significant.
2010	F37 G17	Prati, Alessandro, and Massimo Sbracia. 2010. "Uncertainty and Currency Crises: Evidence from Survey Data." <i>Journal of Monetary Economics</i>, 57(6): 668-81. How does uncertainty about fundamentals affect speculation in the foreign exchange markets? This paper studies empirically the role of uncertainty in currency crises. Uncertainty, which is measured using the dispersion of survey forecasts of key macroeconomic variables, is found to have a non-monotonic effect on exchange rate pressures: it heightens speculative pressures when expected fundamentals are good and eases them when they are bad. This prediction is consistent with a broad class of currency crisis theories, ranging from first-generation to global-game models. The proposed empirical strategy remains valid in the presence of forecasters with strategic objectives and addresses potential endogeneity bias by building a novel set of instrumental variables.
2010	F44	Neculita, Mihaela, and Daniela Sarpe. 2010. "American Depression Impact on Economical Relations between European Union and United States of America." <i>Annals of "Dunarea de Jos" University of Galati: Fascicle 1: Economics and Applied Informatics</i>, 16(1): 153-60. The world economic crisis is a system crisis that has deep implications on country groups. For the developed countries the crisis means the diminishing of the economic increase rhythm, reduction of new work place creation, unemployment increase, deepening of social tensions, and a diminishing of the work productivity increase. Moreover, there a sustained pressure over the social assistance and protection, over the living level increase, and of the antisocial phenomena increase can be noticed. On the other hand, there is a counter-pressure from these countries to maintain certain advantages they have due to the integration policies, advantages that were brought about by the international work division, by the international economic relations based on the comparative cost theory, intensification of armament production, and of technical progress of global finances.
2010	F44	Sentance, Andrew. 2010. "Prospects for the British Economy after the Financial Storm." <i>Economic and Financial Modelling</i>, 17(4): 167-97. There are four main elements supporting the view that the UK economy is now moving out of recession and into the recovery phase of the cycle. (i) As a major trading nation, economic conditions in the UK are strongly influenced by the performance of other parts of the world economy. (ii) The improvement seen by a wide range of business surveys in the UK point to a positive growth picture. (iii) Indicators of consumer spending and confidence such as the CBI's Distributive Trades Survey have signalled a return to growth. (iv) The sharp increases in unemployment recorded in the UK in late 2008 and earlier in 2009 eased dramatically towards late 2009. Nevertheless, the author argues that a key issue for UK economic prospects is the pace of the global economic recovery.
2010	G17	THE SAME AS F37 Prati, Alessandro, and Massimo Sbracia. 2010. "Uncertainty and Currency Crises: Evidence from Survey Data." <i>Journal of Monetary Economics</i>, 57(6): 668-81.
2010	G38	Balmaceda, Felipe, and Ronald Fischer. 2010. "Economic Performance, Creditor Protection, and Labour Inflexibility." <i>Oxford Economic Papers</i>, 62(3): 553-77. We present a static general equilibrium model of an open economy where agents are heterogeneous in terms of observable wealth and there are endogenous credit constraints due to imperfect creditor protection. Improved credit protection, harder assets, and more efficient bankruptcy procedures increase output, investment, and credit penetration. Better credit protection and harder assets lead to higher interest rate spreads. In a capital constrained (unconstrained) economy, greater (lower) wealth inequality leads to higher (lower) investment and output. Interest rate spreads are lower in richer and more unequal economies in terms of their wealth distribution. We also show that increased labour protection leads to lower wages and output in the presence of credit market imperfections. Nevertheless, increased protection benefits workers in (and owners of) firms with strong balance sheets.

Year	DE	Title and Abstract
2010	I13	Jacobsen, Linda A., and Mark Mather. 2010. "U.S. Economic and Social Trends since 2000." <i>Population Bulletin</i>, 65(1): 2-16. This has been a tumultuous decade for the United States. During the first ten years of the twenty-first century, there was a major terrorist attack, a housing meltdown, a severe economic recession, and a significant downturn in the U.S. stock market. Unemployment recently passed the 10 percent mark for the first time since 1983. Household wealth increased somewhat with the stock market gains during the past year, but remains well below prerecession levels. Household net worth dropped by more than \$10 trillion during the recession--the largest loss of wealth since the federal government started keeping records of wealth accumulation fifty years ago. Trends in stock market indicators, household wealth, consumer confidence, and labor force participation are widely reported and used to measure the health of the U.S. economy. But less is known about the ways people are adapting to changing economic conditions. In this Population Bulletin, we look beyond employment and income and examine other important aspects of people's lives, including educational attainment, homeownership, commuting, marriage, fertility, and migration trends. With the close of the decade, it is an appropriate time to review how the U.S. population has changed since 2000.
2010	I14 I15	Castello-Climent, Amparo. 2010. "Channels through Which Human Capital Inequality Influences Economic Growth." <i>Journal of Human Capital</i>, 4(4): 394-450. This paper empirically investigates the theoretical predictions of some of the channels through which human capital inequality may discourage investment and growth. In a cross section of countries over the period 1960-2000, findings reveal that, all other things being equal, a greater degree of human capital inequality increases fertility rates and reduces life expectancy, which in turn hampers the accumulation rates of human capital. This effect is reinforced in the countries where individuals find it difficult to access credit. Extensive sensitivity analyses show that the results are robust across specifications and are not driven by atypical observations, endogenous regressors, or unobservable heterogeneity.
2010	I15 I25	Erdil, Erkan, and Kahraman Kalyoncu. 2010. "Physical and Human Capital Complementarity and Worker Effort Level by Nutritional Level within Labor-Augmenting Solow Type Model." <i>European Research Studies</i>, 13(1): 73-82. Whether the convergence occurs is one of the important issues in economic growth. Besides occurrence of convergence, another important issue in the theory of economic growth is whether the growth of per-capita income depends on the ratio of physical to human capital (K/H) where human capital is defined by the education and the worker effort level calculated by per capita dietary energy supply (DES). This study provides evidence for imbalance effects of (K/H) on growth rate besides convergence issue in a sample of 36 countries. This dependence causes the change in size of convergence rate where with the conditions on (K/H) ratio, convergence rate increases.
2010	J83	Colakovic-Prguda, Nerma. 2010. "The Role and Importance of Social Policy in the Labour Market. (In Serbian. With English summary.)." <i>Zbornik Radova Ekonomskog Fakulteta u Istocnom Sarajevu</i>, 4(0): 223-36. This paper presents the role and importance of social policy which is now high on the priority list of market economies aimed at sustainable economic development. The social partnership and social dialogue are concepts which are emphasized and their negligence can cause big problems, especially in the labour market. Every day, the EU social policy becomes more important. Together with employment policy it is focused to ensure good work conditions, protection and safety in the workplace, the rights of pregnant women, regulation of working time, etc. There is no uniquely formulated social policy in Bosnia and Herzegovina. Development of the effective social policy with a positive approach to employment is a priority task of governments in the FBiH and the RS. The problem is also high poverty rate, the lack of gender sensitivity and social exclusion. Bosnia and Herzegovina is in the process of approaching the European Union and therefore must make some adjustments to European requirements regarding the labour market and social policy.
2010	J83	Kudo, Tadashi. 2010. "Japan's Employment Rate of Persons with Disabilities and Outcome of Employment Quota System." <i>Japan Labor Review</i>, 7(2): 5-25. Although there is no strict international definition of persons with disabilities, I examined the employment situation of persons with disabilities in Japan in this paper using government statistics and statistical surveys by the U.S. and international organizations. The appearance ratio of persons with disabilities is 10% of the world's population while in Japan it is only 5%. It suggests that Japan puts a narrow definition on persons with disabilities. It was also found that Japan's employment rate of working-age persons with disabilities is relatively higher than other countries. From an international standpoint, there are two approaches to expand employment opportunities for persons with disabilities: introduction of (i) a legal system on the antidiscrimination law and (ii) an employment quota system (legally-prescribed minimum employment rate system). Japan has introduced the latter approach. Looking at changes in the number of persons with disabilities working for companies which are covered by the employment quota system for 16 years, the system has brought about substantial results. On the contrary, the employment rate of persons with disabilities in the U.S. which has a typical antidiscrimination law, Americans with Disabilities Act (ADA), is lower than that of Japan and the employment rate has not really increased even after the introduction of ADA. It was confirmed that the strengthening of a typical antidiscrimination law for persons with disabilities does not necessarily bring about the expansion of job opportunities for them.
2010	J83	Herd, Richard, Vincent Koen, and Anders Reutersward. 2010. <i>China's Labour Market in Transition: Job Creation, Migration and Regulation</i>. OECD, Economics Department, OECD Economics Department Working Papers: 749. Over the past decade, the share of jobs not controlled by the state has increased considerably, whilst employment in agriculture has declined, against the backdrop of ongoing urbanisation. Over 200 million people have been drawn into urban areas through official or unofficial migration, despite various obstacles to labour mobility, including the registration system and the associated restrictions to social service access. New labour laws were introduced in 2008 to better protect employees in a market now dominated by private-sector employers, notably via more systematic use of and adherence to written labour contracts, in particular of indefinite duration ones. To what extent the new legislation and implementing regulations will be enforced remains to be seen. For the time being, de facto employment protection is far less than de jure, with an enduring preponderance of fixed-term contracts, involving few restrictions. Minimum wages are set locally and have not kept up with average wages, nor are they effectively enforced. During the recent slowdown, average wages adjusted rapidly and employment was soon on the rise again. However, this episode also highlighted the need to integrate migrants better, not least by relaxing registration rules.
2010	N73	CV: Clark, Gregory. 2010. "The Macroeconomic Aggregates for England, 1209-2008." In <i>Research in Economic History</i>. Alexander J. Field, 51-140. Coedited by Gregory Clark and William A. Sundstrom. Research in Economic History, vol. 27. Bingley, U.K.: Emerald.
2010	N74	Venneslan, Christian. 2010. "Norway's Recovery from the Great Depression--An Act of Balancing?" <i>Scandinavian Economic History Review</i>, 58(2): 119-38. This paper addresses the question of how Norway recovered from the Great Depression and tries to show that a monocausal Schumpeterian explanation is flawed. Three elements of such an explanation are being discussed and dismissed: the shift in employment structure; the spread of electric power; and the changes in household consumption. The paper comes to a more balanced conclusion. Mainly for chronological reasons, supply-side factors can't independently explain the recovery. Not before 1934-35, when recovery had been underway for roughly two years, did supply-side factors start to have a

Year	DE	Title and Abstract
		real impact. Only by viewing these forces in interaction with the demand side, in particular export demand generating an investment boom, can a more plausible explanation of Norway's recovery from the Great Depression be presented.
2010	P34	Posta, Vit. 2010. "The Effect of Labor Productivity on Real Exchange Rate: Evidence from Czech Republic, Hungary, Poland and Slovakia." <i>Ekonomicky Casopis/Journal of Economics</i>, 58(7): 657-76. The paper builds on an intertemporal model of an open economy to formulate the hypothesis of the dependence of real exchange rate on labor productivity. The model is formulated under those assumption on which the Balassa-Samuelson theorem rests. The hypothesis is tested using cointegration technique and vector error correction model. Usually testing the Balassa-Samuelson effect gives mixed results, sometimes finding the opposite reaction of the real exchange rate to the one predicted by the Balassa-Samuelson theorem, pointing to the restrictive nature of the assumptions on which it is based. The analysis shows a little supportive evidence for the Balassa-Samuelson effect. However, according to the analysis the effect of labor productivity on the real exchange rate can hardly be considered as clear-cut as predicted by the Balassa-Samuelson theorem.
2010	P34	Pema, Elda. 2010. "Trends in the Albanian Labour Market: Who Are Albania's Unemployed?" <i>Transition Studies Review</i>, 16(4): 860-71. Albania's experience with transition is unlike most Eastern European countries. In particular, transition started from a deeply impoverished state, proceeded faster than other countries in the region, and was disrupted by financial sector crises. In addition, Albania experienced extreme population movements both abroad (to as many as twenty different countries) and within the country (from rural areas to major cities). All these changes combined have altered the composition of the local labour force in unknown ways. Understanding who Albania's unemployed are at present is important for policy decisions, especially given the double-digit unemployment rates of the last decade. In addition, employment stabilization policies in Albania are important from an international perspective, since Albania exports about 15-20% of its labour force to neighbouring countries. This paper uses administrative data from one of the largest, recently established labour offices, to gain insights into the composition and characteristics of Albania's unemployed.
2010	P34	Chen, Long-Mei. 2010. "Analysis on the Impact of the Financial Crisis on Chinese Employment Based on Kalman Filter. (In Chinese. With English summary.)." <i>Journal of Data Analysis</i>, 5(4): 1-16. The subprime mortgage crisis has become the global financial crisis, many countries suffer a lot during the crisis, their economy declines fast and the consumer demand becomes weak gradually. Foreign trade has played an important role in the development of Chinese economy. While the import demand of the main trade cooperation states declines, the amount of the export goes down greatly and lots of export-oriented enterprises close down, then the unemployment rate of China increases. FDI is one of the important source of investment in China, since the financial crisis, the inflowing of FDI decreases a lot, this absolutely will not be conducive to the Chinese employment. In this thesis, we will use the method of Kalman Filter to make a time-varying coefficients model in order to analyze the impact of import, export, and FDI on Chinese employment during the first quarter of 1997 to the third quarter of 2008.
2010	Z12	Cosgel, Metin, and Bogac A. Ergene. 2010. <i>Intergenerational Wealth Accumulation and Dispersion in the Ottoman Empire: Observations from Eighteenth-Century Kastamonu</i>. University of Connecticut, Department of Economics, Working papers: 2010-24. This article studies the accumulation and intergenerational transmission of wealth in early-modern Ottoman Anatolia by employing data from probate estate inventories (terekes) as found in the court records (sicils) of eighteenth-century Kastamonu, a town located in northern Anatolia. Extracting information on the wealth levels and personal characteristics of father-son pairs in the period between 1710 and 1806, we conduct regression analysis of factors determining the wealth of sons. In this first attempt to simultaneously analyze the estate inventories of parents and children in the Ottoman Empire, we also compare our results with those obtained for regions that were growing rapidly in this era and discuss the implications of our findings for the prospects of capital accumulation in the Ottoman context. Our results show that wealth holding was more equal in Kastamonu than in Britain in the eighteenth century. This was caused in part by the significantly lower transmission of wealth from fathers to sons. Although there was a significant correlation between the wealth-levels of fathers and sons in Kastamonu, this relationship was weaker there than what has been observed for eighteenth-century Britain. Regression to the mean among the sons was more rapid in Kastamonu. Finally, in at least one Ottoman context, our calculations cast doubt on the argument that Islamic inheritance practices led to excessive levels of wealth fragmentation.

(Unemployment and Wage Flexibility in an Evolutionary Setting. With English summary.)." <i>Estudos Economicos</i>, 41(2): 269-96. We make use of an evolutionary game approach to study the relation between wage flexibility and unemployment in an economy with decentralized wage bargains. In our model, labor unions pick a nominal wage out of a finite set with cardinality in each period, while firms choose employment levels that maximize their profits. We are able to show that: 1) the economy presents multiple equilibria, some are characterized by homogeneity of nominal wages (pure strategy equilibrium) and others by heterogeneity of nominal wages (mixed strategy equilibrium); 2) the medium-run equilibrium is selected by a social learning process, given by a replicator dynamics; and 3) the selected medium-run equilibrium may not be the full employment equilibrium.
2011	C87	Bardsen, Gunnar, Stan Hurn, and Zoe McHugh. 2011. <i>Asymmetric unemployment rate dynamics in Australia</i>. National Centre for Econometric Research, NCER Working Paper Series: 71. The unemployment rate in Australia is modelled as an asymmetric and nonlinear function of aggregate demand, productivity, real interest rates, the replacement ratio and the real exchange rate. If changes in unemployment are big, the management of of demand, real interest rates and the replacement ratio will be good instruments to start bringing it down. The model is developed by exploiting recent developments in automated model-selection procedures.

2011	D53	Benmelech, Efraim, Nittai K. Bergman, and Amit Seru. 2011. <i>Financing Labor</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 17144. Financial market imperfections can have significant impact on employment decisions of firms. We illustrate the economic importance of this channel by demonstrating that the responsiveness of employment decisions to firms' financial health is quantitatively similar to the much-studied responsiveness of investment decisions to cash-flows. We use a collage of three 'quasi-experiments' used previously in the investment-cash flow and finance-growth literatures to trace the effects of finance on employment. Our results suggest that financial constraints and the availability of credit play an important role in firm-level employment decisions, as well as aggregate unemployment outcomes. <i>Financing Labor</i> . We study the determinants of the level and the evolution of per capita hours worked in a panel of OECD countries since the 1970s. Following Pesaran (2006), our empirical strategy allows for the possibility of cross-sectionally correlated error terms due to unobserved common factors, which are potentially nonstationary. We find that much of the variation in per capita hours worked across countries and over time can be explained by differences in the level and structure of taxes and government expenditures. Differences in (the evolution of) labor and product market institutions have much less of a role to play. Our results show that a careful treatment of the time-series properties of the data is crucial.

This paper analyzes the dynamics of the youth labor market in Tunisia using unique labor force survey data from 2005 to 2007 that include a longitudinal component. We show that sustained economic growth can reduce the youth unemployment rate by 15 percentage points over the next few years. Tourism is the sector with the highest potential to create jobs for the youth. Yet, the public sector remains the main provider of employment for the graduates, in particular for women. In the face of high turnover in the private sector, young graduates appear to be willing to experience long unemployment spells as they queue for high skill jobs in the public administration.
2011	K12	Marinescu, Ioana. 2011. "Are Judges Sensitive to Economic Conditions? Evidence from UK Employment Tribunals." <i>Industrial and Labor Relations Review</i>, 64(4): 673-98. The author investigates whether judges deciding on unfair dismissal cases are sensitive to economic conditions faced by workers and firms. Using the 1992 survey of Employment Tribunal Applications in Great Britain and controlling for case selection, she finds that both the unemployment and the bankruptcy rates significantly decrease the probability of judges deciding in favor of dismissed employees. A one-point increase in the unemployment rate leads to a seven-point decrease in this probability; this effect, however, is not significant for unemployed workers. These findings are consistent with the idea that judges, while tailoring firing costs to economic circumstances, are somewhat more sensitive to firms' interests.
2011	L65	Waxell, Anders. 2011. "Life Sciences and Human Capital: Jobless Growth on Specialised and Local Labour Markets?" <i>Growth and Change</i>, 42(3): 231-60. Policy makers and scholars often regard the life science industry in general, and bio-technology in particular, as an engine of future economic growth. The expectation is that growth in the industry will ultimately provide a major boost to national employment numbers. However, in this paper, I find that the Swedish life science industry (encompassing pharmaceutical, bio-technology, and medical technology firms) accounts for only a small proportion of total employment in Sweden. Given the recent discussion on jobless growth (i.e., economic growth without employment growth), it is here argued that focusing on employment is not necessarily the best policy approach to assessing the impacts of the life science industry on the overall economy. This paper maps and analyses the scope, structure, and geography of the life science industry and its workforce in Sweden using a unique set of data covering approximately 1,200 firms and 53,000 employees. The industry's workforce has education and income levels significantly higher than national averages, and is heavily concentrated in larger metropolitan areas and major university cities. Despite employing relatively few people and being more or less dependent on the existence and success of a few major pharmaceutical firms, the industry may still have a significant impact on the national economy by engendering high levels of education, income, and export revenues, particularly in specific regions.
2011	N72	Taylor, Jason E., Bharati Basu, and Steven McLean. 2011. "Net Exports and the Avoidance of High Unemployment during Reconversion, 1945-1947." <i>Journal of Economic History</i>, 71(2): 444-54. While economists predicted a return to double-digit unemployment rates during the reconversion from World War II, this outcome did not materialize. This article explores the role that the significant rise in net exports--which accounted for nearly 4 percent of GDP in 1946 and 1947--played in helping the United States avoid a postwar unemployment problem. Using an input-output analysis, we find that the export surplus directly accounted for 1.33 million jobs in 1946 and 1.97 million jobs in 1947. This accounts for close to half of the gains to private sector employment during these years.

		regional Input-Output analysis (MRIO), which will allow us to evaluate the effects on aggregate production, value added and employment inside the Castilla-La Mancha region as well as outside (Spain, EU-27 and rest of the world).
2011	Q18	Kristkova, Zuzana. 2011. "Macroeconomic Consequences of a Common Agricultural Policy Budget Reduction for the Czech Economy--A General Equilibrium Approach." <i>Ekonomicky Casopis/Journal of Economics</i>, 59(8): 802-22. The objective of this paper is to quantify the impact of selected scenarios of a Common Agricultural Policy (CAP) budget reduction on the macroeconomic equilibrium of the Czech economy with the use of a dynamic general equilibrium model. The findings show that in the short term, a reduction in direct payments (1st pillar) is more harmful for the economy than the removal of investment subsidies (2nd pillar); this is completely reversed in the long term, in which the removal of investment subsidies leads to a considerably stronger decline in economic growth.
2011	R42	Venezia, Elisabetta. 2011. "Transport Investments: Are They Crucial for the Economic System?" <i>International Journal of Engineering Management and Economics</i>, 2(4): 351-68. The main aim of this paper is to look for a causal impact of transport investment activity on employment and on GDP through an empirical analysis, and to understand whether or not investments are really important for the economy. The results of the empirical investigation demonstrate the existence of such links and that the impact of transport investments can indeed bring about changes in the economic system, although one must consider that the nature of investments is a strategic factor to have desirable effects and that other variables, such as technology, have a greater importance in the short term on the economic system. The examples for this investigation have been implemented by using national and regional Italian data, although results may be easily extended to other areas, both sectorial and geographical.

2012	B54	Tcherneva, Pavlina R. 2012. "What Do Poor Women Want? Public Employment or Cash Transfers? Lessons from Argentina." Levy Economics Institute, The Economics Working Paper Archive. The literature on public employment policies such as the job guarantee (JG) and the employer of last resort (ELR) often emphasizes their macroeconomic stabilization effects. But carefully designed and implemented policies like these can also have profound social transformative effects. In particular, they can help address enduring economic problems such as poverty and gender disparity. To examine how, this paper will look at the reform of Argentina's Plan Jefes into Plan Familias. Plan Jefes was the hallmark stabilization policy of the Argentine government after the 2001 crisis. It guaranteed a public sector job in a community project to unemployed male and female heads of households. The vast majority of beneficiaries, however, turned out to be poor women. For a number of reasons that are explored below, the program was later reformed into a cash transfer policy, known as Plan Familias, that still exists today. The paper examines this reform in order to evaluate the relative impact of such policies on some of the most vulnerable members of society; namely, poor women. An examination of the Argentine experience based on survey evidence and fieldwork reveals that poor women overwhelmingly want paid work opportunities, and that a policy such as the JG or the ELR cannot only guarantee full employment and macroeconomic stabilization, but it can also serve as an institutional vehicle that begins to transform some of the structures and norms that produce and reproduce gender disparities. These transformative features of public employment policies are elucidated by turning to the capabilities approach developed by Amartya Sen and elaborated by Martha Nussbaum—an approach commonly invoked in the feminist literature. This paper examines how the access to paid employment can enhance what Sen defines as an individual's "substantive freedom." Any policy that fosters genuine freedom begins with an understanding of what the targeted population (in this case, poor women) wants. It then devises a strategy that guarantees that such opportunities exist and removes the obstacles to accessing these opportunities.
2012	C38	Hoeller, Peter, Isabelle Joumard, Mauro Pisu, and Debbie Bloch. 2012. <i>Less Income Inequality and More Growth--Are They Compatible?: Part I. Mapping Income Inequality Across the OECD</i>. OECD Publishing, OECD Economics Department Working Papers: 924. Countries differ widely with respect to the level of labour income inequality among individuals of working age. Labour income inequality is shaped by differences in wage rates, hours worked and inactivity rates. Individual labour income inequality is the main driver of household market income inequality, with family formation as well as self-employment and capital income dispersion playing a smaller role. Household disposable income dispersion is lower in all OECD countries than household market income inequality, due to the redistributive effect of tax and transfer systems, but redistribution differs widely across countries. This paper maps income inequality for all OECD countries across various inequality dimensions and summarises them in inequality outcome diamonds. It also provides a cluster analysis that identifies groups of countries that share similar inequality patterns.
2012	C58	Chen, Shiu-Sheng. 2012. "Consumer Confidence and Stock Returns over Market Fluctuations." <i>Quantitative Finance</i>, 12(10): 1585-97. This paper investigates the link between consumer confidence and stock returns over stock market fluctuations. In particular, I focus on whether the returns have asymmetric effects on confidence. The empirical results from both in-sample and out-of-sample tests provide strong evidence of the existence of an asymmetric linkage between stock returns and consumer confidence: the impacts of returns on confidence are larger in bear markets. Moreover, variables such as the term structure, changes in federal fund rates, changes in unemployment rates, and changes in world oil prices are found to be negatively associated with consumer confidence, as expected.
2012	D49	Coles, Melvyn G., and Dale T. Mortensen. 2012. <i>Equilibrium Labor Turnover, Firm Growth and Unemployment</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 18022. This paper considers a dynamic, non-steady state environment in which wage dispersion exists and evolves in response to shocks. Workers do not observe firm productivity and firms do not commit to future wages, but there is on-the-job search for higher paying jobs. The model allows for firm turnover (new start-up firms are created, some existing firms die) and firm specific productivity shocks. In a separating equilibrium, more productive firms signal their type by paying strictly higher wages in every state of the market. Consequently, workers always quit to firms paying a higher wage and so move efficiently from less to more productive firms. As a further implication of the cost structure assumed, endogenous firm size growth is consistent with Gibrat's law. The paper provides a complete characterization and establishes existence and uniqueness of the separating (non-steady state) equilibrium in the limiting case of equally productive firms. The existence of equilibrium with any finite number of firm types is also established. Finally, the model provides a coherent explanation of Danish manufacturing data on firm wage and labor productivity dispersion as well as the cross firm relationship between them.
2012	F60	Kus, Basak. 2012. "Financialisation and Income Inequality in OECD Nations: 1995-2007." <i>Economic and Social Review</i>, 43(4): 477-95. This paper attempts to examine the link between financialisation and income inequality in advanced countries from a comparative perspective using data from 20 OECD countries over a period of 13 years (1995-2007). The initial regression results show an overall strong correlation between several of the financialisation indicators and income inequality net of conventional

Year	DE	Title and Abstract
		explanations including economic growth rate, unemployment, globalisation, left party power, social spending, union density, female participation in the labour market, and wage bargaining centralisation. The results also show that although financialisation has a positive association with income inequality in nations with strong as well as weak unions, the association is stronger in the latter.

2012	F62	Roman Bernet, Nuria, and María Isabel Escudero Molina. 2012. "Los observatorios industriales sectoriales: Objetivos, composición y funcionamiento. (With English summary)." <i>Economía Industrial</i> , 0(385): 21-24. In 2005, the Ministry of Industry, Tourism, and Trade promoted the creation of one Industrial Observatory for each of the ten specific industries that together generate more than 75% of the industrial GVA and account for almost 80% of the industrial employment. These observatories were a new experience whose objective was to facilitate the participation of business associations, trade unions, and R&D facilities all together in the analysis of the threats and opportunities that globalization presents for the different specific industries and the effects and impacts of the various public policies that are applied, depending on the particularities of each one of them. Through this systematic analysis, policies could be adapted to the true needs of each industry and its effectiveness be ensured, in order to strengthen the competitiveness of the Spanish industry.
2012	H12	Rendahl, Pontus. 2012. <i>Fiscal Policy in an Unemployment Crisis</i> . Faculty of Economics, University of Cambridge. Cambridge Working Papers in Economics. This paper argues that the effectiveness of fiscal policy may increase markedly during periods of low nominal interest rates and high, persistent, unemployment. An increase in government spending boosts economic activity and reduces the unemployment rate both in the present and in the future. As a less disconcerting future spurs a rise in private consumption, unemployment falls even further and triggers an additional rise in private demand, and so on. In a stylized model, I show that the marginal impact of government spending on output is equal to the reciprocal of the elasticity of intertemporal substitution. In a more realistic framework, the effect is somewhat attenuated and displays significant nonlinearities with respect to the depth of the crisis as well as the size of the stimulus package. But in a severe recession with an unemployment rate of eight percent or above, the fiscal multiplier is equal to 1.5.
2012	H59	Kambourov, Gueorgui, Iouri Manovskii, and Miana Pleșca. 2012. <i>Occupational Mobility and the Returns to Training</i> . University of Toronto, Department of Economics, Working Papers. The literature on the returns to training has pointed out that, immediately following a training episode, wages of participants in employer-sponsored training increase substantially while wages of participants in government-sponsored training hardly change. We argue that a clear selection issue has been overlooked by the literature--most of the government-sponsored trainees are occupation switchers while most participants in employer-sponsored training are occupation stayers. An occupational switch involves a substantial destruction of human capital, and once we account for the associated decline in wages we find a large positive impact of both employer- and government-sponsored training on workers' human capital.
2012	I19	Alassane, DRABO, COMBES MOTEL Pascale, and AUDIBERT Martine. 2012. <i>Global burden of disease and economic growth</i> . CERDI, Working Papers: 201212. Relationships between health and economic prosperity or economic growth are difficult to assess. The direction of the causality is often questioned and the subject of a vigorous debate. For some authors, diseases or poor health had contributed to poor growth performances especially in low-income countries. For other authors, the effect of health on growth is relatively small, even if one considers that human capital accumulation needs also health investments. It is argued in this paper that commonly used health indicators in macroeconomic studies (e. g. life expectancy, infant mortality or prevalence rates for specific diseases such as malaria or HIV/AIDS) imperfectly represent the global health status of population. Health is rather a complex notion and includes several dimensions which concern fatal (deaths) and non-fatal issues (prevalence and severity of cases) of illness. The reported effects of health on economic growth vary accordingly with health indicators and countries included in existing analyses. The purpose of the paper is to assess the effect of health on growth, by using a global health indicator, the so-called disability-adjusted life year (DALY) that was proposed by the World Bank and the WHO in 1993. Growth convergence equations are run on 159 countries over the 1999-2004's period, where the potential endogeneity of the health indicator is dealt for. The negative effect of poor health on economic growth is not rejected thus reinforcing the importance of achieving MDGs.
2012	L90	O'Mahony, Mary. 2012. "Service Sector Performance: An Introduction to the INDICSER and SERVICEGAP Projects." <i>National Institute Economic Review</i> , 0(220): R1-5.
2012	O44	Shah, Amita. 2012. "Environment, Employment and Labour: Pathways to Sustainable Development." <i>Indian Journal of Labour Economics</i> , 55(1): 111-30. Environmental concerns have been making major inroads into the various discourses on development globally and nationally. For labour and employment, the environmental perspective has meant a revival of some of the older debates on factor proportions, substitution and mechanisation in the wake of the growing scarcity of not only land, but also other natural resources. The challenges thrown up by the various climate change scenarios have further drawn attention to the criticality of conserving various ecological systems in order to be able to sustain future flows of goods and services or production and consumption in an economy. This essentially implies restructuring the way in which both production and consumption function, which in turn, necessitates changing the role of markets alone in determining the factor prices and their allocation across sectors and segments of consumers within the economy. Reflecting on some of the recent developmental discourses and the experience of 'jobless' growth during the recent period, this paper argues that the present approach, notwithstanding the tall commitments, does not seem to work towards the much-needed convergence between the various developmental objectives, viz. environmental sustainability, employment generation, and growth. Rather the approach tends to focus more on technological solutions and fiscal incentives for moving towards a low-carbon economy without paying adequate attention to the central thrust of the Green Growth agenda, viz. resource regeneration and employment enhancement. The paper thus reinstates the importance of changing the pace and pattern of growth.
2012	P40	Chilosi, Alberto. 2012. "Stakeholder Protection, Varieties of Capitalism, and Long-Term Unemployment." <i>European Journal of Comparative Economics</i> , 9(2): 197-228. In the literature, the issue of the protection of stakeholder interests (of employees in particular) is usually considered in a static context: how should the institutions of corporate governance be shaped having regard to already existing firms, conforming, in particular, to some subjective criteria of fairness and fair play. It is remarkable that no attention is paid to the basic fact that a company in order to exist must first be established, and that the founders-owners are the original shareholders. Moreover, not necessarily the most appropriate protection of stakeholder interests can be provided by the institutions and practice of corporate governance, specific kinds of legal provision may be more suitable. But rather than substitution complementarity prevails between different legal provisions protecting the interests of stakeholders (in particular employees) and the stakeholder protection afforded through the institutions of capital governance, conforming to the logic of the different "varieties of capitalism". An aspect of the latter that is emphasized in the paper, and is usually overlooked, are the much higher rates of long-term unemployment associated with the continental European variety as compared with the Liberal Market

Year	DE	Title and Abstract
		variety of the Anglo-Saxon tradition. But the Scandinavian Social-Democratic market model gives the best of both worlds: low long-term unemployment rates and incidence, together with high degrees of employment protection.
2012	R52	Ganong, Peter, and Daniel Shoag. 2012. <i>Why Has Regional Convergence in the U.S. Stopped?</i>. Harvard University, John F. Kennedy School of Government, Working Paper Series. The past thirty years have seen a dramatic decrease in the rate of income convergence across U.S. states. This decline coincides with a similarly substantial decrease in population flows to wealthy states. We develop a model where labor mobility plays a central role in convergence and can quantitatively account for its disappearance. We then link this decline in directional migration to a large increase in housing prices and housing regulation in high-income areas. The model predicts that these housing market changes generate (1) a divergence in the skill-specific economic returns to living in rich places, (2) a decline in low-skilled migration to rich places and continued low-skilled migration to places with high income net of housing costs, (3) a decline in the rate of human capital convergence and (4) continued income convergence among places with unconstrained housing supply. Using Census data, we find support for the first three hypotheses. To test the fourth hypothesis, we develop a new state-level panel measure of housing supply regulations. Using this measure as an instrument for housing prices, we document the central role of housing prices and building restrictions in the end of income convergence.

2013	A33	Bardhan, Ashok, Dwight M. Jaffee, and Cynthia A. Kroll, eds. 2013. <i>The Oxford Handbook of Offshoring and Global Employment</i>. Oxford and New York: Oxford University Press. Twenty-four papers explore the interaction of globalization, economic growth, and technological developments, and consider how each impacts employment. Papers focus on globalization and employment in the developed world; small, developed, and open economies; other developed countries; the BRIC countries—Brazil, Russia, India, and China; and other parts of the developing world.
2013	C26	Bagger, Jesper, Javier A. Birchenall, Hani Mansour, and Sergio Urzua. 2013. <i>Education, Birth Order, and Family Size</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 19111. We introduce a general framework to analyze the trade-off between education and family size. Our framework incorporates parental preferences for birth order and delivers theoretically consistent birth order and family size effects on children's educational attainment. We develop an empirical strategy to identify these effects. We show that the coefficient on family size in a regression of educational attainment on birth order and family size does not identify the family size effect as defined within our framework, even when the endogeneity of both birth order and family size are properly accounted for. Using Danish administrative data we test the theoretical implications of the model. The data does not reject our theory. We find significant birth order and family size effects in individuals' years of education thereby confirming the presence of a quantity-quality trade off.
2013	F50	CV: Abinales, Patricio N. 2013. "The Philippines under Aquino III, Year 2: A Ponderous Slog Continues." In <i>Southeast Asian Affairs 2013</i>, ed. Daljit Singh, 223-39. Singapore: Institute of Southeast Asian Studies.

2013	G29	Carbo Valverde, Santiago, and Julia Garcia Cabello. 2013. "Transformaciones en la estructura financiera: Implicaciones para la financiación de la economía española. (With English summary.)." <i>Economiaz</i>, 0(84): 93-109. This article examines the profound structural changes that have taken place in the Spanish banking market over the course of the financial crisis and their potential effects on the channels by which the Spanish economy is financed. In particular, it asks whether the generation of internal liquidity markets at Spanish financial institutions (comprising the presence of financial institutions on various regional markets) may have significant effects on lending. The article also considers whether increases in default rates and their detrimental effects on the supply of loans can be reduced by setting up such internal circuits for capital. The findings suggest that non-performing bank loans create spillover effects that result in a reduction in lending in all regions of Spain and not just in those hardest hit by loan defaults and unemployment. However, the restructuring of the banking system has managed to consolidate inter-regional internal capital circuits, which may help attenuate the curtailment of lending and have positive effects for the distribution of lending in the long term.
2013	K11	Phelps, Edmund, and Gylfi Zoega. 2013. "Corporatism and Job Satisfaction." <i>Journal of Comparative Economics</i>, 41(1): 35-47. We introduce reported job satisfaction as a measure of economic performance and find it positively correlated with GDP per capita and the labor force participation rate in a sample of OECD countries and negatively correlated with unemployment. Moreover, we find that many measures of corporatism, which we define in the wider sense as institutions that hamper the allocation of the factors of production and the distribution of income in a capitalist economy, are negatively correlated across countries with job satisfaction. Thus job satisfaction is positively correlated across countries with measures of the protection of property rights and negatively correlated with the volume of regulations of credit markets, labor markets and businesses, in addition to barriers to entrepreneurship, corruption, and lack of access to capital. In contrast, measures of capitalism, such as the number of listed companies and market capitalization, are positively correlated with job satisfaction.
2013	K14	Liu, Yu, Thomas M. Fullerton Jr., and Nathan J. Ashby. 2013. "Assessing the Impacts of Labor Market and Deterrence Variables on Crime Rates in Mexico." <i>Contemporary Economic Policy</i>, 31(4): 669-90. Many studies examine the relationship between crime rates and various economic and/or sociodemographic variables in high income countries, but similar efforts for middle and low income countries are less common. Utilizing an 8-year panel data sample for all 32 states in Mexico, this study assesses the impact of Mexican labor market and deterrence variables on various Mexican crime rates. The principal results indicate that: (1) State gross domestic product (GDP) per capita has ambiguous effect on crime rates under different conditions. Both wages and unemployment rates are negatively linked with crime rates. (2) Although the Mexican judicial and public security systems are widely believed to be ineffective, increased federal police forces and incarceration rates are associated with lower crime rates, but higher public security expenditure per capita is associated with higher crime rates. (3) The impacts from labor market and deterrence variables presented in (1) and (2) continue to hold under the Fox administration as well as for non-border states. Their respective impacts diminish, however, under the Calderon administration as well as for border states because of the small number of observations. Overall, the results indicate that increasing average wages, federal police forces, and incarceration rates would have significant impacts on reducing crime rates in Mexican states.
2013	K23	Valle, Victorio, Fernando Pampillon, and Angel Laborda. 2013. "Las reformas pendientes de la economía española. (The Remaining Reforms of the Spanish Economy. With English summary.)." <i>Boletín de Estudios Económicos</i>, 68(209): 343-68. The current government reform effort to correct the serious imbalances accumulated by the Spanish economy in the last twenty years, needs to be complemented by other reforms that impulse and ensure a robust and fast solution to the crisis. The article ponders over the objectives that should be pursued reforms, lists those that are still pending, and focuses on three that considers essential: i) the tax position aimed at raising levels of European countries with lower restrictive effects and greater equity in the distribution

Year	DE	Title and Abstract
		of the costs of the crisis, ii) to complete labor reform to reverse the temporary employment and active and passive employment policy, and iii) reforming the public administration, especially in areas relating to institutional structure, professionalizing the civil service, and the transparency of its actions.
2013	L66	Gonzalez Andrade, Salvador, and Noe Aron Fuentes Flores. 2013. "Matriz de insumo-producto vitivinicola de Baja California, Mexico. (Wine Input-Output Table Baja California Mexico. With English summary.)." <i>Revista de Economia (Universidad Autonoma de Yucatan)</i>, 30(81): 57-88. The aim of the text is to estimate the input-output matrix for the wine sector (MIPVino) of the State of Baja California, Mexico. In addition, we analyzed the impact it has on employment, an increase of one million pesos in the production of the sector. The findings show that in the wine sector for viticulture activity (primary sector) the employment multiplier is two times higher than the wine activity (industrial sector) since it generates "new" jobs.
2013	L98	Coglianese, Cary, Adam M. Finkel, and Christopher Carrigan, eds. 2013. <i>Does Regulation Kill Jobs?</i>. Philadelphia: University of Pennsylvania Press. Fourteen papers examine the consequences of regulation on the level and quality of employment, focusing on improved regulatory analysis, design, and outcomes. Papers discuss the jobs and regulation debate; the employment impacts of regulation; whether the job effects of regulation differ with the competitive environment; the employment and competitiveness impacts of power-sector regulations; environmental regulatory rigidity and employment in the electric power sector; moving toward best practices--assessing the effects of regulation on employment; lessons from risk assessment controversies for the "job-killing regulations" debate; valuing the nonconsumption impacts of unemployment; a research agenda for improving the treatment of employment impacts in regulatory impact analysis; employment and human welfare--why benefit-cost analysis seems blind to job impacts; unemployment and regulatory policy; reforming the regulatory process to consider employment and other macroeconomic factors; analysis informing public discourse on jobs and regulation; and how to ration analysis of job losses and gains--an exercise in domestic comparative law.
2013	P32	Ksyonzhik, Iryna V. 2013. "Socioeconomic Problems of Village Youth in the Context of Joining the EU." <i>Actual Problems of Economics</i>, 148(10): 177-84. The article covers the main problems of village youth life in Ukraine and carries the analysis of social infrastructure in the countryside, giving the portrait of an average young countryman and determining the key measures of social and economic improvements in the villages of Ukraine.
2013	P47	Gatzia, Dimitria Electra. 2013. "The Problem of Unemployment." <i>Journal of Self-Governance and Management Economics</i>, 1(4): 7-25. The aim of this paper is to address the problem of unemployment. Economists generally agree that a zero rate of unemployment is not only unattainable but also undesirable within capitalism. This is problematic because, as it will be shown, unemployment has adverse effects on both individuals and societies. Assuming that the primary aim of economics is to improve people's lives, it behooves us to find a solution to the problem of unemployment. Two solutions will be offered. The first works within the confines of the capitalist system--it requires instituting welfare policies that alleviate the adverse effects of unemployment. The second involves a paradigm change--it requires replacing capitalism with an alternative economic system that is consistent with a zero rate of unemployment.
2013	Q51	CV: Tsurumi, Tetsuya, Kei Kuramashi, and Shunsuke Managi. 2013. "Determinants of Happiness: Environmental Degradation and Attachment to Nature." 2013	Q51	Cheung, Calista. 2013. <i>Policies to support sustainable long-term growth in New Zealand</i>. OECD Publishing, OECD Economics Department Working Papers: 1076. As its workforce ages and major economies shift towards producing higher value-added goods and services, New Zealand will face increasing challenges to remain globally competitive and maintain high living standards. Future growth will need to come increasingly from productivity gains, and resources will have to shift towards activities that rely more on skills, technology and intangible assets. Strengthening international linkages will be crucial to overcoming geographic disadvantages and will require improvements in the information and communications technology infrastructure, together with innovation leveraged off the country's strong primary industry knowledge base. Continuing to raise skill levels and the pensionable age will also help counter the effects of ageing. Lifting national saving, partly by targeting a higher public saving rate, will reduce the persistently high relative real interest rates and the sustained overvaluation of the real exchange rate, which potentially harm economic activity. To improve the sustainability of growth, revenues from non-renewable resource extraction need to be invested for the benefit of future generations and greater efforts devoted to mitigate the damage to natural capital from economic activity, particularly with respect to water quality. This Working Paper relates to the 2013 OECD Economic Review of New Zealand (www.oecd.org/eco/surveys/New_Zealand).
2013	R10	Canarella, Giorgio, Stephen M. Miller, and Stephen K. Pollard. 2013. <i>Unemployment Rate Hysteresis and the Great Recession: Exploring the Metropolitan Evidence</i>. University of Connecticut, Department of Economics, Working papers: 2013-19. This paper explores the mean-reverting behavior of the unemployment rate using monthly geographically disaggregated data for the period 1991:01 through 2012:02. We apply both standard unit-root tests and tests that allow for one and two structural breaks in the mean. We find evidence that favors both unit-root and stationary processes. No series exhibits stationarity around a constant mean, which does not support the traditional natural-rate hypothesis, but about half of the series exhibit stationarity around a shifting mean. For these series, we find that the break occurs at the Great Recession. To complement the unit-root analysis, we also examine the behavior of the series using the Bai and Perron methods to detect multiple regimes at unknown points of time. We find that the Great Recession also altered the persistence of the unemployment rate series over the identified regimes. In general, the values of the estimated persistence within regimes decrease between those regimes, implying faster absorption of shocks later in the sample period.
2013	Z11	Vinodrai, Tara. 2013. "Design in a Downturn? Creative Work, Labour Market Dynamics and Institutions in Comparative Perspective." <i>Cambridge Journal of Regions, Economy and Society</i>, 6(1): 159-76. This article examines how creative workers are adapting to the global economic downturn and how this process is unfolding in different national and regional institutional spaces. The article draws upon a comparative study of design work in two urban settings in advanced capitalist economies (Toronto, Canada and Copenhagen, Denmark) to explore this question. It demonstrates that the strategies taken by creative workers to respond to changing economic conditions are actively shaped and constrained by their geographic and institutional contexts. The article underscores that the existing national and regional institutions provide the foundation for the future possibilities, welfare and prosperity of creative workers.

Table E25.F Examples of Publications according to New Links in 2006—2013

Year	DE	Title and Abstract
2006		
2006	B25	CV: Bhaduri, Amit. 2006. "The Role of Income Distribution in Long Run Endogenous Growth." In <i>Economic Growth and Distribution: On the Nature and Causes of the Wealth of Nations</i> , ed. Neri Salvadori, 40-57. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2006	B50	CV: Taylor, Lance, Nelson H. Barbosa-Filho, and Codrina Rada. 2006. "Heterodox Business Cycles." In <i>Economic Growth and Distribution: On the Nature and Causes of the Wealth of Nations</i> , ed. Neri Salvadori, 291-310. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2006	B50	CV: Foley, Duncan K., and Lance Taylor. 2006. "A Heterodox Growth and Distribution Model." In <i>Economic Growth and Distribution: On the Nature and Causes of the Wealth of Nations</i> , ed. Neri Salvadori, 75-99. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2006	B52	CV: De-Juan, Oscar. 2006. "A Dynamic AGE Model from a Classical-Keynesian-Schumpeterian Approach." In <i>Economic Growth and Distribution: On the Nature and Causes of the Wealth of Nations</i> , ed. Neri Salvadori, 271-90. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2006	C53 G12	Hahn, Jaehoon, and Hangyong Lee. 2006. "Interpreting the Predictive Power of the Consumption-Wealth Ratio." <i>Journal of Empirical Finance</i> , 13(2): 183-202. Lettau and Ludvigson [Lettau, M., Ludvigson, S. C., 2001a. Consumption, aggregate wealth and expected stock returns. <i>Journal of Finance</i> 56, 815-849] find that the estimated consumption-wealth ratio (cay) is a strong predictor of U.S. stock returns, while Brennan and Xia [Brennan, M. J., Xia, Y., 2005. tay's as good as cay. <i>Finance Research Letters</i> 2, 1-14] argue that the predictive power of cay arises from a look-ahead bias. In a unified framework, we examine how the presence of deterministic time trends affects the estimation and forecasting power of cay. We show that ignoring the presence of a deterministic time trend in estimating the cointegrating relationship among consumption, asset wealth, and labor income leads to a biased estimate of the consumption-wealth ratio. In the presence of a deterministic time trend, cay is a combination of the highly persistent bias component and the unbiased cointegrating residual, and most of the predictive power of cay is attributable to the bias component, casting doubt on the robustness of the forecasting power of cay.
2006	F30	Rochon, Louis-Philippe, and Sergio Rossi, eds. 2006. <i>Monetary and Exchange Rate Systems: A Global View of Financial Crises</i> , Cheltenham, U.K. and Northampton, Mass.: Elgar. Twelve papers explore the causes and consequences of financial crises and provide some original solutions on how to restructure the financial system, national as well as international, and on how to avoid these crises in the future. Papers discuss international financial instability in a world of currencies hierarchy (Andrea Terzi); dollarization and the hegemonic status of the U.S. dollar (Jean-Francois Ponsot); reform and structural change in Latin America—financial systems and instability (Eugenia Correa and Gregorio Vidal); East Asian monetary and financial cooperation—the long road ahead (Kok-Fay Chin); whether financial liberalization affects the distribution of income between wages and profits (Domenica Tropeano); crisis avoidance—the post-Washington Consensus agenda (Louis-Philippe Rochon); reforming the international payment system—an assessment (Claude Gnos); whether there is a role for capital controls (Philip Arestis, Jesus Ferreiro, and Carmen Gomez); liberalization or regulating international capital flows (Paul Davidson); cross-border transactions and exchange rate stability (Sergio Rossi); to fix or to float—theoretical and pragmatic considerations (L. Randall Wray); and exchange rate arrangements and European Union enlargement (Jesper Jespersen).
2006	G12	Santos, Tano, and Pietro Veronesi. 2006. "Labor Income and Predictable Stock Returns." <i>Review of Financial Studies</i> , 19(1): 1-44. We propose a novel economic mechanism that generates stock return predictability in both the time series and the cross-section. Investors' income has two sources, wages and dividends that grow stochastically over time. As a consequence the fraction of total income produced by wages fluctuates depending on economic conditions. We show that the risk premium that investors require to hold stocks varies with these fluctuations. A regression of stock returns on lagged values of the labor income to consumption ratio produces statistically significant coefficients and large adjusted R ² s. Tests of the model's cross-sectional predictions on the set of 25 Fama-French portfolios sorted on size and book-to-market are also met with considerable support.

In a capitalist economy where profits are fully saved and wages fully spent in consumption goods, Kalecki's law asserts that the rate of profit is

Year	DE	Title and Abstract
		equal to the rate of capital accumulation. The divorce between these two variables, as observed during the last twenty years in the US as well as in France, raises a puzzle in this framework. We show that the spectacular augmentation of profit distribution partly provides an account of this, at a theoretical level. We give further indications as to how new corporate governance and the institution of stockholders renewed power have taken part in this phenomena.

2006	H63	Michl, Thomas R. 2006. "Capitalists, Workers, and the Burden of Debt." <i>Review of Political Economy</i> , 18(4): 449-67. This paper analyzes the burden of debt in a growth model that combines overlapping generations of workers who save for life-cycle reasons and dynastic agents who save for bequest reasons ('capitalists'). Ricardian Equivalence prevails, but capitalists regard the debt serviced out of taxes on workers as net wealth. In the long run, the Cambridge Theorem holds: the relationship between the rate of profit and rate of growth is determined by the capitalist saving function, independently of worker or government saving. Two alternative closures are considered. Under exogenous growth constrained by a fully employed labor force, debt and deficits result in temporary effects on the distribution of income but permanent effects on the distribution of wealth. Under endogenous growth constrained by a fully utilized capital stock, debt and deficits result in temporary effects on the growth rates of the components of wealth and permanent effects on the level and distribution of capital.
2006	J11	Cottrell, Allin, and Paul Cockshott. 2006. "Demography and the Falling Rate of Profit." <i>Indian Development Review</i> , 4(1): 39-59. We discuss the original formulation of the theory of the falling rate of profit by Marx and the criticisms of the theory's micro-foundations by Roemer. We then counterpose to this an alternative macroeconomic interpretation in which the falling rate of profit is driven by demographic factors. We follow this up with an examination of why the assumptions made in Roemer's analysis are empirically unjustified. In particular we criticize his use of the average rate of profit rather than the monetary interest rate as the regulator of investment decisions. We conclude with an examination of the social implications of a declining rate of profit.

2006	J58	Posen, Adam, and Daniel Popov Gould. 2006. <i>Has EMU had any Impact on the Degree of Wage Restraint?</i> . CESifo GmbH, CESifo Working Paper Series: CESifo Working Paper No. 1783. We find in cross-sectional investigations that wage restraint is either unchanged or increased following EMU in the vast majority of countries. This contradicts the predictions of a widely-cited family of models of labor market bargaining. In those, Germany would have been expected to display the greatest decline in wage restraint post-EMU, and we find no indication of such a decline. The time-series evidence on Italy shows a significant increase in wage restraint after eurozone entry. This pattern is consistent with the models that emphasise the gains from monetary credibility. The eurozone increase in wage restraint is matched by the increase seen in the UK and Sweden after adopting inflation targeting, another means to credibility.
2006	N33 N43	Galor, Oded, and Omer Moav. 2006. "Das Human-Kapital: A Theory of the Demise of the Class Structure." <i>Review of Economic Studies</i> , 73(1): 85-117. This paper suggests that the demise of the capitalists-workers class structure was a socio-economic transformation orchestrated by the capitalists in reaction to the increasing importance of human capital in sustaining their profit rates. Physical capital accumulation in the process of industrialization enhanced the importance of human capital in production and generated incentives for capitalists to support the provision of public education for the masses, triggering the demise of the existing class structure. The implications of the theory are consistent with the voting patterns on England's education reform of 1902.

2006	Z13	Salvadori, Neri, ed. 2006. <i>Economic Growth and Distribution: On the Nature and Causes of the Wealth of Nations</i> . Cheltenham, U.K. and Northampton, Mass.: Elgar. Sixteen papers, resulting from a conference held in Lucca in the summer of 2004, explore different approaches to the issues of economic growth and distribution and their theoretical, empirical, historical, and methodological implications. Papers discuss inequality and the process of development; the role of income distribution in long-run endogenous growth; the competition-of-capitals doctrine and the wage-profit relationship; a heterodox growth and distribution model; distribution and growth in a post-Keynesian stock-flow consistent model; technological progress, income distribution, and capacity utilization; demand-led growth and the classical approach to value and distribution--whether they are compatible; macroeconomic volatility and income inequality in a stochastically growing economy; the saving-investment nexus in the debate on pension reforms; income distribution and output change--a macro multiplier approach; a dynamic applied general equilibrium model from a classical-Keynesian-Schumpeterian approach; heterodox business cycles; technological innovation, financial fragility, and complex dynamics; growth, history, and institutions; religious culture, institutions, and growth; and trade, poverty, and growth--two perspectives, one message.

2007	C73 C92	Greiner, Ben, Axel Ockenfels, and Peter Werner. 2007. <i>The Dynamic Interplay of Inequality and Trust--An Experimental Study</i> . Harvard Business School, Working Papers: 08-026. We study the interplay of inequality and trust in a dynamic game, where trust increases efficiency and thus allows higher growth of the experimental economy in the future. We find that trust is initially high in a treatment starting with equal endowments, but decreases over time. In a treatment with unequal endowments, trust is initially lower yet remains relatively stable. The difference seems partly due to the fact that equal start positions increase subjects' inclination to condition their trust decisions on wealth comparisons, whereas conditional trust is much less prevalent with unequal initial endowments. As a result, with respect to efficiency, the initially more unequal economy fares worse in the short run but better in the long run, and the disparity of wealth distributions across economies mitigates over time.
2007	E27	Griffiths, David T. 2007. "Forecasting Income Shares: Are Mean-Reversion Assumptions Appropriate?" <i>Applied Economics</i> , 39(19-21): 2699-2711. The article examines some statistical evidence that supports the view that US labour and capital shares of income return to some long-run historical values. We estimate the long-run share values and the length of time it takes to converge to them. We account for the interdependence of the shares by using a vector error-correction model, and this specification is tested against a VAR alternative using Johansen's method to characterize the properties of the cointegrating vector. We find support for the idea that labour and capital shares have historically been mean reverting, in spite of the fairly restrictive assumptions implied when invoking the Cobb-Douglas production function as the rationale. The cumulative impulse response functions indicate that for capital and labour shares, the time required to revert back to long run levels is in the order of thirty quarters.
2007	H20 H31 H71 J81 N93	Munro, John. 2007. <i>The Usury Doctrine and Urban Public Finances in Late-Medieval Flanders: Annuities, Excise Taxes, and Income Transfers from the Poor to the Rich</i> . University of Toronto, Department of Economics, Working Papers. The objectives of this paper are three-fold. The first is to rebut Charles Kindleberger's famous dictum that usury 'belongs less to economic history than to the history of ideas'; and in particular to demonstrate that the resuscitation of the anti-usury campaign from the early 13th century led to a veritable financial revolution in late-medieval French and Flemish towns: one that became the 'norm' in modern European states from the 16th century (in England, from 1693): a shift in public borrowing from interest-bearing loans to the sale of annuities, usually called rentes or renten. That anti-usury campaign had two major features: (1) the decrees of the Fourth Lateran Council of 1215, which provided harsh punishments - excommunication--for both unrepentant usurers and princes who failed to suppress them; and (2) the establishment of the two mendicant preaching orders: the Franciscans (1210) and the Dominicans (1216), whose monks preached hellfire and eternal damnation against all presumed usurers - including, of course, anyone who received any interest on government loans. There is much evidence that from the 1220s, many financiers in many French and Flemish towns, fearing for their immortal souls, preferred to accept far lower returns on buying rentes than the interest they would have earned on loans. These rentes, based on 8th-century Carolingian census contracts, had two basic forms: (1) life-annuities, by which a citizen purchased from the government, with a lump sum of capital, an annual income stream lasting a lifetime, or the lifetime of his wife as well; (2) perpetual annuities, by which the annual income stream was indeed perpetual, or until such time as the government chose to redeem the rentes, at par. Initially, some theologians opposed sales of rentes as subterfuges to cloak evasion of the usury doctrine. But in 1250-1, Pope Innocent IV declared them to be non-usurious contracts, essentially because they were not loans. Subsequent popes in the 15th century confirmed his views and the non-usurious character of rentes, on two conditions: (1) that the buyer of the rente could never demand redemption or repayment, and (2) that the annual annuity payments (and any ultimate redemptions) be in accordance with actual rent contracts: i.e., that the funds be derived from the products of the land. Ecclesiastical authorities soon agreed that taxes on the consumption of the products of the land (and sea) met this test: i.e., taxes on beer and wine (which always accounted for the largest share), bread, textiles, fish, meat, dairy products, etc. The second objective of this paper is to measure the importance of renten in the civic finances of Flemish towns, in terms of both revenues and expenditures: from the annual town accounts Ghent (14th century only), and Aalst (1395-1550), where they had far greater importance. The related third objective is to measure the burden of the excise taxes for master building craftsmen in Aalst, in tables that measure the values of the excise tax revenues expressed in real terms: first, in the equivalent number of 'baskets of consumables' (which form of the base of the Consumer Price Index), and second their value in terms of the annual money-wage incomes of master masons (for 210 days). This provides an entirely new look at the late-medieval 'standard of living' controversy - with indications that this consumption-tax burden sometimes rose from about 13,200 to almost 30,000 days' wage income, for a town of perhaps 3600 inhabitants (but obviously less dramatic on a per capita basis). That tax burden rose the most strongly when, by other indications, real wages (RWI = NWI/CPI) were also finally rising; and thus possibly these real wage gains were largely eliminated. That per capita tax burden would have been all the greater if, in the course of the 15th century, Aalst had experienced the same decline as did small towns of Brabant, to the east, on the order of 25%, and some other Flemish towns, in which the population decline varied from 9% to 28%. In earlier publications I had challenged the widespread view that the era following the Black Death, with a radical change in the land:labour ratio, came to be a 'Golden Age' of the artisan and labourer. I contended instead that frequent inflations eroded or eliminated wage gains, and thus that periodic rises in real wages were due essentially to steep deflations combined with pronounced wage-stickiness. As I also calculated, English artisans in the 1340s had earned real wages that were about 50% of the Flemish; but by the 1480s, they had narrowed that gap (with much less inflation) to about 80%. That gap was probably even smaller, until the 1640s, when England's Parliament finally imposed similar excise taxes on consumption.

Year	DE	Title and Abstract
		scale Overlapping Generations model with uninsurable labor productivity and mortality risk to quantify the impact of the demographic transition towards an older population in industrialized countries on world-wide rates of return, international capital flows and the distribution of wealth and welfare in the OECD. We find that for the U.S. as an open economy, rates of return are predicted to decline by 86 basis points between 2005 and 2080 and wages increase by about 4.1%. If the U.S. were a closed economy, rates of return would decline and wages increase by less. This is due to the fact that other regions in the OECD will age even more rapidly; therefore the U.S. is "importing" the more severe demographic transition from the rest of the OECD in the form of larger factor price changes. In terms of welfare, our model suggests that young agents with little assets and currently low labor productivity gain, up to 1% in consumption, from higher wages associated with population aging. Older, asset-rich households tend to lose, because of the predicted decline in real returns to capital.

With English summary)." <i>Revista de Economia Política/Brazilian Journal of Political Economy</i>, 27(4): 616-32. This article argues that workers' share in profits are actually a share in extra surplus value obtained by means of more intensified labor. Cost reductions obtained by means of more intensified lean production methods cause wages to represent a smaller fraction of the product of a working day when measured at market value. The increased market rate of surplus value is the basis for workers' shares in profits. However, as competition continuously levels out such advantages, the share in profits becomes dependent on a continuous striving to reducing costs and intensifying labor.

2007	O21	Venida, Victor S. 2007. "Marxian Categories Empirically Estimated: The Philippines, 1961-1994." <i>Review of Radical Political Economics</i>, 39(1): 58-79. The article uses a formal model to estimate rates of surplus creation and use for the Philippines. Input-output tables from 1961 to 1994 were used in the estimation. The theoretical framework was the model of social disarticulation, which argued that income inequality and labor surplus resulted in substantial rates of surplus. Results for the Philippines confirmed these arguments and also suggested that a large portion of the surplus might have been devoted to unproductive purposes.
2007	Q15	Messori, Flavio. 2007. "Patrimonializzazione e vitalita dell'agricoltura italiana. (Property Accumulation and Vitality in Italian Agriculture. With English summary)." <i>Rivista di Economia Agraria</i>, 62(1): 33-64. The strong growth in labour productivity and accumulation of wealth in real estate on the hand, simultaneous with the fall in the wage of dependent labour relative to income of independent labour and small firms on the other side signals that the agricultural sector is undergoing an intense process in which there is a transformation of revenues into property capital (real estate and land values)--as there is in the economy on the whole. This paper presents an argument in which land rent is at the centre of a mechanism where land capital becomes the target of income distribution. Moreover, the survival and development of the agricultural sector is explained more by land values than by land productivity. The argument projects a well-known feature of agricultural livelihood at the micro level to the aggregate or macro level.
2007	Q41	Caceres F., Gladys, and Helena Hernandez V. 2007. "La Ley de Asignaciones Economicas Especiales y su papel en la distribucion de los ingresos fiscales petroleros (1998-2006). (The Special Economic Allocations Law and Its Role in the Oil Fiscal Income Distribution [1998-2006]. With English summary)." <i>Economia (Universidad de Los Andes): Nueva Etapa</i>, 32(23): 9-26. The new realities cause that the economic policies head, more and more, towards highest levels of productivity and efficiency. It is also necessary to apply this general condition to an economic issue of vital importance as it is the income distribution. In this preliminary study of the Venezuela's characteristics and particularities of the distribution of incomes provided by the international hydrocarbon market, the allocation of income according to the Law of Special Economic Allocations is compared with the expenses made in transport and communications, education, culture, science and technology, housing and health, in a sample of oil and non-oil states during the 1998-2006 period.

2008	C32	Juselius, Mikael. 2008. "Long-Run Relationships between Labor and Capital: Indirect Evidence on the Elasticity of Substitution." <i>Journal of Macroeconomics</i>, 30(2): 739-56. This paper proposes an indirect method for making empirical inference on the elasticity of substitution between capital and labor. The idea is that estimates of the elasticity may be retrievable from theory derived behavioral equations, by conducting comparative statics with respect to this parameter. This approach is readily applicable to more realistic models than those which are commonly used to derive estimates of the substitution elasticity. It is demonstrated that the conventional approach does not yield sensible estimates on quarterly Finnish manufacturing data. By applying the indirect method, a long-run empirical relationship is found that is consistent with an elasticity of substitution below one.

2008	C33	Smith, James. 2008. "That Elusive Elasticity and the Ubiquitous Bias: Is Panel Data a Panacea?" <i>Journal of Macroeconomics</i>, 30(2): 760-79. There is often assumed to be a unit elasticity of substitution between capital and labour. But estimates based on neoclassical capital demand equations frequently find a smaller value. Recent time-series work for the United States and Canada has suggested that, once the biases inherent in estimating cointegrating vectors are properly accounted for, the elasticity could indeed be close to 1. We investigate this possibility for the United Kingdom. First we use aggregate data and find that the estimated elasticity is in the neighbourhood of 0.4. We then exploit a unique industry-level dataset for the United Kingdom to try and further pinpoint our estimates. Estimates using dynamic panel data methods are close to our benchmark estimate using aggregate data, providing a robust statistical rejection of a unit elasticity in UK data.

2008	G18 N20	Vollrath, Dietz. 2008. <i>Agrarian Structure and Endogenous Financial System Development</i>. Department of Economics, University of Houston, Working Papers: 2008-02. The development of the financial system is shown, both historically and in contemporary data, to be adversely affected by inequality in the distribution of land. To accommodate these empirical findings, a theory is developed that highlights the incentives of landowners to oppose competition in the financial sector. The theory provides an explanation for the co-incident development of the financial sector and overall economy.
2008	G20 O25	Bruno, Miguel. 2008. "Regulation et Croissance Economique au Bresil apres la liberalisation: Un regime d'accumulation bloque par la finance. (With English summary)." <i>Revue de la Regulation</i>, 0(3-4). At the end of the 80s, in the context of the exhaustion of growth regime based on import substitution, trade, and financial liberalization policies started to be presented gradually by the government and many experts as necessary to achieve the structural conditions for the economic development of Brazil. However, after almost two decades of adherence to the ideology of globalization, three main trends emerge from a long-term analysis: declining trend in the relative participation of productive capital in the total stock of fixed capital; rapid expansion of financial income, which reaches an average of 29% of gross disposable income during the period 1993/2005, an extremely high financial burden on total income; the corollary of this high financial burden is the trend towards a regime of slow economic growth coupled with a persistent flexibilization of wage-labor nexus and an increase of the functional income concentration. In order to understand the causes of that macroeconomic performance, which is surprisingly lower than the national historic average, this paper proposes an analysis of the period that followed the market liberalization policies by using the basic concepts and methodology of the regulation theory.
2008	J15	Kahanec, Martin, and Klaus F. Zimmermann. 2008. <i>Migration, the Quality of the Labour Force and Economic Inequality</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 6899. Mobility of workers involves flows of labour, human capital and other production factors and thus contributes to a more efficient allocation of resources. Besides these effects on allocative efficiency, migrant flows affect relative wages and also change the international and national distribution of skills and thereby equality in the receiving society. This paper suggests that skilled immigration promotes economic equality in advanced economies under standard conditions. The context is theoretically explained in a core model and empirically documented using unique data from the WIID database and OECD.

With English summary)." <i>Jingji Yanjiu/Economic Research Journal</i>, 43(2): 106-18. Based on a new data set about individual factor payments, we estimate the national income distribution by integrating individual factor income distribution for 28 provinces between 1978 and 2002. The characteristic and mechanism of the dynamics of the national factor income distribution are documented. The whole national income distributions shift to the right over time, but gradually move toward the bimodal distribution, which visualize the picture of the polarization of income. We also find the bimodal distribution can attribute to the across-sector difference in marginal product of labor, and that other kinds of difference in marginal product also distort the national income distribution substantially, the magnitude ranged from 2% to 15%. Our findings are robust, and may shed highlights on the direction of the ongoing income system reform in China.

2008	P36	Peng, Shuang, and Xiaodong Ye. 2008. "The Evolution of China's National Income Distribution." <i>China Economist</i>, 0(17): 131-42. Since 1978, great transformation has taken place in China's economy and in the distribution of its national income. Income distribution is pertinent to people's immediate interests, to enterprises, and to government agencies, and hinges upon development efficiency, social equality, and the creation of a harmonious society. Considering this, this paper presents an analysis of the patterns of primary and secondary distribution of China's national income and the evolution of the internal income distribution patterns of various economic entities since 1978, offering subsequent recommendations on policy adjustment.
2008	Q24	Bilancini, Ennio, and Simone D'Alessandro. 2008. "Functional Distribution, Land Ownership and Industrial Takeoff: The Role of Effective Demand." <i>B.E. Journal of Economic Analysis and Policy: Contributions to Economic Analysis and Policy</i>, 8(1). In this paper we analyse how the distribution of land property rights affects industrial takeoff and aggregate income through its impact on effective demand. We apply a modified version of the model provided in Murphy et al. (1989, QJE) which allows us to analyse the role of land distribution when it is independent of the distribution of firm ownership. We extend the result of Murphy et al. (1989, QJE) by showing that industrialization and income depend non-monotonically on the distribution of land and by demonstrating that this result is due to the way land distribution affects the distribution of profits among firms. Moreover, we show that there may be a tradeoff between industrialization and income, the latter being associated with a distribution of land which is more equal than that associated with maximum industrialization.
2008	R10	Buch, Claudia M., Paola Monti, and Farid Toubal. 2008. <i>Trade's Impact on the Labor Share: Evidence from German and Italian Regions</i>. Institut für Angewandte Wirtschaftsforschung (IAW), IAW Discussion Papers: 46. Has the labor share declined? And what is the impact of international trade? These questions are not only relevant in an international context they also matter for understanding the regional distribution of incomes in a given country. In this paper, we study two regions with trade exposures that differ from the rest of the country, and which display distinct changes in the labor share. East German and Southern Italian regions have a degree of international openness which is below the countries' averages. At the same time, there has been a more pronounced decline in the labor share in East Germany than in West Germany. In Southern Italy, the labor share has increased in recent years. We show that increased trade openness is not the main culprit behind changing labor shares.

2009	E00	Feyrer, James. 2009. <i>The US Productivity Slowdown, the Baby Boom, and Management Quality</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 15474. This paper examines whether management changes caused by the entry of the baby boom into the workforce explain the US productivity slowdown in the 1970s and resurgence in the 1990s. Lucas (1978) suggests that the quality of managers plays a significant role in determining output. If there is heterogeneity across workers and management skill improves with experience, an influx of young workers will lower the overall quality of management and lower total factor productivity. Census data shows that the entry of the baby boom resulted in more managers being hired from the smaller, pre baby boom cohorts. These marginal managers were necessarily of lower quality. As the boomers aged and gained experience, this effect was reversed, increasing managerial quality and raising total factor productivity. Using the Lucas model as a framework, a calibrated model of managers, workers, and firms suggests that the management effects of the baby boom may explain roughly 20 percent of the observed productivity slowdown and resurgence.
2009	F36	Stockhammer, Engelbert, Ozlem Onaran, and Stefan Ederer. 2009. "Functional Income Distribution and Aggregate Demand in the Euro Area." <i>Cambridge Journal of Economics</i>, 33(1): 139-59. An increase in the wage share has contradictory effects on the subaggregates of aggregate demand. Private consumption expenditures ought to increase because wage incomes typically are associated with higher consumption propensities than capital incomes. Investment expenditures ought to be negatively affected because investment will positively depend on profits. Net exports will be negatively affected because an increase in the wage share corresponds to an increase in unit labour costs and thus a loss in competitiveness. Therefore, theoretically, aggregate demand can be either wage-led or profit-led depending on how these effects add up. The results will crucially depend on how open the economy is internationally. The paper estimates a post-Kaleckian macro model incorporating these effects for the Euro area and finds that the Euro area is presently in a wage-led demand regime. Implications for wage policies are discussed.
2009	I11	Gordon, Robert J. 2009. "Has the Rise in American Inequality Been Exaggerated?" <i>Challenge</i>, 52(3): 92-120. The author argues that, with proper adjustments, the conventional view about the rise in inequality has been exaggerated. Indeed, in recent periods, most of the inequality can be attributed to gains by a small proportion of very high-income individuals. He proposes a variety of aggressive policies to counteract the levels of inequality found by his analysis.

2009	J16	Zacharias, Ajit, and Melissa Mahoney. 2009. "Do Gender Disparities in Employment Increase Profitability? Evidence from the United States." <i>Feminist Economics</i>, 15(3): 133-61. This paper investigates whether the contribution of the declining share of wages in national income to the upswing in profitability between 1982 and 1997 in the United States was aided by the growing incorporation of women into employment. The analysis finds that women helped moderate the decline in the aggregate wage share. The reduction in gender pay disparity overwhelmed the negative effect of women's growing share of market work on the wage share. However, in (one-digit) sectors where wage shares fell, women did not contribute to restraining the fall, indicating that the aggregate outcome was the net result of distinct sectoral trends in women's employment conditions. We argue that the perverse process of labor productivity falling faster than the real wage in the service sector may have played a key role in shaping the aggregate outcome. The post-1997 trends in the US are discussed in a postscript.

2010	C52	Scheufele, Rolf. 2010. "Evaluating the German (New Keynesian) Phillips Curve." <i>North American Journal of Economics and Finance</i>, 21(2): 145-64. This paper evaluates the New Keynesian Phillips curve (NKPC) and its hybrid variant within a limited information framework for Germany. The main interest resides in the average frequency of price re-optimization by firms. We use the labor income share as the driving variable and consider a source of real rigidity by allowing for a fixed firm-specific capital stock. A GMM estimation strategy is employed as well as an identification robust method based on the Anderson-Rubin statistic. We find that the German Phillips curve is purely forward-looking. Moreover, our point estimates are consistent with the view that firms re-optimize prices every 2-3 quarters. These estimates seem plausible from an economic point of view. But the uncertainties around these estimates are very large and also consistent with perfect nominal price rigidity, where firms never re-optimize prices. This analysis also offers some explanation as to why previous results for the German NKPC based on GMM differ considerably. First, standard GMM results are very sensitive to the way in which orthogonality conditions are formulated. Further, model misspecifications may be left undetected by conventional J tests. This analysis points out the need for identification robust methods to get reliable estimates for the NKPC.
2010	D02	Hall, John, and Udo Ludwig. 2010. "Neo-liberalism, the Changing German Labor Market, and Income Distribution: An Institutional and Post Keynesian Analysis." <i>Journal of Economic Issues</i>, 44(2): 345-57. This inquiry relies on an Institutional and Post Keynesian analysis to explore Germany's neo-liberal project, noting cumulative effects emerging as measurable economic and societal outcomes. Investments in technologies generate rising output-to-capital ratios. Increasing exports offset the Domar problem, but give rise to capital surpluses. National income redistributes in favor of capital. Novel labor market institutions emerge. Following Minsky, good times lead to bad: as seeming successes of neo-liberal policies are accompanied by financial instability, growing disparities in household incomes, and sharp declines in German exports on world markets, resulting in one of the deepest, recent contractions in the industrialized world.

		forward between 1980 and 2008. We focus on the robustness of the results when attributing different weights to the different dimensions. Population-weighted international welfare has not worsened over this period. However, the trend in the underlying inequality is ambiguous, once sufficient weight is given to longevity and/or income.
2010	D82	Bental, Benjamin, and Dominique Demougin. 2010. "Declining Labor Shares and Bargaining Power: An Institutional Explanation." <i>Journal of Macroeconomics</i>, 32(1): 443-56. We model the design of labor market institutions in an economy characterized by moral hazard and irreversible investment. In this setting, the environment setting affects the bargaining power of labor. At the optimum the allocation of bargaining power balances the aforementioned frictions. We examine the impact of improved monitoring and investigate the implication upon labor share, effort and investment. The model's predictions are consistent with recent decreasing labor shares and wages per effective labor units observed in most OECD countries. It is also consistent with rising labor productivity and declining ratio between effective labor and capital found in many of these countries.
2010	F54	Fuchs, Christian. 2010. "Critical Globalization Studies: An Empirical and Theoretical Analysis of the New Imperialism." <i>Science and Society</i>, 74(2): 215-47. Affirmative globalization studies stress positive aspects of global capitalism, while critical globalization studies use notions such as "Empire" and "new imperialism" to analyze the global economy's negativity. Critical globalization studies, however, frequently lack a precise theoretical notion of imperialism. This absence can be corrected by connecting the notion of a "new imperialism" to the classical theory of imperialism, as found in Lenin's canonical work. Empirical analysis of data from recent decades shows that Lenin's approach remains broadly correct, and that adaptation of his method to new realities strengthens the theoretical foundation of recent work on global capitalism.
2010	G01	Gezici, Armagan. 2010. "Distributional Consequences of Financial Crises: Evidence from Recent Crises." <i>Review of Radical Political Economics</i>, 42(3): 373-80. The paper examines the distributional consequences of financial crises based on the lessons of the past crises experiences of Argentina, Brazil, Korea, Mexico, and Turkey. It identifies the possible channels through which crises may affect functional and personal distribution of income. It concludes that the crises of the last two decades have both pro-capital and pro-finance distributional outcomes.
2010	G01	Figueroa Sepulveda, Victor M. 2010. "La crisis global. Viejas y nuevas contradicciones. (With English summary)." <i>Problemas del Desarrollo</i>, 41(161): 193-211. The author argues in this article that the present crisis is unusual in that it involves two distinct and profound contradictions. On the one hand, inherent conflicts related to capital have appeared. In this sense, the causes of the present crisis are fundamentally no different from those that gave rise to the great convulsions of the 20th century. All crises speak of class relations that obstruct production because they lead to a fall in profits. However, on the other hand, today capital has entered a sharp contradiction with nature, completely conditioning the route that will have to be followed to achieve a durable solution to the problems faced by accumulation. In the past, every new period of growth was based on technological changes that supported both the redefinition of class relations and a greater exploitation of nature. Today, a sustainable industrial design must include the protection of the environment.
2010	G01	Bricall, Josep. 2010. "An Approach to the Breaks in the Accumulation Process." <i>Economie Appliquee</i>, 63(1): 5-34. The production process launched by the investment by one hand reproduce the financial resources borrowed and, by the other, renew and modify the technical conditions of production in order to extract the profits. Any serious trouble in one of these effects breaks the continuity of the accumulation because of their consequences upon the investment. Two of these breaks deserve some attention. The first occurs when it is not possible to sufficiently overcome the production capacity of an economy: this creates difficulties for its profitability. It is the case in the crisis that occurred in the late nineteenth century and the one that began in the late sixties of the last century. The second is a consequence of a disorder in the financial system. It characterizes the depression in the thirties of the twentieth century and the present crisis.
2010	G01 G24	Acemoglu, Daron, Kenneth Rogoff, and Michael Woodford, eds. 2010. <i>NBER Macroeconomics Annual 2009</i>, Chicago and London: University of Chicago Press. Seven papers, with comments, raise policy-relevant questions and highlight new development in macroeconomic analysis, focusing mainly on the sources of the recent financial crisis and possible policy responses to it. Papers discuss the leverage cycle (John Geanakoplos); reducing foreclosures--no easy answers (Christopher Foote, Kristopher Gerardi, Lorenz Goette, and Paul Willen); the credit rating crisis (Efraim Benmelech and Jennifer Dlugosz); a quantitative analysis of the evolution of the U.S. wage distribution--1970-2000 (Fatih Guvenen and Burhanettin Kuruscu); noisy business cycles (George-Marios Angeletos and Jennifer La'O); letting different views about business cycles compete (Paul Beaudry and Bernd Lucke); and the financial crisis and the Federal Reserve (Frederic S. Mishkin).
2010	L66 R32	Olsen, Erik K. 2010. "Class Conflict and Industrial Location." <i>Review of Radical Political Economics</i>, 42(3): 344-52. This paper examines the effect of class conflict on industrial location both theoretically and empirically. It demonstrates that there is a sound theoretical basis and empirical support for the conclusion that U.S. industries have chosen to abandon agglomeration and scale economies in order to secure a distribution of income that favors capital at the expense of labor. The decline of the U.S. manufacturing belt is examined with reference to union density, bargaining power, and the effects that large-scale production plants have on these factors. The meat packing industry in the postwar United States serves as a case study to establish the specific ways that class conflict has shaped the scale profile and geographic distribution of production plants. The paper builds upon the class conflict approach to urban and regional economics pioneered by Matthew Edel and David Gordon and aims to demonstrate its explanatory power.
2010	N16	Marquetti, Adalmir, Eduardo Maldonado Filho, and Vladimir Lautert. 2010. "The Profit Rate in Brazil, 1953-2003." <i>Review of Radical Political Economics</i>, 42(4): 485-504. This paper investigates the profit rate in Brazil between 1953 and 2003. There was a tendency for the profit rate to fall during the period under study determined mainly by the declining productivity of capital. There were three phases in the behavior of the profit rate. In the first phase, between 1953 and 1973, it slowly declined; in the second, from 1973 to late 1980s, it fell sharply; in the third, from late 1989 to 2003, it increased moderately. These phases correspond to the institutional arrangements of the Brazilian economy, respectively, to the import substitution industrialization (ISI) during the golden age of capitalism, to the crisis and rupture of ISI, and to neoliberalism.
2010	N36	Frankema, Ewout. 2010. "Reconstructing Labor Income Shares in Argentina, Brazil and Mexico, 1870-2000." <i>Revista de Historia Economica</i>, 28(2): 343-74. The labor income share in national income is a good indicator of the extent to which the working classes are able to reap the fruits of economic growth or, conversely, bear the burden of economic stagnation. This paper aims to reconstruct the labor income share of Argentina, Brazil, and Mexico in a three-sector framework, including the rural, the urban formal, and the urban informal sectors. We find that in all three countries the share of labor earnings peaked in the middle of the 20th century. Fluctuations in the Brazilian and Mexican labor income shares were large, with a sharp decline in the post-1961 and post-1976 periods, respectively. In Argentina, the labor income shares tended to be more constant at levels around 50 per cent, testifying to a more stable and egalitarian distribution of income.

2011	C14	Eusepi, Stefano, Bart Hobijn, and Andrea Tambalotti. 2011. "CONDI: A Cost-of-Nominal-Distortions Index." <i>American Economic Journal: Macroeconomics</i>, 3(3): 53-91. We construct a PCE-based price index whose weights minimize the welfare costs of nominal distortions: a cost-of-nominal-distortions index. We compute these weights in a multi-sector New Keynesian model, calibrated to match US data on price stickiness, labor shares, and inflation across sectors. The CONDI weights mostly depend on price stickiness. Moreover, CONDI stabilization leads to negligible welfare losses compared to the optimal policy and is better approximated by core rather than headline inflation targeting. An even better approximation can be obtained with an adjusted core index.
2011	E02	Deutschmann, Christoph. 2011. "A Pragmatist Theory of Capitalism." <i>Socio-Economic Review</i>, 9(1): 83-106. This article explores the potential of pragmatist social theory (Dewey and Mead) for elaborating and clarifying the classical analyses of capitalism by Marx, Schumpeter, Sombart and Weber. It shows how a reinterpretation in the context of pragmatist discourse can overcome the rationalist shortcomings of Weber's theory of capitalism and formulate key Marxist concepts like 'capital' or 'reification' more convincingly. It also outlines a multi-level approach for analysing the dynamics of capitalism, focusing on the interaction between class structures, individual creativity and the communication of innovative paradigms.
2011	E02	Block, Fred. 2011. "Crisis and Renewal: The Outlines of a Twenty-First Century New Deal." <i>Socio-Economic Review</i>, 9(1): 31-57. Most analyses of the US financial crisis of 2007-2009 focus on the proximate causes. This article sees the crisis as a consequence of the decline of a long-term pattern of accumulation in the USA and seeks to outline the requirements for a new period of dynamic economic growth. Drawing on work done by the French Regulation theorists and the US analysts of Social Structures of Accumulation, the paper attempts to describe the types of institutional changes that would be needed to spark a new period of stable economic growth in the USA and in the rest of the world economy. The paper outlines what a green mass consumption economy might involve.
2011	E02	Schneider, Dorothee. 2011. <i>Bargaining, Openness, and the Labor Share</i>. Sonderforschungsbereich 649, Humboldt University, Berlin, Germany, SFB 649 Discussion Papers: SFB649DP2011-068. This paper investigates determinants of changes of the labor share in developed countries with a focus on Western Europe. Using a country-industry panel that covers the private sector, the paper focuses on long and short-run changes within industries. The results show a large and time-persistent impact of increasing globalization on the labor share, especially if the within-industry changes are considered. Openness seems to be the driving force for downward movements in the industry level labor shares while technological and institutional forces impact these shares positively. Furthermore, while investments into information and communication technology (ICT) increase productivity of workers, it has a negative impact on the labor share as it enables higher economic integration which lowers the labor share. Economic integration has stronger impact on the polarization in Western European labor markets than ICT.
2011	E37	Mazumder, Sandeep. 2011. "Cost-Based Phillips Curve Forecasts of Inflation." <i>Journal of Macroeconomics</i>, 33(4): 553-67. It is a well-established idea that prices are a function of marginal cost, yet estimating a reliable measure of marginal cost is difficult to do. Stock and Watson (1999) use the Phillips Curve to forecast inflation for a variety of existing activity variables that researchers commonly use to proxy for marginal cost. This paper uses a similar type of approach to examine the performance of a new candidate for the activity variable, which is marginal cost measured following the theoretical methodology of Bils (1987), which we find to be simple yet powerful when implemented empirically. We then use the Phillips curve to conduct pseudo out-of-sample inflation forecasts for the US using: output, unemployment, hours, the labor share, the capacity utilization rate, and the new measure of marginal cost. For almost all cases, forecast errors are lowest in the regressions with the new marginal cost variable, indicating that this new measure is an improvement over previous attempts to proxy for marginal cost.
2011	F44	Dymski, Gary A. 2011. "Limits of Policy Intervention in a World of Neoliberal Mechanism Designs: Paradoxes of the Global Crisis." <i>Panoeconomicus</i>, 58(3): 285-308. The current global context poses several paradoxes: the recovery from the 2009 recession was not a recovery; investment, normally driven by profit rates, is lagging and not leading economic activity; the crisis is global but debate involves sub-global levels; and public safety-nets, which have helped to stabilize national income, are being cut. These paradoxes can be traced, in part, to the impact of the "truce" that followed the Keynesian-Monetarist controversy on economists' ideas about policy activism. This implicit "truce" has removed activist macro policy from discussion, and shifted attention toward institutions as mechanisms for solving game-theoretic coordination problems. Policy activism then centers on how the "agents" (nations) can achieve optimal use of their available resources (or optimal access to resources) at the global level; and this involves creating and fine-tuning compacts--neoliberal mechanism designs--that can capture rents and attract globally mobile capital. This approach leads economists to see the key problem in the current global crisis as fixing broken neoliberal mechanisms. However, a global economy dominated by mechanisms that feed on aggregate demand without generating it faces the prospect of stagnation or collapse.
2011	F44	Brancaccio, Emiliano, and Giuseppe Fontana, eds. 2011. <i>The Global Economic Crisis: New Perspectives on the Critique of Economic Theory and Policy</i>, Routledge Frontiers of Political Economy. London and New York: Taylor and Francis, Routledge.

Year	DE	Title and Abstract
		Sixteen papers, originally presented at a conference held at the University of Siena in January 2010, explore recent contributions to the critique of mainstream economic theory and policy and consider the origins and possible evolutions of the current economic crisis. Papers discuss some contradictions in "mainstream" interpretations of the crisis and new perspectives in the critique of economic theory and policy; economy and economics--the twin crises; the great recession and the third crisis in economic theory; as if nothing were going to happen--a search in vain for warnings about the current crisis in economic journals with the highest impact factors; changes in income distribution, financial disorder, and crisis; income distribution and borrowing--tracking the U.S. economy with a "New Cambridge" model; changes in functional income distribution in Italy and Europe; low wages, consumer credit, and the crisis--a monetary theory of production approach; back to the future?--the tendency of the (maximum) rate of profit to fall--empirical evidence and theory; the international circuit of key currencies and the global crisis--whether there is scope for reform; globalization and the great crisis; the global crisis in low- and middle-income countries--how the International Monetary Fund responded; notes on Europe, German mercantilism, and the current crisis; privatization, reproduction, and crisis--the case of utilities; property rights in the knowledge economy--an explanation of the crisis; and employment and income distribution from a classical-Keynesian point of view--some tools to ground a normative analysis.
2011	F60 J08	CV; Becker, Uwe. 2011. "The Changing Political Economies of Small West European Countries: Introduction." In <i>The Changing Political Economies of Small West European Countries</i> , ed. Uwe Becker, 11-44. Changing Welfare States series. Amsterdam: Amsterdam University Press.
2011	H26	Busato, Francesco, Bruno Chiarini, and Enrico Marchetti. 2011. "Indeterminacy, Underground Activities and Tax Evasion." <i>Economic Modelling</i> , 28(3): 831-44. This paper introduces underground activities and tax evasion into a one-sector dynamic general equilibrium model with aggregate external effects. The model presents a novel mechanism driving the self-fulfilling prophecies, which is characterized by well behaved (downward sloping) labor demand schedules. This mechanism differs from the customary one, and it is complementary to it. Compared to traditional labor market income, the income derived from underground labor activity is subject to a lower expected tax rate when considering both the probability of detection and the evasion penalty. During a belief-driven expansion, the household allocates more time to both traditional and underground labor supply. In equilibrium, this action serves to lower the effective labor tax rate faced by the household, thus providing stimulus to aggregate labor supply so as to make the initial expansion self-fulfilling. The mechanism here is akin to a "regressive tax"; the household's effective tax rate depends negatively on the level of total labor income. We argue that an underground sector, and the associated tax evasion, offer a good economic rationale for a regressive tax rate.
2011	H53	Gurbuz, Burak, and Marc Raffinot. 2011. "Croissance et repartition des revenus en Turquie (1994-2005): Quel impact sur la pauvreté? (Growth and Income Distribution in Turkey [1994-2005]: What Effect on Poverty? With English summary.)." <i>Region et Développement</i> , 0(34): 19-38. Turkey featured a somewhat paradoxical evolution in income distribution between 1994 and 2005. During 1994-2002 (marked by the 2000-2001 financial crisis), growth was pro-poor in the sense that the income of the poor decreased less than the income of the well-off. Between 2002 and 2005, the Turkish economy rebounded, but growth was mainly beneficial to the middle class. Between 1994 and 2005, growth was pro-poor again. However, this does not mean that the well-being of the poor actually increased, while their expenditure on basic goods and services did increase, notably on education. These changes are hard to explain as they result from many different factors, namely changes in the social protection system, in the assistance to the poor, but also low job creation in the formal sector.
2011	J08	THE SAME AS F60 CV; Becker, Uwe. 2011. "The Changing Political Economies of Small West European Countries: Introduction."
2011	J08 J60	Tcherneva, Pavlina R. 2011. <i>Fiscal Policy Effectiveness: Lessons from the Great Recession</i> . Levy Economics Institute, The Economics Working Paper Archive. This paper reconsiders fiscal policy effectiveness in light of the recent economic crisis. It examines the fiscal policy approach advocated by the economics profession today and the specific policy actions undertaken by the Bush and Obama administrations. An examination of the labor market renders the contemporary aggregate demand-management approach wholly inadequate for achieving certain macroeconomic objectives, such as the stabilization of investment and investor expectations, the generation and maintenance of full employment, and the equitable distribution of incomes. The paper reconsiders the policy effectiveness of alternative fiscal policy approaches, and argues that a policy that directly targets the labor demand gap (as opposed to the output gap) is far more effective in stabilizing employment, incomes, investment, and balance sheets.
2011	P10	Elsenhans, Hartmut. 2011. "World System Theory and Keynesian Macroeconomics: Towards an Alternative Explanation of the Rise and Fall of the Capitalist World System." <i>Les Cahiers du CREAD</i> , 0(97): 5-61. A mechanistic and sometimes dogmatic interpretation of capitalism has kept world systems theory from attaining practical relevance for social movements which try to combine the democratic management of society with efficiency, including the market. By using Keynesian macroeconomics as a basis and integrating it into a long-term Annales type historical perspective, the latter inspired by the work of Karl Marx, major aspects of these theoretical shortcomings can be addressed. Profit depends on rising mass incomes in contrast to rent which does not. Capitalism is, therefore, the unintended consequence of the success of the lower strata. Capitalism as a type of happy accident is expansive, but can be transferred to other societies only if the empowerment of labour is successful. In the current process of globalisation, there remain various risks whereby labour becomes disempowered, both in developing and developed capitalist economies. In addition, underdevelopment hits back and disempowers labour in the most technically developed countries. As such, a global strategy of labour is required which may, nonetheless, be implemented locally, as exchange rate adjustments protect the socially successful cases from destruction through a race to the bottom. The necessity of such a strategy is based on policies currently being implemented in an attempt to relaunch growth and overcome crises which are characterised by a narrow and empirically unfounded dogmatism. Such a mobilisation will not, however, threaten the income and employment position of workers in the North, via the demands and higher competitiveness of workers from the South, as differences in labour costs are mediated through the exchange rate.
2011	P10	Dutt, Amitava Krishna, and Roberto Veneziani. 2011. "Education, Growth and Distribution: Classical-Marxian Economic Thought and a Simple Model." <i>Cahiers d'Economie Politique</i> , 0(61): 157-85. This paper examines the interaction between education, growth, and distribution from a classical-Marxian perspective. It first briefly examines classical-Marxian ideas on the relation between education and growth and income distribution. Drawing on these ideas to the extent that they are relevant for contemporary capitalist economies, it then develops a simple dynamic model of growth and distribution to analyze the effects of the spread of education on profitability, accumulation, distribution, and growth.
2011	P33	Huang, Xianhai, Sheng Xu, and Jing Lu. 2011. "Trade Liberalisation and Labour Income Share Variation: An Interpretation of China's Deviation from the Stolper-Samuelson Theorem." <i>World Economy</i> , 34(7): 1071-87. By constructing a two-country, three-commodity, three-sector theoretical model, we show that trade liberalisation has double effects, i.e., 'factor price effect' and

Year	DE	Title and Abstract
		'technology progress effect', on labour income share. China's deviation from the Stolper-Samuelson Theorem is mainly due to the negative effect of technology progress, which weakens the positive pulling effect of trade liberalisation on labour income share. Based on the panel data of 29 provinces and cities in China dated from 1987 to 2006, we build up an empirical model. We find that because of the offsetting cancellation of opposite effects, the overall effect of trade liberalisation on labour income share is insignificant. However, when eliminating the negative effect of technology progress on labour income share, the effect of trade liberalisation becomes significantly positive. Moreover, the positive effect of trade liberalisation has become smaller in recent years. This is because of the transformation of export structure, which has led to a decrease in the positive effect of export on labour income share.
2011	P33	Bruno, Miguel, Joseph Halevi, and Jaime Marques Pereira. 2011. "Les défis de l'influence de la Chine sur le développement du Brésil: Avantages comparatifs et conflit distributif. (The Challenges of China's Influence on Brazil Development: Comparative Advantages and Distributive Conflicts. With English summary.)" <i>Revue Tiers Monde</i>, 0(208): 83-102. This essay studies the impact of China's economic development on the Brazilian economy, starting from the compromise on income distribution of the Lula presidency aimed at fiscal orthodoxy while attempting to revamp the growth of the domestic market. The sectoral consistency of Brazil's development is linked to the distributive conflict. We conclude that a neodevelopmentalist strategy is required in order to attain the objective of a coherent productive structure. In this context, Brazil's capacity to face up to the challenge of China's industrial exports to its domestic market depends upon the formulation of a new compromise on income distribution. Indeed, a more progressive fiscal stance would be needed in order to implement the neostructuralist policy in a framework of regional integration.

"Wage Formation, Investment Behavior and Growth Regimes: An Agent-Based Analysis." <i>Revue de L'OFCE</i>, 0(124): 235-61. Using the "Keynes+Schumpeter" (K+S) agent-based model developed, we study how the interplay between firms' investment behavior and income distribution shapes the short- and long-run dynamics of the economy at the aggregate level. We study the dynamics of investment under two different scenarios. One in which investment is fully determined by past profits, and one in which investment is tied to expectations about future consumption demand. We show that, independently from the investment scenario analyzed, the emergence of steady growth with low unemployment requires a balance in the income distribution between profits and wages. If this is not the case, the economy gets locked either in stagnation equilibria, or into growth trajectories displaying high volatility and unemployment rates. Moreover, in the demand-led scenario, we show the emergence of a non-linear relation between real wages and unemployment. Finally, we study whether increasing degrees of wage-flexibility are able to restore growth and unemployment and reduce the volatility in the economy. We show that this is indeed the case only when investment is profit-led. In contrast, in the scenario where investment is driven by demand expectations wage-flexibility has no effect on either growth and unemployment. In turn, this result casts doubts on the ability of wage-flexibility policies to stabilize the economy.

2012	F42	Capaldo, Jeronim, and Alex Izurieta. 2012. <i>The Imprudence of Labour Market Flexibilization in a Fiscally Austere World</i>. United Nations, Department of Economics and Social Affairs, Working Papers. This paper assesses the effects of combining fiscal austerity with flexibilization policies aimed at reducing labour costs and increasing competitiveness. Core to our analysis is a global perspective where the aggregation problem is fully taken into account. We derive a stylized macroeconomic framework of distributive and demand dynamics. We show that even in export-led regimes, after considering global feedbacks, flexibilization policies do not lead to higher income and employment. Rather, the end result is contractionary. Over time, the world economy is essentially wage-led and responds positively to coordinated Keynesian stimuli.
2012	F65 L24	Merchand Rojas, Marco Antonio. 2012. "Estado neoliberal y acumulacion por desposesion a favor del capital glocal financiero. (Neoliberal State and Accumulation by Dispossession on Behalf of Glocal Financial Capital. With English summary.)" <i>Apuntes del CENES</i>, 31(54): 73-100. The general aim of this work is to analyze why accumulation by dispossession is one of the modalities that are indiscriminately implemented in all areas of the world economy and represents the best way to stabilize the capitalist system on behalf of financial capital and against the workforce. The conditions under which the capital is imposed in each economic area differ in their methods and ways of reproducing, in spite of its intrinsic character of disposing or outsourcing what is internalized for the benefit of a few (especially for the owners of capital) applies equally in all countries, regardless of whether we are talking about a country of high or low development. Examples abound, we only mention some cases: the financial crisis of 2008, which has meant the greatest insult to the people of the United States, and of course the case of Mexico where for over thirty years, policies of adjustment and stabilization were applied with an irreversible negative effect on the socio-economic welfare of the population.

"Income Distribution and the Size of the Financial Sector: A Sraffian Analysis." <i>Cambridge Journal of Economics</i>, 36(6): 1455-77. This paper explores the existence of links among the recent trends in income distribution, in the turnover of the financial industry and in financial regulation, moving from Sraffa's analyses of money and banking. It presents a linear production model where a banking industry is introduced and argues that changes in the size of the financial industry can change the distributive shares even if the rates of profit and wage remain constant. An increase in the new loans to workers can increase the profit share and reduce the wage share through an increase in effective demand and the level of production. The analysis can support the contention that the process of financial deregulation, with the consequent explosion of the financial system and the rise of systemic risk, is at the basis of the increase in income inequality observed in recent years.

Year	DE	Title and Abstract
2012	H10 J48	Tcherneva, Pavlina R. 2012. <i>Reorienting Fiscal Policy after the Great Recession</i> . Levy Economics Institute. The Economics Working Paper Archive. The paper evaluates the fiscal policy initiatives during the Great Recession in the United States. It argues that, although the nonconventional fiscal policies targeted at the financial sector dwarfed the conventional countercyclical stabilization efforts directed toward the real sector, the relatively disappointing impact on employment was a result of misdirected funding priorities combined with an exclusive and ill-advised focus on the output gap rather than on the employment gap. The paper argues further that conventional pump-priming policies are incapable of closing this employment gap. In order to tackle the formidable labor market challenges observed in the United States over the last few decades, policy could benefit from a fundamental reorientation away from trickle-down Keynesianism and toward what is termed here a "bottom-up approach" to fiscal policy. This approach also reconsiders the nature of countercyclical government stabilizers.
2012	L14	Azmat, Ghazala, Alan Manning, and John Van Reenen. 2012. "Privatization and the Decline of Labour's Share: International Evidence from Network Industries." <i>Economica</i> , 79(315): 470-92. Some authors have suggested that deregulation of product and labour markets is responsible for the decline in labour's share of GDP. A simple model predicts that privatization is associated with a lower labour share, due to job shedding. We test this hypothesis by focusing on privatization of network industries in the OECD. We find that, on average, privatization accounts for a fifth of the fall of labour's share, and over half in Britain and France. This is due to lower employment, but it is partially offset by higher wages and falling barriers to entry, which dampen profit margins.
2012	L24	Vidal, Matt. 2012. "On the Persistence of Labour Market Insecurity and Slow Growth in the US: Reckoning with the Waltonist Growth Regime." <i>New Political Economy</i> , 17(5): 543-64. In this article I systematically incorporate empirical work on rising income inequality and wage stagnation into a regulation theoretic framework for analysing macroeconomic growth. The rise of job polarisation and income inequality coincides with a long period of macroeconomic stagnation, both continuing through to the present (with the exception of a brief period of strong growth and declining inequality in the second half of the 1990s). The corporate scramble to restore profit rates after the crisis of Fordism has transformed the institutional configuration of the political economy. In particular, institutions supporting upward mobility and middle-class incomes in the economy have been eroded by the twin forces of internationalisation (leading to the re-emergence of wage-based competition) and employment externalisation (outsourcing, downsizing, antiunionism, etc). The current growth regime, which may be characterised as Waltonist, based on the Wal-Mart model of buyer-driven global supply chains focused on cutthroat wage-based competition and deunionisation, is not transitional but rather embedded in apparently long-term institutional settlements that amount to a dysfunctional regime.

2013	C12 C18	Stanley, T. D. 2013. "Does Economics Add Up? An Introduction to Meta-regression Analysis." <i>European Journal of Economics and Economic Policies: Intervention</i> , 10(2): 207-20. Meta-analysis is the statistical analysis of an entire empirical literature. It seeks to summarize, evaluate, and analyse what we know about a given empirical question, phenomenon, or effect. Meta-regression analysis (MRA) is meta-econometrics, uses the very tools that produce economics research, and provides a rigorous, objective alternative to conventional narrative reviews in economics. MRA often reveals surprising truths about economics. To illustrate these methods, I discuss meta-analyses of the employment effect of the minimum wage, efficiency wages, the natural rate hypothesis, and unemployment hysteresis, the last two of which provide a rigorous, empirical falsification of the natural rate hypothesis.
2013	D73 F20	Pi, Jiancai, and Yu Zhou. 2013. "Institutional Quality and Skilled-Unskilled Wage Inequality." <i>Economic Modelling</i> , 35(0): 356-63. This paper establishes two-sector general equilibrium models in the presence of unproductive activities to investigate how an improvement of the institutional quality influences the skilled-unskilled wage inequality. We find that an improvement of the institutional quality will affect the interest rate, and then the interest rate combining with the capital intensity will generate an impact on the skilled-unskilled wage inequality. Specifically, both the interest rate and comparisons of the capital-labor relative distributive shares between two sectors play an important role in determining the skilled-unskilled wage gap in an economy featured with unproductive activities. The above results are robust even when we extend the basic theoretical model in several different ways.
2013	E16	Froehlich, Nils. 2013. "Labour Values, Prices of Production and the Missing Equalisation Tendency of Profit Rates: Evidence from the German Economy." <i>Cambridge Journal of Economics</i> , 37(5): 1107-26. During recent years, several empirical studies have found that deviations from labour values to market prices are quite small. However, most of these articles do not offer a detailed reason for this result. In this paper, two theoretical justifications of the labour theory of value are brought together with some data concerning labour values, prices of production, and market prices, on the basis of German input-output tables from 2000 and 2004. In addition, the statistical characteristics of profit rates are analysed. Both of the theoretical arguments are much in line with the empirical observations, because there is only a slight transformation tendency and at the same time profit rates and capital intensity are negatively correlated. Moreover, during the period under observation the German economy seems to be in a state of statistical equilibrium.
2013	E16	Acharya, Sanjaya, Marcello Signorelli, Borut Vojinovic, and Zan Jan Oplotnik. 2013. "Alternative Approach to Economic Restructuring to Benefit the Poor--SAM Multipliers Analysis as Alternative Approach." <i>Scientific Annals of the "Alexandru Ioan Cuza" University of Iasi</i> , 60(1): 1-20. Many economic reforms in developing economies are, in fact, price deregulation in the product markets and trade liberalisation, concerning whether the growth of exports accelerates. This paper, however, attempts to offer a new flavour in the policy reforms using fixed price model to study the growth impact of different sectoral investments and transfers to households. We used Social Accounting Matrix (SAM) multipliers to analyse the flow structure and distributional effects of sectoral investments and transfers in a typical developing economy. Using the case of Nepal, we simulate the effects of additional demand creations to sectors and transfer earning growth to households and measure their effects and conclude that in the given flow structure, the additional sector demand and transfer growth in the economy benefit the middle income groups more; whereas the benefit to the poorest is only modest. We examine the effects of potential pro-poor economic restructuring measures especially with regard to the improvements of efficiency parameters and redirection of factor endowments. Consequently, poor households transfer towards those activities which have higher multiplier effects of additional demand and transfer earning. Furthermore, redirection of factor endowments requires undergoing with the skill upgrade of poor labour to be conducive with higher economic growth.

2013	E16	Morrone, Henrique, and Adalmir Antonio Marquetti. 2013. "Distribuicao e expansao em um modelo neoestruturalista: Uma aplicacao para o Brasil. (Distribution and Expansion in a Neostucturalist Model: An Application to Brazil. With English summary.)." <i>Revista de Economia Contemporanea</i>, 17(3): 468-93. This paper presents a neo-structuralist model that attempts to evaluate the impact of simulation exercises on the economic performance of the Brazilian economy. The data from the National Accounting System is employed to build a Social Accounting Matrix that serves as base for our model. Three experiments are applied: a rise in the investment level, an income transfer to workers, and a policy mix that combines both the preceding simulations (devaluation with redistribution). The results suggest that every experiment impacts positively the Brazilian economy; it validates the neo-structuralist claims about the positive effects of exchange devaluation and redistribution on the level of economic activity.
2013	E16	Gok, Baris, and Metin Karadag. 2013. "Turkiye Ekonomisi icin 2002 Yili Sosyal Hesaplar Matrisi. (A Social Accounting Matrix for Turkish Economy for 2002. With English summary.)." <i>Ege Akademik Bakis/Ege Academic Review</i>, 13(3): 325-35. social accounting matrix (SAM), which represents the transactions of a socio-economic system in a country, can also be utilized as a fundamental data set for economic models to address policy questions. The aim of this study is to construct a SAM for the year of 2002, which can be used as the data set for the computable general equilibrium model constructed to analyze the tax policy changes in Turkey. For this purpose, 2002 input-output table, foreign trade statistics, net tax matrix and public sector statistics were used as data sources. Also, in order to analyze the effects of policy changes on income distribution and welfare, household account was disaggregated into 10 representative groups according to their income size (by quintiles) and settlement (urban, rural) by employing household budget surveys and household consumption expenditures surveys. In this paper, after giving the main features of the SAM very briefly, the procedure of construction of the SAM for Turkish economy for the year of 2002 was explained in detail.

2013	F24	Balli, Faruk, Syed Abul Basher, and Rosmy Jean Louis. 2013. "Risk Sharing in the Middle East and North Africa: The Role of Remittances and Factor Incomes." <i>Economics of Transition</i>, 21(1): 135-55. This study investigates welfare gains and channels of risk sharing among 14 Middle Eastern and North African (MENA) countries, including the oil-rich Gulf region and the resource-scarce economies such as Egypt, Morocco and Tunisia. The results show that for the 1992-2009 period, the overall welfare gains across MENA countries were higher than those documented for the Organization for Economic Cooperation and Development (OECD) nations. In the Gulf region, the amount of factor income smoothing does not differ considerably when output shocks are longer lasting rather than transitory, whereas the amount smoothed by savings increases remarkably when shocks are longer lasting. In contrast, both factor income flows and international transfers respond more to permanent shocks than to transitory shocks in the non-oil MENA countries. The results also show that a significant portion of shocks is smoothed via remittance transfers in the economically less-developed MENA countries, but not in the oil-rich Gulf and OECD countries. Finally, for the overall MENA region, a large part of the shock remains unsmoothed, suggesting that more market integration is needed to remedy the weak link of incomplete risk sharing.
2013	F55	Zarotiadis, Grigoris, and Aristeia Gkagka. 2013. "European Union: A Diverging Union?" <i>Journal of Post Keynesian Economics</i>, 35(4): 537-67. Standard growth theory emphasizes the closure of gaps: as internationalization proceeds, socioeconomic and structural characteristics of different countries become similar. Despite the fact that the European Union (EU) represents a historical experiment of a region of gradually strengthening internationalization, a wide range of EU studies reject the convergence hypothesis, showing an unclear development of standard deviation in time. Many of the studies find that something went wrong in the 1980s, yet they describe it as the result of a temporary effect. In the present paper, we show that the puzzle of the 1980s is not a short-term break in a continuous trend, but a complete alteration of the process, a structural shift toward a persisting period of continuous divergence! The previous trend of closing the gap among the member countries was reversed completely: in 2010, the coefficient of variation returned to higher levels than those of 1960. Second, all previous gains of labor vanished: in the period 1980-2005, real wages lost about 35 percent against per capita gross domestic product (GDP). The empirical findings we provide support our main suspicion: apart from confirming the Organization for Economic Cooperation and Development (OECD) observation of growing and persisting inequality in all Western economies, the gradual transition of the European free trade area into an economic and monetary union, accompanied by the prevalence of a specific policy, explains the prevalence of a period of deepening divergence since the beginning of the 1980s.
2013	F62	Brennan, Jordan. 2013. "The Power Underpinnings, and Some Distributional Consequences, of Trade and Investment Liberalisation in Canada." <i>New Political Economy</i>, 18(5): 715-47. Criticism of trade and investment liberalisation (TAIL) in North America has drawn attention to weak economic performance, wage-profit redistribution, social dumping and fiscal pressure on government programmes as evidence that the TAIL regime has failed to deliver on some of its key promises. This criticism has been unable, however, to establish satisfactory conceptual and empirical connections between the dramatic distributional changes witnessed in the TAIL era and the institutional reorganisation of power that the TAIL regime entrenched. This article will undertake a quantitative assessment of the Canadian political economy to see who the main beneficiaries of the TAIL era have been, contrasting returns to labour and to capital in the pre-TAIL and TAIL eras. Employing tools from the capital as power framework, two pictures are painted: the first picture examines broad changes in the distribution of income and the second examines differential business performance. The evidence from this inquiry suggests that although the official purpose of TAIL was to enhance the prosperity of all Canadians, this trade deal actually represented--both in its intentions and consequences--a political-economic transformation written by dominant capital for dominant capital.
2013	F66	Elsby, Michael W. L., Bart Hobbijn, and Aysegul Sahin. 2013. "The Decline of the U.S. Labor Share." <i>Brookings Papers on Economic Activity</i>, 0(0): 1-52. Over the past quarter century, labor's share of income in the United States has trended downward, reaching its lowest level in the postwar period after the Great Recession. A detailed examination of the magnitude, determinants, and implications of this decline delivers five conclusions. First, about a third of the decline in the published labor share appears to be an artifact of statistical procedures used to impute the labor income of the self-employed that underlies the headline measure. Second, movements in labor's share are not solely a feature of recent U.S. history: the relative stability of the aggregate labor share prior to the 1980s in fact veiled substantial, though offsetting, movements in labor shares within industries. By contrast, the recent decline has been dominated by the trade and manufacturing sectors. Third, U.S. data provide limited support for neoclassical explanations based on the substitution of capital for (unskilled) labor to exploit technical change embodied in new capital goods. Fourth, prima facie evidence for institutional explanations based on the decline in unionization is inconclusive. Finally, our analysis identifies offshoring of the labor-intensive component of the U.S. supply chain as a leading potential explanation of the decline in the U.S. labor share over the past 25 years.

2013	H12	Tridico, Pasquale. 2013. <i>Italy: From Economic Decline to the Current crisis</i>. Department of Economics - University Roma Tre Departmental Working Papers of Economics - University 'Roma Tre': 0173. The objective of this paper is to show that the current global economic crisis, in which also Italy fell in 2008, represents just the last step of a long declining path for the Italian economy which began in the nineties, or to be more precise in 1992 and 1993. In particular, I argue the reasons which explain the long Italian decline, and partly also the deeper recession today, as well as the lack of recovery from the current crisis, can be found in the past reforms of the labour market. In particular the labour flexibility introduced in the last 15 years, which had, along with other policies introduced in parallel, cumulative negative consequences on the inequality, on the consumption, on the aggregate demand, on the labour productivity and on the GDP dynamics.

"Explaining the Interrelations between Health Education and Standards of Living in Portugal: A Simultaneous Equation Approach." <i>International Journal of Public Policy</i>, 9(3): 167-87. The aim of this paper is to analyse the links between health status, education, and economic growth in Portugal. Focus is given to the achievements made in infant mortality rate, which represents the most significant reduction among the OECD countries in the last decades. While this very positive performance is a direct consequence of the investments made in the health sector, it is also important to note that it is a result of other socioeconomic factors outside the health system (mainly in the education system) that have contributed significantly to an improvement of the living conditions. So, to a complete understanding of the Portuguese infant mortality decline, we must consider in our analysis the potential cumulative causation effects between health, education, and per capita income growth. Having this in mind, in this paper we use a three equation model to determine simultaneously the interactions between infant mortality rate, education, and per capita income growth. Our empirical evidence shows that the proposed model is adequate to highlight the potential links between these core factors.
2013	J80	Stauvermann, Peter J. 2013. "Does Globalization Lead to a Rat Race of National Labor-Market Institutions?" <i>Panoeconomicus</i>, 60(1): 73-87. Since just around 30 years we observe that the labor's share of the national income decreases in most countries. In this paper, we introduce an endogenous overlapping generation growth model with an institutional setting of the labor market to show that the changes of the labor-market institutions are one main reason for the decrease of the labor's share. These changes are mainly caused by the increasing globalization resulting in open capital markets and as a consequence in a competition between countries with respect to the labor-market institutions. In the long run, all will suffer. The only ways to stop this rat race are capital controls or international agreements on the labor- market institutions.

"Income Factor Shares from Mining in Remote Australia: An Analysis of the Ranger Uranium Mine and the Tanami Gold Mine in the Northern Territory." <i>Australasian Journal of Regional Studies</i>, 19(3): 369-95. While considerable popular and scholarly attention has focused on the impact of the mining boom on the Australian economy, little has been done to assess how the returns from mining are shared between the different factors of production. Using remote case studies from the Northern Territory, this paper finds that labour shares in these instances are higher than their national counterparts, whereas capital shares vary in proportion to labour shares. Land factor share outcomes are mixed, with large returns to a gold mine compared both to its parent company and to a uranium mine. However, it is argued that further case study analysis is necessary to assess the representativeness of the results obtained in this paper.
2013	L83	Koncul, Niko. 2013. "A Methodical Approach to Relative Price Analysis in Tourism/Metodoloski pristup analizi relativnih cijena u turizmu. (In English and Croatian.)." <i>Acta Turistica</i>, 25(2): 125-45. This paper tries to establish a methodological framework for the analysis of export-import price relationship in selected tourist destinations in the Mediterranean. Due to the lack of reliable price data for a longer time series, following analysis (based on indirectly derived variables) is restricted to the period 2000-2010. Classical economic theory suggests that under free trade conditions all participants are benefited by economic gains. However, further research in modern economics has proved that this hypothesis is only partially true. In this paper, the author tries to examine if the theory proves true in case of tourism and how the sectoral demand responds to changes in price and income.
2013	P34	Wang, Wei, Xinqiang Guo, and Chunrong Ai. 2013. "Financing Constraints, the Decline of Labor's Share and China's Low Consumption. (In Chinese. With English summary.)." <i>Jingji Yanjiu/Economic Research Journal</i>, 48(11): 100-13. Based on the macro facts that the co-movements of the tightened borrowing constraints on medium-small private firms, the declining trend of labor's share and consumption rate in national income, this paper sets up and calibrates a dynamic general equilibrium model consisting of state-owned firms and medium-small private firms, which face borrowing constraints and investment distortion to explore the above phenomenon. This paper sheds light on the following macro story: since the mid-1990s, the change of China's financial environment tightened borrowing constraints on firms. To alleviate the persistent and rising difficulty to obtain financing, the medium-small private firms have sought to self insure through retaining profits as internal savings, hence decrease the profits distribution to households and lower the labor's share. The dominance of state-owned bank structure of financial ownership not only has restrained the development of financial market, but also forms the financing constraints on private firms through the government guidance to bank lending. In the face of a declining household income share, rational consumers choose consumption in a manner that is consistent with a falling share of consumption in GDP, as evident in the data.
2013	Q10	Spolador, Humberto F. S., and Terry L. Roe. 2013. "The Role of Agriculture on the Recent Brazilian Economic Growth: How Agriculture Competes for Resources." <i>Developing Economics</i>, 51(4): 333-59. Drawing upon the Global Trade Analysis Project (GTAP) database, and other time series data, we construct a multi-sector Ramsey model that shows the transition growth of the Brazilian agricultural sector and its effects on growth of the industrial and service sector of the economy, with particular emphasis given to the years 1994-2010. Our results capture the importance of the agriculture's capital intensity and the sector's factor productivity on the sector's growth, the substitution of capital for labor in agriculture, and the sustaining of agriculture's share in

Year	DE	Title and Abstract
		Brazilian GDP. These features are rather unique among emerging economies, most of which have experienced a transition out of agriculture and growth in nonfarm production relative to agriculture.
2013	Y10	Taylor, Lance, Armon Rezai, Rishabh Kumar, Laura de Carvalho, and Nelson Barbosa. 2013. <i>U.S. Size Distribution and the Macroeconomy, 1986-2009</i> . Schwartz Center for Economic Policy Analysis (SCEPA), The New School, SCEPA working paper series. SCEPA's main areas of research are macroeconomic policy, inequality and poverty, and globalization.; 2013-1. The US national income and product accounts are restated in the form of a social accounting matrix or SAM. Using data from the Congressional Budget Office and the Consumer Expenditure Survey of the Bureau of Labor Statistics, the SAM is extended to include seven household groups in the size distribution of income. Aspects of rising inequality are pointed out, and a simple demand-driven model to set up to examine redistributive policies.

Year	DE	Title and Abstract
2006		
2006	B51 P12	Klimovsky, Edith Alicia. 2006. "Tasas de ganancia, acumulacion, produccion y circulacion: Los conceptos basicos de la teoria clasica del valor. (Profit Rates, Accumulation, Production and Circulation: The Basic Concepts of the Classical Theory of Value. With English summary.)." <i>Cuadernos de Economia (National University of Colombia)</i> , 25(44): 33-55. In systems of industries with simple products and circulating capital without natural resources, developed in the framework of the classical theory of value, profit rates, whether uniform or not, can be interpreted in physical terms, and prices satisfy profitability conditions as well as circulation conditions and are, therefore, prices of reproduction, regardless of where the surplus goes. This article demonstrates how the utilization of the surplus affects the conditions for the existence of equilibrium but not the solution for that equilibrium, which depends only on technique and distribution.
2006	D02	CV; Sindzingre, Alice. 2006. "The Relevance of the Concepts of Formality and Informality: A Theoretical Appraisal." In <i>Linking the Formal and Informal Economy: Concepts and Policies</i> , ed. Basudeb Guha-Khasnobis, Ravi Kanbur and Elinor Ostrom, 58-74. UNU-WIDER Studies in Development Economics series. Oxford and New York: Oxford University Press.
2006	E43 H62 H63	Lovrinevic, Zeljko, Zdravko Maric, and Davor Mikulic. 2006. "Maastricht Criteria and the Inclusion of the Underground Economy--The Case of Croatia." <i>Privredna Kretanja i Ekonomska Politika</i> , 16(106): 28-65. The European Union has introduced an explicit obligation for all member countries that the official GDP data needs to include the estimation of the underground economy, resulting from statistical or economic reasons. For this purpose, the so-called Eurostat Exhaustiveness programme has been developed for the group of candidate countries, of which ten have become full members as of the 1st of May 2004. In line with the results of this programme, the new EU members include the correction for the value of the underground economy into

Year	DE	Title and Abstract
		their official GDP figure. With the inclusion of the underground economy, the consequent value of Croatian per capita GDP, measured according to the purchasing power parity, reduces the gap in comparison to the EU-25. Furthermore, the proportion of total expenditures in GDP of the general government sector is reduced as well, which places Croatia below the NMS-8 country average. In terms of the Maastricht convergence criteria, the underground economy inclusion procedure does not affect the fact that the criteria are not met. The inclusion of the underground economy influences two indicators: the proportion of the state sector deficit in the GDP and the proportion of the public debt in the GDP. The inclusion of the underground economy does not help fulfilling the criteria concerning the state sector deficit. The criteria concerning the size of public debt is fulfilled by Croatia even without the inclusion of the underground economy. The inflation criteria and the size of the long-term interest rates criteria are not directly linked to the GDP value.
2006	F50 G20	CV: Coriat, Benjamin, Pascal Petit, and Genevieve Schmeder, eds. 2006. <i>The Hardship of Nations: Exploring the Paths of Modern Capitalism, New Horizons in Institutional and Evolutionary Economics</i> . Cheltenham, U.K. and Northampton, Mass.: Elgar. Fourteen papers assess the perspectives of the post-Fordist era and discuss the conditions for a new regime to emerge in an interdependent world. Papers discuss the future of capitalism (Michel Aglietta); the special position of the United States in the finance-led regime--how exportable the U.S. venture capital industry is (Francois Chesnais); moves toward finance-led capitalism--the French case (Benjamin Coriat); socioinstitutional changes in the post-Fordist era (Pascal Petit); whether the New Economy is made in America (Petit); to have or to be--a topological approach of the interaction between state and economy (Bruno Theret); the institutional and policy weaknesses of the European Union--the evolution of the "policy mix" (Robert Boyer); disruptive effects of financial deregulation--the Japanese and Korean crises (Coriat and Patrice Geoffron); Argentina's structural crisis (Luis Miotti and Carlos Quenan); convergence and diversity in national trajectories of postsocialist transformation (Bernard Chavance and Eric Magnin); the move from the cold war to the new international disorder (Genevieve Schmeder); shadow economy and economic criminalization in transition economies (Jacques Sapir); global geography of post-Fordism--knowledge and polarization (El Mouhoub Mouhoud); and post-Fordisms in a more globalized capitalism (Coriat, Petit, and Schmeder).
2006	G22	CV: Guha-Khasnobis, Basudeb, and Rajeev Ahuja. 2006. "Microinsurance for the Informal Economy Workers in India." In <i>Linking the Formal and Informal Economy: Concepts and Policies</i> , ed. Basudeb Guha-Khasnobis, Ravi Kanbur and Elinor Ostrom, 179-94. UNU-WIDER Studies in Development Economics series. Oxford and New York: Oxford University Press.
2006	H41	CV: Nugent, Jeffrey B., and Shailender Swaminathan. 2006. "Voluntary Contributions to Informal Activities Producing Public Goods: Can These Be Induced by Government and Other Formal Sector Agents? Some Evidence from Indonesian Posyandus." In <i>Linking the Formal and Informal Economy: Concepts and Policies</i> , ed. Basudeb Guha-Khasnobis, Ravi Kanbur and Elinor Ostrom, 212-29. UNU-WIDER Studies in Development Economics series. Oxford and New York: Oxford University Press.
2006	H62	CV: Bertola, Giuseppe, and Pietro Garibaldi. 2006. "The Structure and History of Italian Unemployment." In <i>Structural Unemployment in Western Europe: Reasons and Remedies</i> , ed. Martin Werding, 293-315. CESifo Seminar Series. Cambridge and London: MIT Press.
2006	H62	THE SAME AS E43 CV: Lovrinevic, Zeljko, Zdravko Maric, and Davor Mikulic. 2006. "Maastricht Criteria and the Inclusion of the Underground Economy--The Case of Croatia." <i>Privredna Kretanja i Ekonomska Politika</i> , 16(106): 28-65.
2006	H63	THE SAME AS E43 CV: Lovrinevic
2006	H63	CV: Lovrinevic, Zeljko, Zdravko Maric, and Davor Mikulic. 2006. "Maastricht Criteria and the Inclusion of Underground Economy--The Case of Croatia." <i>Croatian Economic Survey</i> , 0(9): 69-106. European Union has introduced an explicit obligation for all member states that the official GDP data need to include the estimation of the underground economy, resulting from statistical or economic reasons. For this purpose, the so-called Eurostat Exhaustiveness programme has been developed for the group of candidate countries, ten of which have become full members as of the 1st of May 2004. In line with the results of this programme, the new EU members include the correction for the value of the underground economy into their official GDP figure. With the inclusion of underground economy, the consequent value of Croatian GDP per capita, measured according to the purchasing power parity, reduces the gap in comparison to the EU-25. Furthermore, the proportion of total expenditures in GDP of the general government sector is reduced as well, which places Croatia below the NMS-8 country average. In terms of the Maastricht convergence criteria, the underground economy inclusion procedure does not affect the fact that the criteria are not met. The inclusion of the underground economy influences two indicators: proportion of the government sector deficit in GDP and the proportion of the public debt in GDP. The inclusion of the underground economy does not influence on fulfilling the criteria concerning the government sector deficit. The criteria concerning the size of public debt are fulfilled by Croatia even without the inclusion of the underground economy. Inflation criteria and the size of long-term interest rates criteria are not directly linked to the GDP value.
2006	J11	CV: Enchautegui, Maria E., and Richard B. Freeman. 2006. "Why Don't More Puerto Rican Men Work? The Rich Uncle (Sam) Hypothesis." In <i>The Economy of Puerto Rico: Restoring Growth</i> , ed. Susan M. Collins, Barry P. Bosworth and Miguel A. Soto-Class, 152-82. Washington, D.C.: Brookings Institution Press; San Juan, Puerto Rico: Center for the New Economy.
2006	J45 O43	CV: Villamil, Jose J. 2006. "Economic Growth: Comment." In <i>The Economy of Puerto Rico: Restoring Growth</i> , ed. Susan M. Collins, Barry P. Bosworth and Miguel A. Soto-Class, 75-78. Washington, D.C.: Brookings Institution Press; San Juan, Puerto Rico: Center for the New Economy.
2006	J62	CV: Guariglia, Alessandra, and Byung-Yeon Kim. 2006. "The Dynamics of Moonlighting in Russia: What Is Happening in the Russian Informal Economy?" <i>Economics of Transition</i> , 14(1): 1-45. This paper uses the Russian Longitudinal Monitoring Survey (RLMS) to analyse the dynamics of moonlighting by the working-age population. We find that moonlighting is transitory and that a desire to switch jobs expressed in the past is positively related to moonlighting in the present and to actual job changes in the future. We also find that workers who moonlighted as self-employed in the past represent 26.5 percent of the new self-employed. These results suggest that moonlighting in Russia can be seen as an effective incubator for setting up new self-employed businesses, thereby providing long-term benefits for the economy.
2006	K33	CV: Christensen, Robert K. 2006. "The Global Path: Soft Law and Non-sovereigns Formalizing the Potency of the Informal Sector." In <i>Linking the Formal and Informal Economy: Concepts and Policies</i> , ed. Basudeb Guha-Khasnobis, Ravi Kanbur and Elinor Ostrom, 36-57. UNU-WIDER Studies in Development Economics series. Oxford and New York: Oxford University Press.
2006	L32	CV: Andvig, Jens. 2006. "Corruption in China and Russia Compared: Different Legacies of Central Planning." In <i>International Handbook on the Economics of Corruption</i> , ed. Susan Rose-Ackerman, 278-319. Cheltenham, U.K. and Northampton, Mass.: Elgar.

Year	DE	Title and Abstract
2006	L52	Bianco, Giovanni. 2006. "Lavoro irregolare e politiche economiche per l'emersione in Piemonte. (With English summary)." <i>Economia Pubblica</i> , 36(1-2): 95-132. The shadow economy concerns all production factors, all produced and exchanged goods and it is increasing in all industrialised countries, especially in Italy. Though it was present in the Italian economic history, it became recently a bigger issue due to the European regulation, and it became an important problem of national and local economic policy. The article shows and explains the hidden economy, particularly the labour market implications and the economic policy of region Piedmont. The existence of a local economic policy derives not only from the initiative and the administrative autonomy of the local development and the industry policy, but also from the insufficient efficacy of the national economic policy and from contradictory national policy. The new experiences and researches and the local actions show new possibilities/horizons for the economic policy especially for the efficacy linked to the direct involving of producing forces.

According to conventional wisdom, the nature and causes of the informal sector in transition economies is the same as in developing countries, but is this true? The informal sector differs in nature: activities therein are labor-intensive in developing countries but capital-intensive in transition economies. Furthermore, the main cause of the shadow economy during the post-Communist transition is not excessive government interventions, as in developing countries, but the lack of a tradition of rule of law. Econometric evidence is presented to support this alternative view as a more promising approach to research.

2006	Q53	Hanousek, Jan, and Filip Palda. 2006. "Problems Measuring the Underground Economy in Transition." <i>Economics of Transition</i> , 14(4): 707-18. An easy and popular method for measuring the size of the underground economy is to use macro data such as money demand or electricity demand to infer what the legitimate economy needs, and then to attribute the remaining consumption to the underground economy. Such inferences rely on the stability of parameters of the money demand and electricity demand equations, or at very least on knowledge of how these parameters are changing. We argue that the pace of change of these parameters is too variable in transition economies for the above methods of estimating the size of the underground economy to be applicable. We make our point by using Czech Republic and other transition country data from the financial and electricity sectors.
2006	R10	Chaudhuri, Kausik, Friedrich Schneider, and Sumana Chattopadhyay. 2006. "The Size and Development of the Shadow Economy: An Empirical Investigation from States of India." <i>Journal of Development Economics</i> , 80(2): 428-43. Using the state level data from India, this paper investigates the size of the hidden economy in Indian states over the period 1974/75 to 1995/96. Our analysis has shown that after liberalization of the Indian economy in 1991/92, the growth in the size of the hidden economy has decreased on an average. Our results show that the growth in the size of the hidden economy is approximately 4% less in scheduled election years than in all other years. We also demonstrate that the growth is significantly lower in those states where the coalition government is in power. An increased growth of newspapers and the literacy rates translate to cleaner governance, e.g. to fewer amounts of shadow economy activities in the economy.

2007	D23 D53 D90 G30 G31 G32 H40	Malmendier, Ulrike, Geoffrey Tate, and Jonathan Yan. 2007. <i>Corporate Financial Policies With Overconfident Managers</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 13570. Many financing choices of US corporations remain puzzling even after accounting for standard determinants such as taxes, bankruptcy costs, and asymmetric information. We propose that managerial beliefs help to explain the remaining variation across and within firms, including variation in debt conservatism and in pecking-order behavior. Managers who believe that their company is undervalued view external financing as overpriced, especially equity financing. As a result, they display pecking-order preferences for internal financing over debt and for debt over equity. They may also exhibit debt conservatism: While they prefer debt to equity, they still underutilize debt relative to its tax benefits. We test these hypotheses empirically, using late option exercise by the CEO as a measure of overconfidence. We find that, conditional on accessing public markets, CEOs who personally overinvest in their companies are significantly less likely to issue equity. They raise 33 cents more debt to cover an additional dollar of financing deficit than their peers. Moreover,

Year	DE	Title and Abstract
		the frequency with which they access any external finance (debt or equity) is significantly lower, resulting in debt conservatism. The results replicate when identifying managerial overconfidence based on press portrayal as confident or optimistic. We conclude that managerial overconfidence helps to explain variation in corporate financial policies.

Ekonomicky Casopis/Journal of Economics, 55(7): 697-711. The article examines circumstances under which a corruption is harmful from an economic point of view and explores potential instruments to decrease corruption. Even though acts of corruption are generally voluntary exchanges, they are usually not socially optimal because of presence of negative externalities. The conditions under which they would be socially optimal are extremely rare in real life. The article identifies three anticorruption strategies: decreasing benefits of corruption, increasing costs of corruption and increasing probability of uncovering corruption. It focuses in particular on measure to equalize supply and demand or ones that decrease discretion.
2007	D84	Diamandis, Panayiotis F., Georgios P. Kouretas, and Leonidas Zarangas. 2007. "Dual Foreign Currency Markets and the Role of Expectations: Evidence from the Pacific Basin Countries." Research in International Business and Finance, 21(2): 238-59. This paper analyzes the role of expectations about the government policy in the official foreign currency market in determining the black market premium. We use data for the recent float from six emerging markets of the Pacific Basin where active black markets for foreign currency exist, namely, Indonesia, Korea, Malaysia, the Philippines, Singapore and Thailand. To test the impact of anticipated and unanticipated shocks to the official exchange rate on the black market premium, we employ the two-step procedure of Hoffman et al. [Hoffman, D. L., Low, S. A., Schlagenhauf, D. E., 1984. Tests of rationality, neutrality and market efficiency: a Monte Carlo analysis of alternative test statistics. J. Monet. Econ. 14, 339-363] which provides corrected F-statistics and allows us to draw valid inference in the presence of generated regressors. The main finding of our analysis is that anticipated and unanticipated shocks to the official exchange rate have an impact on the black market premium in all six Pacific Basin countries. These results suggest that portfolio balance models provide the suitable theoretical framework for analyzing the behaviour of the black market premium in the markets for foreign currency in the Pacific Basin countries. Furthermore, this implies that economic agents in these countries are sensitive to expected returns in foreign exchange.

2007	H53	Tran, Chung, and Juergen Jung. 2007. The Extension of Social Security Coverage in Developing Countries. Center for Applied Economics and Policy Research, Economics Department, Indiana University Bloomington, Caep Working Papers: 2007-026. We investigate the effects of extending the coverage of social security to uncovered elderly individuals in the informal sector in developing countries. We use a stochastic overlapping generations framework and incorporate important characteristics of developing countries including family transfers and a sizeable informal sector. Our calibrated model predicts that the introduction of a moderately sized social assistance program decreases steady state output by up to 3.25% and labor supply by up to 2.5%. In contrast to literature focusing on developed countries, the model predicts that extending the coverage of the social security system results in welfare gains for low income households. This result indicates that the insurance function and the redistribution function of the social assistance program dominate the distortionary effects in an environment without adequate risk sharing mechanisms and high inequality.
2007	H61	Toader, Stela. 2007. "The Dimension of the Underground Economy, in Romania, in the Period after 1989." Romanian Economic and Business Review, 2(1): 79-84. In the period after 1989, the underground economy in Romania had a constantly ascendant evolution. In this article, we think about the distinguishness of the underground economy level and of the real possibilities of Romanian economy through the dimension of the real total gross domestic product, providing a reason seriously enough to amplify the struggle against the phenomenon of the underground economy, especially as a result of our country's integration in the European Union. Practically, starting with the 1st of January 2007, the internal struggle against the underground economy and the fiscal fraud (as assimilated phenomenon) becomes one of the interests of the community, because they will affect, from so on, not only the public budget but also the community's.

Journal of Policy Analysis and Management, 26(4): 791-810. Some scholars have suggested that a negative consequence of strengthening child support enforcement is to encourage fathers to shift from regular sector to underground employment. We employ data from the Fragile Families and Child Wellbeing Study to investigate the relationship between the strength of child support enforcement (CSE) and levels of underground and regular sector employment

Year	DE	Title and Abstract
		among unmarried fathers. We find that, in general, living in a city with stricter CSE is associated with fewer hours of underground employment. We find little evidence that stronger enforcement is associated with employment or hours in the regular sector.
2007	J13 J82	Dessing, Maryke. 2007. "The S-Shaped Labour Supply Schedule: Evidence from Less-Developed Countries." <i>Canadian Journal of Development Studies</i> , 28(1): 59-98. Consistent with an S-shaped labour supply schedule, the overwhelming evidence for the total supply of labour in less-developed countries shows a negative relationship with wages (and income levels), for both men and women at low wage levels, in particular in rural areas, except during seasonal peaks. In urban areas and at higher wage levels, the relationship becomes positive. Women (and children) usually make most of the adjustment. The study therefore appraises them primarily. Three caveats are discussed with respect to forced labour, informal employment, and child labour.

2007	J28 J81	Giri, D. V., and P. C. Das. 2007. "Plight of Beedi Workers and the Blame Game in Orissa." <i>Indian Journal of Labour Economics</i> , 50(4): 867-76. This article provides a brief description of the beedi industry in Orissa, while outlining the working conditions of the beedi workers, examining the factors contributing to the plight of these workers, and making a critical analysis of the steps taken by the Government for ensuring 'decent work' for the beedi workers in the State. The article shows that the major factors responsible for the prevalence of the precarious working and living conditions of the beedi rollers in the State include certain lacunae in the legislations that are applicable to the beedi industry and the beedi workers, weak trade unions and inadequate and poorly organised inspection staff of the State Labour Directorate, and the Government's failure to ensure implementation of the recommendations of the tripartite Committee on Beedi Workers in Orissa, 2002.
2007	J63	Tokman, Victor E. 2007. "The Informal Economy, Insecurity and Social Cohesion in Latin America." <i>International Labour Review</i> , 146(1-2): 81-107. Most Latin American countries adopted the welfare state as a model, though developing it in very different ways and, often, imperfectly because of structural differences between them and the industrialized countries. Social protection coverage is still patchy, with many informal-sector workers not covered and widespread public feelings of insecurity. The author examines the complicated structural and labour situation and the latest ideas in Latin America and the European Union to strengthen social cohesion. He analyses approaches to incorporating the informal sector into the modern sector, addressing social exclusion, combining flexibility for employers with security for workers, and achieving near-universal social protection.

2007	J81 J83	Kundu, Amit. 2007. "Conditions of Work and Rights of Female Domestic Workers of Kolkata." <i>Indian Journal of Labour Economics</i> , 50(4): 853-66. Domestic workers, most of whom are female, are hired to work in private houses. However, their work remains unrecognised as a legitimate form of activity in India. In this paper, through a micro-level study, the conditions of work and rights of female domestic workers of Kolkata are investigated. The paper shows that young married women coming from distant places with higher number of children, with low and uncertain income of other family members, prefer part-time domestic work to supplement their family income. Through Engel's ratio it is identified that the standard of living of the full-time domestic workers is slightly better than that of the part-time domestic workers. Most of them are deprived of overtime pay, public holidays, and timely payment of salaries. The West Bengal Government also deprives them of the benefit of the State-assisted Scheme of Provident Fund for unorganised workers.
2007	J82	THE SAME AS J13 Dessing, Maryke. 2007. "The S-Shaped Labour Supply Schedule: Evidence from Less-Developed Countries." <i>Canadian Journal of Development Studies</i> , 28(1): 59-98.
2007	J83	Saini, Debi S. 2007. "Securing Working Class Rights for Informal Sector Workers in India: A Case Study of Self-Employed Women's Association." <i>Indian Journal of Labour Economics</i> , 50(4): 821-34. The growing size of the unorganised/informal sector in the era of globalisation is a cause of concern for the advocates of social justice. The workforce in this sector faces many serious problems; but the state has shown indifference to their woes. The Self-Employed Women's Association (SEWA), based in Ahmedabad, Gujarat, has made unique efforts in organising and empowering a large number of women workers in the informal sector, who face a number of difficulties in dealing with state agencies, market realities, and contractors. It has also used the self-help group (SHG) model to involve them in linking with the concerned state agencies. This has facilitated a more effective securing of working class rights by the women workers. This paper analyses the structure and working of SEWA, which combines the twin features of a trade union as well as workers' co-operative and envisages a community support model of social protection to workers in the informal sector. It is further argued that for the effective working of a poverty alleviation model like that of SEWA, some of the necessary conditions include: proactive state support for such efforts, provision of need-based services to members, availability of sagacious leadership, and democratic management structures. It also suggests new legal forms of organisation for responding to the poor people's needs.
2007	K10 L66 N42 N62	Welskopp, Thomas. 2007. "Bis an die Grenzen des Gesetzes: Die Reaktion der legalen Alkoholwirtschaft auf die National Prohibition in den USA, 1920 bis 1933. (Probing the Limits of the Law: The Adaptation of the Legal Alcohol Industries to the Conditions of National Prohibition in the United States, 1920 to 1933. With English summary)." <i>Zeitschrift für Unternehmensgeschichte</i> , 52(1): 1-32. The constitutional alcohol prohibition in the U.S., which came into effect in January 1920, and lasted to December 1933, effectively forced established brewers, distillers, and vintners out of their core businesses. Although their property was not "taken" in a legal sense, prohibition amounted to nothing else but a "cold expropriation" of its value. Under the conditions of National Prohibition an illegal underground economy of alcohol production and distribution mushroomed instead which by the end of the 1920s produced sales of around five billion dollars a year--approximately the same sum Americans would have spent on alcoholic beverages anyway if Prohibition had not come. The article examines how the legal branch of the businesses, the brewers, distillers and Californian grape farmers, dealt with this life-threatening situation and with the emergence of a tempting "wet" black market out of their reach if they did not choose to cross the line into illegality themselves. National Prohibition is treated as a measure of extreme state intervention, like other supply prohibitions or war economy regulations, to which the legal enterprises reacted in a flexible, fully opportunistic manner. The breweries, distilleries, and grape concentrate makers probed the limits of the law when they, after a short period of adaptation and reorientation, turned to the manufacture, transport, and sale of the half-finished ingredients of alcoholic beer, spirits, and wine. While they themselves never really left legal territory--since their products did not contain fermented alcohol--they nevertheless provided the illegal black economy with raw

Year	DE	Title and Abstract
		materials ready to be refined into the final product on a scale that enabled the criminal alcohol business to become the third highest ranked industry in the U.S. by the end of the 1920s.

2007	L92	Lyons, Michal. 2007. "Temporary Migration, the Informal Economy and Structural Change: London's Bicycle Rickshaw Riders." <i>Local Economy</i> , 22(4): 376-87. In the context of social, economic and political change, and of a continuing fall in the real cost of travel, temporary migrations to London, as to other major cities in the global North, have become increasingly common. Indeed, some have speculated that they may come to replace permanent migrations. This trend has intersected with 'informalization' of lower-status jobs in some cities of the global North, including London, and the general depression of migrant wages in low-end jobs in the formal sector. In this context, debate has developed about the role of temporary migrations in migrants' long-term and short-term strategies, and about their impact on host societies. Drawing on a sustainable livelihoods approach the short-term and long-term life strategies and livelihood strategies of 60 Colombian and Polish bicycle rickshaw ('pedicab') riders in London are analysed and compared. Despite the differences in the status of the two groups, findings are that both groups develop and draw on cultural and social capital in the workplace to facilitate dealings with the local economy and polity; both have had an influence on the local economic sector in which they operate; and both migrate temporarily as part of a life strategy at home, as part of which their migrations have a touristic and cultural, as well as instrumental purpose.

2007	Q10	Chaudhuri, Sarbajit, and Dibyendu Banerjee. 2007. "Economic Liberalization, Capital Mobility and Informal Wage in a Small Open Economy: A Theoretical Analysis." <i>Economic Modelling</i> , 24(6): 924-40. Empirical evidence suggests that the size of the informal sector in the developing countries has increased considerably during the liberalized economic regime. The present paper purports to analyze the consequences of economic reforms on the wellbeing of the informal sector workforce using a three-sector general equilibrium model with two informal sectors. The theoretical analysis finds that different liberalized policies produce diverse effects on the informal wage and that these results are independent of the nature of capital mobility between the informal and the formal sectors. It also shows that labour market reforms, contrary to the common wisdom, are likely to produce favourable effects on the informal wage.

2008	C51	Albu, Lucian Liviu, Ion Ghizdeanu, and Marioara Jordan. 2008. "Informal Economic Estimation Models at Macroeconomic Level: Some Theoretical and Methodological Considerations." <i>Timisoara Journal of Economics and Business</i> , 1(2): 177-90. The analytical approach is conducted at the macroeconomic level and the problems that are discussed here come under the impact of the fiscal policy and the tax level on the macro stabilizing programs, the way it is approached in the literature and some of these models are presented here. In Romania's case, the methodology of Dobrescu (1994, 1996) and Albu and the others (1998) is the most common methodology used, for the transition period, in order to estimate the impact that the grey economy has by comparison with the general economy dynamics and the relationship between the grey economy and the institutional approach (Daianu si Albu, 1997). At the same time, there are some references are made to the detailed study on Laffer's curve and its

Year	DE	Title and Abstract
		implications on the fiscal policy plans made by the Economic Forecast Institute in the CEPREMAP (Albu, 1995). Starting from the development of the previous theoretical model regarding the tax evasion in the grey economy using macroeconomics statistical data that are usually employed, in three sub-models, and through their combination, the authors build a general model.
2008	D86	Quintin, Erwan. 2008. "Contract Enforcement and the Size of the Informal Economy." <i>Economic Theory</i> , 37(3): 395-416. This paper describes a model where the size of the informal sector decreases as the degree to which financing contracts can be enforced in the formal sector rises. Agents who choose to operate in the informal sector can evade taxes, but they have no access to official means of contract enforcement. Numerical simulations of the model suggest that lax tax enforcement alone does not suffice to generate a large informal sector. Contractual imperfections, on the other hand, can generate a large informal sector and account for several distinguishing features of the organization of production in developing economies.
2008	H22	Bovi, Maurizio. 2008. "Measuring Tax Burdens in the Presence of Non Observed Incomes." <i>Economics Bulletin</i> , 5(10): 1-6. The Tax-to-GDP ratio is an important tool for both economists and policymakers. Despite its pivotal role, this indicator is measured and analyzed without due attention to the potential biases stemming from the so called non-observed economy. This note aims at filling this gap, pointing out the effects of untaxed and undeclared incomes on both sides of the Tax-to-GDP ratio.
2008	J18	Parlevliet, Jante, and Theodora Xenogiani. 2008. <i>Report on Informal Employment in Romania</i> . OECD Development Centre, OECD Development Centre Working Papers: 271. Informal employment is one of the key features of the Romanian labour market and the main concerns of the Romanian government. Informal employment is not new in Romania. This study attempts to shed light on the issue of informal work in Romania.

"Local Economic Governance in Hard Times: The Shadow Economy and the Textile and Clothing Industries around Lodz and Naples." <i>Socio-Economic Review</i> , 6(3): 473-92. Areas of industrial decline, with poor quality local government and poor infrastructure, frequently find a kind of economic success through the shadow economy. But illegality imposes constraints on the kind of success that can be achieved. The study of such areas in central Poland and southern Italy reveals considerable similarities, despite the fact that the former was part of the former state socialist bloc, the latter not. In both regions, small and medium-sized textile and clothing firms were flourishing within the limits of the shadow economy following the collapse of large corporations in the area. There were, however, important differences. Italian public policy has provided some possible routes out of the shadow economy, and its distinctive governance, which has been taken advantage of to a limited extent by firms, while Polish policy continues to deny that the problem exists. Also, because of the presence of leading clothing brands elsewhere in Italy, southern Italian firms have access to routes for upgrading their activities that are largely unavailable to their Polish counterparts.
2008	L67	Nyamsuren, Nyamaa, and Keun Lee. 2008. "Informal Economic Activities and Firm Performance in a Transition Economy: The Case of the Cashmere Industry in Mongolia." <i>Seoul Journal of Economics</i> , 21(2): 387-425. The cashmere industry is one of the most important foreign currency generators as well as the major income contributor in Mongolia. This study first finds a tendency that cashmere enterprises in Mongolia engage in the trading of raw cashmere rather than use raw cashmere in the production process given the shortage of raw cashmere, its high prices, and the low competitiveness of the final products (garments). This work also finds that there is a high extent of smuggling by enterprise people in the form of selling raw cashmere in black markets, and that a higher degree of smuggling leads to less output, sales. The results suggest the serious damages brought about by smuggling activities in Mongolia. This is in sharp contrast to the impact of formal trading because this does not harm firm profitability and sales growth although it affects production negatively. Finally, income tax rates have a negative and significant impact on profitability and no significant impact on output.

2008	N14	Nikas, Christos. 2008. "Hidden Economy and Hyper-Inflation in Occupied Greece 1941-1944." <i>Archives of Economic History</i> , 20(2): 29-45. The Greek economy during the occupation (1941-1944) is characterized by the aggravation of hyperinflation and hidden economy. The collapse of the tax-collecting mechanism caused the full abandonment of tax controls leading a large part of the economic activity to go underground. The collapse of the public finances led to the imposition of the "inflation tax", with the uncontrolled monetary expansion leading to one of the greatest (and in fact the only one during occupation) hyperinflations recorded in the first half of the 20th century. The purpose of this paper is to place the Greek experience in a theoretical and empirical economic framework.
2008	Q21	Jeannot Rossi, Fernando. 2008. "Desarrollo de la economía informal. (Development of the Informal Economy. With English summary.)." <i>Analisis Economico</i> , 23(52): 133-58. An institutional approach is used by the author, as limited rationality and imperfect concurrence result in informal behaviours occurring much more on the basis of the appropriation process than in relation to forms of property: in this way the circumstantial determining factors acquire meaning; especially in relation to the real origins of this informality. Both in relation to the Tragedy of the Commons, as with the Tragedy of the Anti Commons, there exists a bad assignment of resources by the informal economy, based upon a capitalistic process of appropriation--the appropriation of rents--but not on the development of gains in productivity.

2009	F34	Nabi, Mahmoud Sami, and Imed Drine. 2009. "External Debt, Informal Economy and Growth." <i>Economics Bulletin</i> , 29(3): 1695-1707. We develop an endogenous growth model with overlapping generations taking into account important characteristics of the developing countries: high public external debt and large informal sector. We show that an increasing of the public external debt has two opposite effects. On the one hand, it enhances growth through a positive externality affecting the productivity of private firms. On the other hand, it inhibits growth by ousting the external financing of private firms and enlarging the less efficient informal sector. These two effects generate a non-linear effect of the public external debt on growth and an optimal share of the public external indebtedness. We also show that, under a certain condition, the enlargement of the informal sector could be accompanied by higher growth.
2009	J52	Chiarini, Bruno, and Elisabetta Marzano. 2009. "Interaction between Underground Employment and Unions in Selected Italian Industries." <i>Revue Economique</i> , 60(5): 1155-80. In this paper, we investigate empirically the nature of the relation between underground employment and unions in Italy, focusing on certain productive sectors. The motivation for this analysis is the hypothesis of the existence of two different opposite channels through which unions affect underground employment: a macro-effect, generating shadow activities via higher wages and market rigidities; a micro-effect, entailing a negative impact of trade union power on underground employment. We consider two different measures of the bargaining power of trade unions, i.e., wages and net density. Econometric analysis of Italian data yields three main results. First, mechanisms of interaction between underground employment and unions change profoundly according to the nature of the industry. Second, the two indexes of the trade unions' bargaining power play a different role vis-a-vis the extent of underground employment. Third, there is a counter-intuitive interaction between wage and underground employment, which may be explained in an insider-outsider framework.
2009	J60	Jutting, Johannes P., and Juan R. de Laiglesia, eds. 2009. <i>Is Informal Normal? Towards More and Better Jobs in Developing Countries</i> , Development Centre Studies. Paris and Washington, D.C.: Organisation for Economic Co-operation and Development. Six papers explore how we can deal better with the reality of labor markets in developing countries with a view to achieving the Millennium Development Goals. Papers discuss employment, poverty reduction, and development--what is new (Johannes Jutting and Juan R. de Laiglesia); concepts, measurement, and trends (Jacques Charmes); persisting informal employment--what explains it (David Kucera and Theodora Xenogiani); women in informal employment--what we know and what we can do (Kucera and Xenogiani); moving out of bad jobs--more mobility, more opportunity (Jason Gagnon); and dealing with informal employment--toward a three-pronged strategy (Jutting and Laiglesia). Also available in French under the title Etudes du Centre de Developpement: L'emploi informel dans les pays en developpement: Une normalite indepassable?.
2009	L24	Williams, Colin C. 2009. "Rationales for Outsourcing Domestic Services to Off-the-Books Workers." <i>Journal of Economic Studies</i> , 36(3-4): 343-54. This paper aims to evaluate critically the assumption that the main reason for acquiring domestic services from the off-the-books economy is to save money. Data are reported from an internet survey of 5,500 people living in households with one or more members in employment in the city of Sheffield in the UK, which resulted in 418 responses (a 7.6 per cent response rate). In just 13 per cent of cases where domestic tasks were outsourced to the off-the-books economy the main reason was to save money or cost. Instead, off-the-books workers were used principally due to the problems customers confronted regarding the availability and quality of formal service providers.
2009	M54	Theodore, Nik, Abel Valenzuela Jr., and Edwin Melendez. 2009. "Worker Centers: Defending Labor Standards for Migrant Workers in the Informal Economy." <i>International Journal of Manpower</i> , 30(5): 422-36. The purpose of this paper is to examine the role of day labor worker centers in improving wages and working conditions of migrant casual workers in the USA. The paper reports the results of a survey of worker center executive directors and senior staff, with particular attention to the ways in which centers maintain wage rates, allocate jobs, and redress grievances. Day labor worker centers are now an important presence in construction industry casual labor markets, performing HRM functions that benefit employers and workers.

2009	Q01	Tenguz, Alper Selman. 2009. <i>Strategies of the State towards the Informal Economy</i>, Hamburg: Dr. Kovac. Explores the impact that the informal economy could have on fast and sustainable economic growth in developing countries. Discusses the current state of Informal Economic Activity (IEA) policy advice and what else is needed; the meaning of IEA and the reasons for its existence; elements of the IEA strategy framework; testing the IEA strategy framework; developing the IEA policy actions; and a summary of findings and outlook on further research. Appendices provide information on important economic IEA models; income inequality data; education inequality data; corruption data; country classification cases; indicator data sets; IEA support attitude; and empirical test results.
2009	R41	Rocha, Ricardo, Fabio Sanchez, and Leonardo Garcia. 2009. "Ventas callejeras y espacio publico: Efectos sobre el comercio de Bogota. (Street Vendors and Public Space: The Effects on Commerce in Bogota. With English summary.)." <i>Desarrollo y Sociedad</i>, 0(63): 245-68. The present paper attempts to measure empirically the externalities generated by the street vendors in four zones of the city. Given the lack of information censuses and surveys were carried out during December of 2004 and January 2005. The descriptive statistics show that the established commerce is less formal than expected; whereas the street vendors are mostly stationary, exhibit reduced scale, and low space rivalry. The econometric estimations show that the congestion of the public space generated by street vendors has a negative impact on both sales and employment of established retail commerce. The simulations of a reduction of street vendors pinpoint that although street sales account for just 2% of total sales in the four areas under study, they reduce 14% and 16% sales and employment of formal retail commerce respectively. Finally, some limitations of the methodological strategy are raised and some public policy proposals to face the phenomenon are presented.

2010	A23 J80 Q56	Chaudhuri, Sarbajit, and Ujjaini Mukhopadhyay. 2010. <i>Revisiting the Informal Sector: A General Equilibrium Approach</i>, New York and London: Springer. Explores the informal sector and its role in the context of unemployment, child labor, globalization, and the environment. Discusses theoretical foundations--a general equilibrium approach; the Harris-Todaro migration model and introduction of the informal sector; the informal sector and open unemployment; foreign capital inflow, the informal sector, and welfare; how and how far to liberalize a developing economy; economic liberalization, informal wage, and skilled-unskilled wage inequality; incidence of child labor, the informal sector, and economic liberalization; and the informal sector, pollution, and waste management.
2010	C52	Granda-Carvajal, Catalina. 2010. "The Unofficial Economy and the Business Cycle: A Test for Theories." <i>International Economic Journal</i>, 24(4): 573-86. The shadow economy is an extensive phenomenon worldwide. It poses several questions, the consequences of fluctuations in economic activity being among the major ones. Based on official data, this paper establishes a set of cyclical properties of macroeconomic aggregates and studies how these vary across countries with the size of the unofficial sector. Through comparisons with the existing literature on business cycles in economies featuring underground activities, the obtained 'stylized facts' are used to test the relevance of theoretical predictions on the influence of the shadow economy. Using this procedure allows us to confirm that the evidence is not entirely of the sort suggested in business cycle models. In particular, some important macro aggregates and cyclical properties have been neglected in the analysis altogether, while others have been paid too much attention for no apparent empirical reason. Some possible avenues for future research can be drawn from this exercise.
2010	C52	Granda-Carvajal, Catalina. 2010. <i>The Unofficial Economy and the Business Cycle: A Test for Theories</i>. University of Connecticut Department of Economics, Working papers: 2010-17. 2010	C63	Hokamp, Sascha, and Michael Pickhardt. 2010. "Income Tax Evasion in a Society of Heterogeneous Agents--Evidence from an Agent-Based Model." <i>International Economic Journal</i>, 24(4): 541-53. We analyze the evolution and extent of income tax evasion under alternative governmental policies in an agent-based model with heterogeneous agents. A novel aspect of our modeling is the use of an exponential utility function, which allows us to assume rather realistic audit probabilities and to yield more realistic results with respect to the extent of tax evasion. Further, the introduction of lapse of time effects constitutes another novel aspect of our model. Among other things, the model allows for assessing the impact of alternative policies on tax evasion. Subject to the model features, we find that ethical norms and lapse of time effects reduce the extent of tax evasion particularly strongly.
2010	C73	Araujo, Ricardo Azevedo, and Nathalia Almeida de Souza. 2010. "An Evolutionary Game Theory Approach to the Dynamics of the Labour Market: A Formal and Informal Perspective." <i>Structural Change and Economic Dynamics</i>, 21(2): 101-10. A stylized fact of the labour market in developing countries is that it is highly segmented in informality. One of the main factors that induce workers and firms into informality is an excessive regulatory system that makes formal economy little attractive. This study aims to analyze the dynamics of workers and firms' entrance and withdrawal of the formal and informal economy, assessing the impact of taxes by using an evolutionary game theory approach in which economic agents decide for one these markets according to the expected pay-off. Moreover, the optimal relation between regulatory and enforcement action by the government is evaluated.

2010	E02	Atoyebi, G. O., G. T. Ijaiya, and M. A. Ijaiya. 2010. "Problems of Informal Microfinance in Kwara South: Implications for Rural Finance Policy in Nigeria." <i>International Economics and Finance Journal</i>, 5(1-2): 159-69. The provision of credit to rural households faces many challenges from formal and informal microfinance to rural finance policy. In this paper, results from rural areas are reported. The survey was conducted in some selected rural areas of Ekiti, Irepodun, and Offa local government areas in Kwara South Senatorial District, Nigeria between November 2008 and March, 2009 in which 600 respondents were investigated. These data were described and analysed with regards to implication for rural finance policy in Nigeria. The result shows that problem of continuity, small amount of loan, inability of informal microfinance to meet all loan demands, and provide term finance, limited the rural dwellers access to credit. This suggests that the rural dwellers would not be able to optimize their total

Year	DE	Title and Abstract
		production--the value of which is elastic with respect to credit they can take. They would also not be able to invest in capital intensive projects. The study recommended provision of group collateral, and a sound legal and regulatory framework that would reduce risk and build confidence in informal microfinance.
2010	G01	Ionita, Iulian Gheorghe. 2010. "Money Laundering on the Background of the Financial Crisis--A Romanian Reality." <i>Romanian Economic and Business Review</i>, 5(2): 89-107. The purpose of most illegal activities (especially those in the economic field), whether illegal as specific to organised crime networks (cigarette smuggling, alcohol; trafficking of weapons, nuclear material, drugs, human beings; trade in protected species of animals and plants, with human tissues and organs; forgery of currency or other values etc.) or other illegal activities developed more or less in organised manner (such as embezzlement, corruption, tax evasion, fraud, informatics fraud), is to generate funds for the organised criminality group or individual that develops them. As these illegal activities generate substantial funds, the organised criminality group or individual (launderer) involved have to find a way to control these funds without attracting attention to the activity which generates them or to the persons concerned. Through the process of money laundering one tries and succeeds (in most cases) to hide the real origin and possession of these funds. In the context of the current financial crisis, the phenomenon of money laundering experiences an extension and a specialisation without precedent. This situation demands a concerted reaction by the authorities who enforce the law in preventing and fighting money laundering.
2010	I20	CV: Marcelli, Enrico. 2010. "The Diverse Nature of Informal Work in California." In <i>Informal Work in Developed Nations</i>, ed. Enrico Marcelli, Colin C. Williams and Pascale Joassart, 168-76. Routledge Advances in Heterodox Economics. London and New York: Taylor and Francis, Routledge.
2010	I20	Cappariello, Rita, and Roberta Zizza. 2010. "Dropping the Books and Working Off the Books." <i>Labour</i>, 24(2): 139-62. The paper empirically tests the relationship between underground labour and schooling achievement for Italy, a country ranking badly in both respects when compared with other high-income economies, with a marked duality between North and South. In order to identify underground workers, we exploit the information on individuals' social security positions available from the Bank of Italy's Survey on Household Income and Wealth. After controlling for a wide range of sociodemographic and economic variables and addressing potential endogeneity and selection issues, we show that a low level of education sizeably and significantly increases the probability of working underground. Switching from completing compulsory school to graduating at college more than halves this probability for both men and women. The gain is slightly higher for individuals completing the compulsory track with respect to those having no formal education at all. The different probabilities found for self-employed and dependent workers support the view of a dual informal sector, in which necessity and desirability coexist.

2010	K22	Krasniqi, Armand. 2010. "Impact of the Legislation in Informal Economy of South-Eastern European Countries--With Particular Focus in Kosovo." <i>Journal of Advanced Research in Law and Economics</i>, 1(2): 130-42. In several South Easter European Countries due to the delayed transition, the legal system of the economy is regulated with certain inappropriate provisions which reflect a weak institutional control system and inefficient implementation of sanctions against entities--operators that are not registered which realistically belong to the business activities. Through informal economy channels, which in some particular countries include a high percentage of the movement of goods and services, there is a specific traffic that takes places which actually scores billions of dollars. From such types of activities the government is not capable to collect tax liabilities and results budget becomes inept. The business operation by unregistered entities and operators, especially in area of retail services and construction may significantly distort the competition. These types of activities may encourage legal entities to undertake illegal actions to generate revenues aiming to achieve a sustainable position in market. The audit services of certain departments for employment and trade unfortunately are oriented in auditing only entities and operators that are legal and registered whereas as far as illegal activities that take place in theirs eyes it almost doesn't exist at all. It is a duty of governmental bodies to commit themselves seriously in order to prevent this negative social phenomenon as well as to combat by issuing appropriate legal-economical instruments which primarily would encourage the entities and operators through a micro-credit programs aiming to legalize their economic activities, creation of a guarantee fund by undertaking partially the risk during the first period of business aiming to promote the legalization and to facilitate operating costs within the legal market.
2010	L14	Steer, Liesbet, and Kunal Sen. 2010. "Formal and Informal Institutions in a Transition Economy: The Case of Vietnam." <i>World Development</i>, 38(11): 1603-15. We examine the role of informal and formal institutions behind the growth of private sector in Vietnam since the official recognition of private enterprises in the early 1990s. We show that firms have increasingly taken on risks in their transactions in spite of weak formal institutions. Risk-taking by firms can be explained by the use of informal institutions such as relational contracts and networks along with recourse to emerging formal institutions such as written contracts. Our results suggest that informal institutions remain important as mechanisms of risk management even as the economy matures and new formal institutions gradually develop.
2010	L82	CV: Hart, Keith. 2010. "Africa's Urban Revolution and the Informal Economy." In <i>The Political Economy of Africa</i>, ed. Vishnu Padayachee, 371-88. London and New York: Taylor and Francis, Routledge.
2010	O10	Tanaka, Victor. 2010. "The "Informal Sector" and the Political Economy of Development." <i>Public Choice</i>, 145(1-2): 295-317. This paper takes an initial step in integrating insights from two sets of literature which have focused on central aspects of development with unfortunate independence. It highlights politically valuable resources, which are identified in the political economy literature, and shows that the informal sector literature provides ample evidence that these resources in general are (i) scarcely available to informal entities, (ii) poorly valued in their possession, and (iii) more often collectively unexploited by them. Overall, there seems to be an important though neglected bias in how the political system in less developed countries formulates, crafts, and implements policy.

2011	D22	Grimm, Michael, Jens Kruger, and Jann Lay. 2011. "Barriers to Entry and Returns to Capital in Informal Activities: Evidence from Sub-Saharan Africa." <i>Review of Income and Wealth</i> , 57(0): S27-53. This paper investigates the patterns of capital entry barriers and capital returns in informal micro and small enterprises (MSEs) using a unique micro dataset for seven West African countries. Our findings support the view of a heterogeneous informal sector that is not primarily host to subsistence activities. While an assessment of initial investment identifies some informal activities with negligible entry barriers, a notable cost of entry is associated with most activities. We find very heterogeneous patterns of capital returns in informal MSEs. At very low levels of capital, marginal returns are extremely high--often exceeding 70 percent per month. Above a capital stock of 150 International Dollars, marginal returns are found to be relatively low at around 4-7 percent monthly. We provide some evidence that the high returns at low capital stocks reflect high risks. At the same time, most MSEs appear to be severely capital constrained.
2011	D52 D91 O53	Joo, Donghun. 2011. "Determinants of the Informal Sector and Their Effects on the Economy: The Case of Korea." <i>Global Economic Review</i> , 40(1): 21-43. In this study, we adopt a general equilibrium model with occupational choice and incomplete contract enforcement in order to evaluate the effects of policies to reduce the size of the informal economy. More concretely, we try to quantify the effects of tax, entry cost, and contract enforcement on output, income distribution, and tax revenue. The model is specifically calibrated to the Korean economy. Under the assumption of an endogenously determined interest rate, the effects of policies on total output are restrictive. However, the demand effect shows that entry cost and contract enforcement have significant potential influences on output. Lowering the tax rate increases income inequality in spite of the shrinkage in size of the informal sector. There is no Laffer curve effect when the tax rate is lowered, despite the broadened tax base. Lowering the entry cost turns out to be a viable policy option for reducing the size of the informal sector, as it reduces inequality and increases tax revenue effectively.
2011	D58	Estrades, Carmen, and Maria Ines Terra. 2011. "Fighting Informality in Segmented Labor Markets: A General Equilibrium Analysis Applied to Uruguay." <i>Latin American Journal of Economics</i> , 48(1): 1-37. As in other Latin American countries, labor informality in Uruguay mainly affects less educated workers, who are also more vulnerable to poverty. We analyze the impact of some policies against informality in Uruguay, applying a general equilibrium model with a segmented labor market specification. We simulate two sets of policies: payroll tax cuts and increased enforcement in the informal sector. Both sets of policies are effective in reducing informality, but the effect on poverty is not straightforward. Poverty falls as informality is reduced; however, as enforcement policies increase hiring costs for informal firms, wages of low-skilled workers decline and poverty increases.
2011	D91	THE SAME AS D52 Joo, Donghun. 2011. "Determinants of the Informal Sector and Their Effects on the Economy: The Case of Korea." <i>Global Economic Review</i> , 40(1): 21-43.
2011	E12	Figuera, Stefano. 2011. "Alcune considerazioni sullo Shadow Banking System. (Some Thoughts on the Shadow Banking System. With English summary.)" <i>Studi Economici</i> , 66(104): 69-87. The financial intermediation system has been characterized by the emergence of new subjects and instruments modifying its organization. The development of the shadow banking system parallel to the traditional one has led to the demand, during the recent period of financial crisis, for a more efficient control to weather the growing systemic risk. This changing context leads the author to consider some essential profiles of the monetary nature of the capitalist economy. Specifically, a need is perceived to reinterpret recent events in the light of the credit nature of money and the endogenous character of its supply, aspects on which scholars of the Keynesian school have long focused their attention. The author considers particularly useful the indications deriving from the monetary production theory, especially with reference to the distinction among the various forms of financing, to understand such changes and adopt suitable strategies to handle them.
2011	E12	Forges Davanzati, Guglielmo. 2011. "Sussidi di disoccupazione ed economia sommersa: Un'analisi keynesiano-istituzionalista. (With English summary.)" <i>Studi e Note di Economia</i> , 16(3): 321-38. The aim of this paper is to analyse the role of social and moral norms in the underground economy, within a Keynesian-Institutionalist theoretical framework. In particular, it is shown that the existence of illegal behaviours can be explained in the light of the persistence of social and moral norms which constrain individual choices. Moreover, the effect of increased unemployment benefits in reducing the size of the underground economy is explored, and, on theoretical grounds, it is suggested that this increases aggregate demand and thus employment in the 'regular' sector, while also reducing the labour supply in the underground sector.
2011	E20	Georgiou, George M. 2011. "Measuring the Size of the Informal Economy: Some Critical Comments." <i>Journal of Interdisciplinary Economics</i> , 23(1): 85-107. There has been a burgeoning number of studies attempting to measure the size of the 'black' economy. These are based on a variety of methodologies and provide a range of estimates, not just across countries but within the same countries. This raises a number of issues. What is meant by the term 'black' economy? Is it an appropriate description? What is the theory underlying the estimates of informal economic activity? This paper examines these and other issues, and concludes that whilst the existence of what we prefer to call the 'informal' economy in most countries is incontrovertible, there is a lack of consensus on the appropriate methodology for estimating its size. More importantly, the large number of studies are simply

Year	DE	Title and Abstract
		exercises in measurement without theory, though we are sceptical that even with strong theoretical underpinnings it is possible to provide accurate estimates of a complicated web of informal activities.
2011	E61	Cuff, Katherine, Nicolas Marceau, Steeve Mongrain, and Joanne Roberts. 2011. "Optimal Policies with an Informal Sector." <i>Journal of Public Economics</i> , 95(11-12): 1280-91. This paper characterizes optimal policies in the presence of tax evasion and undocumented workers. In equilibrium, domestic workers may work exclusively in the formal sector or also in the informal sector. Surprisingly, in equilibrium, wages are always equalized between domestic and undocumented workers, even if they do not work in the same sectors of the economy. This is driven by the interaction of firm level decisions with optimal government policy. We also find that enforcement may not always be decreasing in its cost, and that governments will optimally enforce labour market segmentation if enforcement costs are not too high.
2011	F12	Mandal, Biswajit, and Saswati Chaudhuri. 2011. "Informal Wage, Informal Price and Extortion under Migration and Tariff Reform." <i>Modern Economy</i> , 2(1): 39-44. In this paper we propose a theoretical model where formal and informal sectors co-exist in tandem. Trade union segregates some labor from being formal. Capital is not allowed to freely move between formal and informal sectors. Using this sort of framework it has been shown that immigration of unskilled workers reduces the return to informal labor and makes the informal good relatively cheap. A tariff slash also impinges on similar kind of results. In both the cases informal capitalists gain. Moreover, what is more striking is that both migration and tariff reform are equally bad for the economy as a whole since these policies enhance the 'unproductive' element or labor in the society which is really costly as these laborers could have been used to produce some more consumable commodities.
2011	F61	Vega, Carlos Alba. 2011. "La mondialisation par le bas et ses formes de regulation politique. (Globalization from Below and Its Political Regulation Forms. With English summary.)." <i>Revue Tiers Monde</i> , 0(208): 103-19. This article examines globalization from below, constituted by millions of persons and merchandises travelling with and without papers who participate in an opposite side of the hegemonic globalization. These flux which imply transactions which are non institutionalized, informal, sometimes "semi-legal" or "illegal", are generated by migrants, merchants and small entrepreneurs who bring goods, new or second hand, original or pirated, to consumers that otherwise wouldn't have access to the world's wealth. What is this Economic Globalization from below? How do street vendors organize themselves in order to sell these products in forbidden places? We will try to answer these questions with field materials (deep interviews and surveys) from Mexico City's Historical Center.
2011	G11	d'Andria, Diego. 2011. "Investment Strategies of Criminal Organisations." <i>Policy Studies</i> , 32(1): 1-19. Recent transformations affecting large criminal organisations worldwide point to a mutation towards high internationalisation and management practices similar to incorporated enterprises. This trend brings new issues and questions regarding the effectiveness of policies aimed at eradicating such forms of delinquency. Indeed, if organised crime has the ability to modify its investment portfolio composition to react to an increase in punishment and penalties and of public spending devoted to a generic rise of police activity, the deterrent power of traditional security policy is eroded, or totally nullified if the organised crime is capable of obtaining a risk premium for its illicit activities. Researching into the peculiarities of large criminal organisations and formulating a behavioural model for their investment choices, I propose results to support a policy research aimed at undermining their flexibility in assets allocation, both through demand-side and anti-money-laundering policies, and recognising the existing individual incentive asymmetry in entering and exiting organised crime.
2011	H23	Hatipoglu, Ozan, and Gulenay Ozbek. 2011. "On the Political Economy of the Informal Sector and Income Redistribution." <i>European Journal of Law and Economics</i> , 32(1): 69-87. In this paper, we analyze a general equilibrium model in which agents choose to be employed in formal or in the informal sector. The formal sector is taxed to provide income subsidies and the level of redistribution is determined endogenously through majority voting. The model is simulated to produce qualitative results and to illustrate the differences between economies with different distributional features. We show that a distortion in the democratic rule in favor of the rich reduces transfers while the size of the informal sector may remain at high levels. Despite a greater demand for redistribution in societies where the majority has few resources (skills), we find that political systems which work in favor of a rich minority will produce little redistribution. Our results call for pro-poor measures such as free training and education programs that should be offered to those who cannot afford it.
2011	H83	Kim, Young Se, and Jong Won Lee. 2011. "Corruption and Government Roles: Causes, Economic Effects, and Scope." <i>Korea and the World Economy</i> , 12(3): 513-53. This paper reviews recent advances in the economic literature on corruption in order to put some of this material into a broader analytic perspective. Using the widely accepted definition of corruption in the literature, we argue that excessively centralized government structure is one of the ultimate factors that drive a high level of corruption. In accordance with existing studies, we found there is ample evidence that corruption reduces economic efficiencies and has significant distributional consequences. In addition, due to widespread criticism of conventional perception-based corruption measures, we develop alternative measure of corruption that allows more fruitful empirical studies. The estimated magnitude of corruption in Korea suggests a number of important policy implications.

2012	B25	Bagırzade, Elsen Resuloglu. 2012. "İktisat Biliminde Kayıtdışı Ekonomi Arastirmalari Uzerine. (With English summary.)." <i>YDU Sosyal Bilimler Dergisi/NEU Journal of Social Sciences</i> , 5(1): 34-51. The purpose of the research consists in exposing the genesis of hidden economies and determining the evolution and recent tendencies in researching hidden economies. The historical succession method and an interdisciplinary approach together with general-theoretical scientific methods were used in this research. Findings of the research are these: 1) The history of the formation and development of the hidden economy is as old as the history of humanity; 2) Many researchers have investigated this problem in several stages of history, but the systematic research of the problem has increased in the XXth century, especially after the emergence of the institutionalism school of economics; 3) Recent theories of the hidden economy consist of many separate conceptions and approaches related to the determination of the 'hidden economy' concept, estimations of its size, causes of formation, and social and economic consequences; 4) Economic, sociological, cybernetic and juridical approaches differ in research of the hidden economy; 5) An interdisciplinary approach, in other words a universal approach, that combines different approaches (economic, sociological, cybernetic and juridical) is used for perfect results in the latest research. This paper enables one to understand the genesis of the hidden economy, and to learn the historical evolution and modern inclinations of investigations of the problem. Originalities of this paper include introducing the perspectives of the schools of economics related to the phenomenon of the hidden economy, determining the main directions of development in research connected with hidden economies and being the first research in Turkish in this subject.

2012	B54	Tcherneva, Pavlina R. 2012. "What Do Poor Women Want? Public Employment or Cash Transfers? Lessons from Argentina" Levy Economics Institute, The Economics Working Paper Archive. The literature on public employment policies such as the job guarantee (JG) and the employer of last resort (ELR) often emphasizes their macroeconomic stabilization effects. But carefully designed and implemented policies like these can also have profound social transformative effects. In particular, they can help address enduring economic problems such as poverty and gender disparity. To examine how, this paper will look at the reform of Argentina's Plan Jefes into Plan Familias. Plan Jefes was the hallmark stabilization policy of the Argentine government after the 2001 crisis. It guaranteed a public sector job in a community project to unemployed male and female heads of households. The vast majority of beneficiaries, however, turned out to be poor women. For a number of reasons that are explored below, the program was later reformed into a cash transfer policy, known as Plan Familias, that still exists today. The paper examines this reform in order to evaluate the relative impact of such policies on some of the most vulnerable members of society; namely, poor women. An examination of the Argentine experience based on survey evidence and fieldwork reveals that poor women overwhelmingly want paid work opportunities, and that a policy such as the JG or the ELR cannot only guarantee full employment and macroeconomic stabilization, but it can also serve as an institutional vehicle that begins to transform some of the structures and norms that produce and reproduce gender disparities. These transformative features of public employment policies are elucidated by turning to the capabilities approach developed by Amartya Sen and elaborated by Martha Nussbaum-an approach commonly invoked in the feminist literature. This paper examines how the access to paid employment can enhance what Sen defines as an individual's "substantive freedom." Any policy that fosters genuine freedom begins with an understanding of what the targeted population (in this case, poor women) wants. It then devises a strategy that guarantees that such opportunities exist and removes the obstacles to accessing these opportunities.

With English summary.)" <i>Analisis Economico</i> , 27(64): 47-73. This paper addresses both theoretically and methodologically the valor flow estimation of the non-capitalist activity in the Mexican economy during 1970-2003, mostly of the simple mercantile activity which does not employ salaried work. From the perspective of the capitalist production method and its economic categories measurement, such as the estimation of the average profit rate, a proposal for quantifying the surplus of the non-capitalist activity that must be excluded from the calculation is presented. In order to do so, a method based on the business micro-units is justified, rather than assigning a representative income to the self-employed workers, due to the problems derived from the available statistics. In this way the surplus composition in Mexico can be analyzed and its effect on the calculation of the benefit rate shown.

2012	F62	Voicu, Cristina. 2012. "Economics and "Underground" Economy Theory." <i>Theoretical and Applied Economics</i> , 19(7): 71-84. Following examination of the theory underlying "underground" economy study I concluded that a good knowledge of the economic thought history is a must for any paper of economic analysis. The subject is sufficiently dramatic by its nature; so I consider it is necessary to bring the scientific perspective. In addition, "underground" economy is an unavoidable ingredient of any economy, the most profitable component of the economy being the "underground" one. Lack of consideration for this component can lead to severe shortfalls of economic analysis leading to the adoption of unrealistic strategies. I support since the beginning of this paper that epistemic logic rather than the quantitative side will be essentially concerned. In this paper I propose to elaborate on a theory that will mark the right of "underground" economy to exist as a sub-branch of economics. The main argument supporting the need for such an analysis consists of time evidence that shows that "underground" economy is a source of development, subsistence and even escape from the periphery zone for some underdeveloped economies.

2012	J40	Packard, Truman, Johannes Koettl, and Claudio E. Montenegro. 2012. <i>In from the Shadow: Integrating Europe's Informal Labor</i>, Washington, D.C.: World Bank. Explores the experiences of people earning a living working full- or part-time in Europe's untaxed markets for goods, services, and labor, and considers how government policymakers can bring more of these workers in from the shadow economy. Discusses informal employment in Europe's shadow economy; the conceptual framework--more than structural incentives; structural drivers of the shadow economy and informal work; good governance, institutional credibility, and tax morale; and policies to bring work in from the shadow.
2012	J71	Garg, Neeru. 2012. "Accounting for Wage Inequality in Informal Sector." <i>International Journal of Research in Commerce, Economics and Management</i>, 2(7): 34-37. The wage and employment policies relating to the unorganised workers and in particular the issue of wages paid to them has been a subject of considerable discussion among union leaders and labour experts in India. While minimum wage legislation has, to a large extent, been effective in providing protection to workers in the organised sector, with periodic revision, this has not been the case with the unorganised workers, who largely remain outside the purview of minimum wage legislation. During the year 1999-2000, the labour force was estimated to be 407 million. In 2004-05, the labour market consisted of 469.06 million workers and has grown up to 509.3 million in the year 2006. The labour force growth rate accelerated from 1.03 per cent to 2.93 per cent (more than the population growth rate). This paper investigates the structure and growth rate of wage inequality among workers of the informal manufacturing sector of India during the post liberalisation period.
2012	K11 O44	Tajibaeva, Liaila S. 2012. "Property Rights, Renewable Resources and Economic Development." <i>Environmental and Resource Economics</i>, 51(1): 23-41. This paper analyzes the role of endogenous property rights in the development of an open resource-based economy. I incorporate renewable resources and endogenous decisions on property rights into a convex growth model with the formal and informal sectors. I find that along the transition path to steady state, property rights enforcement is not constant but improves with time as well as involves intermediate property rights specification (between open access and perfect property rights). International trade and labor market are driving these endogenous changes. Property rights improve with favorable terms of trade when the economy exports resource services and stronger property rights help maintain the resource stock by deterring illegal harvest. This pushes labor away from the informal harvest sector toward greater participation in the formal sector of the economy. In turn, more labor participation in the formal sector along with capital formation increase the country's output and consumption. Overall, with an open economy and well-functioning institutions, renewable resources have a positive impact on economic growth.
2012	L31	Williams, Colin C., and Sara Nadin. 2012. "Beyond the Commercial versus Social Entrepreneurship Dichotomy: A Case Study of Informal Entrepreneurs." <i>Journal of Developmental Entrepreneurship</i>, 17(3): 1-17. Despite a widespread recognition in the mainstream entrepreneurship literature that many legitimate entrepreneurs do not pursue purely profit-driven commercial goals, the small but burgeoning literature on entrepreneurship in the informal economy has assumed entrepreneurs operating wholly or partially on an off-the-books basis are commercial rather than social entrepreneurs. To evaluate critically this assumption, evidence is reported from a survey involving face-to-face interviews with 70 informal entrepreneurs located in deprived and affluent urban and rural English localities. The finding is that informal entrepreneurs range from those pursuing purely commercial ends through to purely social entrepreneurs pursuing solely social logics, with the majority situated somewhere in-between combining both commercial and social objectives. The outcome is a call to recognize that not all informal entrepreneurs are purely commercial entrepreneurs and that the commercial versus social entrepreneurship dichotomy will need to be transcended if the multifarious goals underpinning informal entrepreneurship are to be better understood.
2012	L69	Mbaye, Souleymane. 2012. "Dynamique de l'artisanat dans la region de ziguinchor (Senegal). (Dynamics of the Small Craft Industry in the Region of Ziguinchor. With English summary.)" <i>Revue Tiers Monde</i>, 0(212): 153-72. The artisanal sector is one of the driving forces of the economy of the region of Ziguinchor which, according to statistics, is the poorest in Senegal. The craft industry is an essential component of the informal sector which has been the subject of numerous studies focusing on the dynamics of accumulation. The application of the segmentation criteria used in the studies on the informal sector (dualism) to the local craft industries formally reveals two categories of units: a first sub group with a high level of saving and investment which is placed, in the economic taxonomy, in the evolutionary or expanded reproduction pole, and a second sub-group characterized by much lower levels. However, there is not always a clear-cut distinction between these two sub-groups. Dynamics implemented in a context of crisis do not necessarily differ from one another.
2012	L86	Goel, Rajeev K., and Michael A. Nelson. 2012. "Shadow Economy and International Software Piracy." <i>Applied Financial Economics</i>, 22(22-24): 1951-59. This article uses pooled data over the period 2004-2007 on about 100 nations to examine the impact of the shadow economy on the piracy of computer software. Results support the main hypothesis that a larger shadow economy leads to higher rates of software piracy. This claim is supported by various robustness checks. A 10% increase in the shadow sector increases software piracy about 1.4%. In other findings, greater economic prosperity and greater Internet diffusion check piracy, while some legal institutional measures have statistically insignificant effects. Policy implications are discussed.

2012	P10	Williams, Colin C., Abbi Kedir, Meryem Fethi, and Sara Nadin. 2012. "Evaluating 'Varieties of Capitalism' by the Extent and Nature of the Informal Economy: The Case of South-Eastern Europe." <i>South-Eastern Europe Journal of Economics</i> , 10(2): 113-30. 'Varieties of capitalism' have been conventionally delineated by the varying types of formal economy that exist. Given that the vast majority of employment globally is in the informal economy, this paper offers a new analytical framework which delineates varieties of capitalism by their degree of informalization and the character of the informal economy. Examining South East Europe through this lens using evidence from a 2007 Eurobarometer survey, the finding is that this region is a 'quasi-formal market economy' and its informal economy composed largely of quasi-formal employment relations, albeit with significant variations in the degree and nature of the informal economy across different countries, sectors and population groups.
2012	P28 Q50	Diss: Liu, Antung Anthony. 2012. Three Essays at the Intersection of Public Finance and Environmental Economics. PhD diss. University of California, San Diego. This dissertation is comprised of three essays which explore environmental economics topics using public finance tools. The first and third essays are applied theory papers examining two overlooked factors--tax evasion and the shadow economy--which sharply alter the calculus of carbon tax reform. The basic finding is that carbon taxes are much less costly than has previously been found, particularly in developing countries. The second essay is an empirical paper studying how China's tax system has impacted its rollout of sewage treatment plants.
2012	Q13	Shiimi, T., P. R. Taljaard, and H. Jordaan. 2012. "Transaction Costs and Cattle Farmers' Choice of Marketing Channel in North-Central Namibia." <i>Agrekon</i> , 51(1): 42-58. About 70 per cent of the Namibian population depends on agricultural activities for their livelihood. Moreover, agriculture remains an important sector in Namibia owing to the fact that its national economy is widely dependent on agricultural production. Cattle producers in the Northern Communal Areas (NCAs) have an option to market their cattle via the formal or informal market. Efforts have been made to encourage producers to market their cattle through the formal market; however, these proved to be futile as the strategy yielded limited improvements. In this study, a number of variables have been analysed to determine factors that influence cattle marketing decisions. Factors influencing the marketing decision on whether to sell or not sell through the formal market have been analyzed using the Probit model. Factors influencing the amount of cattle sold through the formal market, assuming that a producer uses the formal market to sell cattle, were analysed using the Truncated model. Testing the Tobit model against the alternative of a two-part model was done using Cragg's model. Results from empirical research suggest that problems with transportation to MeatCo, marketing experience and the age of cattle producers are some of the factors that significantly influence the decision whether or not sell through the formal market. The accessibility of marketing-related information, accessibility of new information technology, the age of respondents and a lack of improved productivity are some of the factors that influence the proportional number of cattle sold through the formal market. The results suggest that substantially more information is obtained by modelling cattle marketing behaviour as a dual decision-making framework instead of a single decision-making framework.

2012	Q54	Simatele, Danny, Tony Binns, and Munacinga Simatele. 2012. "Urban Livelihoods under a Changing Climate: Perspectives on Urban Agriculture and Planning in Lusaka, Zambia." <i>Journal of Human Development and Capabilities</i> , 13(2): 269-93. With rapidly deteriorating national and local economies, many urban dwellers in sub-Saharan Africa are resorting to informal sector activities to ameliorate the current food insecurity that poor households face. Among these activities is urban agriculture, which is used both as a source of basic foodstuffs and also for income generation. In many cities, the growing of food crops is considered as an activity for rural areas, and is therefore, excluded from urban development and planning policy. This state of affairs has traditionally presented major challenges for many small-scale urban farmers to realise their full potential and attain household food security. In recent years, changes in climatic conditions (e.g. drought and flooding), coupled with a lack of policies supporting the activities of the urban poor, have combined to make it difficult for households to adapt to the changing urban environment. Drawing upon recent field-based research in Lusaka, the capital of Zambia, the paper explores the relationships between urban livelihoods and extreme weather events, and evaluates the extent to which changes in climate and urban governance are impacting upon urban agriculture. The paper has wider relevance in the context of evolving strategies for achieving sustainable urban development, poverty reduction and food security in Africa and elsewhere.
2012	Q58	Pinotti, Paolo. 2012. "Trust, Regulation, and Market Failures." <i>Review of Economics and Statistics</i> , 94(3): 650-58. Government regulation of firms is associated with more negative externalities and unofficial activity across countries. I argue that this correlation mainly reflects causality going from concerns about market failures to demand for government intervention. Using trust in others as a proxy for such concerns, I show that differences in trust explain a great deal of variation in entry regulations. Then, controlling for trust in the regression of market failures on regulation, the latter is no longer associated with worse economic outcomes. The same result is confirmed when I exploit country population as an alternative source of variation in regulation.
2012	Q58	Biswas, Amit K., Mohammad Reza Farzanegan, and Marcel Thum. 2012. "Pollution, Shadow Economy and Corruption: Theory and Evidence." <i>Ecological Economics</i> , 75(1): 114-25. We study how the shadow economy affects pollution and how this effect depends on corruption levels in public administration. Production in the shadow economy allows firms to avoid environmental regulation policies; a large informal sector may be accompanied by higher pollution levels. Our theoretical model predicts that controlling the levels of corruption can limit the effect of the shadow economy on pollution. We use panel data covering the period from 1999 to 2005 in more than 100 countries to test this theoretical prediction. Our estimates confirm that the relationship between the shadow economy and the levels of pollution are dependent on the levels of corruption. Our results hold when we control for the effects of other determinants of pollution, time varying common shocks, country-fixed effects, and various additional covariates.

2013		
2013	C43	Ramoni-Perazzi, Josefa, and Giampaolo Orlandoni-Merli. 2013. "El índice de miseria corregido por informalidad: Una aplicación al caso de Venezuela. (Misery Index Corrected by Informality: Applicable to Venezuela. With English summary)." <i>Ecos de Economía</i> , 17(37): 29-49. This paper suggests a variation of the IMO index (Okun's Misery Index), adapting it to markets with high levels of informality, adding the ESI level (employment in the informal sector) to the unemployment level. This research compares the evolution of several standard misery indexes in several zones during the last decades, with emphasis on the case of Venezuela, for which the new proposed index is also estimated. Results show improvement in the well-being of groups of countries under study, compared to the deterioration of the indicator in Venezuela. In general terms, the IMO is controlled by unemployment, except in Venezuela. However, preponderance of inflation over unemployment in this country seems to occur by the underestimate that the unemployment rate has on the Venezuelan labor market situation.
2013	C78	Charlot, Olivier, Franck Malherbet, and Mustafa Ulus. 2013. "Efficiency in a Search and Matching Economy with a Competitive Informal Sector." <i>Economics Letters</i> , 118(1): 192-94. We consider a dual labor market with a frictional formal sector and a competitive informal sector. We show that the size of the informal sector is generally too large compared to the optimal allocation of the workers. It follows that our results give a rationale to informality-reducing policies.
2013	D61	Ruesga Benito, Santos M., Domingo Carbajo Vasco, and Manuel Perez Trujillo. 2013. "La economía sumergida y el ciclo económico. (The Underground Economy and the Economic Cycle. With English summary)." <i>Atlantic Review of Economics/Revista Atlantica de Economía</i> , 2(0): . There is nothing new about the resurfacing of the debate of the expansion of the underground economy in times of crisis. It is a reiterated topic claiming that irregular practices in the economy are cushioning the social effects in times of economic depression. However, the extensive literature related to the issue, for almost half a century, is not conclusive about the possible countercyclical effect of unregistered activities. This paper reviews relationships between the submerged and the regular sides of economic system, in order to know if they evolve in the same direction or, on the contrary, you can see a counter-cyclical behaviour on the hidden side of the economy. It aims, therefore, to analyse this relationship, first reviewing the academic literature on this subject. Second, establish a set of rational conjectures about the dynamics of both sides of the economic system, registered and hidden, in an autonomous way and interacting between them, from the perspective of developed countries. This develops a line of research that relies on the definition of a function of cost-benefit, little used in academic literature, trying to draw any conclusion on the convergent or divergent dynamics of both, on a widespread basis. And here a function containing the different benefits that might be expected, dipping subjects obtain from all or part of its business activity, as well as costs arising from this (economic, criminal, or other nature) is built to identify the dynamics of both sectors at different stages of the cycle. The outcome is very difficult to evaluate quantitatively and it defines the economic incentive for breaching the barrier of the formality or regularity at each point in time and according to the situation. This function involves certain facts assessable in monetary form, and others difficult to estimate, but that, no doubt, contributes to define the profile of the transgression to the informal economy, such as the moral pressure of the social and economic environment in which the offender lives or the intensity of auditing for compliance with the rules made by the tax, labour, and other authorities, etc. And, finally it comes to an empirical estimate that allows us to compare, through an estimated model of structural equations similar to the one developed by the Austrian Professor Schneider, the dynamics of the hidden sector of the economy in major European Union countries in the last decade, and it also allows us to observe the dissimilar behaviour in times of expansion and in moments of recession of the world economy. After that analysis, it can be observed a counter-cyclical behaviour of the underground economy. The direction of the relationship of the hidden economy with the economic growth, in principle reverse--which confirms its counter-cyclical nature--and the intensity of such a relationship are variables in the comparative analysis among countries, depending the outcome in each country on their economic, institutional, and cultural characteristics. Such a conclusion updates some of the most relevant work carried out in the field of estimation of the underground economy at the international level. And in spite of this, it is noted the low contribution of the economy submerged to the dynamics of growth of the whole economic system.
2013	D78 O50	Schneider, Friedrich, and Andreas Buhn. 2013. <i>Estimating the Size of the Shadow Economy: Methods, Problems and Open Questions</i> . CESifo Group Munich, CESifo Working Paper Series: 4448. This paper presents the various methods to estimate the size of the shadow economy, their strengths and weaknesses. The purpose of the paper is twofold. Firstly, it demonstrates that no ideal method to estimate the size and development of the shadow economy exists. Because of its flexibility, the MIMIC method used to get macro-estimates of the size of the shadow economy is discussed in greater detail. Secondly, the paper focuses on the definition and causal factors of the shadow economy as well as on a comparison of the size of the shadow economy using different estimation methods.
2013	D78	Suntsova, A. O. 2013. "Updating the National Policy on Counteracting Money Laundering. (In Ukrainian. With English summary)." <i>Actual Problems of Economics</i> , 144(6): 95-102. The article analyzes the level of financial development of various countries to estimate the possibility and the applicability of the previously suggested model for updating the national policy on counteracting money laundering. The study is based on the theoretical results of the proposed model concerning the transformation of national financial monitoring.
2013	F10 F53	CV: Walker, John, and Brigitte Unger. 2013. "Measuring Global Money Laundering: "The Walker Gravity Model"." In <i>Combating Money Laundering and Terrorism Finance: Past and Current Challenges</i> , ed. Navin Beekarry, 478-510. Elgar Research Collection. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2013	F43	Birinci, Serdar. 2013. "Trade Openness, Growth, and Informality: Panel VAR Evidence from OECD Economies." <i>Economics Bulletin</i> , 33(1): 694-705. This paper analyzes empirically the linkages between trade openness, economic growth, and the size of the informal economy. I employ panel VAR techniques in a quarterly panel data set composed of 12 advanced economies over the period from 1964:1 to 2010:4 allowing bi-directional interaction between the variables in the system in order to address the endogeneity problem. The results provide evidence that there is a positive bi-directional relationship between GDP growth and trade openness. Second, fluctuations of GDP growth are explained by the size of the informal economy, while the impact of GDP growth on the size of the informal economy is not found to be robust with respect to change in VAR order. Moreover, the size of the informal economy affects GDP growth more than openness, and the causality from openness to GDP growth is slightly stronger than the causality from GDP growth to openness. Finally, there is no conclusive, robust evidence regarding the interaction between the size of the informal economy and trade openness.
2013	F43	Malešević-Perović, Lena, Vladimir Simić, and Vinko Mustra. 2013. "Investigating the Influence of Economic and Socio-political Openness on Growth." <i>International Journal of Economic Sciences and Applied Research</i> , 6(3): 35-59. This paper investigates the influence of international openness on economic growth in a sample of 32 European economies. The usual approach in the literature on the topic is to observe the impact of trade openness on growth. We, however, broaden this standard approach and

Year	DE	Title and Abstract
		analyse not only economic aspect of openness but also socio-political aspect. In our empirical analysis we use the TSLS (two stage least squares) estimator, whereby in the first step we use the standard growth regression that includes, among other variables, openness, and in the second step we include different determinants to instrument openness. Our research, in general, shows that openness is an important determinant of growth in a set of investigated countries. Trade openness and financial openness influence growth positively. The influence of institutions on growth is manifested mainly indirectly--through its influence on trade and financial openness.

2013	F55	Christiansen, Thomas, and Christine Neuhold. 2013. "Informal Politics in the EU." <i>Journal of Common Market Studies</i>, 51(6): 1196-1206. Traditionally, much of the focus of the study of politics has been on formal arrangements and formal institutions. In recent years, however, this dominant focus has given way to an increasing concern with informal aspects of politics. This can be said for both the study of comparative politics and international relations more generally and for research on governance within the European Union in particular. Against this background, the aim of this research note is, first, to review the findings of research on informal governance and, second, to explore whether analytical concepts can be applied to the EU, with the aim of bringing greater conceptual clarity to the field and identifying future research agendas in this area. In a final section, the article also addresses the normative dimension of informal governance in the EU, discussing both the benefits and the risks of such arrangements from the perspective of transparency, efficiency, and democratic accountability.
2013	G23	Agresti, Anna, Jean-Marc Israel, and Clive Jackson. 2013. "Non-bank Financial Intermediation in the Euro Area: Current Challenges for Harmonized Statistics." <i>Banks and Bank Systems</i>, 8(4): 62-66. Structural changes and innovation in the financial sector present challenges for statisticians in keeping statistics fit for purpose, and capable of meeting the needs of policy makers. Much of this innovation has been materialized in the non-bank financial sector. Non-bank financial intermediaries have then also become the focus for the work being carried out on "shadow banking", although the shadow banking is by no means to be identified with the full non-bank financial sector. This paper provides an overview of the financial sector statistics which are collected by the European Central Bank and national central banks in Europe and which are an important source of information on non-bank financial intermediation. Some upcoming developments in the collection and publication of statistics are also presented.
2013	I14	Avendano Castro, William Rodrigo, and Luisa Stella Paz Montes. 2013. "Rebusque y mendicidad: Muestra de desigualdad y pobreza en Cucuta, Norte de Santander, Colombia. (Odd Jobs, and Beggars: Permanent Sample of Inequality and Poverty in the City of Cucuta, North Santander, Colombia. With English summary.)." <i>Apuntes del CENES</i>, 32(55): 165-88. This paper makes a theoretical and reflexive approach to inequality and poverty in San Jose de Cucuta, North Santander, border between Colombia and Venezuela. It presents factors associated with unemployment, which contribute to begging, alms and odd jobs from a socio-economic environment, collects basic information applying a semi-structured survey (random) to a specific population: determining agents of a permanent practice of informal economy in the city. The results refer to a population sample from, for the most part, different regions of the country, associated with such aspects of not only economic, but social and forced displacement because of internal armed conflict and violence (IDPs: Internally Displaced Persons), leading to their establishment in the city which has generated health, education, security problems, among others.
2013	I25	Buehn, Andreas, and Mohammad Reza Farzanegan. 2013. "Impact of Education on the Shadow Economy: Institutions Matter." <i>Economics Bulletin</i>, 33(3): 2052-63. Using panel data for more than 80 countries from 1999-2007 this paper studies the marginal effect of education on the shadow economy, particularly considering the quality of institutions. The results show that higher levels of education fuel the shadow economy in an environment of weak political institutions.
2013	J33	Commander, Simon, Natalia Isachenkova, and Yulia Rodionova. 2013. "Informal Employment Dynamics in Ukraine: An Analytical Model of Informality in Transition Economies." <i>International Labour Review</i>, 152(3-4): 445-67. The transition economies of the former Soviet Union have experienced a surge of informal employment since the 1990s. This trend, the authors argue, is driven by the structure of labour compensation inherited from central planning. Their innovative theoretical model centres on worker choices of full-time and/or part-time employment across formal, informal, and mixed formal-informal sectors. Factoring in the probability of payroll tax evasion detection and the non-monetary benefits provided by state-owned/privatized firms, it suggests that such benefits incentivize workers to combine formal and informal employment. This is confirmed empirically by panel data evidence from the Ukraine Longitudinal Monitoring Surveys.
2013	J44	Diss: Abdulloev, Ilhom. 2013. Impact of Migration on Job Satisfaction, Professional Education and the Informal Sector. PhD diss. Rutgers University. This dissertation focuses on three aspects of the economic life of migrants' relatives who remained in the source country. In the second chapter, we argue that migration increases the job dissatisfaction of migrants' relatives who work in the source country. The family's migration experience allows its members to construct expectations on earnings from migration using information either from the size of remittances or directly from migrants. If their expected earnings from migration greatly exceed their current wages in the source country, migrants' relatives become more dissatisfied with their current jobs. In the third chapter, we argue that migration has both positive and negative effects on education. In estimating the positive impact of remittances we suggest controlling for migration's side effects by including a dummy variable indicating whether there is a migrant in the household. This way, holding remittances constant, the coefficient on the dummy variable captures other negative side effects of migration as a change in the intercept between households with migrants and households without migrants. In the fourth chapter, we discuss how migration reduces informality in the source country: migrants' incomes in new locations and income earned in the home informal economy become an imperfect trade-off. It is also because professional workers have more opportunities to engage in informal activities enabling them to forgo migration, but low-skilled non-professionals do not. We offer concluding comments in the final chapter.
2013	J48	Williams, Colin C. 2013. "Beyond the Formal Economy: Evaluating the Level of Employment in Informal Sector Enterprises in Global Perspective." <i>Journal of Developmental Entrepreneurship</i>, 18(4): 1-21. The aim of this paper is to evaluate the varying level of employment in informal sector enterprises across the globe and to undertake an exploratory analysis of the wider economic and social conditions associated with greater levels of informalization. Examining International Labor Organization surveys conducted in 43 countries, the finding is that the main job of just under one in three (31.5 percent) non-agricultural workers is in an informal sector enterprise. Conducting an exploratory analysis of the correlation between countries with higher levels of employment in informal sector enterprises and economic under-development ('modernization' thesis), higher taxes, corruption and state interference ('neo-liberal' thesis) and inadequate state intervention to protect workers from poverty ('structuralist' thesis), the

Year	DE	Title and Abstract
		finding is that there is a need to synthesize various tenets from all three perspectives. The outcome is a tentative call for a 'neo-modernization' perspective, which posits that higher levels of employment in informal sector enterprises are associated with economic under-development, public sector corruption and inadequate state intervention to protect workers from poverty.
2013	K21	Baumann, Florian, and Tim Friehe. 2013. "Tax Evasion and Tacit Collusion." <i>Public Finance Review</i>, 41(5): 633-57. This article analyzes the interaction between tax evasion and tacit collusion. We show that the possibility of evading taxes generally influences the incentives to form a cartel. We establish that whether tax evasion increases or decreases the set of circumstances allowing stable collusion depends on (1) the relation between the benefits of tax evasion and legal after-tax profits and (2) effective enforcement of antitrust laws. In considering variations in tax enforcement and antitrust enforcement, we find that stricter tax enforcement may actually increase the level of tax evasion, as it may promote the cartelization of industries. In contrast, stricter antitrust enforcement lowers incentives for cartelization, thereby possibly reducing tax evasion at the same time.
2013	L21 M10	Chen, Katherine K. 2013. "Storytelling: An Informal Mechanism of Accountability for Voluntary Organizations." <i>Nonprofit and Voluntary Sector Quarterly</i>, 42(5): 902-22. Using observations, interviews, and archival research of an organization that coordinates the annual Burning Man event, I argue that storytelling is a mechanism by which stakeholders can demand accountability to their needs for recognition and voice. I identify particular frames, or perspectives and guides to action, articulated in members' stories. Deploying a personalistic frame, storytellers recounted individuals' contributions toward a collective endeavor. Such storytelling commemorated efforts overlooked by official accounts and fostered bonds among members. Other storytellers identified problems and organizing possibilities for consideration under the civic society or anarchist frames. By familiarizing organizations with members' perspectives and interests, stories facilitate organizational learning that can better serve stakeholders' interests. Additional research could explore whether (1) consistent face-to-face relations (2) within a bounded setting, such as an organization, and (3) practices that encourage participation in organizing decisions and activities are necessary conditions under which storytelling can enable accountability to members' interests.

2013	O50	Maftעי, Loredana. 2013. <i>A BRIEF ANALYSIS OF THE SHADOW ECONOMY IN EUROPE</i>. Centre for European Studies, Alexandru Ioan Cuza University, CES Working Papers. Shadow economy affects all country around the world. European countries are affected by undeclared work, under-reporting and tax evasion. This phenomenon increases from West to East, the most affected being the Balkan area. The size of shadow economy is growing due to government actions, such as regulation and tax implementation. From a macroeconomic perspective, the economic cycle sustain the shadow economy levels. To combat this phenomenon it is necessary to adopt electronic payments, to reduce tax implementations and social contributions, to bring encouragement in cash deposits use and broaden credit cards.
2013	O50	THE SAME AS D78 Schneider, Friedrich, and Andreas Buhn. 2013. <i>Estimating the Size of the Shadow Economy: Methods, Problems and Open Questions</i>. CESifo Group Munich, CESifo Working Paper Series: 4448.
2013	Q55	Chaudhuri, Sarbajit, and Ujjaini Mukhopadhyay. 2013. "Foreign Direct Investment, Environmentally Sound Technology and Informal Sector." <i>Economic Modelling</i>, 31(0): 206-13. The paper examines the linkages between foreign direct investment, informal sector and transfer of environmentally sound technology (EST) in a developing economy in terms of a three-sector, full-employment general equilibrium model with an informal sector that produces a non-traded input for the formal final good producing sector. The same input is produced by another division of the formal sector, which generates less pollution than the informal sector since the former uses a different type of capital that embodies EST. The formal sector has to pay a penalty for using the output of the excessively polluting informal sector. In this scenario, the analysis finds that foreign capital inflow in the formal sector may accentuate pollution, even if it involves transfer of EST. This result can at least question the favorable environmental impact of FDI in a developing economy even if it involves transfer of EST.
2013	Q57	Goel, Rajeev K., Risto Herrala, and Ummad Mazhar. 2013. "Institutional Quality and Environmental Pollution: MENA Countries versus the Rest of the World." <i>Economic Systems</i>, 37(4): 508-21. Using data for over 100 nations over the years 2004-2007, this study examines the effect, of institutional quality on environmental pollution, focusing primarily on influences of corruption, and the shadow economy, and paying special attention to MENA countries. Controlling for a number of factors, results show that both more corrupt nations and nations with large shadow sectors have qualitatively and quantitatively similar effects in yielding fewer (recorded) emissions; however, MENA nations have higher pollution rates. Policy implications are noted.

Year	DE	Title and Abstract
2006		
2006	C81	Annabi, Nabil, John Cockburn, and Bernard Decaluwe. 2006. <i>Functional Forms and Parametrization of CGE Models</i> . PEP-MPIA, Cahiers de recherche MPIA. This study focused on the choice of functional forms and their parametrization (estimation of free parameters and calibration of other parameters) in the context of CGE models. Various types of elasticities are defined, followed by a presentation of the functional forms most commonly used in these models and various econometric methods for estimating their free parameters. Following this presentation of the theoretical framework, we review parameter estimates used in

Year	DE	Title and Abstract
		the literature. This brief literature review was carried out to be used as a guideline for the choice of parameters for CGE models of developing countries.
2006	C83	Engelberg, Joseph, Charles F. Manski, and Jared Williams. 2006. <i>Comparing the Point Predictions and Subjective Probability Distributions of Professional Forecasters</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 11978. We use data from the Survey of Professional Forecasters to compare point forecasts of GDP growth and inflation with the subjective probability distributions held by forecasters. We find that SPF forecasters summarize their underlying distributions in different ways and that their summaries tend to be favorable relative to the central tendency of the underlying distributions. We also find that those forecasters who report favorable point estimates in the current survey tend to do so in subsequent surveys. These findings, plus the inescapable fact that point forecasts reveal nothing about the uncertainty that forecasters feel, suggest that the SPF and similar surveys should not ask for point forecasts. It seems more reasonable to elicit probabilistic expectations and derive measures of central tendency and uncertainty, as we do here.
2006	C83	Croushore, Dean. 2006. "Consumer Confidence Surveys: Can They Help Us Forecast Consumer Spending in Real Time?" <i>Federal Reserve Bank of Philadelphia Business Review</i>, 0(0): 1-9. In 1993, the Philadelphia Fed undertook a project to develop a real-time data set for macroeconomists, who can use these data in many ways--for example, when analyzing indexes of consumer confidence. Existing research indicates that consumer-confidence measures, though highly correlated with future spending, do not improve forecasts of future spending. But these studies used revised data that were not available to forecasters at the time they made their forecasts. In this article, the author uses the real-time data set to investigate an important question: does using data available to forecasters at the time--that is, real-time data--make measures of consumer confidence more valuable for forecasting?
2006	D61 L43 L90	van der Linden, Jan. 2006. <i>Working Paper 10-06--Network Industry Reform in Belgium: Macroeconometric versus General Equilibrium Analyses</i>. Federal Planning Bureau, Belgium, Working Papers.
2006	E60	Cournede, Boris, and Frederic Gonand. 2006. <i>Restoring Fiscal Sustainability in the Euro Area: Raise Taxes or Curb Spending?</i> OECD Economics Department, OECD Economics Department Working Papers: 520. With population ageing, fiscal consolidation has become of paramount importance for euro area countries. Consolidation can be pursued in various ways, with different effects on potential growth, which itself will be dragged down by ageing. A dynamic general equilibrium model with overlapping generations and a public finance block (including a pay-as-you-go pension regime, a health care system, non ageing-related public spending and a stock of debt to be repaid) is used to compare the macroeconomic impact of four scenarios: a) increasing taxes to finance unchanged pensions and repay public debt, b) lowering future pension replacement rates and repaying public debt through a lower ratio of non ageing-related outlays to GDP, c) raising the retirement age by 1.25 years per decade and repaying increasing taxes only to pay off debt, and d) increasing the retirement age by 1.25 years per decade and paying off debt through a lower ratio of non ageing-related expenditure to GDP. This last scenario is the one where growth is strongest: with gradual increases in the retirement age and spending restraint, average GDP growth in the 2010s would be 0.34 percentage point stronger than in a scenario where fiscal consolidation is achieved exclusively through tax hikes. The appropriate conclusion from the model is not that public spending is bad per se, but that cuts to lower-priority spending items can deliver surprisingly large income gains compared with the alternative of raising taxes.
2006	F43	Tyers, Rod, Jane Golley, Bu Yongxiang, and Ian Bain. 2006. <i>China's Economic Growth and its Real Exchange Rate</i>. Australian National University, College of Business and Economics, School of Economics, ANUCBE School of Economics Working Papers. The recent influx of financial capital to China implies expectations of continued real appreciation and, indeed, rapid expansion had previously led to real appreciations elsewhere in East Asia. In a world of open economies and differentiated traded goods, however, development-related productivity and endowment growth shocks tend to cause real depreciations, the principal exception being the Balassa case where non-traded service sectors are large and productivity shocks are restricted to traded sectors. China is a special case amongst developing countries in that its labour force is likely to decline in future and this will place upward pressure on real wages and its real exchange rate. This paper assesses the magnitudes of the various links between China's growth performance and its real exchange rate using an adaptation of the GTAP-Dynamic global economic model in which a full demographic sub-model is incorporated. A baseline "business as usual" simulation is constructed to 2030, wherein China's growth rate slows considerably due to ageing and slower labour force growth. Comparator simulations are then constructed for cases in which fertility policy is changed, sectoral factor productivity is higher and financial reform reduces the investment interest premium. China's real exchange rate realignments are examined in each case, the results suggesting the current appreciating trend may be temporary, with depreciating forces appearing to dominate in the long term.
2006	F43	Golley, Jane, and Rod Tyers. 2006. <i>Demographic Change and the Labour Supply Constraint</i>. Australian National University, College of Business and Economics, School of Economics, ANUCBE School of Economics Working Papers. China's economic growth has, hitherto, depended on its relative abundance of production labour and its increasingly secure investment environment. Within the next decade, however, China's labour force will begin to contract. This will set its economy apart from other developing Asian countries where relative labour abundance will increase, as will relative capital returns. Unless there is a substantial change in population policy, the retention of China's large share of global FDI will require further improvements in its investment environment, in its factor productivity and/or in its labour force participation rates. The links between demographic change, labour participation rates and growth performance are explored here using a new global demographic model that is integrated with an adaptation of the GTAP-Dynamic global economic model in which regional households are disaggregated by age and gender. China's share of global investment, and hence its growth rate in per capita terms, is found to depend sensitively on its labour force growth and this, in turn, depends on both fertility and labour force participation. Rates of aged participation are low in China but likely to increase and this could offset the growth-retarding effects of fertility decline and ageing.
2006	H50	CV: Tiseno, Andrea. 2006. "Synchronization of Responses to Cyclical Demand Shocks in France, Germany and Italy: Evidence from Central Banks Macro-models." In <i>Convergence or Divergence in Europe? Growth and Business Cycles in France, Germany and Italy</i>, ed. Olivier de Bandt, Heinz Herrmann and Giuseppe Parigi, 251-87. Berlin and New York: Springer.
2006	H61	Jonung, Lars, and martin Larch. 2006. "Improving Fiscal Policy in the EU: The Case for Independent Forecasts." <i>Economic Policy</i>, 0(47): 493-529. We point out that official forecasts of output dynamics are crucial to the assessment of cyclically adjusted budget balances, and provide evidence that in some euro-area countries biased forecasts have played a thus far neglected role in generating excessive deficits. We suggest that the forecast bias may be politically motivated, and that forecasts produced by an independent authority would be better than in-house Ministry of Finance forecasts for the purpose of monitoring budget formation and budget outcomes.

2006	N00	Murtin, Fabrice. 2006. <i>American Economic Development Since the Civil War or the Virtue of Education</i> . Centre for Economic Performance, LSE, CEP Discussion Papers. This paper is the first empirical framework that explains the phenomenon of fast growth combined with the demographic transition occurring in the United States since 1860. I propose a structural model that unifies those events through the role of education: the key feature is that parental education determines simultaneously fertility, mortality and children's education, so that the accumulation of education from one generation to another explains both fast growth and the reduction of fertility and mortality rates. Using original data, the model is estimated and fits in a remarkable way income, the distribution of education and age pyramids. Moreover, some historical data on Blacks, assumed to constitute the bottom of the distribution of education, show that the model predicts correctly the joint distribution of fertility and education, and that of mortality and education. Comparisons with the PSID suggest that the intergenerational correlation of income is also well captured. Thus, this microfounded growth model based on human capital accumulation accounts for many traits of American economic development since 1860. In a second step, I investigate the long-run influence of income inequality on growth. Because children's human capital is a concave function of parental income, income inequality slows down the accumulation of human capital across generations and hence growth. Simulations show that this effect is large.
2006	N12 N71 Q43	Malik, Farooq, and Mahdi Nasereddin. 2006. "Forecasting Output Using Oil Prices: A Cascaded Artificial Neural Network Approach." <i>Journal of Economics and Business</i> , 58(2): 168-80. Recent evidence suggests that oil prices affect output of the economy in a non-linear complex fashion. However, there is no clear agreement on the unknown functional form. An application of artificial neural network for short-term forecasting of GDP using oil prices and utilizing cascaded learning is proposed. We find that the mean absolute forecasting error and the mean square forecasting error is reduced by applying cascaded neural network relative to conventional artificial neural networks and popular linear models. Results also indicate that the developed forecasting approach is useful and point to the potential of this methodology for other economic applications. Our results are important for improving economic forecasts and introduce oil prices as a strong candidate for future forecasting exercises.
2006	O24	Cororaton, Caesar B., and Erwin L. Corong. 2006. <i>Agriculture-sector Policies and Poverty in the Philippines: a Computable General-Equilibrium (CGE) Analysis</i> . PEP-MPIA, Cahiers de recherche MPIA. The Philippines has undertaken substantial trade-policy reforms since the 1980s. However, the poverty impact is not very clear and has been the subject of intense debate, most crucial of which is the likely poverty effects of liberalizing the highly protected agricultural sector. A CGE micro-simulation model is employed to estimate and explain these impacts. Tariff reduction induces consumers to substitute cheaper imported agricultural products for domestic goods, thereby resulting in a contraction in agricultural output. In contrast, the prevalence of cheap, imported inputs reduces the domestic cost of production, benefiting the outward-oriented and import-dependent industrial sector as their output and export increases. The national poverty headcount decreases marginally as lower consumer prices outweigh the income reduction experienced by the majority of households. However, both the poverty gap and severity of poverty worsens, implying that the poorest of the poor become even poorer.

2006	R12	Patuelli, Roberto, Aura Reggiani, Peter Nijkamp, and Uwe Blien. 2006. <i>New Neural Network Methods for Forecasting Regional Employment: An Analysis of German Labour Markets</i> . Tinbergen Institute, Tinbergen Institute Discussion Papers: 06-020/3. In this paper, a set of neural network (NN) models is developed to compute short-term forecasts of regional employment patterns in Germany. NNs are modern statistical tools based on learning algorithms that are able to process large amounts of data. NNs are enjoying increasing interest in several fields, because of their effectiveness in handling complex data sets when the functional relationship between dependent and independent variables is not explicitly specified. The present paper compares two NN methodologies. First, it uses NNs to forecast regional employment in both the former West and East Germany. Each model implemented computes single estimates of employment growth rates for each German district, with a 2-year forecasting range. Next, additional forecasts are computed, by combining the NN methodology with Shift-Share Analysis (SSA). Since SSA aims to identify variations observed among the labour districts, its results are used as further explanatory variables in the NN models. The data set used in our experiments consists of a panel of 439 German districts. Because of differences in the size and time horizons of the data, the forecasts for West and East Germany are computed separately. The out-of-sample forecasting ability of the models is evaluated by means of several appropriate statistical indicators.

2007	D84	Claveria, Oscar, Ernest Pons, and Raul Ramos. 2007. "Business and Consumer Expectations and Macroeconomic Forecasts." <i>International Journal of Forecasting</i> , 23(1): 47-69. Business and consumer surveys have become an essential tool for gathering information about different economic variables. While the fast availability of the results and the wide range of variables covered have made them very useful for monitoring the current state of the economy, there is no consensus on their usefulness for forecasting macroeconomic developments. The objective of this paper is to analyse the possibility of improving forecasts for selected macroeconomic variables for the euro area using the information provided by these surveys. After analyzing the potential presence of seasonality and the issue of quantification, we tested whether these indicators provide useful information for improving forecasts of the macroeconomic variables. With this aim, different sets of models have been considered (AR, ARIMA, SETAR, Markov switching regime models and VAR) to obtain forecasts for the selected macroeconomic variables. Then, information from surveys has been considered for forecasting these variables in the context of the following models: autoregressive, VAR, Markov switching regime and leading indicator models. In all cases, the root mean square error (RMSE) has been computed for different forecast horizons. The comparison of the forecasting performance of the two sets of models permits us to conclude that, in most cases, models that include information from the surveys have lower RMSEs than the best model without survey information. However, this reduction is only significant in a limited number of cases. In this sense, the results obtained extend the results of

Year	DE	Title and Abstract
		previous research that has included information from business and consumer surveys to explain the behaviour of macroeconomic variables, but are not conclusive about its role.
2007	E25	Griffiths, David T. 2007. "Forecasting Income Shares: Are Mean-Reversion Assumptions Appropriate?" <i>Applied Economics</i> , 39(19-21): 2699-2711. The article examines some statistical evidence that supports the view that US labour and capital shares of income return to some long-run historical values. We estimate the long-run share values and the length of time it takes to converge to them. We account for the interdependence of the shares by using a vector error-correction model, and this specification is tested against a VAR alternative using Johansen's method to characterize the properties of the cointegrating vector. We find support for the idea that labour and capital shares have historically been mean reverting, in spite of the fairly restrictive assumptions implied when invoking the Cobb-Douglas production function as the rationale. The cumulative impulse response functions indicate that for capital and labour shares, the time required to revert back to long run levels is in the order of thirty quarters.
2007	F33	Rosnick, David, and Mark Weisbrot. 2007. <i>Political Forecasting? The IMF's Flawed Growth Projections for Argentina and Venezuela</i> . Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This report examines the International Monetary Fund's (IMF) projections for economic growth for Argentina and Venezuela in recent years. It shows that the IMF consistently made large errors in overestimating Argentina's GDP growth for the years 2000, 2001 and 2002, during the country's 1998-2002 depression, and large underestimates for the years 2003-2006, as Argentina's economy grew rapidly. The paper also notes the IMF's repeated large errors in underestimating Venezuela's GDP growth for the years since 2004.

2007	G14	Raunig, Burkhard. 2007. "Are Economic Tracking Portfolios Useful for Forecasting Output and Inflation in Austria?" <i>Applied Financial Economics</i> , 17(13-15): 1043-49. We construct economic tracking portfolios from Austrian stock market returns, euro/dollar exchange rate changes and changes in the oil price to extract revisions of market expectations about future industrial production growth and inflation in Austria. The forecasting ability of the portfolios is evaluated in-sample and in a pseudo out-of-sample forecasting experiment. It turns out that the tracking portfolios track both target variables in-sample. The portfolios also help to forecast annual industrial production growth out-of-sample. The predictive ability of the tracking portfolios for inflation is rather low.
2007	H62	Departement analyse et prevision de l'OFCE. 2007. "France: Relance isolee: Perspectives 2007-2008 pour l'economie francaise. (Isolated Revival: Forecasts for the French Economy for 2007 and 2008. With English summary)." <i>Revue de L'OFCE</i> , 0(103): 31-102. The economic rebound experienced since 2006 in the euro zone would maintain in 2008, despite recent bad news (financial crisis, strength of the euro). In addition to an expansionary fiscal policy, the constraints that impeded French growth would disappear in 2008. German competitive disinflation may stop, and we expect oil prices to slow down. The recovery will be mainly driven by domestic demand. A decline in unemployment, a slight decrease in the saving rate and Tax cuts should lead to a dynamic consumption. The safe financial situation of companies should allow an increase in the private investment. Then, GDP growth would reach 2.6% in 2008, after 1.9% in 2007. However, France will be isolated in the euro zone concerning the fiscal stance, since most of European partners would lead restrictive fiscal policies. Thus, we expect the public deficit to widen in 2008 and to exceed the Maastricht criteria of 3% of GDP.
2007	J51 N22	Ebell, Monique, and Albrecht Ritschl. 2007. <i>Real Origins of the Great Depression: Monopolistic Competition, Union Power, and the American Business Cycle in the 1920s</i> . Sonderforschungsbereich 649, Humboldt University, Berlin, Germany, SFB 649 Discussion Papers: SFB649DP2007-006. Most treatments of the Great Depression have focused on its onset and its aftermath. In contrast, we take a unified view of the interwar period. We look at the slide into and the emergence from the 1920-21 recession and the roaring 1920s boom, as well as the slide into the Great Depression after 1929, and attempt to explain these phenomena in a unified framework. The model framework combines monopolistic product market competition with search frictions and bargaining in the labor market, allowing for both individual and collective (unionized) wage bargaining. We attribute the extraordinary macroeconomic and financial volatility of this period to two factors: Shifts in the wage bargaining regime and in the degree of monopoly power in the economy. The pro-union provisions of the Clayton Act of 1914 contributed to the slide in asset prices and the depression of 1920-21, while a series of tough anti-union Supreme Court decisions in late 1921 and 1922 coupled with the lax anti-trust enforcement of the Coolidge and Hoover administrations enabled a major rise in corporate profits and stock market valuations throughout the 1920s. Landmark court decisions in favor of trade unions in the late 1920s, as well as political pressure on firms to adopt the welfare capitalism model of high wages, made the economy increasingly susceptible to collapsing profit expectations. We model the onset of the great depression as an equilibrium switch from individual wage bargaining to (actual or mimicked) collective wage bargaining. The general equilibrium effects of this regime change are consistent with large decreases in output, employment, and stock prices.
2007	L20	Abberger, Klaus. 2007. "Qualitative Business Surveys and the Assessment of Employment--A Case Study for Germany." <i>International Journal of Forecasting</i> , 23(2): 249-58. Business tendency surveys are a commonly accepted instrument for the assessment of the current business cycle course. Most of these surveys rely on qualitative questions about the current situation of the firms and about their expectations for the coming months. This paper analyzes whether qualitative questions about employment expectations are useful to assessing actual employment changes. In Germany the Ifo Institute specialises in business surveys. The German Ifo data are investigated using three different approaches: smoothing techniques are used to help in dating turning points in the course of the series; error correction models are used to analyze the general lead/lag relationships and Probit models are used to estimate a threshold for the survey-based indicator which helps to differentiate between an increase and a decrease in employment. All three methods indicate that the employment expectations are a leading indicator of actual employment changes.

PPP-based national accounts have become an important part of the database for macroeconomists, development economists, and economic

Year	DE	Title and Abstract
		historians. Frequently used global data come from the Penn World Table (PWT) and the World Bank's World Development Indicators; a substantial fraction of the world is also covered in the PPP accounts produced by the OECD and the European Union. This paper provides an overview of how these data are constructed, and discusses both the theory and the practical problems of implementing it. All of these data are underpinned by the International Comparison Program (ICP), which collects data on prices worldwide. The most recent round of the ICP was for 2005 with final results published in early 2008; version 7.0 of the Penn World Table will soon incorporate these results. The 2005 ICP, like earlier rounds, involved substantial revisions to previous data, most notably revising downwards the size of the Chinese (40 percent smaller) and Indian (36 percent) economies. We discuss the reasons for the revisions, and assess their plausibility. We focus on four important areas: how to handle international differences in quality, the treatment of urban and rural areas of large countries such as China, India, and Brazil, how to estimate prices for government services, health, and education, and the effects of the regional structure of the ICP. All of these affect the interpretation of previous data, as well as the current revisions. We discuss previous revisions of the PWT, and their effects on various kinds of econometric analysis. The paper concludes with health warnings that should be kept in mind when using these data, which are not always suitable for the purposes to which they are put. Some international comparisons are close to impossible, even in theory, and in others, the practical difficulties make comparison exceedingly hazardous.
2008	D81 G10 G11	Rengifo, Erick, and Emanuela Trifan. 2008. <i>How Investors Face Financial Risk Loss Aversion and Wealth Allocation</i> . Fordham University, Department of Economics, Fordham Economics Discussion Paper Series. We study how the wealth-allocation decisions and the loss aversion of non-professional investors change subject to behavioral factors. The optimal wealth assignment between risky and risk-free assets results within a VaR portfolio model, where risk is individually assessed according to an extended prospect-theory framework. We show how the past performance and the portfolio evaluation frequency impact investor behavior. Myopic loss aversion holds at different evaluation frequencies. One year is the optimal frequency at which, under practical constraints, risky holdings are maximized. Previous research using standard VaR-significance levels may underestimate the loss aversion of individual investors.
2008	D82	Baghestani, Hamid. 2008. "Federal Reserve versus Private Information: Who Is the Best Unemployment Rate Predictor?" <i>Journal of Policy Modeling</i> , 30(1): 101-10. This paper shows that the Federal Reserve and private forecasts of the unemployment rate for 1983-2000 have much in common: they produce very similar mean errors and mean squared errors, and, while biased, they are efficient and accurately predict the direction of change in the actual series. However, the private forecasts encompass those of the Federal Reserve and are thus more informative. In light of these findings, we first address several questions related to the unemployment forecasts and then discuss such policy issues as the Federal Reserve's credibility, accountability, and transparency.
2008	D83 E63	Preston, Bruce. 2008. "Adaptive Learning and the Use of Forecasts in Monetary Policy." <i>Journal of Economic Dynamics and Control</i> , 32(11): 3661-81. This paper investigates monetary policy design when central bank and private-sector expectations differ. Private agents learn adaptively; the central bank has a possibly misspecified model of the economy. Successful implementation of optimal policy using inflation targeting rules requires the central bank to have complete knowledge of private agents' learning behavior. If the central bank mistakenly assumes private agents to have rational expectations when in fact they are learning, then policy rules frequently lead to divergent learning dynamics. However, if the central bank does not correctly understand agents' behavior, stabilization policy is best implemented by controlling the path of the price level rather than the inflation rate.
2008	E65	Soto, Raimundo. 2008. <i>Dollarization, Economic Growth, and Employment</i> . Instituto de Economía, Pontificia Universidad Católica de Chile., Documentos de Trabajo: 338. Dollarization brought economic stability to Ecuador and higher economic growth. The labor market has not reacted accordingly and unemployment rates remain stubbornly around 10%. I use a simple econometric model of the labor market to disentangle the impact on employment of GDP growth, real wages, the cost of capital, and the real exchange rate. I found two opposing effects at work. On one hand, vigorous economic growth has led to a substantial expansion of labor demand (scale effect). On the other hand, changes in relative factor prices brought about by the dollarization process have played against employment creation (substitution effects): real minimum wages have increased while at the same time the real price of imported intermediate goods and the cost of capital have declined steadily. Together, these price changes indicate that labor is becoming a more expensive factor of production and, thus, signal for substituting labor away.

2008	G11	Blaskowitz, Oliver, and Helmut Herwartz. 2008. <i>Testing directional forecast value in the presence of serial correlation</i> . Sonderforschungsbereich 649, Humboldt University, Berlin, Germany, SFB 649 Discussion Papers: SFB649DP2008-073. Common approaches to test for the economic value of directional forecasts are based on the classical Chi-square test for independence, Fisher's exact test or the Pesaran and Timmerman (1992) test for market timing. These tests are asymptotically valid for serially independent observations. Yet, in the presence of serial correlation they are markedly oversized as confirmed in a simulation study. We summarize serial correlation robust test procedures and propose a bootstrap approach. By means of a Monte Carlo study we illustrate the relative merits of the latter. Two empirical applications demonstrate the relevance to account for serial correlation in economic time series when testing for the value of directional forecasts.

2008	G21	Jakubik, Petr, and Jaroslav Hermanek. 2008. "Stress Testing of the Czech Banking Sector." <i>Prague Economic Papers</i> , 17(3): 195-212. The results of stress tests of the Czech banking sector based on credit risk and credit growth models, applied to the household and corporate sector are presented in the paper. The use of these newly developed models enables the stress tests to be linked to the CNB's official quarterly macroeconomic forecast. In addition, the article updates the stress scenarios, including simple sensitivity analyses of credit risk for individual sectors. Based on the analysis, an answer is sought to the question of whether the observed credit growth to corporate sector and households poses any threat to the stability of the banking sector. The analyses conclude that the banking sector as a whole seems to be resilient to the macroeconomic shocks under consideration.
2008	N13 N33 O14	Voigtlander, Nico, and Joachim Voth. 2008. <i>How the West "invented" fertility restriction</i> . Department of Economics and Business, Universitat Pompeu Fabra, Economics Working Papers. Europeans restricted their fertility long before other parts of the world did so. By raising the marriage age of women, and ensuring that a substantial proportion remained celibate, the "European Marriage Pattern" (EMP) reduced childbirths by up to 40%. We analyze the rise of this first socio-economic institution in history that limited fertility through delayed marriage. Our model emphasizes changes in agricultural production following the Black Death. The production of meat, wool, and dairy (pastoral products) increased, while grain production declined. Women had a comparative advantage producing pastoral goods. They often worked as servants in husbandry, where they remained unmarried long after they had left the parental household. In a Malthusian world, this translated into lower population pressure, raising average wages by up

Year	DE	Title and Abstract
		to a quarter. The Black Death thus set into motion a virtuous circle of higher wages and fertility decline that underpinned Europe's high per capita incomes. We demonstrate the importance of this effect in a calibration of our model.
2008	N13 N33 O14	Voigtlander, Nico, and Joachim Voth. 2008. <i>The Three Horsemen of Growth: Plague, War and Urbanization in Early Modern Europe</i>. Department of Economics and Business, Universitat Pompeu Fabra, Economics Working Papers. How did Europe overtake China? We construct a simple Malthusian model with two sectors, and use it to explain how European per capita incomes and urbanization rates could surge ahead of Chinese ones. That living standards could exceed subsistence levels at all in a Malthusian setting should be surprising. Rising fertility and falling mortality ought to have reversed any gains. We show that productivity growth in Europe can only explain a small fraction of rising living standards. Population dynamics - changes of the birth and death schedules - were far more important drivers of the longrun Malthusian equilibrium. The Black Death raised wages substantially, creating important knock-on effects. Because of Engel's Law, demand for urban products increased, raising urban wages and attracting migrants from rural areas. European cities were unhealthy, especially compared to Far Eastern ones. Urbanization pushed up aggregate death rates. This effect was reinforced by more frequent wars (fed by city wealth) and disease spread by trade. Thus, higher wages themselves reduced population pressure. Without technological change, our model can account for the sharp rise in European urbanization as well as permanently higher per capita incomes. We complement our calibration exercise with a detailed analysis of intra-European growth in the early modern period. Using a panel of European states in the period 1300-1700, we show that war frequency can explain a good share of the divergent fortunes within Europe.
2008	O54	Klein, Lawrence R., Fyodor I. Kushnirsky, and Alejandro Delgado Mercado. 2008. "Econometric Forecasting at Mixed Frequencies: Application to Mexico's Economy: Part I: Mexican High Frequency and Low Frequency Econometric Models." <i>Journal of Economic and Social Measurement</i>, 33(2-3): 179-217. In a two-part paper, we apply to the Mexican economy the methodology of forecasting at mixed frequencies developed by Klein and Kushnirsky (2005). We construct two macroeconomic models for Mexico--high frequency, with monthly observations, and low frequency, with annual observations. For each model we provide a description of the data, their sources, and methods of computation. The equations of the high frequency model follow the stages of the calculation of Mexico's GDP using two parallel approaches, output and expenditure, and averaging the results. The equations of the low frequency model are grouped into three blocks: production, consumption, and investment; foreign direct investment and trade; and wages, prices, and finance. Our methodology demonstrates how the high frequency model can be used for periodic adjustments of selected key indicators in the low frequency model, especially fixing initial conditions for the dynamics of the low frequency model so that it may be extrapolated a few years into the future. The methodology includes a theoretical foundation, methods for the adjustment of model structures and properties, procedures for achieving mutually consistent solutions, and step-by-step applications.
2008	P16	Matthews, Kent, Patrick Minford, and Ruthira Naraidoo. 2008. <i>Vicious and Virtuous Circles--The Political Economy of Unemployment in Interwar UK and USA</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 6839. This paper develops a political economy model of multiple unemployment equilibria to provide a theory of an endogenous natural rate of unemployment. This model is applied to the UK and the US interwar period which is remembered as the decade of mass unemployment. The theory here sees the natural rate and the associated path of unemployment as a reaction to shocks (mainly demand in nature) and the institutional structure of the economy. The channel through which these two forces feed on each other is a political economy process whereby voters with limited information on the natural rate react to shocks by demanding more or less social protection. The reduced form results obtained confirm a pattern of unemployment behaviour in which unemployment moves between high and low equilibria in response to shocks.
2008	R31	2008. "Forecast in Detail." <i>Economic Outlook</i>, 32(1): 51-67.
2008	R31	Tkacz, Greg, and Carolyn Wilkins. 2008. "Linear and Threshold Forecasts of Output and Inflation Using Stock and Housing Prices." <i>Journal of Forecasting</i>, 27(2): 131-51. This study examines whether simple measures of Canadian equity and housing price misalignments contain leading information about output growth and inflation. Previous authors have generally found that the information content of asset prices in general, and equity and housing prices in particular, are unreliable in that they do not systematically predict future economic activity or inflation. However, earlier studies relied on simple linear relationships that would fail to pick up the potential nonlinear effects of asset price misalignments. Our results suggest that housing prices are useful for predicting GDP growth, even within a linear context. Meanwhile, both stock and housing prices can improve inflation forecasts, especially when using a threshold specification. These improvements in forecast performance are relative to the information contained in Phillips-curve type indicators for inflation and IS-curve type indicators for GDP growth.
2009		
2009	A14	Gunnel, Stefan, and Karl-Heinz Todter. 2009. "Does Benford's Law Hold in Economic Research and Forecasting?" <i>Empirica</i>, 36(3): 273-92. First and higher order digits in data sets of natural and socio-economic processes often follow a distribution called Benford's law. This phenomenon has been used in business and scientific applications, especially in fraud detection for financial data. In this paper, we analyse whether Benford's law holds in economic research and forecasting. First, we examine the distribution of regression coefficients and standard errors in research papers, published in <i>Empirica</i> and <i>Applied Economics Letters</i> . Second, we analyse forecasts of GDP growth and CPI inflation in Germany, published in <i>Consensus Forecasts</i> . There are two main findings: the relative frequencies of the first and second digits in economic research are broadly consistent with Benford's law and in sharp contrast, the second digits of <i>Consensus Forecasts</i> exhibit a massive excess of zeros and fives, raising doubts on their information content.
2009	C11	Schorfheide, Frank, Keith Sill, and Maxym Kryshko. 2009. <i>DSGE Model-Based Forecasting of Non-modelled Variables</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 14872. This paper develops and illustrates a simple method to generate a DSGE model-based forecast for variables that do not explicitly appear in the model (non-core variables). We use auxiliary regressions that resemble measurement equations in a dynamic factor model to link the non-core variables to the state variables of the DSGE model. Predictions for the non-core variables are obtained by applying their measurement equations to DSGE model-generated forecasts of the state variables. Using a medium-scale New Keynesian DSGE model, we apply our approach to generate and evaluate recursive forecasts for PCE inflation, core PCE inflation, the unemployment rate, and housing starts along with predictions for the seven variables that have been used to estimate the DSGE model.
2009	C20	Heim, John J. 2009. <i>Does Consumer Confidence, As Measured By U. Of Michigan Indices, Affect Demand For Consumer And Investment Goods (Or Just Proxy For Things That Do)?</i>. Rensselaer Polytechnic Institute, Department of Economics, Rensselaer Working Papers in Economics. Declining consumer confidence is cited as a cause of declining consumer demand, independent of changes income, wealth, etc. If so, it may also affect demand for investment goods, as businesses adjust production to reflect changes in consumer confidence and its anticipated effect on demand. This paper examines the University of Michigan's Index of

Year	DE	Title and Abstract
		Consumer Sentiment (ICS), and the Index of Consumer Expectations (ICE), a subcomponent of ICS also used in the Index of Leading Economic Indicators Index. Using simple two variable regressions ICS lagged one year explained considerable variance in current consumption (but not vice versa). Both the ICS and ICE lagged one year were found systematically related to consumer demand for nondurable goods, but not durable goods, services, or total consumer demand when an extensive list of other factors affecting demand such as income, wealth, interest rates, credit availability and the exchange rate were controlled for. Neither ICS nor ICE was found related to any component of investment.
2009	C20	Heim, John J. 2009. <i>Does Consumer Confidence, As Measured By The Conference Board's Index Of Consumer Confidence, Affect Demand For Consumer And Investment Goods(Or Just Proxy For Things That Do)?</i> . Rensselaer Polytechnic Institute, Department of Economics, Rensselaer Working Papers in Economics. Declining consumer confidence is cited as a cause of declining consumer demand. If so, it may also affect business spending on investment goods, as businesses adjust production in response to changes in consumer confidence that will affect demand. This paper examines effects on consumption and investment of changes in the conference Board's Index of Consumer Confidence (ICC), and its subcomponent Index of Consumer Expectations (ICE). Using simple two variable regressions prior year values of ICS were found significantly related to current year consumption (but not vice versa). Using more sophisticated models, in which other variables that influence consumer demand are controlled for, the ICC, again lagged one period, was found also found systematically related to total consumer spending and spending on each of its parts: durable and nondurable goods, and services. Control variables included income, wealth, interest rates, consumer credit availability and exchange rates. No ICE relationship with any kind of consumer demand was found. With controls for other factors affecting investment, including the accelerator, depreciation allowances, interest rates, profits and stock market levels, the ICC was not found related to any type of investment. However but the 3 year average value of ICE (current and past two years) was found related to both inventory investment and housing investment. The magnitude of the impact of 2008 changes in ICC was found to be very large, capable of explaining the entirety of the estimated decline in GDP during 2009.
2009	C20 E00	Heim, John J. 2009. <i>The Real Exchange Rate And The U. S. Economy 2000-2008</i> . Rensselaer Polytechnic Institute, Department of Economics, Rensselaer Working Papers in Economics. This paper is a revision of Rensselaer Polytechnic Institute's Working Papers in Economics Series, No. 803, entitled "How Falling Exchange Rates 2000-2007 Have Affected the U.S. Economy and Trade Deficit (Evaluated Using the Federal Reserve's Real Broad Exchange Rate)". It expands the analysis to measure exchange rate effects on the U.S. economy through 2008. It also utilizes a significantly improved method for assessing the meaning of the regression coefficient on the exchange rate variable in consumption and investment functions, removing ambiguity as to whether they should be interpreted as income or substitution effects. The paper attempts econometrically, using a seven behavioral equation model, to determine the total impact during 2000-2008 of the U.S. real exchange rate's 13.8% decline. Using projections based on an econometric model of the U.S. economy 1960-2000, the paper suggests that the effect on demand for domestically produced consumer goods (and exports) is positive, but strongly negative for investment goods. The estimated overall negative effect of declining real exchange rates on the GDP is 1.9% over the eight years, or about a quarter percent decline a year. This revised estimate is less than half the estimated impact reported Working Paper 803. It is estimated the decline reduced the trade deficit \$189 billion from what it otherwise would have been, down from \$244 billion reported Working Paper 803.
2009	C20 E00	Heim, John J. 2009. <i>Demand For Durable Goods, Nondurable Goods And Services</i> . Rensselaer Polytechnic Institute, Department of Economics, Rensselaer Working Papers in Economics. Separate macroeconomic consumption demand functions are developed and tested for (1) durable goods, (2) nondurable goods and (3) services. These are compared for consistency with econometric studies of total consumer demand. Key factors determining demand for these goods are tested using U.S. 1960-2000 data. The econometric method used was 2SLS with heteroskedasticity controls. Data in first differences are used to reduce multicollinearity, non stationarity and autocorrelation. The models explain 94% of the variance in demand for consumer durables, 86% of demand for nondurable consumer goods and 81% of services demand. Demand for durables like autos and appliances, was found to be driven by the disposable income, wealth, the exchange rate, availability of consumer credit, interest rates on consumer credit, demand for new housing, which affects appliance demand, and population growth. Demand for nondurable goods, such as groceries and clothes, was driven by the same factors, except for new housing demand and the exchange rate. Demand for consumer services such as laundry, restaurant, and entertainment services was found to be related to disposable income, wealth, and population growth, but not related to consumer credit availability, or consumer credit interest rates. However, mortgage interest rates paid by households did seem to affect the demand for services.
2009	E30 E50 H20 O51 R20	Baker, Dean. 2009. <i>The Housing Crash Recession and the Case for a Third Stimulus</i> . Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This paper makes the case for a third stimulus package to in the face of economic indicators signaling that the economy is in a deeper downturn than was expected based on previous projections. Specifically, the report calls for an employer tax-credit for extending health care coverage and another per worker employer tax credit for increasing paid time off from work. The author also makes the case for a housing policy centered on the stabilization of prices in non-bubble and deflated markets rather than applying the same efforts on markets that remain at bubble inflated levels. Finally, the paper argues that the dollar must be allowed to fall in one effort to adjust trade imbalances that are compounding the U.S. economic crisis caused by the collapse of the housing market.
2009	E42 F42	McKibbin, Warwick, and Waranya Pim Chanthapun. 2009. <i>Exchange Rate Regimes in the Asia-Pacific Region and the Global Financial Crisis</i> . Australian National University, Centre for Applied Macroeconomic Analysis, CAMA Working Papers. Rising economic integration in Asia and periodic volatility in global and national financial markets raise the issue of the optimal degree and form of monetary cooperation among Asian economies. There is a large literature on the benefits and costs of monetary cooperation, however, less can be found with a specific focus on Asia. A number of studies have explored whether Asia might form an optimal currency area, although these have focused on the nature of shocks, in particular business cycle correlations, as well as the extent of trade linkages among economies. Less has been done on the impact of portfolio shifts and financial shocks, and how these shocks impact on financial cooperation. This paper has two goals. The first is to explore the impacts of the current global financial crisis on Asian economies under existing monetary and exchange rate arrangements. The second is to explore how alternative forms of cooperation and exchange rate regimes might change the economic outcomes in Asia. In particular, the paper explores the impact of current regimes compared to one of three hypothetical regimes: (i) all countries peg to the US dollar, (ii) all Asian economies are in an Asian Currency Union with an Asian Central Bank setting policy, or (iii) floating exchange rates with each central bank in Asia independently choosing optimal time-consistent, close-loop policy rules to target a loss function consisting of deviation in inflation and output growth from desired levels.

2009	E51	Beaton, Kimberly. 2009. <i>Credit Constraints and Consumer Spending</i> . Bank of Canada, Working Papers. This paper examines the relationship between aggregate consumer spending and credit availability in the United States. The author finds that consumer

Year	DE	Title and Abstract
		spending falls (rises) in response to a reduction (increase) in credit availability. Moreover, she provides a formal assessment of the possibility that credit availability is particularly important for consumer spending when it undergoes large changes. In this respect, she estimates a consumption function in which only large expansions and contractions in credit affect spending. She concludes that large changes in credit availability are particularly important for consumers' spending decisions. As should be expected, these periods tend to be associated with periods of high economic uncertainty. These results show that credit availability should be taken into account when modeling and forecasting consumer spending.

Harvard Business School, Harvard Business School Working Papers: 10-023. The confluence of three trends in the U.S. residential housing market—rising home prices, declining interest rates, and near-frictionless refinancing opportunities—led to vastly increased systemic risk in the financial system. Individually, each of these trends is benign, but when they occur simultaneously, as they did over the past decade, they impose an unintentional synchronization of homeowner leverage. This synchronization, coupled with the indivisibility of residential real estate that prevents homeowners from deleveraging when property values decline and homeowner equity deteriorates, conspire to create a "ratchet" effect in which homeowner leverage is maintained or increased during good times without the ability to decrease leverage during bad times. If refinancing-facilitated homeowner-equity extraction is sufficiently widespread—as it was during the years leading up to the peak of the U.S. residential real-estate market—the inadvertent coordination of leverage during a market rise implies higher correlation of defaults during a market drop. To measure the systemic impact of this ratchet effect, we simulate the U.S. housing market with and without equity extractions, and estimate the losses absorbed by mortgage lenders by valuing the embedded put-option in non-recourse mortgages. Our simulations generate loss estimates of \$1.5 trillion from June 2006 to December 2008 under historical market conditions, compared to simulated losses of \$280 billion in the absence of equity extractions.
2009	G17	Blaskowitz, Oliver, and Helmut Herwartz. 2009. <i>On economic evaluation of directional forecasts</i> . Sonderforschungsbereich 649, Humboldt University, Berlin, Germany, SFB 649 Discussion Papers: SFB649DP2009-052. It is commonly accepted that information is helpful if it can be exploited to improve a decision making process. In economics, decisions are often based on forecasts of up or downward movements of the variable of interest. We point out that directional forecasts can provide a useful framework to assess the economic forecast value when loss functions (or success measures) are properly formulated to account for realized signs and realized magnitudes of directional movements. We discuss a general approach to evaluate (directional) forecasts which is simple to implement, robust to outlying or unreasonable forecasts and which provides an economically interpretable loss/success functional framework. As such, the measure of directional forecast value is a readily available alternative to the commonly used squared error loss criterion.

2009	L84	Ashiya, Masahiro. 2009. "Strategic Bias and Professional Affiliations of Macroeconomic Forecasters." <i>Journal of Forecasting</i> , 28(2): 120-30. This paper investigates strategic motives of macroeconomic forecasters and the effect of their professional affiliations. The 'wishful expectations hypothesis' suggests that a forecaster predicts what his employer wishes. The 'publicity hypothesis' argues that forecasters are evaluated by both accuracy and ability to generate publicity, and that forecasters in industries that emphasize publicity most will make most extreme and least accurate predictions. The 'signaling hypothesis' asserts that an extreme forecast signals confidence in own ability, because incompetent forecasters would mimic others to avoid public notice. Empirical evidence from a 26-year panel of annual GDP forecasts is consistent with the publicity hypothesis. This indicates that conventional tests of rationality are biased toward rejecting the rational expectations hypothesis.
2009	O12 Q54 Q56	Eboli, Fabio, Ramiro Parrado, and Roberto Roson. 2009. <i>Climate Change Feedback on Economic Growth: Explorations with a Dynamic General Equilibrium Model</i> . Fondazione Eni Enrico Mattei, Working Papers: 2009.43. Human-generated greenhouse gases depend on the level of economic activity. Therefore, most climate change studies are based on models and scenarios of economic growth. Economic growth itself, however, is likely to be affected by climate change impacts. These impacts affect the economy in multiple and complex ways: changes in productivity, resource endowments, production and consumption patterns. We use a new dynamic, multi-regional Computable General Equilibrium (CGE) model of the world economy to answer the following questions: Will climate change impacts significantly affect growth and wealth distribution in the world? Should forecasts of human-induced greenhouse gases emissions be revised, once climate change impacts are taken into account? We found that, even though economic growth and emission paths do not change significantly at the global level, relevant differences exist at the regional and sectoral level. In particular, developing countries appear to suffer the most from climate change impacts.

2010	C58	Rodriguez, Abel, and Gavino Puggioni. 2010. "Mixed Frequency Models: Bayesian Approaches to Estimation and Prediction." <i>International Journal of Forecasting</i> , 26(2): 293-311. We describe Bayesian models for economic and financial time series that use regressors sampled at higher frequencies than the outcome of interest. The models are developed within the framework of dynamic linear models, which provides a high level of flexibility and allows direct interpretation of the results. The

Year	DE	Title and Abstract
		problem of the collinearity of intraperiod observations is solved using model selection and model averaging approaches. Bayesian approaches to model selection automatically adjust for multiple comparisons, while predictions based on model averaging allow us to account for both model and parameter uncertainty when predicting future observations. A novel aspect of the models presented here is the introduction of new formulations for the prior distribution on the model space that allow us to favor sparse models where the significant coefficients cluster on adjacent lags of the high frequency predictor. We illustrate our approach by predicting the gross national product of the United States using the term structure of interest rates.
2010	D13 J10	Boersch-Supan, Axel H., and Alexander Ludwig. 2010. <i>Old Europe ages: Reforms and Reform Backlashes</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 15744. The extent of the demographic changes in Europe is dramatic and will deeply affect future labor, financial and goods markets. The expected strain on public budgets and especially social security has already received prominent attention, but aging poses many other economic challenges that threaten growth and living standards if they remain unaddressed. This paper focuses on three large Continental European countries: France, Germany, and Italy. These countries have large pay-as-you-go pension systems and vulnerable labor markets. At the same time, they show remarkable resistance against pension and labor market reform. While there is no shortage of reform proposals to address population aging, most of those focused on pension and labor market reform, little is known about behavioral reactions to such reforms. This paper therefore sheds light on the potential benefits of pension and labor market reform for growth and living standards, taking into account behavioral reactions to specific reforms. Which behavioral reactions will strengthen, which will weaken reform policies? Can Old Europe maintain its standard of living even if behavioral reactions offset some of the current reform efforts?
2010	F40	Beaton, Kimberly, Rene Lalonde, and Stephen Snudden. 2010. <i>The Propagation of U.S. Shocks to Canada: Understanding the Role of Real-Financial Linkages</i> . Bank of Canada, Working Papers. This paper examines the transmission of U.S. real and financial shocks to Canada and, in particular, the role of financial frictions in affecting the transmission of these shocks. These questions are addressed within the Bank of Canada's Global Economy Model (de Resende et al. forthcoming), a dynamic stochastic general-equilibrium model with an active banking sector and a detailed role for financial frictions. We find that U.S. financial shocks, as well as real shocks, have important effects on the Canadian economy. Moreover, financial frictions on both the demand and supply sides of credit amplify the first round impact of all types of U.S. shocks on the U.S. economy, as well as the second round impact on Canada. Real-financial linkages also increase the persistence of the Canadian response to U.S. shocks. We find that the interaction between the endogenous response of commodity prices and U.S. financial frictions plays an important role in the propagation of U.S. shocks to the Canadian economy. Finally, real-financial linkages also help to generate the positive cross correlation between domestic demand in the United States and Canada observed in the data, which is difficult to explain with a model where the transmission of shocks between countries is only based only on trade.
2010	F44	Asako, Kazumi, and Katsuaki Ochiai. 2010. "Macroeconomic Adjustment to the Lehman Shock in Japan." <i>Journal of East Asian Economic Integration</i> , 14(1): 3-46. In this paper, we overview the macroeconomic adjustment to the Lehman shock in Japan. After retrospectively the Japanese economy since the Plaza Accord which led Japan to the bubble economy and the 'lost decade' we explain the business cycles in Japan and show related macroeconomic indicators since as early as the 1980s. Then we trace the macroeconomic responses of the Japanese economy to the Lehman shock by selectively looking at such aspects as the contribution of GDP growth by expenditure components, from peak to trough of the CI (composite index), production and inventory adjustment, and employment adjustment. We also supplement our analyses by observing additional factors including export, investment, consumption, exchange rate, and the stock market. The roles played by policy measures and expectations formation are also emphasized to explain why and how the Japanese economy did not develop as forecasted against the 'once in a hundred years' crisis.

2010	J40	Ashenfelter, Orley, Kirk Doran, and Bruce Schaller. 2010. <i>A Shred of Credible Evidence on the Long Run Elasticity of Labor Supply</i> . Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 199ashenfelter.pdf. The available estimates of the wage elasticity of male labor supply in the literature have varied between -0.2 and 0.2, implying that permanent wage increases have relatively small, poorly determined effects on labor supplied. The variation in existing estimates calls for a simple, natural experiment in which men can change their hours of work, and in which wages have been exogenously and permanently changed. We introduce a panel data set of taxi drivers who choose their own hours, and who experienced two exogenous permanent fare increases instituted by the New York City Taxi and Limousine Commission. Our preferred estimate suggests that their elasticity of labor supply is about -0.2.
2010	J60	D'Amuri, Francesco, and Juri Marcucci. 2010. "Google it!" <i>Forecasting the US Unemployment Rate with a Google Job Search index</i> . Fondazione Eni Enrico Mattei, Working Papers: 2010.31. We suggest the use of an Internet job-search indicator (the Google Index, GI) as the best leading indicator to predict the US unemployment rate. We perform a deep out-of-sample forecasting comparison analyzing many models that adopt both our preferred leading indicator (GI), the more standard initial claims or combinations of both. We find that models augmented with the GI outperform the traditional ones in predicting the monthly unemployment rate, even in most state-level forecasts and in comparison with the Survey of Professional Forecasters.
2010	R28	Aron, Janine, and John Muellbauer. 2010. <i>Modelling and Forecasting UK Mortgage Arrears and Possessions</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 7986. This paper presents new models for aggregate UK data on mortgage possessions (foreclosures) and mortgage arrears (payment delinquencies). The innovations include the treatment of difficult to observe variations in loan quality and shifts in forbearance policy by lenders, by common latent variables estimated in a system of equations for arrears and possessions, for quarterly data over 1983-2009. A second innovation is the theory-justified use of an estimate of the proportion of mortgages in negative equity, based on an average debt to equity ratio, as one of the key drivers of possessions and arrears. A third is the systematic treatment of measurement bias in the months in arrears measures. Finally, the paper does not impose a proportional long-run relationship between possessions and arrears assumed in the previous UK literature. A range of economic forecast scenarios for forecasts to 2013 reveals the sensitivity of mortgage possessions and arrears to different economic conditions, highlighting potential risks faced by the UK and its mortgage lenders. A comprehensive review of data on arrears and possessions completes the paper.

2011	A20	Levy, David M., and Sandra J. Peart. 2011. "Soviet Growth and American Textbooks: An Endogenous Past." <i>Journal of Economic Behavior and Organization</i> , 78(1-2): 110-25. Between 1960 and 1980 American economics textbooks overestimated Soviet

Year	DE	Title and Abstract
		growth. They held that the Soviet economy was growing faster than the US economy and yet they kept the ratio of Soviet-US output constant over two decades. The textbooks downplayed any uncertainty associated with such growth estimates. We offer evidence that the optimistic portrait of the Soviet economy in the textbooks was in part driven by an assumption of efficiency and abstraction from institutional concerns.
2011	C01	Rossi, Barbara. 2011. <i>Advances in Forecasting Under Instability</i> . Duke University, Department of Economics, Working Papers: 11-20. The forecasting literature has identified two important, broad issues. The first stylized fact is that the predictive content is unstable over time; the second is that in-sample predictive content does not necessarily translate into out-of-sample predictive ability, nor ensures the stability of the predictive relation over time. The objective of this chapter is to understand what we have learned about forecasting in the presence of instabilities, especially regarding the two questions above. The empirical evidence raises a multitude of questions. If in-sample tests provide poor guidance to out-of-sample forecasting ability, what should researchers do? If there are statistically significant instabilities in the Granger-causality relationships, how do researchers establish whether there is any Granger-causality at all? And if there is substantial instability in predictive relationships, how do researchers establish which models is the "best" forecasting model? And finally, if a model forecasts poorly, why is that, and how should researchers proceed to improve the forecasting models? In this chapter, we will answer these questions by discussing various methodologies for inference as well as estimation that have been recently proposed in the literature. We also provide an empirical analysis of the usefulness of the existing methodologies using an extensive database of macroeconomic predictors of output growth and inflation.
2011	C54	Stanica, Cristian Nicolae. 2011. "Modeling Government Policies Used for Sustaining Economic Growth in Romania." <i>Romanian Journal of Economic Forecasting</i> , 14(4): 90-105. This paper presents some government policies scenarios and proposes the appropriate policies for stimulating the economic growth in Romania. The GDP dynamics, budgetary revenues, employment and wages are forecasted using a macroeconomic model of the Romanian economy. The direct effects of the fiscal policies and the indirect effects of the economic growth changes are investigated by three alternative scenarios as compared to a baseline scenario. The baseline should meet the following requirements: update of the macroeconomic indicators and maintenance of the same fiscal policy in the forecast period 2012-2013 as to 2011.
2011	D72	Mihai-Yiannaki, Simona. 2011. "Where To?--The EU Unemployment Post Crisis." <i>Global Business and Economics Review</i> , 13(3-4): 240-56. The paper combines under a literature review, secondary and tertiary data analysis, a unique construct of three perspectives: the new classical macroeconomics theory related to unemployment, a finance approach of the relationship with exchange rates and the legal repercussions of the social policy drawn by the latest Lisbon Treaty. When comparing the strong evidence of similar reactions following the recent 2007-2010 financial crisis with the post crisis situation of 1973, EU's performance looks always unfavourable compared to the one of the US. One of the reasons presented is the EU's four-folded modular pattern in social and political policies compared to a relatively unitary one across the Atlantic. Despite evidence of similar reactions, the difference between the two worlds regards a certain degree of inability to understand the core of the problem economically, socially and politically, leading to failure to find the appropriate applicable social policies towards economic success.
2011	E02 I31 L50 L93 L96 L98 N15 N75 O43	Herd, Richard, Paul Conway, Sam Hill, Vincent Koen, and Thomas Chalaux. 2011. <i>Can India Achieve Double-digit growth ?</i> . OECD Publishing, OECD Economics Department Working Papers: 883. In recent years, India has enjoyed one of the highest growth rates worldwide, weathering the global financial crisis better than many other countries. Prudent macroeconomic policies will be critical to prolonging the current expansion, given the risks associated with high inflation and volatile capital flows. A steadfast commitment to fiscal consolidation is needed to continue to reduce the large deficit that emerged in the aftermath of the slowdown and avoid crowding out private investment. Stepping up structural reforms will also be necessary if double-digit growth rates are to be achievable over the coming decade or so. Indeed, the operating environment for private business remains challenging. While infrastructure is improving in key sectors, partly thanks to greater private investment, bottlenecks endure and efforts to intensify competition and ensure continued strong investment are required. Labour market reforms are also required to promote job creation. Rapid economic development has boosted living standards and reduced poverty but poverty remains high. There is a need to strengthen social welfare systems and access to health and education to ensure widespread benefits from continued high growth. This Working Paper relates to the 2011 OECD Economic Survey of India (www.oecd.org/eco/surveys/india)
2011	O43	Barnes, Sebastian, Romain Bouis, Philippe Briard, Sean Dougherty, and Mehmet Eris. 2011. <i>The GDP Impact of Reform: A Simple Simulation Framework</i> . OECD Publishing, OECD Economics Department Working Papers: 834. This paper presents a framework to assess the impact of a wide range of structural policy reforms on GDP per capita at various horizons by linking together previous empirical studies mostly carried out by the OECD. The simple accounting framework consists of reduced-form equations and offers a more tractable and realistic alternative to an estimated general equilibrium model. This comes at the expense of several potential shortcomings including inter alia insufficient account of interrelationships between policies or spillover effects, risks of double-counting the effects of certain reforms, endogeneity issues and the omission of interactions across different policy areas. Bearing these caveats in mind, the plausible scenarios suggest that the largest long-run GDP per capita gains may be obtained from reforms that would raise the quantity and quality of education, strengthen competition in product markets, reduce the level and/or duration of unemployment benefits, cut labour tax wedges and relax employment protection legislation. Past reforms in these areas might also have contributed to as much as half of GDP per capita growth in OECD countries in the decade prior to the recent financial and economic crisis. Simulations further indicate that addressing all policy weaknesses in each OECD country by aligning policy settings on the OECD average could raise GDP per capita by as much as 25% in the typical country.
2011	O43	Bouis, Romain, and Romain Duval. 2011. <i>Raising Potential Growth After the Crisis: A Quantitative Assessment of the Potential Gains from Various Structural Reforms in the OECD Area and Beyond</i> . OECD Publishing, OECD Economics Department Working Papers: 835. This paper provides an illustrative assessment of the impacts on potential GDP over a 5 to 10-year horizon of structural reform scenarios in the areas of product and labour markets, relying on existing OECD empirical studies. Results of simulations suggest that a gradual alignment of product market regulations to best practice in a broad range of non-manufacturing sectors could boost aggregate labour productivity levels by several per cent over the next decade in many OECD countries, and by over five per cent across most of continental Europe, as well as for the BRIICS. Relaxation of job protection legislation could also raise productivity growth for a while in many OECD and non-OECD G20 countries, although the effects are estimated to be smaller than those from product market reforms. In a scenario under which they would be phased in relatively quickly, labour market reforms in the areas of unemployment benefit systems, activation policies, labour taxes and pension systems could raise employment rates by several percentage points in a number of OECD countries over a 10-year horizon. Large continental European countries would have the largest benefits to reap from reforms. The overall potential GDP gain for the average OECD country

Year	DE	Title and Abstract
		from undertaking the full range of reforms considered here might come close to 10% at a 10-year horizon, indicating the presence of ample room for structural reforms to offset the permanent GDP losses from the recent crisis.
2011	P27	2011. "Forecast for 2011-2013: The Development of Industrial Sectors." <i>Problems of Economic Transition</i> , 54(2): 5-59. The section on industry from the RF Ministry of Economic Development's forecast for 2011-13 is presented here in English translation. The forecast contains two basic versions (2b--moderately optimistic and 1b--conservative) and two additional ones (1a--pessimistic and 2c--optimistic). The nature of each version is determined by the forecast of oil price dynamics. Version 2b is taken as the primary one in the forecast.
2011	P27	2011. "The Dobrescu Macromodel of the Romanian Market Economy--2005 Version--Yearly Forecast--Spring Forecast 2011, March Estimate." <i>Romanian Journal of Economic Forecasting</i> , 14(1): 277-81. The macromodel estimates the short and medium-term economic implications for internal policies and changes in the international context. This version of the Romanian macromodel incorporates the experience accumulated through the utilization of its previous forms--either experimental (tested during 1991-1995) or operational (developed during 1996-2003). At the same time, it introduces some methodological and information improvements. The most significant is the structural decomposition of the economy, associated with input-output techniques. Due to the relatively advanced stage of the transitional processes in Romania, the behavioral functions were accommodated --as much as possible--to the standard relationships. Unlike the versions that used the statistical series beginning in 1980, the present one is based exclusively on information concerning the period 1989--2004. Therefore, we have considered more adequately naming this variant the macromodel of the Romanian market (not transition, as before) economy. In this article we present the Spring forecast for 2011.
2011	Q47	Mostafaei, Hamidreza, and Shaghayegh Kordnoori. 2011. "Residual Grey Markov Model for the Developments of GDP, Population and Energy Consumption in Iran." <i>Advances in Management and Applied Economics</i> , 1(2): 93-105. Grey system theory can powerfully deal with incomplete and uncertain information. In this paper, we introduced an improved grey GM(1,1) model that integrates residual modification with a Markov chain model. Using this model, we improved the forecast accuracy of the original grey forecast model and achieved the predictions and analyses of GDP, population, and energy consumption of Iran from 2009 to 2021 based on the data from 1992 to 2006. We examined development relationship between GDP, population, and energy consumption in the future.
2012		
2012	C18	Vermeulen, Philip. 2012. <i>Quantifying the qualitative responses of the output purchasing managers index in the US and the Euro area</i> . European Central Bank, Working Paper Series: 1417. The survey based monthly US ISM production index and Eurozone manufacturing PMI output index provide early information on industrial output growth before the release of the official industrial production index. I use the Carlson and Parkin probability method to construct monthly growth estimates from the qualitative responses of the US ISM production index and the Eurozone manufacturing PMI output index. I apply the method under different assumptions on the cross-sectional distribution of output growth using the uniform, logistic and Laplace distribution. I show that alternative distribution assumptions lead to very similar estimates. I also test the performance of the different growth estimates in an out of sample forecasting exercise of actual industrial production growth. All growth estimates beat a simple autoregressive model of output growth. Distribution assumptions again matter little most of the time except during the financial crisis when the estimates constructed using the Laplace distributional assumption perform the best. My findings are consistent with recent findings of Bottazzi and Sechi (2006) that the distribution of firm growth rates has a Laplace distribution.
2012	C25	Giovanis, Eleftherios. 2012. "Study of Discrete Choice Models and Adaptive Neuro-fuzzy Inference System in the Prediction of Economic Crisis Periods in USA." <i>Economic Analysis and Policy</i> , 42(1): 79-95. In this study two approaches are applied for the prediction of the economic recession or expansion periods in USA. The first approach includes Logit and Probit models and the second is an Adaptive Neuro-Fuzzy Inference System (ANFIS) with Gaussian and Generalized Bell membership functions. The in-sample period 1950-2006 is examined and the forecasting performance of the two approaches is evaluated during the out-of-sample period 2007-2010. The estimation results show that the ANFIS model outperforms the Logit and Probit model. This indicates that the neuro-fuzzy model provides a better and more reliable signal on whether or not a financial crisis will take place.
2012	C46	Todter, Karl-Heinz. 2012. "Risk Measurement with a Safety Belt: Pareto Meets Chebyshev." <i>Kredit und Kapital</i> , 45(2): 175-87. Risk measures based on the Gaussian distribution are prone to understate the probability of extreme events. To capture fat tails and extreme events, we combine the Pareto law with finite variance bounds of Chebyshev. This density encompasses the tail behaviour of a wide range of random variables with unknown distribution. It provides a well-defined conservative measure of risks. Applications to measurement of forecast uncertainty and to value at risk and expected shortfall illustrate the approach empirically.
2012	D21	Mitra, Shalini. 2012. <i>Does Financial Development Cause Higher Firm Volatility and Lower Aggregate Volatility?</i> . University of Connecticut, Department of Economics, Working papers: 2012-07. The period before the financial crisis was characterized by unprecedented calm in the U.S. and other developed countries. Volatility of aggregate output growth declined in the U.S. beginning in the early 1980's until the fall of 2007 (the phenomenon has been widely called the Great Moderation). Meanwhile micro level evidence suggests increasing volatility at the firm level over the last 60 years including the period of the Great Moderation. I conduct a quantitative analysis of the role played by financial development in the divergence of firm and aggregate volatilities. In a DSGE setting based on Kiyotaki and Moore (1997) type borrowing constraints I show that financial development is associated with increasing firm growth volatility and declining aggregate volatility. The reason for the divergence is a decline in correlation of the firm with the aggregate as financial development occurs.
2012	D73	Maekawa, Satoko, and Mototsugu Fukushige. 2012. "Tax Projections and Economic Forecasts by Government Bureaucrats: Hidden Manoeuvrings behind Fiscal Reconstruction in Japan." <i>Japanese Economic Review</i> , 63(4): 528-45. This paper investigates how the hidden manoeuvrings of governments' fiscal department bureaucrats affect tax projections and economic growth forecasts. The empirical results suggest that they underestimate their tax projections when these are based on their forecasts of government debt. We also analyze the manoeuvrings of fiscal bureaucrats on economic forecasts and find that their forecasts of economic growth rates depend on their own projections of government debt and fiscal deficits.
2012	D90 F35	Corong, Erwin, Lawrence Dacuycuy, Rachel Reyes, and Angelo Taningco. 2012. <i>The Growth and Distributive Impacts of Public Infrastructure Investments in the Philippines</i> . PEP-MPIA, Working Papers MPIA. This study investigates the role of public infrastructure investment on economic growth and poverty reduction in the Philippines. Using a dynamic general equilibrium-microsimulation model that explicitly models public capital as a production input, we find that the positive supply side effects of higher public investment expenditure manifest over time, through higher capital accumulation and improved productivity. Our

Year	DE	Title and Abstract
		findings reveal that higher public infrastructure investment not only positively impacts real GDP, but also reduces poverty and inequality in the short and long run. In this context, the Philippine government needs to become more proactive in finding ways to finance higher public investment expenditures. This is especially relevant with respect to international financing, given the narrow tax base in the country. Our simulation results confirm that international financing is a better alternative than tax financing when considered in terms of its ability to improve the economy's physical infrastructure in order to create job opportunities, improve productivity and complement its social protection measures.
2012	G33	Dimova, Dilyana. 2012. <i>The Role of Consumer Leverage in Generating Financial Crises</i>. University of Oxford, Department of Economics, Economics Series Working Papers: 631. Consumer leverage can generate financial crises characterized by increased bankruptcy, tightened credit access and reduced demand for goods. This paper embeds financial frictions in the mortgage contracts of homeowners within a two-sector economy to show that even at moderate initial levels, household indebtedness can create a lasting financial downturn such as the subprime mortgage crisis. Using two seemingly positive disturbances that triggered the subprime mortgage crisis—an increased housing supply and a relaxation of borrowing conditions—the model demonstrated that the subprime downturn was not a precedent but the natural consequence of financial frictions. The oversupply of houses lowers asset prices and reduces the value of the real estate collateral used in the mortgage. This worsens the leverage of indebted consumers and raised their bankruptcy prospects generating a pro-cyclical risk premium. A relaxation of borrowing conditions turns credit-constrained households into a potential source of disturbances themselves when market optimism allows them to overleverage with little downpayment. In both cases, the resulting excessive consumer leverage impairs household credit access for a lengthy after-shock period and diverts resources from their consumption. Their reduced demand for goods may propagate the downturn to the rest of the economy depressing output in other sectors. Adding credit constraints in the financial sector that provides housing mortgages deepens the negative impact of the shocks and makes recovery even more protracted.
2012	P11	Okali, Ivan. 2012. "K tvorbe a vyuzivaniu strategii rozvoja. (On the Creation and Implementation of Development Strategies. With English summary.)" <i>Ekonomicky Casopis/Journal of Economics</i>, 60(7): 659-80. The paper deals with development strategies as tools of structural changes in the economy. The first part discusses the experience gained in creation development strategies of the Slovak economy after 2000. In the next section, it devoted attention not only to differences between strategies, visions, and forecasts, but also to their connections. There are considered rules of strategies--their relationship to economic research, combining analytical and synthetical viewpoints, interdisciplinary approach, variability of solutions, etc. A part of the article is an explanation of cognitive and practical functions of strategies studies. The conclusions look at strategies in the regulation of market economy and justify the need of their continuous innovation.
2012	P33	Kharazishvili, Y. M., and I. M. Nazaraga. 2012. "Investments: An Approach to Their Forecast. (In Ukrainian. With English summary.)" <i>Actual Problems of Economics</i>, 135(9): 213-22. The article determines the dependence of investments upon export of goods (and services) and presents one of the approaches to investments forecast which is based on this dependence. Export of commodities and services is determined as a function of world prices for key exported goods. Forecast calculations of major macroeconomic indices of the socioeconomic development of Ukraine are carried out by means of the macroeconomic model "Alpha" for the years 2012-2013.

2013	C15	McAleer, Michael, Felix Chan, and Les Oxley. 2013. <i>Modelling and Simulation: An Overview</i>. Tinbergen Institute, Tinbergen Institute Discussion Papers: 13-069/III. The papers in this special issue of Mathematics and Computers in Simulation cover the following topics: improving judgmental adjustment of model-based forecasts, whether forecast updates are progressive, on a constrained mixture vector autoregressive model, whether all estimators are born equal: the empirical properties of some estimators of long memory, characterising trader manipulation in a limit-order driven market, measuring bias in a term-structure model of commodity prices through the comparison of simultaneous and sequential estimation, modelling tail credit risk using transition matrices, evaluation of the DPC-based inclusive payment system in Japan for cataract operations by a new model, the matching of lead underwriters and issuing firms in the Japanese corporate bond market, stochastic life table forecasting: a time-simultaneous fan chart application, adaptive survey designs for sampling rare and clustered populations, income distribution inequality, globalization, and innovation: a general equilibrium simulation, whether exchange rates affect consumer prices: a comparative analysis for Australia, China and India, the impacts of exchange rates on Australia's domestic and outbound travel markets, clean development mechanism in China: regional distribution and prospects, design and implementation of a Web-based groundwater data management system, the impact of serial correlation on testing for structural change in binary choice model: Monte Carlo evidence, and coercive journal self citations, impact factor, journal influence and article influence.
2013	C36	Gallant, A. Ronald, Raffaella Giacomini, and Giuseppe Ragusa. 2013. <i>Generalized Method of Moments with Latent Variables</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 9692. The contribution of generalized method of moments (Hansen and Singleton, 1982) was to allow frequentist inference regarding the parameters of a nonlinear structural model without having to solve the model. Provided there were no latent variables. The contribution of this paper is the same. With latent variables.
2013	C38	Barhouni, Karim, Olivier Darne, and Laurent Ferrara. 2013. "Testing the Number of Factors: An Empirical Assessment for a Forecasting Purpose." <i>Oxford Bulletin of Economics and Statistics</i>, 75(1): 64-79. GDP forecasts based on dynamic factor models, applied to a large data set, are now widely used by practitioners involved in nowcasting and short-term macroeconomic forecasting. One recurrent empirical question that arises when dealing with such models is the way to determine the optimal number of factors. At the same time, statistical tests have recently been put forward in the literature in order to optimally determine the number of significant factors. In this article, we propose to reconcile both fields of interest by selecting the number of factors, through a testing procedure, to include in the forecasting equation. Through an empirical exercise on French and German GDPs, we assess the impact of a battery of recent statistical tests for the number of factors for a forecasting purpose. By implementing a rolling experience, we also assess the stability of the results overtime.
2013	C38	Ramos, Carmen, and Blanca Moreno. 2013. "Characterization of Spanish Economic Sectors from an Economic and Environmental Perspective: Evolution and Forecast of Greenhouse Gas Emissions." <i>Regional and Sectoral Economic Studies</i>, 13(2): 117-34. The aim of the Kyoto Protocol is to reduce the growth of greenhouse gases emissions. In this context, it is very important to characterize the economic sectors according to environmental indicators to properly design environmental policies. Moreover, it could be advisable to analyze the emissions that directly and indirectly are generated by economic sectors to carry out their production and meet their demand. This paper conducts such environmental characterization and analysis for Spanish industries through an input-output analysis. In addition, we forecast the effects of an increase in consumption on greenhouse gases emissions by using macroeconomic forecasts from 2011 to 2014.

2013	D85 Q51	Saaty, Thomas L., and Luis G. Vargas. 2013. <i>Decision Making with the Analytic Network Process: Economic, Political, Social and Technological Applications with Benefits, Opportunities, Costs and Risks</i> , Second edition. International Series in Operations Research and Management Science, vol. 195. New York and Heidelberg: Springer. Fifteen papers comprise an updated second edition that explores the Analytic Network Process (ANP)--the application of network structures with dependence and feedback in decisions. Papers discuss the ANP; forecasting the resurgence of the U.S. economy in 2001--an expert judgment approach; an ANP model for financial-crisis forecasting; outsourcing a firm's application development group; the Arctic National Wildlife Refuge--an ANP validation example; the Ford Explorer case; a synthesis of complex criteria decision making--a case toward a consensus agreement for a Middle East conflict resolution; U.S. energy security; stabilizing social security for the long term; when shall Poland enter the Eurozone?; the conflict between China and Taiwan; the U.S. response to the North Korean nuclear threat; criteria for evaluating group decision-making methods; an innovative orders-of-magnitude approach to Analytic Hierarchy Process-based multicriteria decision making--prioritizing divergent intangible humane acts; and sensitivity analysis in the Analytic Hierarchy Process.
2013	F10 F62 J18 Q38 Q51	Cheung, Calista. 2013. <i>Policies to support sustainable long-term growth in New Zealand</i> . OECD Publishing. OECD Economics Department Working Papers: 1076. As its workforce ages and major economies shift towards producing higher value-added goods and services, New Zealand will face increasing challenges to remain globally competitive and maintain high living standards. Future growth will need to come increasingly from productivity gains, and resources will have to shift towards activities that rely more on skills, technology and intangible assets. Strengthening international linkages will be crucial to overcoming geographic disadvantages and will require improvements in the information and communications technology infrastructure, together with innovation leveraged off the country's strong primary industry knowledge base. Continuing to raise skill levels and the pensionable age will also help counter the effects of ageing. Lifting national saving, partly by targeting a higher public saving rate, will reduce the persistently high relative real interest rates and the sustained overvaluation of the real exchange rate, which potentially harm economic activity. To improve the sustainability of growth, revenues from non-renewable resource extraction need to be invested for the benefit of future generations and greater efforts devoted to mitigate the damage to natural capital from economic activity, particularly with respect to water quality. This Working Paper relates to the 2013 OECD Economic Review of New Zealand (www.oecd.org/eco/surveys/New Zealand).
2013	F55	Burghilea, Cristina, Corina Maria Ene, and Carmen Uzla. 2013. "Impact of Economic Models on European Union Economies Development." <i>Theoretical and Applied Economics</i> , 20(4): 91-102. The horizon of 2050 is projected to offer a new vision of the economy, supported by a coordination of economic policies in order to generate sustainable growth, employment levels, and social cohesion, which would contribute to the economic and financial recovery of the European Union. Challenges facing the EU are higher than before the recession, while the margin of maneuver is limited. The enhanced role of the EU demonstrates the increasing economic and political power of emerging countries.

2013	G00	Beber, Alessandro, Michael W. Brandt, and Maurizio Luisi. 2013. <i>Distilling the Macroeconomic News Flow</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 19650. We propose a simple cross-sectional technique to extract daily factors from economic news released at different times and frequencies. Our approach can effectively handle the large number of different announcements that are relevant for tracking current economic conditions. We apply the technique to extract real-time measures of inflation, output, employment, and macroeconomic sentiment, as well as corresponding measures of disagreement among economists about these indices. We find that our procedure provides more timely and accurate forecasts of future changes in economic conditions than other real-time forecasting approaches.
2013	H83 P26	Kuchukov, R. 2013. "The Public Sector and Its Role in Strategy-2020." <i>Problems of Economic Transition</i> , 55(9): 50-64. The author discusses the Russian public sector and points out that high-quality economic growth should become a priority objective of economic policy and the foundation of a government program of neoindustrial economic modernization.
2013	I25	Johansson, Asa, Yvan Guillemette, Fabrice Murtin, David Turner, Giuseppe Nicoletti, Christine de la Maisonneuve, Philip Bagnoli, Guillaume Bousquet, and Francesca Spinelli. 2013. <i>Long-Term Growth Scenarios</i> . OECD Publishing. OECD Economics Department Working Papers: 1000. This paper presents the results from a new model for projecting growth of OECD and major non-OECD economies over the next 50 years as well as imbalances that arise. A baseline scenario assuming gradual structural reform and fiscal consolidation to stabilise government-debt-to GDP ratios is compared with variant scenarios assuming deeper policy reforms. One main finding is that growth of the non-OECD G20 countries will continue to outpace OECD countries, but the difference will narrow substantially over coming decades. In parallel, the next 50 years will see major changes in the composition of the world economy. In the absence of ambitious policy changes, global imbalances will emerge which could undermine growth. However, ambitious fiscal consolidation efforts and deep structural reforms can both raise long-run living standards and reduce the risks of major disruptions to growth by mitigating global imbalances.

2013	J30	Angelini, Elena, Alistair Dieppe, and Beatrice Pierluigi. 2013. <i>Learning about wage and price mark-ups in euro area countries</i> . European Central Bank. Working Paper Series: 1512. In this paper we show that higher flexibility, measured by lower wage and price mark-ups leads to reduced inflationary pressures, increase in competitiveness, and higher output. A rational expectation and a learning version of the ECB's New Multi-Country Model are used to understand plausible dynamics of labour cost and price adjustments. In the rational expectation version of the model gains are quicker but more short-lived than in a learning environment. We argue that a rational expectation model appears appropriate to describe the abrupt wage adjustment which took place in the Baltic States. By contrast, a learning model appears better suited to capture the gradual wage adjustment of Germany during the 2000s and the one that started in Spain and Italy after the 2008-09 crisis. In fact, in view of implementation lags and the need to change institutions, in the above countries the adjustment should be expected to deliver output gains less quickly than in the Baltic States. In this paper we use the linked version of the model to evaluate the aggregate impact of the imposed shocks as well as possible spillover effects within the euro area. All in all, spillover effects are relatively small.

2013	P28 Q31	Rautava, Jouko. 2013. "Oil Prices, Excess Uncertainty and Trend Growth: A Forecasting Model for Russia's Economy." <i>Focus on European Economic Integration</i> , 0(0): 77-87. The sharp contraction of Russian output in 2008-2009 and the country's recent poor growth performance came as a surprise to policymakers and analysts in Russia and elsewhere. In this paper, we examine the

Year	DE	Title and Abstract
		factors behind these developments, using a small structural error-correction (SVEC) macro model built for forecasting purposes. The estimation of the model indicates that Russia's economy is still strongly influenced by international oil prices and that there seems to be no major difference in this respect before and after the 2008-2009 crisis. However, in our linear model setup, oil prices alone cannot, for example, explain the major recession Russia faced in 2008-2009. To improve our forecasts around such particular events, we should explicitly account for increased uncertainty that is likely to have a direct impact on the real economy. Here, we estimate the impact of excess uncertainty by using exchange rate expectations. As to Russia's recent poor growth performance, the computations in this paper suggest that trend growth in Russia has halved from about 4% before 2008 to about 2% in 2013.

Table E29.F Examples of Publications according to New Links in 2006—2013

Year	DE	Title and Abstract
2007		
2007	C53	Isiklar, Gultekin, and Kajal Lahiri. 2007. "How Far Ahead Can We Forecast? Evidence from Cross-Country Surveys." <i>International Journal of Forecasting</i>, 23(2): 167-87. Using monthly GDP forecasts from Consensus Economics, Inc. for 18 developed countries, reported over 24 different forecast horizons during the period 1989-2004, we find that the survey forecasts do not have much value when the horizon goes beyond 18 months. Using two alternative approaches to measure the flow of new information in fixed-target survey forecasts, we find that the biggest improvement in forecasting performance comes when the forecast horizon is around 14 months. The dynamics of information accumulation over forecast horizons can provide both the forecasters and their clients with an important clue in their selection of the timing and frequency in the use of forecasting services. The limits to forecasting that these private market forecasters exhibit are indicative of the current state of macroeconomic foresight.
2010		
2010	G12 G17 G21	de Wit, Erik R., Peter Englund, and Marc Francke. 2010. <i>Price and Transaction Volume in the Dutch Housing Market</i>. Tinbergen Institute, Tinbergen Institute Discussion Papers: 10-039/2. Housing markets typically exhibit a strong positive correlation between the rate of price increase and the number of houses sold. We document this correlation on high-quality Dutch data for the period 1985-2007, and estimate a VEC-model that allows us to study the mechanism giving rise to the correlation. The data identify the flows of new houses offered for sale as well as the number of houses sold. According to the estimated model, shocks to market fundamentals (the mortgage rate) have an immediate and significant impact on the rate of sale, little impact on the rate of entry of new houses for sale, and a gradual impact on the house prices. This pattern is consistent with a search model where buyers and sellers gradually learn about changes in market conditions.
2011		
2011	J71	Biddle, Jeff, and Daniel S. Hamermesh. 2011. <i>Cycles of Wage Discrimination</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 17326. Using CPS data from 1979-2009 we examine how cyclical downturns and industry-specific demand shocks affect wage differentials between white non-Hispanic males and women, Hispanics and African-Americans. Women's and Hispanics' relative earnings are harmed by negative shocks, while the earnings disadvantage of African-Americans may drop with negative shocks. Negative shocks also appear to increase the earnings disadvantage of bad-looking workers. A theory of job search suggests two opposite-signed mechanisms that affect these wage differentials. It suggests greater absolute effects among job-movers, which is verified using the longitudinal component of the CPS.

2006	C15	Meyermans, Eric, and Patrick Van Brusselen. 2006. <i>Working Paper 02-06--An Evaluation of the Risks Surrounding the 2006-2012 NIME Economic Outlook: Illustrative Stochastic Simulations</i> . Federal Planning Bureau, Belgium, Working Papers. In this Working Paper, we describe how we used stochastic simulation to evaluate the risks surrounding the January 2006 NIME Economic Outlook (neo) for the world economy. We summarise the main results by showing confidence intervals around the baseline projection as well as probabilities that certain events will occur. The results presented in this Working Paper are of an illustrative nature and do not constitute an update of the January 2006 NIME Economic Outlook.
2006	C20	Marcellino, Massimiliano. 2006. <i>A Simple Benchmark for Forecasts of Growth and Inflation</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 6012. A theoretical model for growth or inflation should be able to reproduce the empirical features of these

Year	DE	Title and Abstract
		variables better than competing alternatives. Therefore, it is common practice in the literature, whenever a new model is suggested, to compare its performance with that of a benchmark model. However, while the theoretical models become more and more sophisticated, the benchmark typically remains a simple linear time series model. Recent examples are provided, e.g., by articles in the real business cycle literature or by new-keynesian studies on inflation persistence. While a time series model can provide a reasonable benchmark to evaluate the value added of economic theory relative to the pure explanatory power of the past behavior of the variable, recent developments in time series analysis suggest that more sophisticated time series models could provide more serious benchmarks for economic models. In this paper we evaluate whether these complicated time series models can really outperform standard linear models for GDP growth and inflation, and should therefore substitute them as benchmarks for economic theory based models. Since a complicated model specification can over-fit in sample, i.e. the model can spuriously perform very well compared to simpler alternatives, we conduct the model comparison based on the out of sample forecasting performance. We consider a large variety of models and evaluation criteria, using real time data and a sophisticated bootstrap algorithm to evaluate the statistical significance of our results. Our main conclusion is that in general linear time series models can be hardly beaten if they are carefully specified, and therefore still provide a good benchmark for theoretical models of growth and inflation. However, we also identify some important cases where the adoption of a more complicated benchmark can alter the conclusions of economic analyses about the driving forces of GDP growth and inflation. Therefore, comparing theoretical models also with more sophisticated time series benchmarks can guarantee more robust conclusions.
2006	C72	Angeletos, George-Marios, and Alessandro Pavan. 2006. <i>Socially Optimal Coordination: Characterization and Policy Implications</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 12778. In recent years there has been a growing interest in macro models with heterogeneity in information and complementarity in actions. These models deliver promising positive properties, such as heightened inertia and volatility. But they also raise important normative questions, such as whether the heightened inertia and volatility are socially undesirable, whether there is room for policies that correct the way agents use information in equilibrium, and what are the welfare effects of the information disseminated by the media or policy makers. We argue that a key to answering all these questions is the relation between the equilibrium and the socially optimal degrees of coordination. The former summarizes the private value from aligning individual decisions, whereas the latter summarizes the value that society assigns to such an alignment once all externalities are internalized.
2006	C83	Boero, Gianna, Jeremy Smith, and Kenneth F. Wallis. 2006. <i>Uncertainty and disagreement in economic prediction : the Bank of England Survey of External Forecasters</i>. University of Warwick, Department of Economics, The Warwick Economics Research Paper Series (TWERPS). This article introduces a new source of survey data, namely the Bank of England Survey of External Forecasters. The survey collects point and density forecasts of inflation and GDP growth, and hence offers the opportunity of constructing direct measures of uncertainty. We present a simple statistical framework in which to define and interrelate measures of uncertainty and disagreement. The resulting measures are compared with other direct measures of uncertainty, nationally and internationally. A significant, sustained reduction in inflation uncertainty followed the 1997 granting of operational independence to the Bank of England to pursue a monetary policy of inflation targeting.
2006	D01	Hommes, Cars. 2006. <i>Interacting Agents in Finance</i>. Tinbergen Institute, Tinbergen Institute Discussion Papers: 06-029/1. Interacting agents in finance represent a behavioral, agent-based approach in which financial markets are viewed as complex adaptive systems consisting of many boundedly rational agents interacting through simple heterogeneous investment strategies, constantly adapting their behavior in response to new information, strategy performance and through social interactions. An interacting agent system acts as a noise filter, transforming and amplifying purely random news about economic fundamentals into an aggregate market outcome exhibiting important stylized facts such as unpredictable asset prices and returns, excess volatility, temporary bubbles and sudden crashes, large and persistent trading volume, clustered volatility and long memory.
2006	G13	Snowberg, Erik, Justin Wolfers, and Eric Zitzewitz. 2006. <i>Partisan Impacts on the Economy: Evidence from Prediction Markets and Close Elections</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 12073. Political economists interested in discerning the effects of election outcomes on the economy have been hampered by the problem that economic outcomes also influence elections. We sidestep these problems by analyzing movements in economic indicators caused by clearly exogenous changes in expectations about the likely winner during election day. Analyzing high frequency financial fluctuations on November 2 and 3 in 2004, we find that markets anticipated higher equity prices, interest rates and oil prices and a stronger dollar under a Bush presidency than under Kerry. A similar Republican-Democrat differential was also observed for the 2000 Bush-Gore contest. Prediction market based analyses of all Presidential elections since 1880 also reveal a similar pattern of partisan impacts, suggesting that electing a Republican President raises equity valuations by 2-3 percent, and that since Reagan, Republican Presidents have tended to raise bond yields.
2006	H00	Buitier, Willem H. 2006. <i>How Robust is the New Conventional Wisdom? The Surprising Fragility of the Theoretical Foundations of Inflation Targeting and Central Bank Independence</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 5772. Flexible inflation targeting cannot be rationalised using conventional welfare economic criteria, except in a single, practically uninteresting special case. New-Keynesian DSGE models imply that optimal monetary policy implements the Bailey-Friedman Optimal Quantity of Money rule and that actual inflation fully validates or accommodates core inflation. Flexible inflation targeting is also inconsistent with the mandates of leading inflation targeters like the Bank of England and the ECB. These mandates are lexicographic in price stability and therefore does not permit a trade-off between inflation volatility and output gap volatility in the monetary policy maker's objective function. Operational independence of the central bank is limited by the central bank's intertemporal budget constraint. Price stability, or an externally imposed inflation target, may not be independently financeable by the central bank. In that case, active budgetary support from the Treasury is necessary to make the inflation target financeable. Independent monetary policy is fully compatible with coordinated and cooperative monetary and fiscal policy. Central bank operational independence precludes substantive accountability; it is compatible only with a weak form of formal accountability: reporting obligations. Central bank independence will only survive if it is viewed as legitimate by the polity and its citizens. A necessary condition for this is that the central bank restricts its activities and public discourse to its natural core mandate: price stability and the capacity and willingness to act as lender of last resort. The Protocol on the Statute of the ESCB and the ECB has given the ECB a mandate that goes beyond this natural core mandate. Such behaviour represents a threat to its continued independence.
2006	J00	Oreopoulos, Philip, Till von Wachter, and Andrew Heisz. 2006. <i>The Short- and Long-Term Career Effects of Graduating in a Recession: Hysteresis and Heterogeneity in the Market for College Graduates</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 12159. The standard neo-classical model of wage setting predicts short-term effects of temporary labor market shocks on careers and low costs of recessions for both more and less advantaged workers. In contrast, a vast range of alternative career models based on frictions in the labor market suggests that labor market shocks can have persistent effects on the entire earnings profile. This paper analyzes the long-term effects of graduating in a recession on earnings, job mobility, and employer characteristics for a large sample of Canadian college graduates with different predicted earnings using matched

Year	DE	Title and Abstract
		university-employer-employee data from 1982 to 1999, and uses its results to assess the importance of alternative career models. We find that young graduates entering the labor market in a recession suffer significant initial earnings losses that eventually fade, but after 8 to 10 years. We also document substantial heterogeneity in the costs of recessions and important effects on job mobility and employer characteristics, but small effects on time worked. These adjustment patterns are neither consistent with a neo-classical spot market nor a complete scarring effect, but could be explained by a combination of time intensive search for better employers and long-term wage contracting. All results are robust to an extensive sensitivity analysis including controls for correlated business cycle shocks after labor market entry, endogenous timing of graduation, permanent cohort differences, and selective labor force participation.
2006	J22	Ham, John, and Kevin Reilly. 2006. <i>Using Micro Data to Estimate the Intertemporal Substitution Elasticity for Labor Supply in an Implicit Contract Model</i>. Institute of Economic Policy Research (IEPR), IEPR Working Papers: 06.54. Economists have devoted substantial resources to estimating the intertemporal substitution elasticity for labor supply because this elasticity plays a crucial role in the real business cycle literature. Generally, the estimates of the elasticity have been too low to explain business cycles. Economists have responded by trying to modify real business cycle models to allow for smaller elasticities, but they have experienced mixed success at best. However, the standard intertemporal substitution model has not done well when tested, and if this model is incorrect, so will be the estimated labor supply elasticities based upon it. An equilibrium alternative to the standard intertemporal labor supply model is the implicit contract model. In this latter model firms and workers bargain over state-contingent contracts denominated in terms of consumption and hours of work. Further, the price of leisure is the marginal product of labor or the shadow wage, which differs from the observed wage. A number of studies have found that the data are compatible with an implicit contract model; in particular in Ham and Reilly (2002) we found that we could reject a separable (within period) implicit contract model but not a non-separable one. If an implicit contract model is appropriate, this is the context in which we should try to estimate the intertemporal labor supply elasticity. However this estimation is potentially quite difficult with micro data since the shadow wage (marginal product of labor) is unobserved. In this paper we first develop a procedure that allows one to estimate the intertemporal substitution elasticity in an implicit contract model from micro data. We then implement this procedure using the Panel Study of Income Dynamics (PSID) and the Consumer Expenditure Survey (CES). We obtain statistically significant elasticities of 0.9 with the PSID and 1.0 with the CES. The consistency of the estimate across the data sets is impressive given that we use different estimation approaches (micro data versus synthetic cohorts) and different consumption measures (food consumption versus total nondurable consumption) in the two data sets. These results are three times larger than existing estimates based on the standard intertemporal supply elasticity from this data set and thus offer more hope that equilibrium perspectives on the labor market are capable of tracking the data. Given that the implicit contract model is less likely to be rejected than the standard model in our work and other research, we believe that our approach should prove to be quite useful.
2006	L11	Amirault, David, Carolyn Kwan, and Gordon Wilkinson. 2006. <i>Survey of Price-Setting Behaviour of Canadian Companies</i>. Bank of Canada, Working Papers. In many mainstream macroeconomic models, sticky prices play an important role in explaining the effects of monetary policy on the economy. Various theories have been set forth to explain why prices are sticky. This study takes a firm-level survey approach, in a spirit similar to Blinder et al. (1998), to shed some light on the question of why prices are sticky. In particular, the Bank of Canada's regional offices surveyed 170 Canadian firms for their views on price dynamics. The authors find that the most important motivators of price changes are price changes by competitors, changes in domestic input costs, and changes in demand. Surprisingly, but consistent with the results reported in Bils and Klenow (2002), the survey evidence suggests that more than 50 per cent of firms change their prices more than four times a year. Moreover, the survey indicates that prices change more frequently than they did ten years ago, because of more intense competition and advances in information technology.
2006	O24	Pahlavani, Mosayeb, Ed Wilson, and Abbas Valadkhani. 2006. "Structural Changes in the Iranian Economy: An Empirical Analysis with Endogenously Determined Breaks." <i>International Journal of Applied Business and Economic Research</i>, 4(1): 1-8. This paper employs annual time series data (1960-2003) and the ZA (Zivot and Andrews, 1992) and the LP (Lumsdaine and Papell, 1997) approaches to determine endogenously the more likely time of major structural breaks in various macroeconomic variables of the Iranian economy. We have considered the presence of one and two unknown structural breaks in the data. The results obtained from these two approaches are consistent in that the time of one structural break in eight out of the ten variables examined in the paper is the same. The resulting structural breaks coincide with important phenomena in the economy such as the 1974 oil shock, the 1979 Islamic revolution, the Iraqi war, or the implementation of the exchange rate unification policy in 1993 in the case of the official exchange rate.
2006	Z13	Salvadori, Neri, ed. 2006. <i>Economic Growth and Distribution: On the Nature and Causes of the Wealth of Nations</i>, Cheltenham, U.K. and Northampton, Mass.: Elgar. Sixteen papers, resulting from a conference held in Lucca in the summer of 2004, explore different approaches to the issues of economic growth and distribution and their theoretical, empirical, historical, and methodological implications. Papers discuss inequality and the process of development; the role of income distribution in long-run endogenous growth; the competition-of-capitals doctrine and the wage-profit relationship; a heterodox growth and distribution model; distribution and growth in a post-Keynesian stock-flow consistent model; technological progress, income distribution, and capacity utilization; demand-led growth and the classical approach to value and distribution--whether they are compatible; macroeconomic volatility and income inequality in a stochastically growing economy; the saving-investment nexus in the debate on pension reforms; income distribution and output change--a macro multiplier approach; a dynamic applied general equilibrium model from a classical-Keynesian-Schumpeterian approach; heterodox business cycles; technological innovation, financial fragility, and complex dynamics; growth, history, and institutions; religious culture, institutions, and growth; and trade, poverty, and growth--two perspectives, one message.
2007		
2007	C23	Cimadomo, Jacopo. 2007. <i>Fiscal Policy in Real Time</i>. CEPR research center, Working Papers. In this paper we argue that any assessment on the intentional stance of fiscal policy should be based upon all the information available to policymakers at the time of fiscal planning. In particular, real-time data on the discretionary fiscal policy "instrument", the structural primary balance, should be used in the estimation of fiscal policy reaction functions. In fact, the ex-post realization of discretionary fiscal measures may end up to be drastically different from what intentionally planned by fiscal authorities in the budget law. If this is the case, and if revision errors in the policy indicator are correlated with the ones in the regressors, it is shown that commonly used estimators become biased possibly inducing a misleading judgement on the policy stance. We derive the functional form of that bias and, based on empirical second-order moments, we are able to accurately predict the potential impact of using revised data in the evaluation of the ex-ante stance of fiscal policy. When fiscal policy rules are estimated on real-time data, our results indicate a counter-cyclical stance in OECD countries, especially during economic expansions. This contrasts with conventional findings based on revised data, which point to fiscal policy acyclicity or pro-cyclicity, and with Forni and Momigliano (2005) who

Year	DE	Title and Abstract
		employ real-time data for the output gap and find countercyclicality, but just in recessions. Further, we test whether threshold effects might be at play in the reaction of fiscal policy to the economic cycle and to debt accumulation. It emerges that the intentional cyclical behavior of fiscal policy is characterized by two regimes, and that the switch between them is likely to occur when output is close to its equilibrium level. On the other hand, the use of revised data does not allow to identify any threshold effect.
2007	C68 N72 Q33 Q43	Dissou, Yazid. 2007. <i>Energy Prices and Real Economic Activity in Canada: A Multi-Sector Dynamic General Equilibrium Analysis</i> . University of Ottawa, Department of Economics, Working Papers: 0707E. As a net exporter of oil, the recent upward trend in the world prices of energy products represents both an opportunity and a challenge for Canada. This study investigates the aggregate and sectoral effects of a sustained increase in these prices on the Canadian economy using a multi-sector forward-looking dynamic general equilibrium model. Counterfactual simulation results suggest that these price shocks would be beneficial to the Canadian economy on an aggregate basis, as real GDP would increase during most periods and households would increase their consumption profile during all periods and would thereby improve their well being. Nevertheless, the price increases would also shift resources toward export booming sectors and would lead to an appreciation of the real exchange rate that would not be beneficial to traditional manufacturing export industries.
2007	D52	Donaldson, John, and Rajnish Mehra. 2007. <i>Risk Based Explanations of the Equity Premium</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 13220. This essay reviews the family of models that seek to provide aggregate risk based explanations for the empirically observed equity premium. Theories based on non-expected utility preference structures, limited financial market participation, model uncertainty and the small probability of enormous losses are detailed. We impose the additional requirements that candidate models yield consistent inter temporal portfolio choice and that a representative agent can be constructed which is independent of the underlying heterogeneous economy's initial wealth distribution. While many models are able to replicate a wide variety of financial statistics including the premium, few satisfy these latter criteria as well.
2007	G22 G28	Caballero, Ricardo J., and Arvind Krishnamurthy. 2007. <i>Collective Risk Management in a Flight to Quality Episode</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 12896. We present a model of optimal intervention in a flight to quality episode. The reason for intervention stems from a collective bias in agents' expectations. Agents in the model make risk management decisions with incomplete knowledge. They understand their own shocks, but are uncertain of how correlated their shocks are with systemwide shocks, treating the latter uncertainty as Knightian. We show that when aggregate liquidity is low, an increase in uncertainty leads agents to a series of protective actions--decreasing risk exposures, hoarding liquidity, locking-up capital--that reflect a flight to quality. However, the conservative actions of agents leave the aggregate economy over-exposed to negative shocks. Each agent covers himself against his own worst-case scenario, but the scenario that the collective of agents are guarding against is impossible. A lender of last resort, even if less knowledgeable than private agents about individual shocks, does not suffer from this collective bias and finds that pledging intervention in extreme events is valuable. The intervention unlocks private capital markets.
2007	J63	Pissarides, Christopher A. 2007. <i>The Unemployment Volatility Puzzle: Is Wage Stickiness the Answer?</i> . Centre for Economic Performance, LSE, CEP Discussion Papers. I study the cyclical behavior of an equilibrium search model with endogenous job creation and destruction, with focus on the model's failure to match the observed cyclical volatility of unemployment. Job creation in the model is influenced by wages in new matches. I summarize microeconomic evidence on wages in new matches and show that the key model elasticities are consistent with the evidence. Therefore explanations of the unemployment volatility puzzle have to preserve the cyclical volatility of wages. I discuss some extensions of the model that can increase cyclical unemployment volatility through mechanisms other than wage stickiness.

2008	C41	Hoeberichts, Marco, Maarten van Rooij, and Arjen Siegmans. 2008. <i>Market Thinness, List Price Revisions and Time to Sell: Evidence from a large-scale housing dataset</i> . Netherlands Central Bank, Research Department, DNB Working Papers. This paper uses a large dataset, covering more than 70% of the Dutch housing market, to analyze the relationship between market thinness, price setting behavior and time to sell. Our findings confirm the typical result that overpricing increases the time on market. In addition, we find evidence of quicker list price reductions suggesting that overpricing is part of a strategy to search for the opportunity of high revenues and to learn about the market. Moreover, we are able to confirm the theory put forward by Lazear (1986) on the relation between atypical goods and the speed of price adjustments. Sellers of atypical houses are more uncertain about the price buyers want to pay and take time to learn about the market, thereby increasing the expected time on market and the time to price revisions. Market liquidity has a positive, i.e. shortening, effect on the time to sale and leads to quicker price revisions due to the increased opportunities for learning.
2008	H80	Badinger, Harald. 2008. <i>Cyclical Fiscal Policy, Output Volatility, and Economic Growth</i> . CESifo GmbH, CESifo Working Paper Series: CESifo Working Paper No. 2268. This paper provides a comprehensive empirical assessment of the relation between the cyclicity of fiscal policy, output volatility, and economic growth, using a large cross-section of 88 countries over the period 1960 to 2004. Identification of the effects of (endogenous) cyclical fiscal policy is achieved by exploiting the exogeneity of countries' political and institutional characteristics, which we find to be relevant determinants of fiscal cyclicity. There are three main results: First, both pro- and countercyclical fiscal policy amplify output volatility, much in a way like pure fiscal shocks that are unrelated to the cycle. Second, output volatility, due to variations in cyclical and discretionary fiscal policy, is negatively associated with economic growth. Third, there is no direct effect of cyclicity of economic growth other than through output volatility. These findings advocate the introduction of fiscal rules that limit the use of (discretionary and) cyclical fiscal policy to improve growth performance by reducing volatility.
2008	J11 Q56	Di Tella, Rafael, and Robert MacCulloch. 2008. "Gross National Happiness as an Answer to the Easterlin Paradox?" <i>Journal of Development Economics</i> , 86(1): 22-42. The Easterlin Paradox refers to the fact that happiness data are typically stationary in spite of considerable increases in income. This amounts to a rejection of the hypothesis that current income is the only argument in the utility function. We find that the happiness responses of around 350,000 people living in the OECD between 1975 and 1997 are positively correlated with the level of income, the welfare state and (weakly) with life expectancy; they are negatively correlated

Year	DE	Title and Abstract
		with the average number of hours worked, environmental degradation (measured by SOx emissions), crime, openness to trade, inflation and unemployment; all controlling for country and year dummies. These effects separate across groups in a pattern that appears broadly plausible (e.g., the rich suffer environmental degradation more than the poor). Based on actual changes from 1975 to 1997, small contributions to happiness can be attributed to the increase in income in our sample. Interestingly, the actual changes in several of the 'omitted variables' such as life expectancy, hours worked, inflation and unemployment also contribute to happiness over this time period since life expectancy has risen and the others have, on average, fallen. Consequently the unexplained trend in happiness is even bigger than would be predicted if income was the only argument in the utility function. In other words, introducing omitted variables worsens the income-without-happiness paradox.
2008	O16	Snieska, Vytautas, Daiva Laskiene, and Irena Pekarskiene. 2008. "Stock Returns and the Macroeconomic Environment: The Case of the Vilnius Stock Exchange." <i>Transformations in Business and Economics</i>, 7(2): 115-29. This paper investigates the relationship between domestic macroeconomic variables and surplus returns of stocks in Lithuanian stock market. How macroeconomic factors influence dynamics of stock index, were studied by using correlation-regressive analysis method. Dependence between share rates and macroeconomic indexes is analyzed globally both by academics and practitioners. When investigating this dependence, up to now the biggest securities markets--USA, Great Britain, Japan, and Italy and so on, received the greatest attention. In growing stock markets, like the Lithuanian one, such researches are insufficient. Lack of research determines that it is not only important to estimate existing relation between separate macroeconomic indexes and stock prices in definite period, but also the stability of the relation relatively to time and changing economic indicators. The aim of this article is to determine and to evaluate the relation between Lithuanian enterprises' stock rates and economic indicators, and herewith to develop already existing researches about securities prices dependence on macroeconomic factors. The research findings disclosed, that during the considered period most of Lithuania's macroeconomic factors were correlating with shares' prices fairly strong, and it is possible to forecast the direction of these effects.
2008	O51	Turner, Laure, and Herve Boulhol. 2008. <i>Recent Trends and Structural Breaks in US and EU15 Labour Productivity Growth</i>. OECD Economics Department, OECD Economics Department Working Papers: 628. This paper examines shifts in labour productivity growth in the United States and in Europe between 1970 and 2007 based on econometric tests of structural breaks. Additionally, it makes use of time-series-based projected labour productivity growth up to 2009 in order to detect any recent break according to a central scenario as well as high and low scenarios, both derived from a 95% confidence interval. The identification of structural breaks in US labour productivity growth is far from obvious. A statistically significant break date is found in the late 1990s only if the upper scenario materialises in the future, which means that despite a clear pick-up in productivity growth in the second half of the 1990s, the size of the hump is not still large enough compared with past variation to make this change a statistically significant break. However, a significant breakpoint is detected in the mid-1990s for the difference in labour productivity growth between the United States and the EU15 based on observed data, which seems to be due to both the initial catch-up of Europe and the halt of the convergence process in the mid-1990s. Finally, European ICT-intensive countries are shown to have structurally performed better in terms of productivity growth than non-ICT-intensive countries.

2009	C01 C93 D19 H31	Spears, Dean. 2009. <i>Bounded Rationality as Deliberation Costs: Theory and Evidence from a Pricing Field Experiment in India</i>. Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 195spears.pdf. How might bounded rationality shape decisions to spend? A field experiment verifies a theory of bounded rationality as deliberation costs that can explain findings from previous experiments on pricing in developing countries. The model predicts that (1) eliminating deliberation costs will increase purchasing at a higher price without impacting behavior at a lower price, (2) bounded rationality has certain greater effects on poorer people, and (3) deliberation costs can suppress screening by prices. Each prediction is confirmed by an experiment that sold soap in rural Indian villages. The experiment interacted assignment to different subsidized prices with a treatment that eliminated marginal deliberation costs. The results suggest implications of bounded rationality for theory and social policy.

2009	C31	Longford, Nicholas. 2009. <i>A house price index defined in the potential outcomes framework</i>. Department of Economics and Business, Universitat Pompeu Fabra, Economics Working Papers. Current methods for constructing house price indices are based on comparisons of sale prices of residential properties sold two or more times and on regression of the sale prices on the attributes of the properties and of their locations. The two methods have well recognised deficiencies, selection bias and model assumptions, respectively. We introduce a new method based on propensity score matching. The average house prices for two periods are compared by selecting pairs of properties, one sold in each period, that are as similar on a set of available attributes (covariates) as is feasible to arrange. The uncertainty associated with such matching is addressed by multiple imputation, framing the problem as involving missing values. The method is applied to a register of transactions of residential properties in New Zealand and compared with the established alternatives.

2009	E27 R20 R21	Baker, Dean. 2009. <i>The Housing Crash Recession and the Case for a Third Stimulus</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This paper makes the case for a third stimulus package to in the face of economic indicators signaling that the economy is in a deeper downturn than was expected based on previous projections. Specifically, the report calls for an employer tax-credit for extending health care coverage and another per worker employer tax credit for increasing paid time off from work. The author also makes the case for a housing policy centered on the stabilization of prices in non-bubble and deflated markets rather than applying the same efforts on markets that remain at bubble inflated levels. Finally, the paper argues that the dollar must be allowed to fall in order to adjust trade imbalances that are compounding the U.S. economic crisis caused by the collapse of the housing market.

2009	E64 J38	Baker, Dean, and John Schmitt. 2009. <i>The \$1 Trillion Wage Deficit</i> . Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. The strong rise in the U.S. stock market since the spring and the return to positive economic growth in the third quarter of this year have created a consensus among economists that the Great Recession is very likely over. Unfortunately, the end of the official recession will have little visible impact on U.S. labor markets until almost 2012. Within that time, this paper estimates that U.S. workers will have lost over \$1 trillion in wages and salaries, \$150 billion more than the 10-year costs of proposed health care reform legislation.
2009	F33 F35 O20	Weisbrot, Mark. 2009. <i>CEPR Responds to the IMF's Reply and Defense of Its Policies During the World Recession</i> . Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This paper is part of a discussion between CEPR and the International Monetary Fund (IMF) regarding CEPR's paper, "IMF-Supported Macroeconomic Policies and the World Recession: A Look at Forty-One Borrowing Countries." An IMF representative presented a response to that paper at an October 15, 2009 event in Washington D.C., in remarks and a power point presentation. The earlier CEPR paper examined IMF agreements with 41 countries during the current global recession and found that 31 of the 41 countries had implemented pro-cyclical policies--for example cutting spending or tightening monetary policy--that would be expected to exacerbate an economic downturn. This new discussion paper responds to the IMF's defense of its policies.

Variations in leverage cause fluctuations in asset prices. This leverage cycle can be damaging to the economy, and should be regulated.
2009	G01	Jagannathan, Ravi, Mudit Kapoor, and Ernst Schaumburg. 2009. <i>Why are we in a recession? The Financial Crisis is the Symptom not the Disease!</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 15404. Globalization has brought a sharp increase in the developed world's labor supply. Labor in developing countries--countries with vast pools of underemployed people--can now more easily augment labor in the developed world, without having to relocate, in ways not thought possible only a few decades ago. We argue that the large increase in the developed world's labor supply, triggered by geo-political events and technological innovations, is the major underlying cause of the global macro economic imbalances that led to the great recession. The inability of existing institutions in the US and the rest of the world to cope with this shock set the stage for the great recession: The inability of emerging economies to absorb savings through domestic investment and consumption due to inadequate national financial markets and difficulties in enforcing financial contracts; the currency controls motivated by immediate national objectives; and the inability of the US economy to adjust to the perverse incentives caused by huge money inflows leading to a breakdown of checks and balances at various financial institutions. The financial crisis in the US was but the first acute symptom that had to be treated. A sustainable recovery will only occur when the natural flow of capital from developed to developing nations is restored.
2009	G01	Mian, Atif R., and Amir Sufi. 2009. <i>House Prices, Home Equity-Based Borrowing, and the U.S. Household Leverage Crisis</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 15283. Using individual-level data on homeowner debt and defaults from 1997 to 2008, we show that borrowing against the increase in home equity by existing homeowners is responsible for a significant fraction of both the sharp rise in U.S. household leverage from 2002 to 2006 and the increase in defaults from 2006 to 2008. Employing land topology-based housing supply elasticity as an instrument for house price growth, we estimate that the average homeowner extracts 25 to 30 cents for every dollar increase in home equity. Money extracted from increased home equity is not used to purchase new real estate or pay down high credit card balances, which suggests that borrowed funds may be used for real outlays (i.e., consumption or home improvement). Home equity-based borrowing is stronger for younger households, households with low credit scores, and households with high initial credit card utilization rates. Homeowners in high house price appreciation areas experience a relative decline in default rates from 2002 to 2006 as they borrow heavily against their home equity, but experience very high default rates from 2006 to 2008. Our estimates suggest that home equity-based borrowing is equal to 2.8% of GDP every year from 2002 to 2006, and accounts for at least 34% of new defaults from 2006 to 2008.

2009	H31	Goldberg, Pinelopi, and Rebecca Hellerstein. 2009. <i>How Rigid Are Producer Prices?</i> . Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 193goldberg.pdf. How rigid are producer prices? Conventional wisdom is that producer prices are more rigid than and so play less of an allocative role than do consumer prices. In the 1987-2008 micro data collected by the U.S. Bureau of Labor Statistics for the PPI, we find that producer prices for finished goods and services in fact exhibit roughly the same rigidity as do consumer prices that include sales, and substantially less rigidity than do consumer prices that exclude sales. Large firms change prices two to three times more frequently than do small firms, and by smaller amounts, particularly for price decreases. Longer price durations are associated with larger price changes, though there is considerable heterogeneity in this relationship. Long-term contracts are associated with somewhat greater price rigidity for goods and services, though the differences are not dramatic. The size of price decreases plays a key role in inflation dynamics, while the size of price increases does not. The frequencies of price increases and decreases tend to move together, and so cancel one another out.

2009	N00	Landon-Lane, John, Hugh Rockoff, and Richard H. Steckel. 2009. <i>Droughts, Floods and Financial Distress in the United States</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 15596. The relationships among the weather, agricultural markets, and financial markets have long been of interest to economic historians, but relatively little empirical work has been done. We push this literature forward by using modern drought indexes, which are available in detail over a wide area and for long periods of time to perform a battery of tests on the relationship between these indexes and sensitive indicators of financial stress. The drought indexes were devised by climate historians from instrument records and tree rings, and because they are unfamiliar to most economic historians and economists, we briefly describe the methodology. The financial literature in the area can be traced to William Stanley Jevons, who connected his sun spot theory to rainfall patterns. The Dust bowl of the 1930s

Year	DE	Title and Abstract
		brought the climate-finance link to the attention of the general public. Here we assemble new evidence to test various hypotheses involving the impact of extreme swings in moisture on financial stress.
2009	N90	Gaffney, Mason. 2009. <i>Review of Philip Anderson, 2008, The Secret Life of Real Estate</i> . University of California at Riverside, Department of Economics, Working Papers: 200905. Anderson establishes the reality of an 18-year cycle in real estate prices, 1800 to date, emphasizing the land element, mainly urban land and subsoil resources. He relates this to privatization, which he calls "enclosure", although he does not trace the history back to the 16th Century enclosure movement in England, nor recommend undoing privatization. He supports his thesis with a wealth of data, surveying a wide literature of secondary sources. He finds the same sequence of leading and lagging indicators in each cycle. Other dips are trivial relative to those based on the real estate cycle, and he faults other economists for failing to notice this. The work is flawed in some particulars, but on the whole persuasive.

2010	C46	Hannsgen, Greg. 2010. <i>Infinite-variance, Alpha-stable Shocks in Monetary SVAR</i> . Levy Economics Institute, The, Economics Working Paper Archive. The process of constructing impulse-response functions (IRFs) and forecast-error variance decompositions (FEVDs) for a structural vector autoregression (SVAR) usually involves a factorization of an estimate of the error-term variance-covariance matrix V. Examining residuals from a monetary VAR, this paper finds evidence suggesting that all of the variances in V are infinite. Specifically, this study estimates alpha-stable distributions for the reduced-form error terms. The ML estimates of the residuals' characteristic exponents "alpha" range from 1.5504 to 1.7734, with the Gaussian case lying outside 95 percent asymptotic confidence intervals for all six equations of the VAR. Variance-stabilized P-P plots show that the estimated distributions fit the residuals well. Results for subsamples are varied, while GARCH(1,1) filtering yields standardized shocks that are also all likely to be non-Gaussian alpha stable. When one or more error terms have infinite variance, V cannot be factored. Moreover, by Proposition 1, the reduced-form DGP cannot be transformed, using the required nonsingular matrix, into an appropriate system of structural equations with orthogonal, or even finite-variance, shocks. This result holds with arbitrary sets of identifying restrictions, including even the null set. Hence, with one or more infinite-variance error terms, structural interpretation of the reduced-form VAR within the standard SVAR model is impossible.
2010	E02	Christiano, Lawrence J., Mathias Trabandt, and Karl Walentin. 2010. <i>Involuntary Unemployment and the Business Cycle</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 15801. We propose a monetary model in which the unemployed satisfy the official US definition of unemployment: they are people without jobs who are (i) currently making concrete efforts to find work and (ii) willing and able to work. In addition, our model has the property that people searching for jobs are better off if they find a job than if they do not (i.e., unemployment is 'involuntary'). We integrate our model of involuntary unemployment into the simple New Keynesian framework with no capital and use the resulting model to discuss the concept of the 'non-accelerating inflation rate of unemployment'. We then integrate the model into a medium sized DSGE model with capital and show that the resulting model does as well as existing models at accounting for the response of standard macroeconomic variables to monetary policy shocks and two technology shocks. In addition, the model does well at accounting for the response of the labor force and unemployment rate to the three shocks.
2010	F00	Bacchetta, Philippe, Cedric Tille, and Eric van Wincoop. 2010. <i>Self-Fulfilling Risk Panics</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 7920. Recent crises have seen very large spikes in asset price risk without dramatic shifts in fundamentals. We propose an explanation for these risk panics based on self-fulfilling shifts in risk made possible by a negative link between the current asset price and risk about the future asset price. This link implies that risk about tomorrow's asset price depends on uncertainty about risk tomorrow. This dynamic mapping of risk into itself gives rise to the possibility of multiple equilibria and self-fulfilling shifts in risk. We show that this can generate risk panics. The impact of the panic is larger when the shift from a low to a high risk equilibrium takes place in an environment of weak fundamentals. The sharp increase in risk leads to a large drop in the asset price, decreased leverage and reduced market liquidity. We show that the model can account well for the developments during the recent financial crisis.
2010	G18 G38	Shachmurove, Yochanan. 2010. <i>The Next Financial Crisis</i> . Penn Institute for Economic Research, Department of Economics, University of Pennsylvania, PIER Working Paper Archive. The examination of U.S. crises reveals that the current financial crisis follows past patterns. An investment bubble creates excess demand for new financing instruments. During the railroad bubbles of the nineteenth century loans were issued at a pace higher than many companies could pay back. The current housing bubble originated from issuing sub-prime mortgages that assume that housing prices would only rise. The increased demand for credit induces financial innovations and instruments that circumvent existing regulations. Inevitably, the bubble bursts. The history of financial crises teaches that policy reforms and new regulations cannot prevent future financial crises.
2010	J31	Avouyi-Dovi, Sanvi, Denis Fougere, and Erwan Gautier. 2010. <i>Wage Rigidity, Collective Bargaining and the Minimum Wage: Evidence from French Agreement Data</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 7932. Using several unique data sets on wage agreements at both the firm- and the industry-levels in France, we examine the impact of typical European wage-setting institutions on the form and the degree of wage rigidity. We highlight different stylized facts concerning wage stickiness. First, in France, the typical duration of a wage agreement is one year. Consequently, a Taylor (1980) -type model appears to

Year	DE	Title and Abstract
		reproduce appropriately the distribution of agreement durations. Some 30 percent of settlements stipulate several predetermined wage changes during the year following the date of signature of the agreement. The frequency of wage agreements is highly seasonal, but the dates at which agreements take effect are more staggered. The date at which the national minimum wage level is revised each year has a significant impact on the timetable of wage agreements, both at the firm- and at the industry-levels. Wage increases negotiated at these two levels mainly depend on the inflation regime, the firm profitability and the proportion of minimum-wage workers in the same industry.
2010	J31	Dhyne, Emmanuel, and Martine Druant. 2010. <i>Wages, labor or prices: how do firms react to shocks?</i>. European Central Bank Working Paper Series: 1224. Survey results in 15 European countries for almost 15,000 firms reveal that Belgian firms react more than the average European firm to adverse shocks by reducing permanent and temporary employment. On the basis of a firm-level analysis, this paper confirms that the different reaction to shocks is significant and investigates what factors explain this difference. Although the explanatory value of the variables is limited, most of the explanatory power of the model being associated with the dummy variables coding for firm size, sector and country, the variables investigated provide valuable information. The importance of wage bargaining above the firm level, the automatic system of index-linking wages to past inflation, the limited use of flexible pay, the high share of low-skilled blue-collar workers, the labor intensive production process as well as the less stringent legislation with respect to the protection against dismissal are at the basis of the stronger employment reaction of Belgian firms. On the contrary, employment is safeguarded by the presence of many small firms and a wage cushion.
2010	M10 M50	Alexopoulos, Michelle, and Trevor Tombe. 2010. <i>Management Matters</i>. University of Toronto, Department of Economics, Working Papers. New indications of managerial innovations are created and then used to show that changes in organizational technologies are an important source of economic growth. Specifically, the analysis demonstrates that, first, in response to a positive managerial technology shock, output, productivity and hours significantly increase in the short run, second, these types of innovations are as important as non-managerial ones in explaining movements in these variables at business cycle frequencies, and, third, product and process innovations promote the development of new managerial techniques.
2010	N15	Chow, Gregory. 2010. <i>Will China Have Serious Inflation?</i>. Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 205chow.pdf There has been much concern about inflation in China recently. The People's Bank in the last few months has raised the reserve requirement several times to control the money supply to slow down inflation. In 1985 when I was organizing a summer workshop on macroeconomics in cooperation with the Ministry of Education, Premier Zhao Ziyang asked me to forecast inflation in 1985-1986 because in 1984 the supply of money in the form of currency in circulation increased by 50 percent. I estimated an equation using data from 1952 to 1984 to explain inflation and used the equation to project forward to forecast an inflation rate for 1985 of no more than 9 percent which turned out to be correct. This equation was published in Chow (1987, equation 18) and updated using data up to 2004 in Chow (2007, pp. 34-5).
2010	P45	Shelburne, Robert. 2010. <i>The Global Financial Crisis and Its Impact on Trade: The World and the European Emerging Economies</i>. UNECE, ECE Discussion Papers Series: 2010_2. This paper describes how the global financial crisis of 2007-2010 impacted trade both globally and more specifically for the European emerging economies, which in terms of GDP decline, were the most negatively impacted economies in the world. Just as with GDP, the trade of the European emerging economies was more severely impacted by the crisis than the trade for other regions of the world; exports for over one half of these economies declined by more than 50 per cent between the third quarter of 2008 and the first quarter of 2009. Despite these large declines, the geographical and sectoral distribution of their trade remained relatively stable. Most of these economies adjusted to the shock with a currency depreciation of about 20 per cent. The current account deficits of many of these economies which were quite large prior to the crisis were reduced significantly. Although there were some increases in protectionist measures and they did have a beggarthy-neighbor component, in many cases these measures reflected macroeconomic policy failures, especially regarding the coordination of fiscal stimulus programs, and may have been welfare improving second best policies. The crisis is unlikely to result in major design changes in the world trading system, although the opposite is true for the world financial system.

2011	B14 B15	Wray, L. Randall. 2011. <i>"The Financial Crisis Viewed from the Perspective of the "Social Costs" Theory"</i>. Levy Economics Institute, The Economics Working Paper Archive. This paper examines the causes and consequences of the current global financial crisis. It largely relies on the work of Hyman Minsky, although analyses by John Kenneth Galbraith and Thorstein Veblen of the causes of the 1930s collapse are used to show similarities between the two crises. K.W. Kapp's "social costs" theory is contrasted with the recently dominant "efficient markets" hypothesis to provide the context for analyzing the functioning of financial institutions. The paper argues that, rather than operating "efficiently," the financial sector has been imposing huge costs on the economy-costs that no one can deny in the aftermath of the economy's collapse. While orthodox approaches lead to the conclusion that money and finance should not matter much, the alternative tradition-from Veblen and Keynes to Galbraith and Minsky-provides the basis for developing an approach that puts money and finance front and center. Including the theory of social costs also generates policy recommendations more appropriate to an economy in which finance matters.
2011	D03	Deaton, Angus, and Olivier Dupriez. 2011. <i>Spatial price differences within large countries</i>. Princeton University, Woodrow Wilson School of Public and International Affairs, Research Program in Development Studies., Working Papers: 1321. National and international statistical systems are strangely reticent on differences in price levels within countries. Nations as diverse as India and the United States publish inflation rates for different areas, but provide nothing that allows comparisons of price levels across places at a moment of time. The International Comparison Project, which at each round collects prices and calculates price indexes for most of the countries of the world, publishes nothing on within country differences, and in some important cases including China, Brazil, and India, rural prices are either not collected or are underrepresented, which potentially distorts the comparison between large and small countries, Deaton and Heston (2010). Yet spatial price indexes are required if we are to compare real incomes across areas, and both national and global poverty estimates require intra-as well as inter-national price indexes. There are also good grounds for suspecting that price levels differ across regions. Several large Indian states are larger than most countries, and consumption patterns are sharply different across the subcontinent. And for the same reasons that we expect price levels to be lower in poorer countries the Balassa-Samuelsson theorem we would expect prices to be lower in poorer areas within countries, at least if people are not completely mobile across space.
2011	D81	Cukierman, Alex, and Yehuda Izhakian. 2011. <i>Bailout Uncertainty in a Microfounded General Equilibrium Model of the Financial System</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 8453. This paper develops a micro-founded general equilibrium model of the financial system composed of ultimate borrowers, ultimate lenders and financial intermediaries. The model is used to investigate the impact of uncertainty about the likelihood of governmental bailouts on leverage, interest rates, the volume of defaults and the real economy. The distinction between risk and uncertainty is implemented by applying the Gilboa-

Year	DE	Title and Abstract
		Schmeidler maxmin with multiple priors framework to lenders' beliefs about the probability of bailout. Events like Lehman's collapse are conceived of as 'black swan' events that led lenders to put a positive mass on bailout probabilities that were previously assigned zero mass. Results of the analysis include: (i) An unanticipated increase in bailout uncertainty raises interest rates, the volume of defaults in both the real and financial sectors and may lead to a total drying up of credit markets. (ii) Lower ex ante bailout uncertainty is conducive to higher leverage--which raises moral hazard and makes the economy more vulnerable to ex post increases in bailout uncertainty. (iii) Bailout uncertainty raises the likelihood of bubbles, the amplitude of booms and busts as well as the banking and the credit spreads. (iv) Bailout uncertainty is associated with higher returns' variability in diversified portfolios and systemic risks. (v) Expansionary monetary policy reinforces those effects by inducing higher aggregate leverage levels.
2011	J21 J33 J62 J80	Schmitt, John. 2011. <i>Labor Market Policy in the Great Recession: Some Lessons from Denmark and Germany</i> . Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This paper reviews the recent labor-market performance of 21 rich countries, with a focus on Denmark and Germany. Denmark, which was widely seen as one of the world's most successful labor markets before the downturn, has struggled in recent years. Germany, however, has outperformed the rest of the world's rich countries since 2007, despite earlier labor-market difficulties. Labor-market institutions seem to explain the different developments in the two economies. Danish institutions--which include extensive opportunities for education, training, and placement of unemployed workers--appear to perform well when the economy is at or near full employment, but have not been effective during the downturn. German labor-market institutions, which emphasize job security by keeping workers connected to their current employers, may have drawbacks when the economy is operating at or near full employment, but have performed well in the Great Recession. The paper also discusses lessons for U.S. labor-market policy.
2011	J61	Schmitt, John, and Kris Warner. 2011. <i>Deconstructing Structural Unemployment</i> . Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. Some economic observers argue "structural unemployment" has increased in the wake of the Great Recession, but in this paper we find little support for either of two arguments that suggest that structural unemployment has been on the rise. The first argument focuses on the large increase in unemployment among construction workers. The second argument is that falling house prices have reduced the mobility of unemployed workers--creating a "housing lock" in which unemployed workers, who would otherwise relocate to regions with jobs, are stuck in high unemployment areas.

2011	K20	Kowalski, Tadeusz, and Yochanan Shachmurove. 2011. <i>An Historical Walk Through Recent Financial Crises</i> . Penn Institute for Economic Research, Department of Economics, University of Pennsylvania, PIER Working Paper Archive. This paper analyzes the causes and implications of recent financial crises. Financial crises in general lead to changes in both theory and practice of economics. The paper takes an historical overview. The global consensus of economic theory during the 20th century is discussed. The paper describes the Bretton Woods regime after World War II, details the era of adaptive expectations and motivates the emerging of the rational expectations school of thoughts. Various perspectives on the causes of the financial crisis are incorporated. The paper provides some policy suggestions and remarks on the consequences of ever-changing capital markets.
2011	O13	Foldvari, Peter, Bas van Leeuwen, and Jan Luiten van Zanden. 2011. <i>Long-run patterns in market efficiency and the genesis of the market economy: Markets around the Mediterranean from Nebuchadnezzar to Napoleon (580 BC and 1800AD)</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 8521. Price volatility, reflecting the ability to absorb exogenous supply-or demand shocks, is an important dimension of market performance. In this paper we present a model to study the factors determining the price volatility of markets of basic foodstuffs in pre industrial societies. This model is used to explain the development of price volatility on markets in countries around the Mediterranean between 580 BC and 1800 AD. This is the region for which we have the oldest evidence of functioning markets (from Mesopotamia), so that we can track their development in time over a period of more than 2000 years. We find a break in market performance: medieval markets had a much lower level of volatility than ancient markets--a fact we try to explain within our model. Moreover, we suggest that this reduction in price volatility may have had important consequences for the economic behavior of farmers: price variability had to be reduced to the level that we find for the post-1000 period to induce farmers to specialize.
2011	R00 R51	Bayer, Patrick, Christopher Geissler, and James W. Roberts. 2011. <i>Speculators and Middlemen: The Role of Flippers in the Housing Market</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 16784. In thinly traded markets for heterogenous, durable goods, such as housing, intermediaries may play especially important roles. Using a unique micro-level dataset of housing transactions in Los Angeles from 1988-2008 and a novel research design, we identify and measure the importance of two very distinct types of intermediaries, also known as "flippers". The first type act as middlemen who quickly match sellers and buyers, operate throughout housing market cycles and earn above average returns when they buy and sell. The second type act as speculators who attempt to time markets by holding assets for longer periods of time, perform relatively poorly when buying and selling and are strongly associated with price instability in their targeted areas. The presence of these unsophisticated speculators and positive feedback trading contribute the first pieces of evidence from the housing market to a growing body of work in other financial markets that questions whether speculators always act to stabilize prices.
2011	R33	Barr, Jason, Bruce Mizrach, and Kusum Mundra. 2011. <i>Skyscraper Height and the Business Cycle: International Time Series Evidence</i> . Department of Economics, Rutgers University, Newark, Working Papers Rutgers University, Newark. This paper is the first to rigorously test how height and output co-move. Because builders can use their buildings for non-rational or non-pecuniary gains, it is widely believed that (a) the most severe forms of height competition occur near the business cycle peaks and (b) that extreme height are examples of developers "gone wild." We find virtually no support for either of these popularly held claims. First we look at both the announcement and completion dates for record breaking buildings and find there is very little correlation with the business cycle. Second, cointegration and Granger causality tests show that height and output are cointegrated and that height does not Granger cause output. These results are robust for the United States, Canada, China and Hong Kong.

Financial frictions lead to persistence and when combined with illiquidity to non-linear

Year	DE	Title and Abstract
		amplification effects. Risk is endogenous and liquidity spirals cause financial instability. Increasing margins further restrict leverage and exacerbate downturns. A demand for liquid assets and a role for money emerges. The market outcome is generically not even constrained efficient and the issuance of government debt can lead to a Pareto improvement. While financial institutions can mitigate frictions, they introduce additional fragility and through their erratic money creation harm price stability.
2012	F44	Yao, Wen. 2012. <i>International Business Cycles and Financial Frictions</i>. Bank of Canada, Working Papers. This paper builds a two-country DSGE model to study the quantitative impact of financial frictions on business cycle co-movements when investors have foreign asset exposure. The investor in each country holds capital in both countries and faces a leverage constraint on her debt. I show quantitatively that financial frictions along with foreign asset exposure give rise to a multiplier effect that amplifies the transmission of shocks between countries. The key mechanism is that a negative shock in the home country reduces the wealth of investors in both countries, which tightens their leverage constraints, leading to a fall in investment, consumption, and hours worked in the foreign country. Compared to the existing literature, which tends to produce either negative or positive but small cross-country correlations, this model produces positive and sizable correlations that are consistent with the data. The model can account for most of the investment, employment and consumption correlations and predicts more than half of the output correlation. In addition, the model shows that, consistent with empirical findings, when investors have more foreign asset exposure to the other country, the output correlation between the two countries increases.
2012	H62	Baker, Dean. 2012. <i>Attacking the Treasury View, Again</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This paper considers the case for and against 'the treasury view'--the idea that in a downturn, government spending has no effect on economic activity or unemployment. The report covers three areas: the evidence for expansionary fiscal contraction--the idea that somehow cutting budget deficits will lead to an increase in growth, even in the middle of a downturn; the logic of expansionary contraction; and finally, a more sustainable path for the economy that is not designed to generate inequality in the same way that the pre-crisis economy was.
2012	I21 N37	Park, Hyunjoon, Jere Behrman, and Jaesung Choi. 2012. <i>Do Single-Sex Schools Enhance Students' STEM (Science, Technology, Engineering, and Mathematics) Outcomes?</i>. Penn Institute for Economic Research, Department of Economics, University of Pennsylvania, PIER Working Paper Archive. Despite women's significant improvement in educational attainment, underrepresentation of women in Science, Technology, Engineering, and Mathematics (STEM) college majors persists in most countries. We address whether one particular institution--single-sex schools--may enhance female--or male--students' STEM careers. Exploiting the unique setting in Korea where assignment to all-girls, all-boys or coeducational high schools is random, we move beyond associations to assess causal effects of single-sex schools. We use administrative data on national college entrance mathematics examination scores and a longitudinal survey of high school seniors that provide various STEM outcomes (mathematics and science interest and self-efficacy, expectations of a four-year college attendance and a STEM college major during the high school senior year, and actual attendance at a four-year college and choice of a STEM major two years after high school). We find significantly positive effects of all-boys schools consistently across different STEM outcomes, whereas the positive effect of all-girls schools is only found for mathematics scores.
2012	I21 N37	Hyder, Asma, Jere Behrman, and Hans-Peter Kohler. 2012. <i>Negative Economic Shocks and Child Schooling: Evidence from Rural Malawi</i>. Penn Institute for Economic Research, Department of Economics, University of Pennsylvania, PIER Working Paper Archive. This study investigates the impacts of negative economic shocks on child schooling in households of rural Malawi, one of the poorest countries in Sub-Saharan Africa (SSA). Two waves of household panel data for years 2006 and 2008 from the Malawi Longitudinal Study of Families and Health (MLSFH) are used to examine the impact of negative shocks on child schooling. Both individually-reported and community-level shocks are investigated. A priori the impact of negative shocks on schooling may be negative (if income effects dominate) or positive (if price effects dominate). Also the effects may be larger for measures of idiosyncratic shocks (if there is considerable within-community variation in experiencing shocks) or for aggregate shocks (if community support networks buffer better idiosyncratic than aggregate shocks). Finally there may be gender differences in the relevance for child schooling of shocks reported by men versus those reported by women with, for example, the former having larger effects if resource constraints have strong effects on schooling and if because of gender roles men perceive better than women shocks that affect household resources. The study finds that negative economic shocks have significant negative impacts on child school enrollment and grade attainment, with the estimated effects of the community shocks larger and more pervasive than the estimated effects of idiosyncratic shocks and with the estimated effects of shocks reported by men as large or larger than the estimated effects of shocks reported by women.
2012	Q02	Erten, Bilge. 2012. <i>Super-cycles of commodity prices since the mid-nineteenth century</i>. United Nations, Department of Economics and Social Affairs, Working Papers. Decomposition of real commodity prices suggests four super-cycles during 1865-2009 ranging between 30-40 years with amplitudes 20-40 percent higher or lower than the long-run trend. Non-oil price super-cycles follow world GDP, indicating they are essentially demand-determined; causality runs in the opposite direction for oil prices. The mean of each super-cycle of non-oil commodities is generally lower than for the previous cycle, supporting the Prebisch-Singer hypothesis. Tropical agriculture experienced the strongest and steepest long-term downward trend through the twentieth century, followed by non-tropical agriculture and metals, while real oil prices experienced a long-term upward trend, interrupted temporarily during the twentieth century.
2012	R23 R28 R38	Geanakoplos, John, Robert Axtell, Dooyne J. Farmer, Peter Howitt, Benjamin Conlee, Jonathan Goldstein, Matthew Hendrey, Nathan M. Palmer, and Chun-Yi Yang. 2012. <i>Getting at Systemic Risk via an Agent-Based Model of the Housing Market</i>. Cowles Foundation for Research in Economics, Yale University, Cowles Foundation Discussion Papers: 1852. Systemic risk must include the housing market, though economists have not generally focused on it. We begin construction of an agent-based model of the housing market with individual data from Washington, DC. Twenty years of success with agent-based models of mortgage prepayments give us hope that such a model could be useful. Preliminary analysis suggests that the housing boom and bust of 1997-2007 was due in large part to changes in leverage rather than interest rates.

2013	C33 N17	Romain, Houssa, Jan Mohimont, and Chris Otrok. 2013. <i>Credit Shocks and Macroeconomic Fluctuations in Emerging Markets</i>. CESifo Group Munich, CESifo Working Paper Series: 4281. In this paper, we examine the role of global and domestic credit supply shocks in macroeconomic fluctuations for Emerging Markets. For this purpose, we impose a set of zero and sign restrictions within a medium-scale Bayesian Vector Auto-Regression model. Quarterly data from South Africa and G-7 countries in 1985-2010 show that credit supply shocks impact significantly on macroeconomic aggregates in these economies. However, credit supply shocks have played, on average, a less important role than credit demand shocks. Moreover, shocks originating from G7-

Year	DE	Title and Abstract
		countries are the main drivers of real activity in South Africa, although they played a marginal role in the 1996-1999 South African recession.
2013	C63	Lan, Hong, and Alexander Meyer-Gohde. 2013. <i>Pruning in Perturbation DSGE Models—Guidance from Nonlinear Moving Average Approximations</i> . Sonderforschungsbereich 649, Humboldt University, Berlin, Germany, SFB 649 Discussion Papers: SFB649DP2013-024. We derive recursive representations of nonlinear moving average (NLMA) perturbations of DSGE models. As the stability of higher order NLMA representations follows directly from stability at first order, these recursive representations provide rigorous support for the practice of pruning that is becoming widespread. Our recursive representation differs from pruned perturbations in that it centers the approximation and its coefficients at the approximation of the stochastic steady state consistent with the order of approximation. We compare our algorithm with six different pruning algorithms at second and third order, documenting the differences between these six algorithms and standard (non pruned) state space perturbations at first, second, and third order in a unified notation compatible with the popular software package Dynare. While our third order algorithm is the most accurate, the gains over two alternate algorithms are modest, suggesting that this choice is unlikely to be a potential source of error.
2013	F15	Burstein, Ariel, and Gita Gopinath. 2013. <i>International Prices and Exchange Rates</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 18829. We survey the recent empirical and theoretical developments in the literature on the relation between prices and exchange rates. After updating some of the major findings in the empirical literature we present a simple framework to interpret this evidence. We review theoretical models that generate insensitivity of prices to exchange rate changes through variable markups, both under flexible prices and nominal rigidities, first in partial equilibrium and then in general equilibrium.
2013	F39	Aron, Janine, Kenneth Creamer, John Muellbauer, and Neil Rankin. 2013. <i>Exchange Rate Pass-Through to Consumer Prices in South Africa: Evidence from Micro-Data</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 9735. A sizeable literature examines exchange rate pass-through to disaggregated import prices but very few micro-studies focus on consumer prices. This paper explores exchange rate pass-through to consumer prices in South Africa during 2002-2007, using a unique data set of highly disaggregated data at the product and outlet level. The paper adopts an empirical approach that allows pass-through to be calculated over various horizons, including controls for domestic and foreign costs. It studies how pass-through differs across types of consumption goods and services and draws some aggregate implications about pass-through, using actual weights from the CPI basket. The heterogeneity of pass-through for different food sub-components and the role of switches between import and export parity pricing of maize is investigated and found significant for five out of ten food sub-components. Overall pass-through to the almost 63 percent of the CPI covered is estimated at about 30 percent after two years, but is higher for food.
2013	I12 I18	Ruhm, Christopher J. 2013. <i>Recessions, Healthy No More?</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 19287. Using data from multiple sources, over the 1976-2009 period, I show that total mortality has shifted over time from strongly procyclical to being essentially unrelated to macroeconomic conditions. The relationship also shows some instability over time and is likely to be poorly measured when using short (less than 15 or 20 year) analysis periods. The secular change in the association between macroeconomic conditions and overall mortality primarily reflects trends in effects for specific causes of death, rather than changes in the composition of total mortality across causes. Deaths due to cardiovascular disease and transport accidents continue to be procyclical (although possibly less so than in the past), whereas strong countercyclical patterns of cancer fatalities and some external sources of death (particularly those due to accidental poisoning) have emerged over time. The changing effect of macroeconomic conditions on cancer deaths may partially reflect the increasing protective influence of financial resources, perhaps because these can be used to obtain sophisticated (and expensive) treatments that have become available in recent years. That observed for accidental poisoning probably has occurred because declines in mental health during economic downturns are increasingly associated with the use of prescribed or illicitly obtained medications that carry risks of fatal overdoses.
2013	L93	Lucier, John L., and William J. Page III. 2013. "Scheduled Passenger Air Transportation in the Producer Price Index: Improvements and Trends." <i>Monthly Labor Review</i> , 136(7): . In response to airlines' increasingly complex and variable airfare pricing regimes in recent decades, the Bureau of Labor Statistics moved from an individual fare code approach to tracking prices to an average-pricing approach; as a result, the Producer Price Index for scheduled passenger air transportation is better able to capture true airline pricing behavior.
2013	M30	Anderson, Eric, Emi Nakamura, Duncan Simester, and Jon Steinsson. 2013. <i>Informational Rigidities and the Stickiness of Temporary Sales</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 19350. Frequent price changes do not imply a rapid response of prices to economic shocks if the price changes are based on old information. We study the extent of such information "stickiness" for temporary sales. Institutionally, we describe how and why temporary sales are "sticky plans" that are updated infrequently, despite the occurrence of frequent price changes. We then study the empirical characteristics of sales and regular price changes using a unique dataset from a large retailer, containing direct measures of both regular prices and sales, in addition to wholesale prices. The timing and magnitude of regular price changes respond strongly to wholesale price changes and to aggregate economic shocks, while temporary sales are unresponsive. Finally, we show that sales account for the majority of the observed cross-sectional heterogeneity in the frequency of price changes, as well as the downward sloping hazard of retail price changes.
2013	N17	THE SAME AS C33 Romain, Houssa, Jolan Mohimont, and Chris Otrok. 2013. <i>Credit Shocks and Macroeconomic Fluctuations in Emerging Markets</i> . CESifo Group Munich, CESifo Working Paper Series: 4281
2013	O53	Cosgel, Metin M., Bogac A. Ergene, and Atabey Kaygun. 2013. <i>A temporal analysis of wealth in eighteenth-century Ottoman Kastamonu</i> . University of Connecticut, Department of Economics, Working papers: 2013-03. This article studies temporal variations in wealth levels and distribution in an Ottoman context during the eighteenth century. By analysing the probate estate inventories of the Muslim deceased in Kastamonu, located in north-central Anatolia, we demonstrate that real wealth levels generally declined over the course of the century. Our analysis also suggests that the economic conditions of poor men, if not women, deteriorated more so than those of the rich, fuelling growing inequality. The article explores the factors that contributed to these trends and discusses the relevance of our findings for long-term economic development patterns in the region from a comparative perspective.
2013	O53	Cosgel, Metin M., and Bogac A. Ergene. 2013. "Law and Economics" <i>Literature and Ottoman Legal Studies</i> . University of Connecticut, Department of Economics, Working papers: 2013-02. This article considers the relevance of hypotheses developed in the "law and economics" literature regarding settlement/trial decisions in the Ottoman Empire. In particular, it explores the applicability of the "selection principle" and "50 percent plaintiff win-rate" formulated by George Priest and Benjamin Klein. The article also demonstrates how existing research based on Ottoman court records can contribute to the "law and economics"

Year	DE	Title and Abstract
		scholarship, which is dominated by research based on modern, Western contexts. The article utilizes the court records from eighteenth-century Kastamonu to make observations about settlement/litigation decisions in an Ottoman context.
2013	O53	Cosgel, Metin M., and Bogac A. Ergene. 2013. <i>The Selection Bias in Court Records: Settlement and Trial in Eighteenth Century Kastamonu</i> . University of Connecticut, Department of Economics, Working papers: 2013-12. Court records are used extensively in historical research. Preserved as summaries of daily legal proceedings, they give historians a unique opportunity of access to the information about the names, personal characteristics, and socio-economic status of individuals and about the laws, local customs, and legal institutions that were used in resolving disputes. Although researchers have thoroughly discussed the limitations of these records in accurately reflecting court proceedings, the problem of selection bias has not been systematically studied. Since litigants would likely settle disputes in which one side is likely to be a clear winner, the cases that go to trial would likely be the difficult and uncertain ones for which there is greater disagreement, altogether comprising a non-random and unrepresentative subset of all disputes. We study the selection bias in Ottoman courts in the town of Kastamonu in northern Anatolia, from the late seventeenth and the eighteenth centuries. We separate disputes by type and study the distribution of court participants according to size, gender, and religious and socioeconomic status. We run regression analysis to determine the factors affecting the likelihood of cases being tried in court. Our results indicate that the cases that wound up in court were selected systematically. If the selection bias is ignored, research based on Ottoman court records may be seriously flawed in its ability to yield general conclusions.
2013	O57 Q54	Cavallo, Alberto, Eduardo Cavallo, and Roberto Rigobon. 2013. <i>Prices and Supply Disruptions during Natural Disasters</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 19474. We study the daily behavior of supermarket prices and product availability following two recent natural disasters: the 2010 earthquake in Chile and the 2011 earthquake in Japan. In both cases there was an immediate and persistent effect on product availability. The number of goods available for sale fell 32% in Chile and 17% in Japan from the day of the disaster to its lowest point, which occurred 61 and 18 days after the earthquakes, respectively. Product availability recovered slowly, and a significant share of goods remained out of stock after six months. By contrast, prices were stable for months, even for goods that were experiencing severe shortages. These trends are present at all levels of aggregation, but there is heterogeneity across categories. We further look at the frequency and magnitudes of price changes in both countries and find that the results in Chile are consistent with pricing models where retailers have fear of "customer anger". In Japan the evidence suggests a bigger role for supply disruptions that restricted the ability of retailers to re-stock goods after the earthquake.
2013	Q30	Jacks, David S. 2013. <i>From Boom to Bust: A Typology of Real Commodity Prices in the Long Run</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 18874. This paper considers the evidence on real commodity prices over 160 years for 30 commodities representing 7.89 trillion USD worth of production in 2011. In so doing, it suggests and documents a complete typology of real commodity prices, comprising long-run trends, medium-run cycles, and short-run boom/bust episodes. The findings of the paper can be summarized as follows: real commodity prices of both energy and non-energy commodities have been on the rise from 1950 across all weighting schemes; there is a consistent pattern, in both past and present, of commodity price super-cycles which entail decades-long positive deviations from these long-run trends with the latest set of super-cycles likely at their peak; these commodity price super-cycles are punctuated by booms and busts which are historically pervasive and becoming more exacerbated over time. These last elements of boom and bust are also found to be particularly bearing in determining real commodity price volatility as well as potentially bearing in influencing growth in commodity exporting economies.

2006	B20	CV: Friedman, Milton. 2006. "From Galbraith to Economic Freedom: Part I: The Conventional Wisdom of J. K. Galbraith." In <i>The Road to Economic Freedom. Volume 2.</i> , ed. Philip Booth and John Meadowcroft, 345-81. An Elgar Reference Collection. Cheltenham, U.K. and Northampton, Mass.: Elgar in association with the Institute of Economic Affairs.
2006	C58 G17	Boucher, Christophe. 2006. "Stock Prices, Inflation and Stock Returns Predictability." <i>Finance</i> , 27(2): 71-101. This paper considers a new perspective on the relationship between stock prices and inflation, by estimating the common long-term trend in real stock prices, as reflected in the earning-price ratio, and both expected and realized inflation. We study the role of the transitory deviations from the common trend in the earning-price ratio and realized inflation for predicting stock market fluctuations. In particular, we find that these deviations exhibit substantial out-of-sample forecasting abilities for real stock returns. Moreover, we find that this variable provides information about future stock returns at short and intermediate horizons that is not captured by other popular forecasting variables.

2006	C92	Deck, Cary A., Kevin A. McCabe, and David P. Porter. 2006. "Why Stable Fiat Money Hyperinflates: Results from an Experimental Economy." <i>Journal of Economic Behavior and Organization</i>, 61(3): 471-86. Experiments are used to study acceptance of a fiat money as a medium of exchange. In these finite horizon markets, people trade valuable goods for intrinsically worthless money. However, when a public sector capable of printing money is introduced, the private sector is crowded out, producing dramatic hyperinflations and collapses in trading. This economic failure is found to be a consequence of the public sector undermining the market's ability to coordinate trade. The inefficiency associated with the hyperinflation is found not to be a purely monetary phenomenon resulting from an increasing money supply.

2006	D02	Diss: Hameed, Farhan. 2006. Two Essays on Institutional Transparency and One on Inflation Expectations. PhD diss. Johns Hopkins University.
2006	D13	Cysne, Rubens Penha. 2006. "An Intra-household Approach to the Welfare Costs of Inflation." <i>Estudos Economicos</i>, 36(3): 593-609. The literature on the welfare costs of inflation universally assumes that the many-person household can be treated as a single economic agent. This paper explores what the heterogeneity of the agents in a household might imply for such welfare analyses. First, we show that allowing for a one-person or for a many-person transacting technology impacts the money demand function and, therefore, the welfare costs of inflation. Second, more importantly, we derive sufficient conditions under which welfare assessments which depart directly from the knowledge of the money demand function (as in Lucas, 2000) are robust (invariant) under the number of persons considered in the household. Third, we show that Bailey's (1956) partial-equilibrium measure of the welfare costs of inflation can be obtained as a first-order approximation of the general-equilibrium welfare measure derived in this paper using a many-person transacting technology.
2006	D44	Diss: Galenianos, Manolis. 2006. Essays on Frictional Markets. PhD diss. University of Pennsylvania. Chapter 1: Directed Search with Multiple Job Applications (joint with Philipp Kircher)--Job Market Paper. We develop an equilibrium directed search model of the labor market where workers can simultaneously apply for multiple jobs. The main result is that all equilibria exhibit wage dispersion despite the fact that workers and firms are homogeneous. Wage dispersion is driven by the simultaneity of application choice. Risk-neutral workers apply for both 'safe' and 'risky' jobs. The former yield a high probability of a job offer, but for low pay, and act as a fallback option; the latter provides higher potential payoff, but are harder to get. Furthermore, the density of posted wages is decreasing, consistent with stylized facts. Unlike most directed search models, the equilibria are not constrained efficient. Chapter 2: Dispersion of Money Holdings and Efficiency (joint with Philipp Kircher)--preliminary and incomplete. We consider a monetary economy with multilateral meetings between buyers and sellers. Every seller has a single indivisible good and all buyers have the same valuation for the good, though they may hold different amounts of money. The number of buyers that visit a particular seller is random due to lack of coordination. The good is allocated using a second price auction. We show that in equilibrium ex ante identical buyers choose different money holdings: carrying more money increases the probability of winning the auction, but it is costly because of discounting and inflation. The unique equilibrium distribution of money holdings is explicitly characterized and it is shown to be non-degenerate and continuous, while its shape depends on the inflation rate. When inflation is high, buyers hold lower real balances on average which results in lower expected profits for sellers. Efficient entry of sellers occurs only when the inflation rate approaches the Friedman rule, rendering holding money costless. In that case the distribution of money collapses to a mass point. Chapter 3: Hiring Through Referrals--in progress. I propose a model of endogenous network formation among workers to provide an explanation as to why firms use referrals in order to hire. Workers have high or low productivity, which is imperfectly observed by firms. Before entering the labor market, workers observe each other's abilities and form costly bilateral links. When hiring, a firm can ask one of its current employees to refer a friend (link), in addition to posting a vacancy. High ability workers are more likely to be employed and hence they are more desirable as friends; therefore they only link with each other. This leaves low ability workers no choice but to link among themselves, which they do because they are employed with positive (though lower) probability. Therefore, in equilibrium the network is completely segregated across ability which means that a firm with a vacancy has an incentive to hire a referred applicant if it believes that the current employee has high ability. In this way, the informal network alleviates the informational problems of firms and the market frictions that workers face.
2006	F50	CV: Walter, Andrew. 2006. "Domestic Sources of International Monetary Leadership." In <i>International Monetary Power</i> , ed. David M. Andrews, 51-71. Cornell Studies in Money. Ithaca and London: Cornell University Press.
2006	F50	CV: Henning, C. Randall. 2006. "The Exchange-Rate Weapon and Macroeconomic Conflict." In <i>International Monetary Power</i> , ed. David M. Andrews, 117-38. Cornell Studies in Money. Ithaca and London: Cornell University Press.
2006	F51	Foster, Dennis M. 2006. "State Power, Linkage Mechanisms, and Diversion against Nonrivals." <i>Conflict Management and Peace Science</i>, 23(1): 1-21. Mitchell and Prins (2004) have recently found that diversion from high levels of inflation is observed only among enduring rivals. However, neither this nor any other cross-national test of the relevance of opportunity to diversion has included a potentially important determinant of diversionary capacity: major power status. I contend that since militarily powerful states have both more extensive sets of international commitments and much greater physical capacities to divert against broader sets of opponents, they are less likely to limit their diversionary behavior to enduring rivals. Cross-national time series analyses of the association between inflation and militarized interstate dispute (MID) initiation for the period 1960-1999 reveal several differences between the diversionary activity of major powers and that of all other states. Models that account for the interaction between inflation and rivalry reveal that while nonmajor powers seemingly divert only against enduring rivals, major powers are marginally less likely to do so against rivals than they are against nonrivals. However, more detailed analyses indicate that these latter findings are being driven by the American case: While the United States is more likely to initiate MIDs against nonrivals than rivals at the highest levels of inflation, other major powers are more likely to initiate MIDs against rivals than nonrivals at all points. Moreover, the United States is, on average, more likely than all other states to initiate MIDs at all levels of inflation. At minimum, these findings imply that the United States is unique among major powers both in its capacity to divert from inflation and in its propensity to link diversion from inflation against nonrivals to its most important rivalries.
2006	G00	Camera, Gabriele, ed. 2006. <i>Recent Developments on Money and Finance: Exploring Links between Market Frictions, Financial Systems and Monetary Allocations</i>, Studies in Economic Theory, vol. 24. Berlin and New York: Springer. Twelve papers, most previously published as a special issue of the journal <i>Economic Theory</i> , assemble current theoretical work on monetary theory, banking, and finance. Papers discuss deposit insurance and bank regulation in a monetary economy; a monetary mechanism for sharing capital; domestic financial market frictions, unrestricted international capital flows, and crises in small open economies; inflation, growth, and exchange rate regimes in small open economies; aggregate risk sharing and equivalent financial mechanisms in an endowment economy of incomplete participation; asset pricing implications of efficient risk sharing in an endowment economy; distributional aspects of the divisibility of money; the distribution of money and prices in an equilibrium with lotteries; money, price dispersion, and welfare; a simple search model of money with heterogeneous agents and partial acceptability;

		decentralized credit and monetary exchange without public record keeping; and limited participation, private money, and credit in a spatial model of money.
2006	G17	THE SAME AS C58 Boucher, Christophe. 2006. "Stock Prices, Inflation and Stock Returns Predictability." <i>Finance</i>, 27(2): 71-101.
2006	H53	Ferreira, Francisco H. G., Phillippe G. Leite, Julie A. Litchfield, and Gabriel Ulyseia. 2006. "Ascensao e queda da desigualdade de renda no Brasil. (The Rise and Fall of Brazilian Inequality: A Summary of the Last 25 Years. With English summary.)" <i>Economica (Fluminense Federal University)</i>, 8(1): 147-71. Measured by the Gini coefficient, income inequality in Brazil rose from 0.57 in 1981 to 0.63 in 1989, before falling back to 0.56 in 2004. Using standard decomposition techniques, this paper presents a preliminary investigation of the determinants of Brazil's distributional reversal in the 1981-2004 period. The rise in inequality in the 1980s appears to have been driven by increases in the educational attainment of the population in a context of highly convex returns, and by high and accelerating inflation. While the secular decline in inequality, which began in 1993, is associated with declining inflation, it also appears to have been driven by three structural and policy changes which have so far not attracted sufficient attention in the literature, namely: sharp declines in the returns to education; pronounced rural-urban convergence; and increases in social assistance transfers targeted to the poor.
2006	H75	Taylor, Lori L. 2006. "Comparable Wages, Inflation, and School Finance Equity." <i>Education Finance and Policy</i>, 1(3): 349-71. A Comparable Wage Index (CWI) is an attractive mechanism for measuring geographic variations in the cost of education. A CWI measures uncontrollable variations in educator pay by observing systematic variations in the earnings of comparable workers who are not educators. Together, the 2000 census and the Occupational Employment Statistics survey support the construction of just such an index. The resulting panel of index values measures wage levels in all parts of the United States from 1997 through 2004 and reveals substantial variation in purchasing power both across school districts and across time. Such inequalities undermine the equity and adequacy goals of school finance formulas. If states were successfully directing additional resources to school districts in high-cost environments, then measured inequality within states should fall when differences in purchasing power are taken into account. Instead, cost adjustment widens the spending gap in all but a handful of states.
2006	J58	Lye, Jenny N., and Ian M. McDonald. 2006. "Union Power and Australia's Inflation Barrier, 1965:4 to 2003:3." <i>Australian Journal of Labour Economics</i>, 9(3): 287-304. This paper considers the view that trade union power played a major role in the deterioration of macroeconomic performance in Australia in the 1970s and that the subsequent decrease in trade union power has improved Australia's macroeconomic possibilities. Using the model of a range of equilibria, it is shown that the evidence supports these views. Increases in trade union power and unemployment benefits, the latter increasing the reservation wage upon which bargained wages are based, shifted the inflation barrier to higher rates of unemployment in the 1970s. Subsequently, the decrease in trade union power has reversed this shift such that at the end of the period, in 2003:3, the inflation barrier is at a rate of unemployment of 3.1 per cent.
2006	L10 N83	Munro, John. 2006. <i>Entrepreneurship in Early-Modern Europe (1450 - 1750): An Exploration of Some Unfashionable Themes in Economic History</i>. University of Toronto, Department of Economics, Working Papers. Entrepreneurship, by its very essence, concerns the theory of the firm - the individual enterprise - which in turn is the essential core of micro-economics. A major theme of this study, however, is to demonstrate the interaction of micro- and macro-economic phenomena: to show how such firms or enterprises, and entrepreneurship itself, were often shaped by, and often helped shape, such macro-economic forces as demographic changes, monetary changes, price changes - in terms of both deflation and inflation - long distance trade, overseas exploration and expansion (colonialism), and indeed related changes in social institutions and socio-cultural values that were also influenced by such macro-economic changes. One generalization about macro-economic changes involving inflations and deflations has both general and considerable importance in the history of European business enterprises and entrepreneurship itself: for long-term inflations (when moderate) tend to cheapen or reduce the relative factor costs of labour, land (rent contracts), and capital (fixed interest rates in loan contracts). Similarly, long term deflations tend, in reverse fashion, to increase the real or relative factor costs of labour, land, and capital, especially with pronounced wage-stickiness, and related 'stickiness' in leasehold rent contracts (and more so with customary tenures), and with loan contracts--even if the long-term trends in real interest rates was falling over this long period. At the same time, both inflations and deflations are accompanied by changes in the relative prices of key industrial inputs. The key question to be posed is this: how did entrepreneurs respond to such changes in their factor costs, both short term and long term? This study commences by demonstrating how deflation in mid-15th century Europe, in increasing the purchasing power of silver, provided the stimulus for two major technological innovations in silver-mining and smelting that led to the South German silver-copper mining boom of 1460-1540, which also meant major changes in commercial-industrial entrepreneurship and in industrial scales. That mining boom in turn laid the foundations for the 130 year inflation of the Price Revolution (1520-1650) - an inflation further fostered by a financial revolution in credit and banking institutions (from the 1520s), and then further fuelled by the influx of Spanish-American silver.. The heart of this study is on the role of inflation, and associated macro-economic changes, in producing the roots of modern capitalist entrepreneurship, during what is often called Tawney's Century (1540-1640). We begin, however, with two famous related theses: Hamilton's thesis of 'Profit Inflation' (in which wages lag behind consumer prices), a wrongly-constructed thesis that endures only because Keynes endorsed it; and Nef's thesis of the 'Tudor Stuart industrial revolution' - a much ridiculed response to Hamilton - whose merit lies in revealing the capitalist entrepreneurship, major technological changes, and changes in industrial scale that resulted from the substitution of coal - the hear of modern industrialization - for every more costly wood charcoal. Tawney's three theses themselves concern the origins of modern agrarian capitalist, the related 'Rise of the Gentry' debate (on the role of inflation in shifting land ownership from the aristocracy to the capitalist gentry landowners), and the Weber-Tawney thesis on Religion (Protestantism) and the Rise of Capitalism, which, I endeavour to show has its real relevance only from the late 17th century. Associated with the Price Revolution era is the Age of Overseas Expansion (involving one of the most momentous technological and entrepreneurial change of the early modern era: the development of the Full Rigged Atlantic ship, with heavy artillery). England joined that overseas commercial-colonial race rather late, in the 1550s, but in doing developed the foundations of modern capitalism in creating the joint stock company. The study ends with the following era of monetary scarcity and deflation provided another macro-economic challenge whose response was revolutionary changes in banking and financial institutions - i.e., in financial-commercial entrepreneurship. It also fostered the growth and spread of rent-seeking Mercantilist philosophies that also influenced the character of early-modern capitalist entrepreneurship.
2006	L83	Hobijn, Bart, Federico Ravenna, and Andrea Tambalotti. 2006. "Menu Costs at Work: Restaurant Prices and the Introduction of the Euro." <i>Quarterly Journal of Economics</i>, 121(3): 1103-31. Restaurant prices in the euro area increased dramatically after the introduction of the euro. We show that this increase can be explained by a common menu cost model, extended to include a state-dependent decision of firms on when to adopt the new currency. Two mechanisms drive this result. First, firms concentrate otherwise staggered price increases around the changeover. Second, before the adoption of the euro, prices do not reflect the marginal cost increases expected to occur after the changeover. This "horizon effect" disappears as soon as the new currency is adopted, causing a jump in the optimal price.

Year	DE	Title and Abstract
2006	L83	Kohler-Togelhofer, Walpurga, Christa Magerl, and Peter Mooslechner. 2006. "Revised and New Competitiveness Indicators for Austria Reflect Improvement Trend since EMU Accession." <i>Monetary Policy and the Economy</i>, 0(0): 70-97. Maintaining and improving competitiveness is one key goal of economic policy. In the short run, it is primarily price and cost developments as well as exchange rate changes that have the biggest impact on the development of an economy's competitiveness. The competitiveness of Austrian manufacturing exporters has continued to augment since the country's entry into Economic and Monetary Union (EMU)—this has been confirmed by the 2006 revision of the price competitiveness indicator for Austria (deflated by the (Harmonised) Index of Consumer Prices--HICP/CPI) and even more so by the new cost competitiveness indicator (deflated by relative unit labor costs) launched in this context. The marked improvement of the cost competitiveness indicator in recent years reflects moderate wage policies coupled with comparatively solid productivity growth in the Austrian manufacturing sector. The lower gain measured by the price competitiveness indicator may be linked to the fact that the HICP/CPI was broadly driven by oil price developments in 2004 and 2005, which masked the favorable unit labor cost developments in the manufacturing industry. Contrary to the development in the manufacturing sector, the price competitiveness in Austria's travel and tourism sector has deteriorated somewhat: Even though price developments in Austria were more favorable than in the competition markets, they did not wholly offset losses in competitiveness related to exchange rate developments.
2006	L89	Zizmond, Egon, and Matjaz Novak. 2006. "Deregulacija cen in nove oblike inercijske inflacije v tranziciji--Primer dimnikarskih storitev v Sloveniji. (Deregulation of Prices and New Forms of Inflation Inertia in Transition--The Case of Chimney Sweep Services in Slovenia. With English summary.)" <i>Nase Gospodarstvo/Our Economy</i>, 52(1-2): 11-17. In Slovenia, prices in the non-tradable sector were largely regulated and this hindered the normal functioning of markets. In order to find new forms of inflation inertia which might emerge after price deregulation in transition, we developed a three-part model of monitoring prices: the analysis of production function indicates the technical efficiency in production, the analysis of the cost function evaluates whether the cost pressure is endogenous or exogenous, and the analysis of technical coefficients indicates whether investment in new technology has increased. This article presents the results of the empirical analysis of the effects of price deregulation in Slovenian chimney sweep services after the year 1996.
2006	L89	Ercolani, Marco G., and Jayasri Dutta. 2006. <i>The Euro-changeover and Euro-inflation: Evidence from Eurostat's HICP</i>. Department of Economics, University of Birmingham, Discussion Papers. Though anecdotal evidence suggests that retail price inflation increased temporarily in January 2002 when Euro notes and coins were introduced, the evidence from official statistics largely refutes this. We test for the presence of a sudden temporary increase in inflation for Euro-changeover countries. We use the countries that did not join the Euro: Denmark, Sweden and the UK; as a control group. Though the results are sensitive to the estimation method, we do uncover weak evidence of a minor increase in aggregate inflation in January 2002 for the countries that did join the Euro. Similar tests for the Restaurant sector find a strong Euro-changeover effect on temporary inflation. Summary tests for 129 other price sub-categories are also discussed.
2006	N53 N54	Dimitrios, Dadakas, and Varelas Erotokritos. 2006. "Evaluation of Agricultural Output Gap in Greece: 1858-1938." <i>Journal of Financial Management and Analysis</i>, 19(2): 97-109. The objective of this paper is to estimate the agricultural output gap for Greece during the period 1858-1938 using the univariate approach. To investigate the unit root hypothesis we use the Lumsdaine & Papell methodology. We show that models containing the agricultural output gap, as measured by the Hondrick-Prescott (HP) filter, have more explanatory power and statistically superior properties compared to models containing output gaps calculated using other methodologies.
2006	N83	THE SAME AS L10 Munro, John. 2006. <i>Entrepreneurship in Early-Modern Europe (1450 - 1750): An Exploration of Some Unfashionable Themes in Economic History</i>. University of Toronto, Department of Economics, Working Papers.
2006	P10	Booth, Philip, and John Meadowcroft, eds. 2006. <i>The Road to Economic Freedom. 2 vols., An Elgar Reference Collection</i>. Cheltenham, U.K. and Northampton, Mass.: Elgar In association with the Institute of Economic Affairs. Thirty-eight previously published papers explore the market economy. Papers focus on monetary policy and price stability; unemployment; the economics of government; government regulation and the size of government; the power of language and ideas; and socialism.
2006	P14	CV: Bae, Kee-Hong, Young Sup Yun, and Warren Bailey. 2006. "Determinants of Bond Holdings by Foreign Investors." In <i>Asian Bond Markets: Issues and Prospects</i>. Bank for International Settlements, 102-28. BIS Papers, no. 30. Basel: Bank for International Settlements.
2006	P20	Egert, Balazs, and Ronald MacDonald. 2006. <i>Transmission Mechanism in Transition Economies: Surveying the Surveyable</i>. CESifo GmbH, CESifo Working Paper Series: CESifo Working Paper No. 1739. This paper surveys recent advances in the monetary transmission mechanism (MTM). In particular, while laying out the functioning of the separate channels in the MTM, special attention is paid to exploring possible interrelations between different channels through which they may amplify or attenuate each others' impact on prices and the real economy. We take stock of the empirical findings especially as they relate to countries in Central and Eastern Europe, and compare them to results reported for industrialised countries, especially for the euro area. We highlight potential pitfalls in the literature and assess the relative importance and potential development of the different channels.
2006	P20	Coricelli, Fabrizio, Balazs Egert, and Ronald MacDonald. 2006. <i>Monetary Transmission Mechanism in Central & Eastern Europe: Gliding on a Wind of Change</i>. William Davidson Institute at the University of Michigan Stephen M. Ross Business School, William Davidson Institute Working Papers Series: wp850. This paper surveys recent advances in empirical studies of the monetary transmission mechanism (MTM), with special attention to Central and Eastern Europe. In particular, while laying out the functioning of the separate channels in the MTM, it explores possible interrelations between different channels and their impact on prices and the real economy. The empirical findings for Central and Eastern Europe are then briefly compared with results for industrialized countries, especially for the euro area. We highlight potential pitfalls in the literature and assess the relative importance, and potential development, of the different channels, emphasizing the relevant asymmetries between Central and Eastern European countries and the euro area.

2006	Z13	Massey, Douglas S., and Chiara Capoferro. 2006. "Salvase Quien Pueda: Structural Adjustment and Emigration from Lima." <i>Annals of the American Academy of Political and Social Science</i>, 606(0): 116-27. Beginning in 1987, Peru imposed a regime of structural adjustment to transform its economy along neoliberal lines. This analysis suggests that a shift resulted in the odds of international migration and the motivations for leaving among inhabitants of Peru's largest labor market. Before 1987, under the regime of import substitution industrialization, jobs at wages capable of sustaining a basic standard of living were widely available; those few who left the country self-selected for higher human capital and moved abroad to improve their earnings. Under neoliberalism, however,

Year	DE	Title and Abstract
		both employment and wages fell to levels that made it difficult for families to sustain themselves. In response, households--with the assistance of friends and relatives with foreign experience--diversified their labor portfolios away from the local job market structural adjustment zones. The number of migrants then rose, the diversity of foreign destinations increased, and migration became less selective with respect to human capital.

2007	C46	Nadarajah, Saralees, and Arjun K. Gupta. 2007. "A Compound Beta Distribution with Applications in Finance." <i>Statistical Methods and Applications</i>, 16(1): 69-83. If X and Y are gamma distributed independent random variables then it is well known that the ratio $X/(X + Y)$ has the beta distribution. In this note, the distribution of $W = X/(X + Y)$ is considered when X and Y have the compound gamma distribution. We refer to the distribution of W as compound beta and describe an application to consumer price indices to show that compound beta is a better model than one based on the standard beta distribution. We derive various properties of W, including its probability density function, cumulative distribution function, hazard rate function and moments.
2007	D20	Boivin, Jean, Marc Giannoni, and Ilian Mihov. 2007. <i>Sticky Prices and Monetary Policy: Evidence from Disaggregated U.S. Data</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 12824. This paper disentangles fluctuations in disaggregated prices due to macroeconomic and sectoral conditions using a factor-augmented vector autoregression estimated on a large data set. On the basis of this estimation, we establish eight facts: (1) Macroeconomic shocks explain only about 15% of sectoral inflation fluctuations; (2) The persistence of sectoral inflation is driven by macroeconomic factors; (3) While disaggregated prices respond quickly to sector-specific shocks, their responses to aggregate shocks are small on impact and larger thereafter; (4) Most prices respond with a significant delay to identified monetary policy shocks, and show little evidence of a "price puzzle," contrary to existing studies based on traditional VARs; (5) Categories in which consumer prices fall the most following a monetary policy shock tend to be those in which quantities consumed fall the least; (6) The observed dispersion in the reaction of producer prices is relatively well explained by the degree of market power; (7) Prices in sectors with volatile idiosyncratic shocks react rapidly to aggregate monetary policy shocks; (8) The sector-specific components of prices and quantities move in opposite directions.

2007	D86	Coenen, Gunter, Andrew T. Levin, and Kai Christoffel. 2007. "Identifying the Influences of Nominal and Real Rigidities in Aggregate Price-Setting Behavior." <i>Journal of Monetary Economics</i>, 54(8): 2439-66. We formulate a generalized price-setting framework that incorporates staggered contracts of multiple durations and that enables us to directly identify the influences of nominal vs. real rigidities. We estimate this framework using macroeconomic data for Germany (1975-1998) and for the U.S. (1983-2003). In each case, we find that the data are well-characterized by nominal contracts with an average duration of about two to three quarters. We also find that new contracts exhibit very low sensitivity to marginal cost, corresponding to a relatively high degree of real rigidity. Finally, our results indicate that backward-looking price-setting behavior (such as indexation to lagged inflation) is not needed in explaining the aggregate data, at least in an environment with a stable monetary policy regime and a transparent and credible inflation objective.
2007	H52 I20	Heylen, Freddy, and Lorenzo Pozzi. 2007. "Crises and Human Capital Accumulation." <i>Canadian Journal of Economics</i>, 40(4): 1261-85. This paper studies the effects of crises on human capital formation. Theoretically, a crisis undermines total factor productivity, which reduces the return to working and to accumulating physical capital. If the crisis is temporary, young agents will study now and work later. Human capital rises. To test our model we rely on inflation crises as our main empirical proxy. Using GMM panel procedures, our analysis for 86 countries in 1970-2000 confirms the positive effects of crises on human capital. Our main findings survive several robustness tests.
2007	H72	Canova, Fabio, and Evi Pappa. 2007. "Price Differentials in Monetary Unions: The Role of Fiscal Shocks." <i>Economic Journal</i>, 117(520): 713-37. We study the effect of regional expenditure and revenue shocks on price differentials for 47 US states and 9 EU countries. We identify shocks using sign restrictions on the dynamics of expenditures, revenues, deficits and output and construct two estimates for structural price differentials dynamics, one for the average and one for each unit, which optimally weight information contained in the data for all units. On average, expansionary fiscal disturbances produce positive, while distortionary balance budget shocks produce negative price differential responses. The negative price differential responses in some units is partially explained by spillovers and labour supply effects.

2007	J81	Munro, John. 2007. <i>The Usury Doctrine and Urban Public Finances in Late-Medieval Flanders: Annuities, Excise Taxes, and Income Transfers from the Poor to the Rich</i>. University of Toronto, Department of Economics, Working Papers. The objectives of this paper are three-fold. The first is to rebut Charles Kindleberger's famous dictum that usury 'belongs less to economic history than to the history of ideas'; and in particular to demonstrate that the resuscitation of the anti-usury campaign from the early 13th century led to a veritable financial revolution in late-medieval French and Flemish towns: one that became the 'norm' in modern European states from the 16th century (in England, from 1693): a shift in public borrowing from interest-bearing loans to the sale of annuities, usually called rentes or renten. That anti-usury campaign had two major features: (1) the decrees of the Fourth Lateran Council of 1215, which provided harsh punishments - excommunication--for both unrepentant usurers and princes who failed to suppress them; and (2) the establishment of the two mendicant preaching orders: the Franciscans (1210) and the Dominicans (1216), whose monks

Year	DE	Title and Abstract
		preached hellfire and eternal damnation against all presumed usurers - including, of course, anyone who received any interest on government loans. There is much evidence that from the 1220s, many financiers in many French and Flemish towns, fearing for their immortal souls, preferred to accept far lower returns on buying rentes than the interest they would have earned on loans. These rentes, based on 8th-century Carolingian census contracts, had two basic forms: (1) life-annuities, by which a citizen purchased from the government, with a lump sum of capital, an annual income stream lasting a lifetime, or the lifetime of his wife as well; (2) perpetual annuities, by which the annual income stream was indeed perpetual, or until such time as the government chose to redeem the rentes, at par. Initially, some theologians opposed sales of rentes as subterfuges to cloak evasion of the usury doctrine. But in 1250-1, Pope Innocent IV declared them to be non-usurious crafts, essentially because they were not loans. Subsequent popes in the 15th century confirmed his views and the non-usurious character of rentes, on two conditions: (1) that the buyer of the rente could never demand redemption or repayment, and (2) that the annual annuity payments (and any ultimate redemptions) be in accordance with actual rent contracts: i.e., that the funds be derived from the products of the land. Ecclesiastical authorities soon agreed that taxes on the consumption of the products of the land (and sea) met this test: i.e., taxes on beer and wine (which always accounted for the largest share), bread, textiles, fish, meat, dairy products, etc. The second objective of this paper is to measure the importance of renten in the civic finances of Flemish towns, in terms of both revenues and expenditures: from the annual town accounts Ghent (14th century only), and Aalst (1395-1550), where they had far greater importance. The related third objective is to measure the burden of the excise taxes for master building craftsmen in Aalst, in tables that measure the values of the excise tax revenues expressed in real terms: first, in the equivalent number of 'baskets of consumables' (which form of the base of the Consumer Price Index), and second their value in terms of the annual money-wage incomes of master masons (for 210 days). This provides an entirely new look at the late-medieval 'standard of living' controversy - with indications that this consumption-tax burden sometimes rose from about 13,200 to almost 30,000 days' wage income, for a town of perhaps 3600 inhabitants (but obviously less dramatic on a per capita basis). That tax burden rose the most strongly when, by other indications, real wages (RWI = NWI/CPI) were also finally rising; and thus possibly these real wage gains were largely eliminated. That per capita tax burden would have been all the greater if, in the course of the 15th century, Aalst had experienced the same decline as did small towns of Brabant, to the east, on the order of 25%, and some other Flemish towns, in which the population decline varied from 9% to 28%. In earlier publications I had challenged the widespread view that the era following the Black Death, with a radical change in the land:labour ratio, came to be a 'Golden Age' of the artisan and labourer. I contended instead that frequent inflations eroded or eliminated wage gains, and thus that periodic rises in real wages were due essentially to steep deflations combined with pronounced wage-stickiness. As I also calculated, English artisans in the 1340s had earned real wages that were about 50% of the Flemish; but by the 1480s, they had narrowed that gap (with much less inflation) to about 80%. That gap was probably even smaller, until the 1640s, when England's Parliament finally imposed similar excise taxes on consumption.
2007	L24	Rajagopal. 2007. "Trade Openness and Inflation in Latin American Countries." <i>Estudios Economicos de Desarrollo Internacional</i>, 7(1): 77-98. In the pre-reforms period, the trade policy in Latin America had involved very high levels of protection and government intervention. The recent trade liberalization policies of the Latin American countries have sought to reverse the protectionist policies and open the scope for foreign direct investment and joint ventures in the public and private sector industries. This paper discusses the impact of trade openness policy on tariff structure, export competitiveness, inflation, and economic growth of Latin American countries. The relationship between the trade openness and general price level as an indicator of inflation and robustness of this relationship has been explored in the study.

2007	M11	Tsoukis, Chris, and Naveed Naqvi. 2007. "Price Rigidities, Inventories, and Growth Fluctuations." <i>Managerial and Decision Economics</i>, 28(6): 619-31. We investigate the interactions of price rigidities and storability of goods, and their implications for inflation and growth. The model is an optimising, stochastic general equilibrium one, featuring endogenous growth, the possibility of (short run) excess demand and inflation derived from sluggish and staggered price setting (a version of the New Keynesian Phillips Curve). Analytical short-run dynamics are derived. A notable feature is the predicted short-run comovements between growth and inflation (negative) and between the inventory ratio and growth (positive). Increased price flexibility reduces the persistence of the system but its overall influence on variances is uncertain.
2007	M11	Basci, Erdem, Syed F. Mahmud, and Eray M. Yucel. 2007. "Money and Productive Efficiency: Evidence from a High-Inflation Country." <i>Emerging Markets Finance and Trade</i>, 43(1): 64-73. This paper examines how money balances held by manufacturing firms affect their efficiency in generating sales revenue in a high-inflation economy. The analysis employs data from Turkish firms to estimate a stochastic frontier model, finding a strong positive association between the firms' money holdings and their efficiency. However, the role of money balances seems to diminish as firms hold higher raw material inventories.
2007	N64	Druzic, Ivo. 2007. "Dynamics of the Croatian Economy." <i>Zagreb International Review of Economics and Business</i>, 10(2): 63-86. Croatia entered the industrialization process that initiated its accelerated growth as a 'latecomer,' being late by more than a century. By mostly using its resources for industrial development, Croatia succeeded in doing in 30-40 years after World War II, what it took developed countries 70-90 years to do. Controversial economic events in the pre-transition period, especially in light of the transition recession during the 1990s, have given rise to equally controversial professional discussion and adverse estimates concerning the (lack of) economic development success in this period. Therefore, the best effort would be to establish an analysis founded upon straightforward untempered empirical facts and their possible time frame stratifications. It is hoped that this will be a more objective path to unhindered insight into real growth mechanics.

2007	Q40	van den Noord, Paul, and Christophe Andre. 2007. <i>Why has Core Inflation Remained so Muted in the Face of the Oil Shock?</i>. OECD Economics Department, OECD Economics Department Working Papers: 551. To help policymakers form a judgment on inflation risks and the required monetary policy stance the OECD has developed an analytical framework based on a set of 'eclectic' Phillips curves estimated for the two largest OECD economies, the United States and the euro area, which is presented in this paper. This

Year	DE	Title and Abstract
		framework is used in the preparation of the Economic Outlook to explain recent developments in core inflation, excluding food and energy, based on developments in measures of economic slack (the output gap), spill-over effects from energy prices onto core inflation and lagged responses to past inflation via expectations formation. The fact that the knock-on effects from energy shocks onto core inflation appear small in comparison with the 1970s can be explained by the secular fall in energy intensity, a low and stable rate of 'mean inflation'--to which observed inflation reverts after a shock has worked its way through--and persistent slack in the aftermath of the bursting of the dotcom bubble.
2007	Q42	Reyes Guzman, Gerardo. 2007. "Incremento en los precios del maiz y la tortilla en Mexico. (With English summary)." <i>Problemas del Desarrollo</i> , 38(151): 103-26. George W. Bush proposed to reduce petroleum consumption 20% by 2017. Both ethanol and liquid coal have been considered for this. It is planned to increase the production of ethanol to 35 billion gallons a year and to raise efficiency levels in the use of gasoline. An annual 35 billion gallons of ethanol in 2017 is equivalent today to 317.5 million tons of corn. Under present conditions it is impossible to achieve that target without the help of Latin American countries allied to the United States. As a consequence the economies involved are now facing a bottleneck that should be evaluated.

2008		
2008	B21	Lagueroie, Stephanie, and Francisco Vergara. 2008. "The Theory of Price Controls: John Kenneth Galbraith's Contribution." <i>Review of Political Economy</i> , 20(4): 569-93. Price controls have always aroused controversy. Before the Second World War, most economists saw them as either impossible to implement or unwise. Even during wartime it was widely believed that prices should remain as free as possible. Many economists saw benefits to price controls during the war, but also identified numerous costs to these controls. They also tended to favor limited price controls, applying to only those goods needed to fight the war. John Kenneth Galbraith was generally sympathetic to price controls during the war. He too supported limited controls, but then changed his mind and supported more extensive price controls during the Second World War. After the war, inflation tended to reappear long before full-employment was reached, even when production and employment were falling. From his wartime experiences, Galbraith tried to draw lessons for peacetime inflation. He proposed price and wage monitoring for a few hundred big companies and the unions with whom they negotiate.
2008	C67	Rampa, Giorgio. 2008. "Using Weighted Least Squares to Deflate Input-Output Tables." <i>Economic Systems Research</i> , 20(3): 259-76. This article proposes a balancing procedure for the deflation of input-output (I-O) tables from the viewpoint of users. This is a 'subjective' variant of the Weighted Least Squares (WLS) method, already known in the literature. It is argued that it is more flexible than other methods, and it is shown that SWLS subsumes the first-order approximation of RAS as a special case. Flexibility is due to the facts that (a) users can attach differential 'reliability' weights to first (unbalanced) estimates, depending on the confidence they have in the different parts of their pre-balancing work, (b) differently from RAS, one is not bound to take any row or column total as exogenously given, and (c) additional constraints can be added to it. The article describes also how SWLS was utilised to estimate a yearly (1959-2000) series of constant-price I-O tables for the Italian economy.
2008	D22	Malik, Wasim Shahid, Ahsan ul Haq Satti, and Ghulam Saghir. 2008. "Price Setting Behaviour of Pakistani Firms: Evidence from Four Industrial Cities of Punjab." <i>Pakistan Development Review</i> , 47(3): 247-66. Macroeconomic research has mostly been focused on investigating microfoundations of the theory and transmission channels of policy ever since rational expectations have found place in the literature. It was in the 1990s that macroeconomists started working on models incorporating the assumption of nominal rigidity in the optimal behaviour of individuals and firms. These models have gained empirical support from both aggregate as well as firm-level data. The evidence for developing countries on the issue is limited and Pakistan is no exception. This study aims at investigating the price setting behaviour of Pakistani firms. Besides this, the potential effects of changes in financial cost on the overall pricing and production decisions have also been investigated. Pakistani firms perceive themselves to be operating in a competitive environment though most of their clientele is regular. The majority of the firms use current information while reviewing prices. Around 70 percent of the firms use either a state-dependent pricing rule or a combination of both time and state-dependent rules. Pakistani firms revise and change their prices usually in the months of June and July. The main determinants of change in the price level are the cost of raw material, energy and inflation. The competitors' price generally figures in price decrease. Among the causes of price stickiness, implicit contract with the customers is at the top; the fixed term contract comes next. Most of the firms change their wage structure annually. About half of the firms index their workers' wages to inflation and for the purpose refer to the earlier inflation rate. On the whole, labour productivity and changes in inflation rate are observed as the main determinants of wage change.
2008	F24	Balderas, J. Ulyses, and Hiranya K. Nath. 2008. "Inflation and Relative Price Variability in Mexico: The Role of Remittances." <i>Applied Economics Letters</i> , 15(1-3): 181-85. This article derives generalized impulse responses from the estimation of a vector autoregression (VAR) model using monthly data between 1995 and 2005 for Mexico, to examine the inflation-relative

Year	DE	Title and Abstract
		price variability (RPV) relationship, and to investigate if remittances could account for the observed relationship. While the positive relationship between inflation and RPV is a robust result, remittances are found to have significant positive effects on both inflation and RPV. These results are interpreted as providing evidence in support of our intuition that remittances could be responsible for generating a positive relationship between inflation and RPV.
2008	F24 N75	CV: Burdekin, Richard C. K., and Hsin-hui I. H. Whited. 2008. "Economic Interdependence with Taiwan." In <i>China's Monetary Challenges: Past Experiences and Future Prospects</i> . Richard C. K. Burdekin, 188-218. Cambridge and New York: Cambridge University Press.
2008	I28	Ferreira, Francisco H. G., Phillippe G. Leite, and Julie A. Litchfield. 2008. "The Rise and Fall of Brazilian Inequality: 1981-2004." <i>Macroeconomic Dynamics</i>, 12(0): 199-230. Brazil's Gini coefficient rose from 0.57 in 1981 to 0.63 in 1989, before falling back to 0.56 in 2004. Poverty incidence rose from 0.30 in 1981 to 0.33 in 1993, before falling to 0.22 in 2004. This paper presents a preliminary investigation of the determinants of Brazil's distributional reversal over this period. The rise in inequality in the 1980s appears to have been driven by increases in educational attainment in a context of convex returns, and by high and accelerating inflation. Although the secular decline in inequality, which began in 1993, is associated with declining inflation, it also appears to have been driven by four structural and policy changes, namely, declining returns to education; pronounced rural-urban convergence; increases in social assistance transfers targeted to the poor; and a possible decline in racial inequality. Falling inequality has made a substantial contribution to poverty reduction.
2008	J18	CV: Straubhaar, Thomas. 2008. "Demographic Development: Not Really a Problem for Coming Generations." 2008	K40	Hayo, Bernd, and Stefan Voigt. 2008. "Inflation, Central Bank Independence, and the Legal System." <i>Journal of Institutional and Theoretical Economics</i>, 164(4): 751-77. We argue that a higher degree of de facto independence of the legal system from other government branches as well as strong public trust in the working of the legal system may reduce the average inflation rate of countries through two channels: by lowering transaction costs in the economy and by strengthening de facto central bank independence. In the empirical section of the paper, we present evidence in favour of both channels after controlling for other influences in a sample containing both developed and less-developed countries.
2008	L44	CV: Cihak, Martin. 2008. "Central Banks and Financial Stability: A Survey of Financial Stability Reports." In <i>Current Developments in Monetary and Financial Law. Volume 5</i> . International Monetary Fund, 191-222. Washington, D.C.: International Monetary Fund.
2008	M14	Mavridis, Savas X. 2008. "(In Greek. With English summary.)." <i>Review of Economic Sciences</i>, 0(14): 7-28. After the accession of Greece to the European Euro Zone and especially after the summer 2003 and up to the autumn time 2007 the prices for certain goods and services were strongly increased. The development of the prices for food, interest rates of banks and the development in the tourism sector on the one hand, but especially the behavior of the uncontrolled increase of the prices of the above mentioned products and services without the essential governmental price control, led and is still leading to terrible social injustice and problems. Basically the theory of the well functioning of the free market is at stake and practices with monopolistic market terms are allowed. The above mentioned development is not only contra-dictating the system of the free market, but creates certain questions related with the definition of the general accepted terms of ethics and justice as they have been defined by Aristotle, Kant, the fathers of the Church and the modern social philosophers. The extent and the dimensions of the above mentioned problems become quite apparent with the comparative data analysis concerning the pricing of related and similar products and services in Greece and in other member-countries of the E.U. so that the dimension of the social responsibility of the Greek firms is diminishing.
2008	N51 N52	Berry, Brian J. L., and Adam Okulicz-Kozaryn. 2008. "Are There ENSO Signals in the Macroeconomy?" <i>Ecological Economics</i>, 64(3): 625-33. Whether ENSO has affected U.S. macroeconomic performance has been a matter of dispute. To address the issue we explore whether there has been any co-cyclicality of ENSO fluctuations and the rates of inflation and economic growth over the 1894-1999 timespan and, failing this, whether aperiodic ENSO shocks have had any impact on these variables. Neither co-cyclicality nor aperiodic shocks are discernible. While ENSO may briefly influence the performance of particular sectors of the economy in particular regions, as documented by the previous literature, such locally-important effects vanish into the noise surrounding macroeconomic trends in an economy as large and complex as that of the U.S.
2008	N75	CV: Burdekin, Richard C. K., and Hsin-hui I. H. Whited. 2008. "Economic Interdependence with Taiwan." In <i>China's Monetary Challenges: Past Experiences and Future Prospects</i> . Richard C. K. Burdekin, 188-218. Cambridge and New York: Cambridge University Press.
2008	N91 N92	Sonora, Robert J. 2008. "Bivariate Relative City Price Convergence in the United States: 1918-1997." <i>Review of Financial Economics</i>, 17(2): 92-111. As in international tests of purchasing power parity, panel unit root tests have been successful in rejecting a unit root process in U.S. city relative prices over the period 1918-1997. However, there is an empirical question of what the rejection of a 'panel unit root', particularly with respect to real exchange rates, means. This paper employs a variety of univariate unit root and cointegration tests which have recently come to the fore. These tests improve the power and reduce size distortion found in standard unit root and cointegration tests such as the Dickey-Fuller and Phillips-Perron tests. I find considerable evidence for rejecting a unit root process in the majority of U.S. city relative prices over the entire sample period and two subperiods. Less successful are stationarity tests conducted on regions of the U.S.
2008	Q01	Fava Neves, Marcos. 2008. "Strategies for Solving the Food Inflation Problem." <i>International Food and Agribusiness Management Review</i>, 11(3): 179-86. This article addresses some of the partial truths and misinformation in media reporting over the booming food prices debate. Many studies are only linking biofuels to the inflation cause, while ignoring several other factors such as the growth of the world population, economic development and income distribution. An overview of the causes is discussed and 10 strategies proposed which policy makers, governments, and organizations can adapt to move the world forward towards long-term sustainability.
2008	Q21	Romstad, Eirik. 2008. "The Informational Role of Prices." <i>European Review of Agricultural Economics</i>, 35(3): 263-80. The paper extends the framework of prices beyond the standard market setting to incorporate public goods and natural resources. These are settings where one does not usually think of market solutions. Core theory has established that price-taking behaviour by both suppliers and consumers, i.e., the absence of strategic considerations, greatly improves the informational value of prices, and hence of economic equilibria. This also holds when using market-like institutions to allocate resources for public goods. Policy effectiveness in many areas can be improved when agents are induced to reveal, voluntarily and truthfully, their willingness-to-pay or production costs.

2009	A14	Gunnel, Stefan, and Karl-Heinz Todter. 2009. "Does Benford's Law Hold in Economic Research and Forecasting?" <i>Empirica</i>, 36(3): 273-92. First and higher order digits in data sets of natural and socio-economic processes often follow a distribution called Benford's law. This phenomenon has been used in business and scientific applications, especially in fraud detection for financial data. In this paper, we analyse whether Benford's law holds in economic research and forecasting. First, we examine the distribution of regression coefficients and standard errors in research papers, published in <i>Empirica</i> and <i>Applied Economics Letters</i> . Second, we analyse forecasts of GDP growth and CPI inflation in Germany, published in <i>Consensus Forecasts</i> . There are two main findings: the relative frequencies of the first and second digits in economic research are broadly consistent with Benford's law and in sharp contrast, the second digits of <i>Consensus Forecasts</i> exhibit a massive excess of zeros and fives, raising doubts on their information content.
2009	C31	Longford, Nicholas. 2009. <i>A house price index defined in the potential outcomes framework</i>. Department of Economics and Business, Universitat Pompeu Fabra, Economics Working Papers. Current methods for constructing house price indices are based on comparisons of sale prices of residential properties sold two or more times and on regression of the sale prices on the attributes of the properties and of their locations. The two methods have well recognised deficiencies, selection bias and model assumptions, respectively. We introduce a new method based on propensity score matching. The average house prices for two periods are compared by selecting pairs of properties, one sold in each period, that are as similar on a set of available attributes (covariates) as is feasible to arrange. The uncertainty associated with such matching is addressed by multiple imputation, framing the problem as involving missing values. The method is applied to a register of transactions of residential properties in New Zealand and compared with the established alternatives.
2009	C68	Kilian, Lutz. 2009. <i>Why Agnostic Sign Restrictions Are Not Enough: Understanding the Dynamics of Oil Market VAR Models</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 7471. Sign restrictions on the responses generated by structural vector autoregressive models have been proposed as an alternative approach to the use of exclusion restrictions on the impact multiplier matrix. In recent years such models have been increasingly used to identify demand and supply shocks in the market for crude oil. We demonstrate that sign restrictions alone are insufficient to infer the responses of the real price of oil to such shocks. Moreover, the conventional assumption that all admissible models are equally likely is routinely violated in oil market models, calling into question the use of median responses to characterize the responses to structural shocks. When combining sign restrictions with additional empirically plausible bounds on the magnitude of the short-run oil supply elasticity and on the impact response of real activity, however, it is possible to reduce the set of admissible model solutions to a small number of qualitatively similar estimates. The resulting model estimates are broadly consistent with earlier results regarding the relative importance of demand and supply shocks for the real price of oil based on structural VAR models identified by exclusion restrictions, but imply very different dynamics from the median responses in VAR models based on sign restrictions only.
2009	D41	Heemeijer, Peter, Cars Hommes, Joep Sonnemans, and Jan Tuinstra. 2009. "Price Stability and Volatility in Markets with Positive and Negative Expectations Feedback: An Experimental Investigation." <i>Journal of Economic Dynamics and Control</i>, 33(5): 1052-72. The evolution of many economic variables is affected by expectations that economic agents have with respect to the future development of these variables. We show, by means of laboratory experiments, that market behavior depends to a large extent on whether realized market prices respond positively or negatively to average price expectations. In the case of negative expectations feedback, as in commodity markets, prices converge quickly to their equilibrium value, confirming the rational expectations hypothesis. In the case of positive expectations feedback, as is typical for speculative asset markets, large fluctuations in realized prices and persistent deviations from the benchmark fundamental price are likely. We estimate individual forecasting rules and investigate how these explain the differences in aggregate market outcomes.
2009	F44	Diss: Davis, (Jonathan) Scott. 2009. <i>Globalization and the Business Cycle</i>. PhD diss. Vanderbilt University. This dissertation studies the effect of globalization, specifically increased international trade and financial integration, on various aspects of the international business cycle. The second chapter, "Globalization and International Business Cycle Co-movement", investigates the links between bilateral trade integration, financial integration, industrial specialization, and business cycle correlation. Using a reduced form empirical approach, and an international real business cycle model with endogenous trade integration, financial integration, industrial specialization, and cyclical co-movement, I show that a model based on classical assumptions can replicate some of the causal channels that we see in the data, but it fails to match others. I then speculate as to what features are missing from the real business cycle model that could explain these empirical irregularities. The third chapter, "Globalization and the Phillips Curve", attempts to find the effect of increasing trade integration on the short run tradeoff between output and inflation. Specifically, we try to answer two closely related questions. Will increased international trade integration make inflation less sensitive to movements in the domestic output gap, and will inflation become more sensitive to movements in the foreign output gap? This paper answers these questions using a sticky price DSGE model. We find that trade integration leads to a slight reduction in the sensitivity of inflation to the domestic output gap. Also, inflation is somewhat sensitive to the foreign output gap, and this sensitivity increases with the level of trade integration. The fourth chapter, "Variable Markups and International Business Cycle Co-movement", incorporates endogenous markup variability into a real business cycle model to evaluate the impact of markup variability on international business cycle co-movement. We show both the qualitative and quantitative significance of markup variability on cyclical co-movement, and we show that introducing markup variability can help reconcile the positive effect of trade on co-movement found in the data with the negative effect predicted by the real business cycle model (the trade-co-movement puzzle). Thus this paper shows how strategic production decisions by individual firms can have a significant effect on the co-movement of aggregate production across countries.

2009	F62	Younus, Sayera, and Mark Wheeler. 2009. "The Impact of Monetary Policy Changes in a Global Economy: Evidence from Bangladesh." <i>Global Journal of Finance and Economics</i>, 6(2): 113-26. The study examines the impact of changes in monetary policy on Bangladesh's economy. Specifically, we examine the impact of domestic and foreign monetary shocks on Bangladesh's major economic aggregates. In the context of a global economy such as Bangladesh, the conduct of monetary policy becomes increasingly more difficult as globalization proceeds. It becomes important to examine the impact of changes in relevant foreign variables, such as the money supply, when formulating domestic monetary policy. The empirical results of our analysis show that innovations to the foreign money supply have significant impacts on Bangladesh's real exchange rate and, at long time horizons, Bangladesh's price level. However, the foreign money supply does not have an impact on Bangladesh's money supply or output. Our results also indicate that innovations to Bangladesh's money supply have significant impacts on Bangladesh's price level and output. That is, even in this small, open, economy, monetary policy can be used to alter domestic variables.

2009	F62	Bandoi, Anca, Dorel Berceanu, and Dana Danculescu. 2009. "Price Stability and Financial Stability in the Context of EUROSISTAM's Monetary Policy." <i>European Research Studies</i>, 12(4): 19-36. In this article we propose to review some aspects of the relationship between price stability and financial stability in the current economic context. It is acknowledged that monetary policy of the EUROSISTAM still has as the main objective price stability, this being one of the most important ways of supporting sustainable economic growth. Although there are many theoretical approaches of the price stability concept all converging towards the idea of measuring and control of permanent inflation. Financial stability can be seen in the broad sense as the situation in which the financial system may ensure the efficient allocation of savings to investment opportunities and may face the shock without major disruptions. Viewed from this perspective the increased complementarity between price stability and financial stability is associated with economic globalization and, in particular, eliminating impediments to the free movement of capital flows. On the other hand the financial stability may be defined as a situation characterized by the absence of banking crises and by the existence of a certain level of price stability of the assets, including interest rates.
2009	F65	Yol, Marial A. 2009. "Does the PPP Theory Hold in African Countries? Evidence from LM Unit Root Tests." <i>Asian-African Journal of Economics and Econometrics</i>, 9(1): 1-18. The objective of this study is to test the validity of PPP theory by applying unit root tests that allow for structural breaks in the data. The study utilizes annual data from thirty-one African countries over the period 1980-2007. The various unit root tests employed find that, with the exception of the Ivory Coast, relative PPP holds in thirty African countries.
2009	G24	Raines, J. Patrick, Heather R. Richardson, and Charles G. Leathers. 2009. "Where Bernanke Is Taking the Federal Reserve: A Post Keynesian and Institutional Perspective." <i>Journal of Post Keynesian Economics</i>, 31(3): 367-82. We develop a perspective on where Bernanke is taking the Federal Reserve by drawing from Paul Davidson's Post Keynesian analyses of the current financial crisis and the Federal Reserve as an effective market maker and Thorstein Veblen's perception that the Federal Reserve was supporting credit-inflation by large investment banks in the 1920s. New Deal legislation restricted the ability of investment banks to create credit-inflation and left the Federal Reserve with only an indirect relationship with investment banks. Financial deregulation and financial derivatives resulted in a new and larger form of credit-inflation by underwriter-bank conglomerates. Bernanke's responses to the inevitable financial crisis are bringing the Federal Reserve into an even closer relationship with underwriter-bank conglomerates than Veblen envisioned.

2009	Q58	Diss: Li, Zhe. 2009. Environmental Policies, Heterogeneous Firms and Labour Market Dynamics and Inflation. PhD diss. University of Toronto. This thesis covers three issues: the aggregate and welfare effects of environmental policies when plants are heterogeneous; what causes the different patterns of employment dynamics in small versus large firms over business cycles; and the welfare costs of expected and unexpected inflation. In the first chapter, we show that accounting for plant heterogeneity is important for the evaluation of environmental policies. We develop a general equilibrium model in which monopolistic competitive plants differ in productivity, produce differentiated goods and choose optimally a discrete emission-reduction technology. Emission-reduction policies affect both the fraction of plants adopting the advanced emission-reduction technology and the market shares of those with high levels of productivity. Calibrated to the Canadian data, the model shows that the aggregate costs of an emission tax to implement the Kyoto Protocol are 40 percent larger than the costs that would result with homogenous plants. In the second chapter, we incorporate labor search frictions into a model with lumpy investment to explain a set of firm-size-related facts about the United States labor market dynamics over business cycles. Contrary to the predictions of standard models, we observe that job destruction is procyclical in small firms but counter-cyclical in large ones. Calibrated to U.S. data, the model generates this asymmetric pattern of employment dynamics in small versus large firms. This is because a favorable aggregate productivity shock tightens the labor market. A tighter labor market hurts investing small firms. As a result, workers move from small to large firms during booms. In the third chapter, we analyze the welfare costs of inflation when money is essential to facilitate trades among anonymous agents and information about nominal shocks is incomplete as in Lucas (1972). In the model, the transactions in which money is essential coincide with those in which agents are affected by monetary shocks. Consequently, when the money supply changes, the average value of money and its variation in value in different markets affect agents simultaneously. Calibrated to U.S. data, we find that the welfare costs of expected inflation are two orders higher than the welfare costs of unexpected inflation.

2010	A20	Lavoie, Marc. 2010. "The Possible Perverse Effects of Declining Wages." <i>International Journal of Pluralism and Economics Education</i>, 1(3): 260-75. Central bankers fear deflation but this is incomprehensible within the standard AS/AD framework based on a real wealth effect. This framework is amended by introducing debt effects that reduce aggregate demand when prices fall, as emphasised long ago by Keynes, Kalecki and Fisher, thus showing that wage deflation may have perverse effects. An alternative model is then presented, based on markup pricing and non-decreasing returns, and incorporating the impact of income distribution on aggregate demand. The wealth and debt effects, as well as those of income redistribution, are then considered when wage and

Year	DE	Title and Abstract
		price deflation occurs. The purpose of the paper is to provide a pedagogical tool showing why deflation is being feared by economists operating in the real world and demonstrating why the downward flexibility of wages may have negative macroeconomic effects.
2010	B16	von Auer, Ludwig. 2010. "Drobisch's Legacy to Price Statistics." <i>Jahrbucher fur Nationalokonomie und Statistik</i>, 230(6): 673-89. This paper attempts to establish a greater awareness among researchers for the noteworthy contributions to price index theory made by Moritz Wilhelm Drobisch (1802-1896), a German mathematician and philosopher at the Universitat Leipzig. Few economists and statisticians are aware of the fact that neither Etienne Laspeyres nor Hermann Paasche originally devised the well-known price indices that presently carry their names. Moritz Wilhelm Drobisch was the first to publish them in 1871 in a treatise and, shortly thereafter, in an abridged version that appeared in this very journal. He rejected them, however, because in his view they were inappropriate measures of inflation. Instead, he devised the unit value index, which he regarded as superior to all other price index formulas. This paper contains a description of his pioneering scientific achievements together with a synopsis of his personal and professional life. Its purpose is to give credit where credit is due, but more importantly, it attempts to recognize these seminal contributions in light of the factors that have tarnished them in the recorded annals of price index history. It attempts to put them into their proper perspective.
2010	C01	Aruoba, S. Boragan, and Francis Diebold. 2010. <i>Real-Time Macroeconomic Monitoring: Real Activity, Inflation, and Interactions</i>. Penn Institute for Economic Research, Department of Economics, University of Pennsylvania, PIER Working Paper Archive. We sketch a framework for monitoring macroeconomic activity in real-time and push it in new directions. In particular, we focus not only on real activity, which has received most attention to date, but also on inflation and its interaction with real activity. As for the recent recession, we find that (1) it likely ended around July 2009; (2) its most extreme aspects concern a real activity decline that was unusually long but less unusually deep, and an inflation decline that was unusually deep but brief; and (3) its real activity and inflation interactions were strongly positive, consistent with an adverse demand shock.
2010	C42	Marques, Carlos Robalo, Fernando Martins, and Pedro Portugal. 2010. <i>Price and wage formation in Portugal</i>. European Central Bank, Working Paper Series: 1225. This paper brings together empirical research on price and wage dynamics for the Portuguese economy based both on micro and macro data. As regards firms' pricing behaviour the most noticeable finding is that prices in Portugal are somewhat less flexible than in the United States but more flexible than in the Euro Area. Regarding firms' wage setting practices, we uncover evidence favouring the hypothesis of aggregate and disaggregate wage flexibility. Despite the existence of mandatory minimum wages, the presence of binding wage floors and the general use of extension mechanisms, the firms still retain some ability to circumvent collective agreements via the mechanism of the wage cushion. The evidence also suggests that Portuguese wages behave in a fashion consistent with the wage curve literature, but the responsiveness of real wages to unemployment changes may have declined over the last decade.
2010	D03	Basak, Suleyman, and Hongjun Yan. 2010. "Equilibrium Asset Prices and Investor Behaviour in the Presence of Money Illusion." <i>Review of Economic Studies</i>, 77(3): 914-36. This article analyses the implications of money illusion for investor behaviour and asset prices in a securities market economy with inflationary fluctuations. We provide a belief-based formulation of money illusion which accounts for the systematic mistakes in evaluating real and nominal quantities. The impact of money illusion on security prices and their dynamics is demonstrated to be considerable even though its welfare cost on investors is small in typical environments. A money-illusioned investor's real consumption is shown to generally depend on the price level, and specifically to decrease in the price level. A general-equilibrium analysis in the presence of money illusion generates implications that are consistent with several empirical regularities. In particular, the real bond yields and dividend price ratios are positively related to expected inflation, the real short rate is negatively correlated with realized inflation, and money illusion may induce predictability and excess volatility in stock returns. The basic analysis is generalized to incorporate heterogeneous investors with differing degrees of illusion.
2010	E02	Blinder, Alan. 2010. <i>Quantitative Easing: Entrance and Exit Strategies</i>. Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 1219. Apparently, it can happen here. On December 16, 2008, the Federal Open Market Committee (FOMC), in an effort to fight what was shaping up to be the worst recession since 1937, reduced the federal funds rate to nearly zero. From then on, with all of its conventional ammunition spent, the Federal Reserve was squarely in the brave new world of quantitative easing. Chairman Ben Bernanke tried to call the Fed's new policies credit easing, probably to differentiate them from what the Bank of Japan had done earlier in the decade, but the label did not stick.
2010	E02	Ito, Takatoshi. 2010. <i>Great Inflation and Central Bank Independence in Japan</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 15726. Japan suffered a very high inflation rate in 1973-74. The CPI inflation rate rose to near 30% in 1974, the highest rate in the postwar Japanese history after the chaotic hyperinflation following the end of the Second World War. Traditionally, the oil crisis is blamed for the 1973-74 high inflation. However, due to monetary policy decisions in 1972-73, the inflation rate had already exceeded 10% before the onset of the oil crisis in October 1973. These decisions include the interest rate cut of June 1972 and the interest rate hike of April 1973, which in retrospect proved too small. Concern about the rapid yen appreciation produced political pressure on the Bank of Japan to continue easing. The Bank of Japan came out of the Great Inflation of 1973 with a stronger voice. The Bank successfully argued that its recommendation to tighten monetary policy should not be overruled or the high inflation would be repeated. By this logic, the Bank of Japan obtained /de facto/ independence after 1975. When faced with the next economic recovery in 1979, again accompanied by oil price increases, the Bank of Japan was able to tighten monetary policy and to contain the inflation rate under 10 percent. The interest rate in the 1972-75 period was well below, by as much as 25 percentage points in 1973, the interest rate suggested by a modified monthly Taylor rule regression.
2010	E02	Lopez, Monica Correa, Agustin Garcia Serrador, and Ana Cristina Mingorance. 2010. <i>Product Market Competition and Inflation Dynamics: Evidence from a Panel of OECD Countries</i>. BBVA Bank, Economic Research Department, Working Papers: 1025. We analyse the impact of product market competition on the responsiveness of inflation to macroeconomic imbalances. Results based on a 20-country OECD panel estimated for the period 1961-2006 show that if product market competition is high the response of inflation to lagged inflation and unemployment is reduced, while inflation is more responsive to changes in productivity growth in countries in which competition is above the OECD average. When product market competition is measured by barriers to firms' entry, we also find that low entry barriers dampen the effect on inflation of movements in import prices. These results are attributed to temporary mark-up changes after demand- and supply-side shocks.
2010	E69	Nersisyan, Yeva, and L. Randall Wray. 2010. <i>Does Excessive Sovereign Debt Really Hurt Growth? A Critique of This Time Is Different</i>, by Reinhart and Rogoff. Levy Economics Institute, The, Economics Working Paper Archive. The worst global downturn since the Great Depression has caused ballooning budget deficits in most nations, as tax revenues collapse and governments bail out financial institutions and attempt countercyclical fiscal policy. With notable exceptions, most economists accept the desirability of expansion of deficits over the short term but fear possible long-term effects. There are a number of theoretical arguments that lead to the conclusion that higher government debt ratios might depress growth. There are other arguments related to more immediate effects of debt on inflation and national solvency. Research conducted by Carmen Reinhart and Kenneth Rogoff is frequently cited

Year	DE	Title and Abstract
		to demonstrate the negative impacts of public debt on economic growth and financial stability. In this paper we critically examine their work. We distinguish between a nation that operates with its own floating exchange rate and nonconvertible (sovereign) currency, and a nation that does not. We argue that Reinhart and Rogoff's results are not relevant to the case of the United States.
2010	H51	Gupta, Rangan, and Cobus Vermeulen. 2010. "Private and Public Health Expenditures in an Endogenous Growth Model with Inflation Targeting." <i>Annals of Economics and Finance</i>, 11(1): 139-53. This paper develops a monetary endogenous growth overlapping generations model characterized by endogenous longevity and an inflation targeting monetary authority, and analyzes the growth dynamics that emerges from this framework. Besides the endogenous longevity which depends on the complementarity of private and public health expenditures, the growth process is endogenized by allowing for a productive role of government expenditure on infrastructure. Following the huge existing literature, money is introduced by assuming that banks are obligated to hold a fraction of the deposits as cash reserve requirements. Given this framework, we show that multiple equilibria emerges, with the low-growth (high-growth) equilibrium being unstable (stable) and locally determinate (locally indeterminate). In addition, we show that, under certain conditions, endogenous fluctuations and even chaos could emerge around the high-growth equilibrium.
2010	I23	Ewing, Kris M., Kim A. Beckert, and Bradley T. Ewing. 2010. "The Response of US College Enrollment to Unexpected Changes in Macroeconomic Activity." <i>Education Economics</i>, 18(4): 423-34. This paper estimates the extent and magnitude of US college and university enrollment responses to unanticipated changes in macroeconomic activity. In particular, we consider the relationship between enrollment, economic growth, and inflation. A time series analysis known as a vector autoregression is estimated and impulse response functions are calculated to measure the enrollment response to these economic shocks. The results suggest that enrollment patterns differ by gender and are consistent with economic theory.
2010	J43	CV; Gricar, Sergej, and Stefan Bojnec. 2010. "Consumer Food Prices in Slovenia during the Last Decade." 2010	J43	Mitra, Indrani. 2010. "The Effect of Trade Liberalization on Consumer Price Index of Agricultural Labourers in India." <i>India Macroeconomics Annual</i>, 0(0): 169-214. In this paper, our objective is to judge the effect of trade liberalization on Consumer Price Index for Agricultural Labourers (CPIAL). The period selected for this study stretches from 1977-78 to 2003-04. We investigated if there has been any structural break during this period. Under restricted trade regime, domestic prices of agricultural goods were pegged at a low level compared to their international prices. With liberalization of trade, domestic prices of agricultural goods were expected to experience a price-hike. This included the two main cereals: rice and wheat that contribute a major share in the consumption basket of the agricultural labourers. We also verified if the timing of the structural break was consistent with the treaty of trade liberalization entered into by India. Finally, we investigated the scale effects of agricultural trade on CPIAL.
2010	L26	Kontsas, Stamatias. 2010. "A Dynamic Approach to the Effects of Economic Reform and Free Trade on National Income and Economic Growth." <i>Archives of Economic History</i>, 22(1): 133-42. Consider an economy characterized initially by full employment of all available resources and excess aggregate demand, repressed inflation, and a general shortage of goods and services. The planned economies of Central and Eastern Europe before the collapse of communism are cases in point. All factors of production are held fixed by assumption. When prices are set free, the general price level rises in response to market forces. This general price increase is accompanied by a change in relative prices because prices tend to increase most in those sectors where the initial excess demand was largest. This process continues until the new profit opportunities and incentives arising in markets where relative prices have increased begin to be exploited by innovative entrepreneurs.
2010	L31	Ahmadi, Ali Mohammad, Mehdi Yousefi, and Somayeh Fazaeli. 2010. "Consumer Price Index Changes in Iran's Public and Health Sectors. (In Farsi. With English summary)." <i>Quarterly Journal of the Economic Research</i>, 0(1): 99-111. One of the major macroeconomic objectives of the governments is to control the inflation rate. High inflation and its associate destructive impacts on public welfare are a concern of social and economic policymakers. Consequently, they aim to control the inflation rate. Inflation within the health sector is attributed to various factors including aging population, insurance problems such as imperfect coverage and maladministration, lower productivity of production factors mainly medical staff and equipment, technological variation in delivering medical services, population growth and the lack of symmetric information among the suppliers and the demanders of health services. The findings of this study show that the resulting inflation rate for the health sector is relatively higher than the overall CPI inflation in Iran. To achieve a better understanding of inflation process in the Iranian health sector, in addition to the above factors, other issues should be considered. They include the effects of technological development, the existence of a verity of formal and informal fees in the private sector, the role of non-governmental Organizations (NGO) in setting medical and paramedical fees.

2010	M30	Young, Andrew T., and Daniel Levy. 2010. <i>Explicit Evidence on an Implicit Contract</i>. Department of Economics, West Virginia University, Working Papers: 10-07. We offer the first direct evidence of an implicit contract in a goods market. The evidence we offer comes from the market for Coca-Cola. We demonstrate that the Coca-Cola Company left a substantial amount of written evidence of its implicit contract with its consumers—a very explicit form of an implicit contract. The contract represented the promise of a five cent (nominal) price and adherence to the "Secret Formula". In general, the implicit nature of such contracts makes observation difficult. To overcome this difficulty, we adopt a narrative approach. Based on the analysis of a large number of historical documents obtained from the Coca-Cola Archives and other sources, we offer evidence of the Coca-Cola Company both acknowledging and acting on this implicit contract. We also make another unique contribution by exploring quality as a margin of adjustment available to Coca-Cola. The implicit contract included a promise not only of a constant nominal price but also a constant quality (i.e., 6.5 oz. of the Secret Formula). During a period of over 70 years, we find evidence of only a single case of true quality change. By studying the margin of adjustment the Coca-Cola Company chose in response to changes in market conditions, we demonstrate that the perceived costs of breaking the implicit contract were large. We argue that one piece of direct evidence on the magnitude of these costs is the aftermath "New Coke's" introduction in 1985.

2010	N82	Hickey, Ross D., and David S. Jacks. 2010. <i>Nominal Rigidities and Retail Price Dispersion in Canada over the Twentieth Century</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 16098. We introduce a new data set on over 230,000 monthly prices for 10 goods in 50 Canadian cities over the 40 year period from 1910 to 1950. This coupled with previously published price information from the late twentieth century allows us to present one of the first comprehensive views of nominal rigidities and retail

Year	DE	Title and Abstract
		price dispersion over the past 100 years. We find that nominal rigidities have been conditioned upon prevailing rates of inflation with a greater frequency of price changes occurring in the 1920s and the 1970s. Additionally, the process of retail market integration has surprisingly followed a U-shaped trajectory, with many domestic markets being better integrated--as measured by the average dispersion of retail prices--at mid-century than in the 1990s. We also consider the linkages between nominal rigidities and price dispersion, finding results consistent with present-day data.

2010	R00	Lipsey, Richard. 2010. <i>Four Essays On Famous Diagrams In Economics: The Scitovsky Paradox; Location Theory, Aggregate Demand and Supply Curves, the Phillips Curve</i> . Department of Economics, Simon Fraser University, Discussion Papers. The first of these four essays covers the Scitovsky paradox and community indifference curves. It argues that the so-called paradox is not a paradox but instead reveals an important social conflict that cannot be resolved by economic means and whose existence was suppressed when consumers' surplus replaced community indifference curves as the main tool for assessing the welfare effects of economic changes. The second essay first repeats von Thunen's analysis of the location of economic activity around a central market. It then considers Losches' analysis of the hexagonal lattice as the optimal way to locate firms selling a product to customers evenly spread in space. The essay argues that under free entry of firms this configuration is neither produced nor preserved if imposed. Also such entry permits the existence in equilibrium of significant pure profits. The third essay puts the AD-AS analysis through its paces and argues that Colander's criticisms of the theoretical underpinnings of the AD curve are invalid. The final essay deals with the evolution of the Philips curve, placing it in its historical context. It argues that the literature is bedeviled by an important confusion between the two different theories underlying the AD and the Philips curves.

2011	C26	Areosa, Waldyr Dutra, Michael McAleer, and Marcelo C. Medeiros. 2011. "Moment-Based Estimation of Smooth Transition Regression Models with Endogenous Variables." <i>Journal of Econometrics</i> , 165(1): 100-111. Nonlinear regression models have been widely used in practice for a variety of time series and cross-section datasets. For purposes of analyzing univariate and multivariate time series data, in particular, smooth transition regression (STR) models have been shown to be very useful for representing and capturing asymmetric behavior. Most STR models have been applied to univariate processes, and have made a variety of assumptions, including stationary or cointegrated processes, uncorrelated, homoskedastic or conditionally heteroskedastic errors, and weakly exogenous regressors. Under the assumption of exogeneity, the standard method of estimation is nonlinear least squares. The primary purpose of this paper is to relax the assumption of weakly exogenous regressors and to discuss moment-based methods for estimating STR models. The paper analyzes the properties of the STR model with endogenous variables by providing a diagnostic test of linearity of the underlying process under endogeneity, developing an estimation procedure and a misspecification test for the STR model, presenting the results of Monte Carlo simulations to show the usefulness of the model and estimation method, and providing an empirical application for inflation rate targeting in Brazil. We show that STR models with endogenous variables can be specified and estimated by a straightforward application of existing results in the literature.
2011	C38	Kebo, Yaya. 2011. "Modelling the Asymmetric Effect of Inflation on Financial Development: An Econometric Investigation for Cote d'Ivoire and Senegal." <i>Asian-African Journal of Economics and Econometrics</i> , 11(1): 175-83. This paper investigates the effect of inflation on financial development in Cote d'Ivoire and Senegal. We first used the technique of principal components analysis to build an overall index for financial development. This summary measure is then used to estimate threshold and alternative forms of nonlinear models. Our empirical findings show that the effect of inflation on financial development changes over time depending on the economic growth rate. In Senegal, inflation has found to have negative effects on financial development. In contrast, in Cote d'Ivoire inflation depresses financial deepening only in periods of low economic activity.
2011	C38	Beck, Guenter W., Kirstin Hubrich, and Massimiliano Marcellino. 2011. <i>On the importance of sectoral and regional shocks for price-setting</i> . European Central Bank, Working Paper Series: 1334. We use a novel disaggregate sectoral euro area data set with a regional breakdown to investigate price changes and suggest a new method to extract factors from over-lapping data blocks. This allows us to separately estimate aggregate, sectoral, country-specific and regional components of price changes. We thereby provide an improved estimate of the sectoral factor in comparison with previous literature, which decomposes price changes into an aggregate and idiosyncratic component only, and interprets the latter as sectoral. We find that the sectoral component explains much less of the variation in sectoral regional inflation rates and exhibits much less volatility than previous findings for the US indicate. We further contribute to the literature on price setting by providing evidence that country- and region-specific factors play an important role in addition to the sector-specific factors. We conclude that sectoral price changes have a "geographical" dimension, that leads to new insights regarding the properties of sectoral price changes.
2011	C38	Bermingham, Colin, and Antonello D'Agostino. 2011. <i>Understanding and forecasting aggregate and disaggregate price dynamics</i> . European Central Bank, Working Paper Series: 1365. The issue of forecast aggregation is to determine whether it is better to forecast a series directly or instead construct forecasts of its components and then sum these component forecasts. Notwithstanding some underlying theoretical results, it is generally accepted that forecast aggregation is an empirical issue. Empirical results in the literature often go unexplained. This leaves forecasters in the dark when confronted with the option of forecast aggregation. We take our empirical exercise a step further by considering the underlying issues in more detail. We analyse two price datasets, one for the United States and one for the Euro Area, which have distinctive dynamics and provide a guide to model choice. We also consider multiple levels of aggregation for each dataset. The models include an autoregressive model, a factor augmented autoregressive model, a large Bayesian VAR and a time-varying model with stochastic volatility. We find that once the appropriate model has been found, forecast aggregation can significantly improve forecast performance. These results are robust to the choice of data transformation.
2011	C54	Aruoba, S. Boragan, and Frank Schorfheide. 2011. "Sticky Prices versus Monetary Frictions: An Estimation of Policy Trade-Offs." <i>American Economic Journal: Macroeconomics</i> , 3(1): 60-90. We develop a two-sector monetary model with a centralized and decentralized market. Activities in the centralized market resemble those in a standard New Keynesian economy with price rigidities. In the decentralized market, agents engage in bilateral exchanges for which money is essential. This paper is the first to formally estimate such a model, evaluate its fit based on postwar US data, and assess its money demand properties. Steady-state welfare calculations reveal that the distortions created by the monetary friction may be of similar magnitude as the distortions created by the New Keynesian friction.

Year	DE	Title and Abstract
		Keynesian dynamic stochastic general equilibrium models are the principal paradigm currently employed for central bank policymaking. In this paper, we construct experimental economies, populated with human subjects, with the structure of a New Keynesian DSGE model. We give individuals monetary incentives to maximize the objective functions in the model, but allow scope for agents' boundedly rational behavior and expectations to influence outcomes. Subjects participate in the roles of consumer/workers, producers, or central bankers. Our objective is twofold. The first objective is general, and is to create an experimental environment for the analysis of macroeconomic policy questions. The second objective is more focused and is to consider several specific research questions relating to the persistence of shocks, the behavior of human central bankers, and the pricing behavior of firms, using our methodology. We find that the presence of menu costs is not necessary to generate persistence of output shocks, but rather that monopolistic competition in the output market is sufficient. Interest rate policies of human discretionary central bankers are characterized by persistence in interest rate shocks, the use of the Taylor principle, and lower output and welfare than under an automated instrumental rule. Patterns in price changes conform closely to stylized empirical facts.
2011	D18	CV: Wolff, Edward N., Lindsay A. Owens, and Esra Burak. 2011. "How Much Wealth Was Destroyed in the Great Recession?." In <i>The Great Recession</i> , ed. David B. Grusky, Bruce Western and Christopher Wimer, 127-58. New York: Russell Sage Foundation.
2011	D45	Fleissig, Adrian R., and Gerald Whitney. 2011. "A Revealed Preference Test of Rationing." <i>Economics Letters</i> , 113(3): 234-36. This paper derives a revealed preference test for utility maximization under rationing and can detect, for which goods rationing is binding without specifying a functional form or imposing rationing constraints prior to estimation. For UK data from 1920-55, we find evidence of utility maximization under rationing with rationing binding for food and other services. Estimated virtual prices exceed observed food prices by 16.5% in 1947 and observed prices of other services by 10.9% in 1952.
2011	D62	Chiu, Jonathan, and Miguel Molico. 2011. "Uncertainty, Inflation, and Welfare." <i>Journal of Money, Credit, and Banking</i> , 43(0): 487-512. This paper studies the welfare costs and the redistributive effects of inflation in the presence of idiosyncratic liquidity risk, in a microfounded search-theoretical monetary model. We calibrate the model to match the empirical aggregate money demand and the distribution of money holdings across households and study the effects of inflation under the implied degree of market incompleteness. We show that in the presence of imperfect insurance the estimated long-run welfare costs of inflation are on average 40% to 55% smaller compared to a complete markets, representative agent economy, and that inflation induces important redistributive effects across households.

2011	H74	Fujiki, Hiroshi, and Hirofumi Uchida. 2011. "Inflation Target and Debt Management of Local Government Bonds." <i>Japan and the World Economy</i> , 23(3): 178-89. We show that the optimal inflation target imposed on a discretionary central bank varies with the extent of fiscal decentralization. Our analysis compares two fiscal regimes for local government bond management: the partially decentralized (PD) regime where the central government determines the amount of local bond; and the fully decentralized (FD) regime where each local government determines the amount of local bond. In both regimes, an inflation target has two effects: it harnesses surprise inflation; and it induces excess issuance of local bonds. Due to externality in determining the level of local government bond, however, the second effect, and thereby the optimal level of the inflation target, are smaller in the FD regime than in the PD regime. We also find that even if fiscal decentralization in its isolation deteriorates social welfare, we may be able to improve social welfare by introducing an inflation target when fiscal decentralization measures are adopted.
2011	J00	Wolfl, Anita, and Juan S. Mora-Sanguinetti. 2011. <i>Reforming the Labour Market in Spain</i> . OECD Publishing, OECD Economics Department Working Papers: 845. After steady employment growth since the 1990s, Spain has experienced the sharpest increase in unemployment among OECD countries during the crisis, amplified by structural problems of the labour market. Very high de facto severance payment of permanent contracts has resulted in a rigid dual market with adverse effects on unemployment and productivity. The collective wage bargaining system has hindered firms from adapting to macroeconomic shocks exacerbating their negative effects on the labour market. The recent labour market reform legislation is a positive step to reduce excessive protection of workers in permanent contracts, although some uncertainty remains on how courts will interpret it. It also makes it easier for firms to opt out from higher level collective agreements. The large drop-out rate from lower secondary education is an important factor explaining very high unemployment among young workers. Better access of young people to training is an effective tool to keep them out of a depressed labour market. Finally, the matching of people to jobs, notably through the public employment services, needs to be made more efficient, all the more so under currently tight fiscal constraints. Although the recent reform allows private for-profit firms to provide placement services, more needs to be done. Performance of regional public employment services should be benchmarked and incentives of unemployment benefit recipients to search for a job increased.
2011	K11 O34	Alhadeff, Peter, and Caz McChrystal. 2011. "Inflation and US Music Mechanicals, 1976-2010." <i>Global Business and Economics Review</i> , 13(1): 1-12. Recorded music is a commodity bundled with a number of intellectual property rights. This paper illustrates the conflict over the value of one of the most important rights of music, the so-called mechanical rate that the record labels pay to songwriters and their publishers for the reproduction, in a recorded medium, of their work. There has been a serious devaluation of the US mechanical rate against inflation since the Copyright Act of 1976. As Congress and the CARP Tribunal are ultimately involved in setting terms, the implication is that songwriters and their publishers are losing power in the USA against the record labels. For a variety of reasons, the phenomenon seems to be particular to the USA. It has also gone unnoticed in the current music business literature. Scholars who succeed in clarifying musicians' legal rights should also consider basic economics as a useful analytical tool.
2011	N84	Moore, Lyndon. 2011. "What Was the Market Value of Daimler during the German Hyperinflation?" <i>Economic Inquiry</i> , 49(1): 172-73. The claim of Bresciani-Turroni that Daimler's equity capital reached the equivalent of only 327 of their cars during the German hyperinflation has spread widely through the hyperinflation literature. There are two critical errors in Bresciani-Turroni's calculation, and the minimum market value of Daimler in November 1922 was far lower, at around 94 cars.

2011	P48	Baky-Haskuee, Mortaza. 2011. "A Co-integration Approach to the Effect of Oil Income on Resource Allocation in Iranian Economy." <i>International Journal of Economics and Finance</i> , 3(2): 194-99. This paper investigates the effect of oil income on real exchange rate defined as relative prices of non-tradable to tradable sector in Iranian economy. Increase in oil income, increases demand for both tradable and non-tradable goods. Tradable goods prices follow international prices while non-tradable prices are set in domestic markets. Therefore an increase in oil income will result in real exchange rate appreciation and change in resource allocation in different economic sectors. Oil windfalls have changed the structure of the economy and relative prices such that the shares of agriculture and industry have decreased and the shares of services and construction have increased in GDP. The results show that there is a long run co-integration relation between oil income, capital outflow, GDP and real exchange rate.

2011	R22	Nagayasu, Jun. 2011. "Heterogeneity and Convergence of Regional Inflation (Prices)." <i>Journal of Macroeconomics</i>, 33(4): 711-23. It is generally thought that members in a monetary union experience a similar level of inflation. This paper verifies this conventional belief. Using regional data, we present statistical evidence of heterogeneous inflation in Japan. Not only does the average inflation differ significantly across regions, but regional inflation responds differently to common economic and monetary factors. Furthermore, we show no evidence of price convergence in the entire group of regions although there is some evidence of convergence in subgroups. These results suggest that diversified regional inflation can exist within a monetary union.

2012	B00	Kregel, Jan. 2012. "Diversity and Uniformity in Economic Theory as an Explanation of the Recent Economic Crisis". Levy Economics Institute, The Economics Working Paper Archive. Market economies and command economies have long been differentiated by the presence of alternative choice in the form of diversity. Yet most mainstream economic theory is premised on the existence of uniformity. This paper develops the implications of this contradiction for the theory of prices, income creation, and the analysis of the recent financial crisis, and provides a critique of traditional theory from an institutionalist perspective developed by J. Fagg Foster.
2012	E16	Andre, Francisco J., M. Alejandro Cardenete, and M. Carmen Lima. 2012. "Using a CGE Model to Identify the Policy Trade-Off between Unemployment and Inflation: The Efficient Phillips Curve." <i>Economic Systems Research</i>, 24(4): 349-69. This paper provides a new reading of a classical economic relation: the short-run Phillips curve. Our point is that, when dealing with inflation and unemployment, policy-making can be understood as a multicriteria decision-making problem. Hence, we use so-called multiobjective programming in connection with a computable general equilibrium (CGE) model to determine the combinations of policy instruments that provide efficient combinations of inflation and unemployment. This approach results in an alternative version of the Phillips curve labelled as efficient Phillips curve. Our aim is to present an application of CGE models to a new area of research that can be especially useful when addressing policy exercises with real data. We apply our methodological proposal within a particular regional economy, Andalusia, in the south of Spain. This tool can give some keys for policy advice and policy implementation in the fight against unemployment and inflation.
2012	E59	Hillinger, Claude, Bernd Sussmuth, and Marco Sunder. 2012. <i>The Quantity Theory of Money and Friedmanian Monetary Policy: An Empirical Investigation</i>. CESifo Group Munich, CESifo Working Paper Series: 3754. We introduce an approach for the empirical study of the quantity theory of money (QTM) that is novel both with respect to the specific steps taken as well as the general methodology employed. Empirical studies of the QTM have focused directly on the relationship between the rate of change of the money stock and inflation. We believe that this is an inferior starting point for several reasons and focus instead on the Cambridge form of the QTM. We find that the coefficient k fluctuates strongly in the short run, but has a low and steady rate of change in the long run, which makes the QTM a useful instrument for the long-run control of inflation. An important finding that contradicts all of the previous literature is that the QTM holds for low inflation as well as for high inflation. We discuss how our findings relate to monetarism generally and propose an adaption of McCallum's rule for a Friedmanian monetary policy.

2012	F63	Correa, Eugenia, Gregorio Vidal, and Wesley Marshall. 2012. "Financialization in Mexico: Trajectory and Limits." <i>Journal of Post Keynesian Economics</i>, 35(2): 255-75. This article seeks to contribute to the academic debate regarding financialization, through an analysis of its evolution in Mexico. As we argue, Mexico has been at the forefront of the tendencies and historical events that have defined financialization at the global level. Moreover, Mexico is alone among the world's largest economies in its continual application of public policies that serve the needs of a financialized economy. The degree to which such policies have been applied and their corresponding results have made Mexico one of the more interesting case studies in the causes and consequences of financialization.
2012	G02	De Mello, Joao Manoel P., and Marcio G. P. Garcia. 2012. "Bye, Bye Financial Repression, Hello Financial Deepening: The Anatomy of a Financial Boom." <i>Quarterly Review of Economics and Finance</i>, 52(2): 135-53. Since the conquest of hyperinflation, with the Real Plan, in 1994, the Brazilian financial system has grown from early infancy to late adolescence. We describe the process of maturing with emphasis on the defining features of the Brazilian financial system over the last 20 years: (1) stabilization and the subsequent financial crisis; (2) universality of banks; (3) market segmentation through public lending; (4) institutional improvement. Further paraphrasing Diaz-Alejandro (1985), we raise some hypotheses on why, this time, the financial boom has not (at least yet) turned into a financial crash.
2012	G02	Noussair, Charles N., Gregers Richter, and Jean-Robert Tyran. 2012. "Money Illusion and Nominal Inertia in Experimental Asset Markets." <i>Journal of Behavioral Finance</i>, 13(1): 27-37. We test whether large but purely nominal shocks affect real asset market prices. We subject a laboratory asset market to an exogenous shock, which either inflates or deflates the nominal fundamental value of the asset while holding the real fundamental value constant. After an inflationary shock, nominal prices adjust upward rapidly, and we observe no real effects. However, after a deflationary shock, nominal prices display considerable inertia and real prices adjust only slowly and incompletely toward the levels that would prevail in the absence of a shock. Thus, an asymmetry is observed in the price response to inflationary and deflationary nominal shocks.
2012	H12	Buitier, Willem H., and Ebrahim Rahbari. 2012. <i>The ECB as Lender of Last Resort for Sovereigns in the Euro Area</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 8974. The paper establishes that sovereigns, like banks, need a lender of last resort (LoLR). In the euro area the ECB, with its estimated 3.4 trillion euro non-inflationary loss absorption capacity, is the only credible sovereign LoLR. The ECB/Eurosystem has been acting as sovereign LoLR through its SMP purchases of periphery sovereign debt in the secondary markets. It has also contributed, through the deeply subsidised bank funding it provided through the 3-year LTROs, half of a mechanism to purchase periphery sovereign debt in the primary issue markets. The other half has been financial repression requiring banks in Italy and Spain to purchase more of their own government's debt than they would voluntarily and at below-market yields. We expect that, once Spain and Italy are under troika programmes, the Eurosystem will also lend to these sovereigns indirectly, through loans by the national central banks to the IMF which on-lends them to these sovereigns. We recommend that, to increase its effectiveness as LoLR, the ESM be given a banking license. To reduce the illegitimate and unaccountable abuse of the ECB/Eurosystem as a quasi-fiscal actor, we propose that all its credit risk-related losses be jointly and severally guaranteed/indemnified by the 17 euro area member states.

Year	DE	Title and Abstract
2012	H27	MUNRO, John. 2012. <i>Money Matters: A Critique of the Postan Thesis on Medieval Population, Prices, and Wages</i>. University of Toronto, Department of Economics, Working Papers. This paper is a critique of Michael Postan's famous Malthusian-Ricardo model demonstrating that late-medieval prices and wages were essentially determined by demographic factors, especially after the Black Death, while contending that monetary factors played no role in determining prices or wages. His central argument is simple: that rapid and drastic depopulation (falling perhaps from ca. 1320)--by about 50% in England ca. 1450--drastically altered the land:labour ratio so that real wages increased, both from a rise in the marginal productivity of labour and also from a corresponding fall in the costs of foodstuffs. As Ricardo had argued, a population decline necessarily led to lower grain prices, reduced rents, as well as to increased real wages. A related part of Postan's model is the contention that grain prices alone fell after the Black Death, while prices of most livestock products and especially industrial products rose, thus producing a widening divergence in commodity prices in late-medieval Europe. This paper seeks to show that monetary factors also played a role in determining or influencing both prices and real wages in medieval Europe, both before and after the Black Death. The evidence produced here reveals cycles of inflation and deflation from the late 12th to early 16th century: with a sharp deflation before the Black Death, an equally severe inflation for the quarter century following the Black Death, which was then followed by steep deflation into the early 15th century, after which the deflationary trend was broken only by the final phase of the Hundred Years' War and by civil wars in Flanders. Deflation resumed in the very late 15th century, enduring until the eve of the inflationary European Price Revolution, from ca. 1515-20 to ca. 1650. The tables in this paper demonstrate that during both periods of inflation and of deflation, agricultural and industrial prices rose and fell together, if not necessarily in full tandem. These cycles of inflation and deflation were essentially due to monetary and not demographic factors; but differences in relative prices can be explained as well by real factors. Thus the core theme of the paper: 'money matters', though monetary factors certainly do not explain all economic phenomena. The final section of the paper deals with post-Plague real wages, demonstrating first a sharp fall in real wages following the Black Death and then a sharp rise in real wages from the later 14th century. That was essentially a result and function of downward nominal wage-stickiness during the deflations that took place in this era, especially during the two bullion famines of ca. 1370-ca. 1415 and ca. 1440-1475. An examination of the root causes of wage-stickiness, essentially a post-Plague phenomenon, has been more thoroughly explored in many other of my online working papers and numerous publications (since 2003). The statistical evidence on prices and wages is taken from both England and Flanders (up to ca. 1500): i.e., from both a basically rural agrarian economy (England) and a much more commercialized, industrialized, urbanized economy (Flanders). If such radically different economies experienced the same trends in commodity prices and wages (nominal and real)--as they did, the agrarian-based Ricardo model cannot provide the full explanation--so that again a role for monetary factors must be allowed, all the more so in light of the detailed monetary evidence supplied in this paper.
2012	I13	CV: McGuire, Alistair, Victoria Serra-Sastre, and Maria Raikou. 2012. "How Are Rising Health Care Expenditures Explained?." In <i>The LSE Companion to Health Policy</i>, ed. Alistair McGuire and Joan Costa-Font, 129-43. Cheltenham, U.K. and Northampton, Mass.: Elgar.

2012	N50	Couharde, Cecile, Vincent Geronimi, and Armand Taranco. 2012. "Les hausses recentes des cours des matieres premieres traduisent-elles l'entree dans un regime de prix plus eleves? (Do Recent Increases in Commodity Prices Indicate Entry into a Higher Price Regime? With English summary)." <i>Revue Tiers Monde</i>, 0(211): 13-34. In this paper, we seek to determine whether the recent increase in commodity prices, and especially in prices of food products, reflects a regime switch towards higher price levels. Accordingly, we use a Kalman filter and a Markov-switching model in order to analyze the evolution of terms-of-trade for commodities and food products over the period 1900-2010. Our results support the hypothesis that the commodity terms-of-trade have moved, since 2006 (2008 for food products), to a new regime characterized by an average price level about 50% higher than the one that prevailed over the period 1986-2005 (1986-2007 for food products).
2012	N94	Lundh, Christer. 2012. "Wage Forms, Costs of Living and the Urban-Rural Wage Gap: Southern Sweden, 1881-1930." <i>Scandinavian Economic History Review</i>, 60(2): 123-45. One common finding of studies of industrialising economies in the nineteenth and twentieth centuries is the existence of an urban-rural nominal wage gap. For the analysis of its causes and context it is however essential to know the extent to which the gap is due to urban-rural differences in payments in kind, cost of living and consumption patterns. Only a few studies have tried to estimate the real urban-rural wage gap though. This paper belongs to this stream of literature, aiming to develop a method for the estimation of the real wage gap given the kind of data available in the Swedish context, and to use it to estimate the real wage gap for Malmo County in 1881-1930. The main result is that the gap is reduced to about one-half of its nominal size when differences in payments in kind, cost of living, and consumption patterns are accounted for. The real wage gap was still substantial though, and the trend was increasing. While urban real wages were ranging from 10% less to 40% more than agrarian wages in the nineteenth century, urban real wages were 30-100% above agrarian wages in the 1920s.
2012	O43	Emara, Noha. 2012. "Inflation Volatility, Institutions, and Economic Growth." <i>Global Journal of Emerging Market Economies</i>, 4(1): 29-53. The study analyzes the effect of inflation volatility on growth in the presence of different degrees of institutional development. A nonlinear growth regression specification using a system generalized method of moments (GMM) procedure on a sample of 37 countries over the period 1989-2006 is estimated. While the level of inflation was found not to have a significant effect on growth, which is in line with previous studies, inflation volatility does significantly impact growth even for countries with moderately high levels on inflation. In addition and in contrast with the results of Acemoglu et al. (2003) and Easterly (2005), the study finds that policies, particularly inflation volatility, does not act as a proxy for institutions. Improving institutions will have a statistically significant positive impact on growth which will help to reduce the negative impact of inflation volatility.
2012	O44	Hoseininasab, Seyed Ebrahim, and Hatf Hazeri Niri. 2012. "Computable General Equilibrium Analysis of the Effect of Energy Carrier's Subsidies Reform on Inflation and GDP. (In Farsi. With English summary)." <i>Quarterly Journal of Economic Growth and Development Research</i>, 2(7): 67-80. Measuring the economic effects of energy subsidy reform and determining how to apply protective measures to reduce its negative effects are the most essential steps in determining the conditions and scenarios of energy price reform. This paper evaluates the effects of energy subsidy reform on inflation and GDP based on approved scenarios by Parliament in 2010 using standard computable general equilibrium (SCGE) model. The results show that reforming energy carrier's subsidies without income redistribution will result in a significant fall in total production and employment and will lead to higher inflation. On the other hand, supportive government policies and income redistribution resulting from energy price reforms under various scenarios to producers and consumers will considerably compensate increased production costs and reduction in total production, and will decline the percent of unemployment. In contrast, the increased liquidity resulting from redistribution increases the pressure of demand and inflation.

2012	P00	Kregel, Jan. 2012. <i>"Diversity and Uniformity in Economic Theory as an Explanation of the Recent Economic Crisis"</i> . Levy Economics Institute, The Economics Working Paper Archive. Market economies and command economies have long been differentiated by the presence of alternative choice in the form of diversity. Yet most mainstream economic theory is premised on the existence of uniformity. This paper develops the implications of this contradiction for the theory of prices, income creation, and the analysis of the recent financial crisis, and provides a critique of traditional theory from an institutionalist perspective developed by J. Fagg Foster.
2012	Q02	Tamakoshi, Go, and Shigeyuki Hamori. 2012. <i>"Informational Roles of Commodity Prices for Monetary Policy: Evidence from the Euro Area."</i> <i>Economics Bulletin</i> , 32(2): 1282-90. This paper examines the linear and nonlinear causal relationships between commodity price indices and macroeconomic variables such as the consumer price index (CPI) and the industrial production index (IP) in the Euro zone. We use monthly time series data from January 1999 to December 2011 and employ a solid nonparametric, nonlinear causality test by Diks and Panchenko (2006) as well as the linear Granger causality test using Lag Augmented Vector Autoregression (LA-VAR) approach. Main findings of the study include: (i) Oil price only linearly Granger-causes the CPI and hence can be seen as a better information variable for the general price level than non-energy commodity price. (ii) There is a significant one-way linear causality from commodity price to IP. (iii) A significant nonlinear relationship between CPI and IP is identified by the nonparametric causality test. Such results are relevant for monetary policy makers who wish to mitigate the possible future inflation by using commodity or oil price indices as information variables.
2012	Q02	De Gregorio, Jose. 2012. <i>"Commodity Prices, Monetary Policy, and Inflation."</i> <i>IMF Economic Review</i> , 60(4): 600-633. During the second half of the 2000s, the world experienced a rapid and substantial rise in commodity prices. This shock posed complex challenges for monetary policy, in particular because of the significant increase in food and energy prices, and the repercussions they had on aggregate inflation measures. This paper discusses the role of commodity price shocks (CPS) in monetary policy in the light of recent episodes of such shocks. It begins by discussing whether monetary policy should target core or headline inflation, and what should be the role of CPS in setting interest rates. It is argued that there are good reasons to focus on headline inflation, as most central banks actually do. Although core inflation provides a good indicator of underlying inflation pressures, the evolution of commodity prices should not be overlooked, because of pervasive second-round effects. This paper reviews the evidence on the rise of inflation across countries and reports that food inflation, more than energy inflation, has relevant propagation effects on core inflation. This finding is particularly important in emerging market economies, where the share of food in the consumer basket is significant. The evidence also shows that countries that had lower inflation during the run up of commodity prices before the global crisis had more inflation in the subsequent rise after the global crisis, suggesting that part of the precrisis inflationary success may have been because of repressed inflation. This paper also discusses other factors that may explain different inflationary performances across countries.
2012	Q02	Tang, Ke, and Wei Xiong. 2012. <i>"Index Investment and the Financialization of Commodities."</i> <i>Financial Analysts Journal</i> , 68(6): 54-74. The authors found that, concurrent with the rapidly growing index investment in commodity markets since the early 2000s, prices of non-energy commodity futures in the United States have become increasingly correlated with oil prices; this trend has been significantly more pronounced for commodities in two popular commodity indices. This finding reflects the financialization of the commodity markets and helps explain the large increase in the price volatility of non-energy commodities around 2008.
2012	Q47	Nixon, Dan, and Tom Smith. 2012. <i>"What Can the Oil Futures Curve Tell Us about the Outlook for Oil Prices?"</i> <i>Bank of England Quarterly Bulletin</i> , 52(1): 39-47. Large movements in the oil price have had significant effects on UK CPI inflation over the past few years. In order to produce an inflation forecast, it is necessary to assume a path for oil and other commodity prices. The Monetary Policy Committee assumes that oil prices follow the path given by market futures prices when deciding their central projections for CPI inflation and GDP growth. This article considers arguments for and against using the futures curve as an assumed path and describes some of the other indicators used by the committee in assessing the outlook for oil prices.
2012	Q53	Diss: Hamilton, Timothy. 2012. A Multi-level Residential Sorting Model with an Application to Cost of Living Indices. PhD diss. North Carolina State University. Sorting models to date have operated at the macro level or micro level. Regardless of the scale, all existing sorting models analyze a single choice from a single set of alternatives. Intuition suggests, however, that households choose a city and subsequently select a neighborhood within that city. This stylized reality is absent from conventional sorting models, which ignore information at one of these stages. In addition, due to the size of the full choice set, capturing this entire sorting process in a single model can be prohibitive in terms of computation and data collection. I use the theory of two-stage budgeting to develop an empirically feasible sorting model that more accurately replicates household behavior. Empirically, I focus on the cost of air pollution. Results point to an additional trade off between air pollution and neighborhood level amenities that increases the marginal willingness to pay for clean air by a considerable amount. I also show that allowing for heterogeneity in preferences for local public goods has a considerable impact on the estimated value of clean air. This dissertation also explores an application of the model in which I construct spatially explicit measures of the cost of living that can be used to adjust income and calculate a broad measure of welfare. The analysis focuses on the distribution of such welfare across the population, as well the change in this distribution followings simulated reductions pollution concentrations. Empirical results suggest that accounting for public goods leads to a distribution of adjusted income that has a wider spread than that of pure monetary income. This implies that households with less income tend to face higher costs of living, determined by an inferior set of public goods relative to housing prices paid to obtain such goods.

Palmer, and Chun-Yi Yang. 2012. <i>Getting at Systemic Risk via an Agent-Based Model of the Housing Market</i> . Cowles Foundation for Research in Economics, Yale University, Cowles Foundation Discussion Papers: 1852. Systemic risk must include the housing market, though economists have not generally focused on it. We begin construction of an agent-based model of the housing market with individual data from Washington, DC. Twenty years of success with agent-based models of mortgage prepayments give us

Year	DE	Title and Abstract
		hope that such a model could be useful. Preliminary analysis suggests that the housing boom and bust of 1997-2007 was due in large part to changes in leverage rather than interest rates.
2012	R52	Gupta, Rangan, and Josine Uwilingiye. 2012. "Comparing South African Inflation Volatility across Monetary Policy Regimes: An Application of Saphe Cracking." <i>Journal of Developing Areas</i> , 46(1): 45-54. Recent empirical evidence on the direct link of inflation targeting and inflation volatility is at best mixed. However, comparing inflation volatility across alternative monetary policy regimes within a country based on conventional ways, used in previous studies, begs the question. The question is not whether the volatility of inflation has changed, but rather whether the volatility is different than it otherwise would have been. In such a backdrop, this paper uses the cosine-squared cepstrum to provide evidence that CPI inflation in South Africa has become more volatile since the first quarter of 2000, when the country moved into an inflation targeting regime, than it would have been had the South African Reserve Bank (SARB) continued with the more eclectic monetary policy approach pursued in the pre-targeting era.
2013		
2013	B26	Laidler, David. 2013. <i>The Fisher Relation in the Great Depression and the Great Recession</i> . University of Western Ontario, Economic Policy Research Institute, University of Western Ontario, Economic Policy Research Institute Working Papers: 20132. The Fisher relation played a very different role in debates surrounding the Great Depression and the more recent Great Recession. This paper explores some of these differences, and suggests an explanation for them derived from a sketch of the idea's evolution between the two events, thus providing a brief case study of the interaction of economic ideas and economic events that is a central feature of the History of Economic Thought.
2013	C44	Jaggi, Chandra K., Aditi Khanna, Sarla Pareek, and Ritu Sharma. 2013. "Ordering Policy in a Two-Warehouse Environment for Deteriorating Items with Shortages under Inflationary Conditions." <i>International Journal of Strategic Decision Sciences</i> , 4(2): 27-47. In this paper, the two-warehouse inventory problem is considered for deteriorating items with constant demand rate and shortages under inflationary conditions. In today's unstable global economy, the effects of inflation and time value of money cannot be ignored; as it increases the cost of goods. To safeguard from the rising prices, during the inflation regime, the organization prefers to keep a higher inventory, thereby increasing the aggregate demand. This additional inventory needs additional storage space that is facilitated by a rented warehouse. Further ahead, in the real business world, to retain the freshness of the commodity, most of the organizations adopt the first-in-first-out (FIFO) dispatching policy. FIFO policy yields fresh and good conditioned stock thereby resulting in customer satisfaction, especially when items are deteriorating in nature. However, the two warehousing systems usually assume that the holding cost of items is more in RW than the OW due to modern preserving techniques. Therefore, to reduce the inventory costs, it is economical to consume the goods of RW at the earliest. This approach is termed as Last-In-First-Out (LIFO) approach. The objective of the present research is to develop a two warehouse inventory model with FIFO and LIFO dispatching policies under inflationary conditions. Further, comparison between FIFO and LIFO policies has been exhibited with the help of a numerical example. Sensitivity analysis has also been performed to study the impact of various parameters on the optimal solution.
2013	F38	Wu, Chia-Wei, and Tien-Wang Tsauro. 2013. "Tobin Tax Effects under Currency Substitution: Real Exchange Rate Dynamics and Stability. (In Chinese. With English summary)." <i>Academia Economic Papers</i> , 41(4): 559-96. This paper extends the model of Tsauro (2011) to include a Tobin tax. It proposes to examine how the real exchange rate will be affected by an increase in the Tobin tax, and investigate how the monetary expansion and the Tobin tax coordinate to maintain the real exchange rate stability. The major findings are as follows: (1) In the long run, the rise of the Tobin tax rate would cause the real exchange rate to decrease, output to increase, and real foreign currency balances to decrease, but whether the real balances increase or decrease depends on the magnitude between the currency substitution elasticities. (2) In the short run, the magnitude of foreign inflation rates is crucial in influencing the behavior of real exchange rates, (i.e., real exchange rates may overshoot, undershoot or misjump around their equilibrium values) while the magnitude of the effect of the Tobin tax on the stock of foreign currency and other structure parameters in the model are key elements to determine the degree of real exchange rate movements. (3) The range of an increase in the rate of the Tobin tax should be smaller than monetary expansion in order to maintain real exchange rate stability. It is shown that if the degree of currency substitution is higher, the range of an increase in the rate of the Tobin tax should be bigger; if the cost elasticity of holding foreign currency is higher, the range of an increase in the rate of the Tobin tax should be smaller.
2013	F39	Aron, Janine, Kenneth Creamer, John Muellbauer, and Neil Rankin. 2013. <i>Exchange Rate Pass-Through to Consumer Prices in South Africa: Evidence from Micro-Data</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 9735. A sizeable literature examines exchange rate pass-through to disaggregated import prices but very few micro-studies focus on consumer prices. This paper explores exchange rate pass-through to consumer prices in South Africa during 2002-2007, using a unique data set of highly disaggregated data at the product and outlet level. The paper adopts an empirical approach that allows pass-through to be calculated over various horizons, including controls for domestic and foreign costs. It studies how pass-through differs across types of consumption goods and services and draws some aggregate implications about pass-through, using actual weights from the CPI basket. The heterogeneity of pass-through for different food sub-components and the role of switches between import and export parity pricing of maize is investigated and found significant for five out of ten food sub-components. Overall pass-through to the almost 63 percent of the CPI covered is estimated at about 30 percent after two years, but is higher for food.
2013	F53 H83	CV: McCarthy, Paul. 2013. "Governance Structure of ICP 2005." In <i>Measuring the Real Size of the World Economy: The Framework, Methodology, and Results of the International Comparison Program--ICP</i> . World Bank, 47-57. Washington, D.C.: World Bank.
2013	L21	Otero Serrano, Juan. 2013. "The Influence of Macroeconomic Factors over the Firm's Diversification Strategy: Empirical Evidence from US Publicly Trading Firms from 1979 to 2006." <i>EsicMarket</i> , 0(144): 143-54. The objective of this research is to establish whether a relationship between firm motives for diversification and macroeconomic conditions exists. To measure the influence of the economic factors on the firm diversification decision, if any, several multi-factor models are employed. As a measurement of diversification level, the change in the number of segments per firm by year (SegGrowth) is estimated on some economic indexes. The study period is divided on sub-periods based on the bull and bear markets as defined by Dow Theory and the Standard & Poor's Equity Research. Results from the regression models suggest that the firm diversification decision is influenced by poor macroeconomic conditions. The average number of segments per year during bear market periods is significantly greater than that for the bull market periods. These results indicate that firms have a propensity to diversify during poor economic conditions. One possible explanation is that when the firm faces economic and financial risks, the diversification could be a solution to lower the risk or to exploit new productive opportunities.
2013	L21	Otero Serrano, Juan. 2013. "La influencia de los factores macroeconomicos sobre la estrategia de diversificacion corporativa: Datos empiricos de empresas de comercio publico de EE.UU. pertenecientes al periodo comprendido entre 1979 y 2006. (The Influence

2013	M37	Oust, Are. 2013. "Rent Indices, Oslo 1970-2008." <i>International Journal of Housing Markets and Analysis</i> , 6(3): 341-55. Purpose--Rents are both a very important cost variable in the housing market, having large welfare and distributional implication, and one of the most important variables in house price research. The aim of this paper is to construct rent indices for Norway's capital, Oslo. Design/methodology/approach--This paper uses a unique dataset with 24,257 housing for rent advertisements, creating hedonic indices using the time dummy variable method. Findings--In this paper, the author presents annual rent indices for Norway's capital, Oslo, over the period from 1970 to 2008. In addition to an aggregate index, they construct hedonic rent indices for different flat types. Originality/value--Existing Norwegian rent indices start around 2000 or are constructed with the purpose of being a part of the CPI, and are therefore adjusted for change in quality. Since the author's indices are not adjusted for quality, they give new information about Norwegian rent for the past 40 years.
2013	M37	Rauch, Ferdinand. 2013. "Advertising Expenditure and Consumer Prices." <i>International Journal of Industrial Organization</i> , 31(4): 331-41. This paper studies the effect of a change in the marginal costs of advertising on advertising expenditures of firms and on consumer prices. I make use of a policy change in Austria, that involved an increase of the taxation of advertising in parts of the country, and a simultaneous decrease in other parts. I show that advertising expenditures of firms move quickly in the opposite direction of the marginal costs of advertising. Consumer prices increase with advertising in some industries, and decrease in others. This effect correlates with informational differences in advertisements across industries.
2013	O25	Sharify, Nooraddin. 2013. "Input-Output Modelling of the Effect of Implicit Subsidies on General Prices." <i>Economic Modelling</i> , 33(0): 913-17. Implicit subsidies are implemented for different reasons in many countries. These subsidies generally emerge through selling public resources such as gas, oil, and water at a lower price to one or more sectors. They are not considered in government payments and national accounts. Hence, it is expected that any change in the size of these subsidies influences the price of the relative sectors through the intermediate expenditures. This paper aims at developing the table adjusting price (TAP) and standard Leontief price (SLP) models to measure the effect of an exogenous change in the size of implicit subsidy on the price indices of all sectors. The proposed models allowed the researcher to analyse a change in the level of implicit subsidy in different cases. In addition, an empirical example illustrates the result of the implementation of these models.
2013	O25	Zonooz, Behrooz Hady. 2013. "An Overview of Industrial Policies in Iran and Korea in 1960-2012." <i>Journal of Money and Economy</i> , 8(1): 31-74. Understanding the degree of price stickiness and the nature of price setting is necessary for analyzing the effects of monetary policy on economy. To the best of our knowledge, no comprehensive study has examined the degree of price stickiness in Iran yet. For this reason, we examine the basic features of retail price setting behavior using a large data set containing the micro data underlying the construction of the CPI over the period 2004:5 to 2011:9. First we calculate the frequency and size of price changes for 359 categories of consumer goods and services in order to obtain the degree of nominal rigidity of consumer prices. We then investigate what models of price setting, including time dependent and state dependent models, are more consistent with price adjustment pattern in Iran. Based on our results, Consumer prices are highly flexible and there is a high degree of downward rigidity. Also, there is a considerable amount of heterogeneity across sectors both in terms of the frequency and size of price changes. The methods used in this paper for identifying the pattern of pricing supports the existence of both time and state-dependent pricing patterns.
2013	O49	Berndt, Ernst R., and Iain M. Cockburn. 2013. <i>Price Indexes for Clinical Trial Research: A Feasibility Study</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 18918. We estimate hedonic price indexes for clinical trial research, an important component of biomedical R&D, using a large sample of agreements between trial sponsors and clinical investigators obtained from MediData Solutions Worldwide Inc. Nominal prices measured as total grant cost per patient rose by a factor of 4.5 between 1989 and 2011, while the NIH Biomedical R&D Price Index (BRDPI) focused on input costs rose only 2.2-fold. Most of the disparity appears to be attributable to changes in the nature and organization of clinical trials: during this period the average number of patients per site fell substantially while "site work effort" more than doubled. After controlling for these changes in the characteristics of investigator agreements using a variety of methods based on hedonic regressions, we find that the estimated rate of inflation in clinical trials costs tracks the BDRPI very closely. Results from this study suggest that it should be feasible for statistical agencies to develop a producer price index for this type of R&D activity, contributing to broader efforts to develop a deflator for contracted R&D services.
2013	R19	Nath, Hiranya K., and Jayanta Sarkar. 2013. <i>City Relative Price Dynamics in Australia: Are Structural Breaks Important?</i> . National Centre for Econometric Research, NCER Working Paper Series: 89. This paper examines the dynamic behaviour of relative prices across seven Australian cities by applying panel unit root test procedures with structural breaks to quarterly CPI data for 1972Q1-2011Q4. We find overwhelming evidence of convergence in city relative prices. Three common structural breaks are endogenously determined at 1985, 1995, and 2007. Further, correcting for two potential biases, namely Nickell bias and time aggregation bias, we obtain half-life estimates of 2.3-3.8 quarters that are much shorter than those reported by previous research. Thus, we conclude that both structural breaks and bias corrections are important to obtain shorter half-life estimates.

E31: Balance of Links

457	Links in 2005
142	New links in 2006-2013
223	Potential links at the end of 2013
822	Total

The date of final verification: December 22, 2017.

E31 — Contributors — Авторы

Baranov, Alexander O. — Баранов Александр Олегович — 0.55 AS²;

Lychagin, Anton M. — Лычагин Антон Михайлович — 1.05 AS;

Lychagin, Dmitry M. — Лычагин Дмитрий Михайлович — 0.5 AS;

Lychagin, Mikhail V. — Лычагин Михаил Васильевич — 1.1 AS;

Mkrtychyan, Gagik M. — Мкртчян Гагик Мкртичевич — 0.55 AS;

Muhina, Irina K. — Мухина Ирина Константиновна — 0.55 AS;

Popov, Ilya Y. — Попов Илья Юрьевич — 0.5 AS;

Slepenkova, Juiya M. — Слепенкова Юлия Михайловна — 0.5 AS;

Suslov, Victor I. — Суслов Виктор Иванович — 0.55 AS.

The total volume of derivative works for E31 is equal to 5.85 AS.

Общий объем раздела E31 — 5,85 авторских (уч.-изд.) л.

² AS — Author's Sheet — unit of measuring the volume of a literary work; equal to 40,000 characters (including the spaces between words), or 3,000 sq cm of illustrations (maps) like the table E31.E.

E32 Business Fluctuations; Cycles ¹

2006	C21	Bower, Uwe, and Catherine Guillemineau. 2006. <i>Determinants of business cycle synchronisation across euro area countries</i>. European Central Bank, Working Paper Series: 587. We investigate the key factors underlying business cycle synchronisation in the euro area applying the extreme-bounds analysis. We examine both traditional determinants and new, EMU-specific policy and structural indicators over the past 25 years. Our evidence seems to support the endogeneity hypothesis of the optimum currency area criteria. The implementation of the single market intensified bilateral trade across euro area countries and contributed to higher business cycle symmetry. The introduction of the single currency led to an intensification of intra-industry trade which has become the main driving force ensuring the coherence of business cycles. In addition, the set of robust determinants of business cycle synchronisation has varied over time, depending on the difference phases of the European construction, with fiscal policy, in addition to industrial and financial structures, playing a greater role during the completion of the Single Market, while short-term interest rate differentials and cyclical services have become more determinant since Economic and Monetary Union.
2006	C24	Huizinga, Harry, and Dantao Zhu. 2006. <i>Financial Structure and Macroeconomic Volatility: Theory and Evidence</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 5697. This paper presents a simple model capturing differences between debt and equity finance to examine how financial structure matters for macroeconomic volatility. Debt finance is relatively cheap in the sense that debt holders need to verify relatively few profitability states, but debt finance may lead to costly bankruptcy. At the aggregate level, a more debt-based financial structure leads to a higher bankruptcy rate. Therefore, aggregate output is more variable in case of a heavy reliance on debt finance. This paper provides empirical evidence that countries with more equity finance have a lower variance of GDP and a lower probability of episodes of negative economic growth.
2006	D53	Goenka, Aditya, and Christophe Prechac. 2006. "Stabilizing Sunspots." <i>Journal of Mathematical Economics</i>, 42(4-5): 544-55. This paper analyzes stabilization of sunspot equilibria in an incomplete financial market framework. Indexation of nominal bonds or introduction of real securities can eliminate the sunspot equilibria. However, we show that the utility of one type of consumer may be minimized at a Walrasian allocation relative to other sunspot equilibrium allocations. Thus, if considering stabilization policies from the status quo of incomplete financial markets, there may be no consensus on implementing them.
2006	D53	Kato, Ryo. 2006. "Liquidity, Infinite Horizons and Macroeconomic Fluctuations." <i>European Economic Review</i>, 50(5): 1105-30. This paper develops a computable dynamic general equilibrium model in which corporate demand for liquidity is endogenously determined. In the model, liquidity demand is motivated by moral hazard, as in Holmstrom and Tirole (J. Politic. Econom. 106(1998)1). As a result of incorporating agency cost and endogenously determined liquidity demand, the model can replicate an empirical business cycle fact, the hump-shaped dynamic response of output, which is seldom observed in standard RBC dynamics. Further, in the model the corporate demand for liquidity from a financial intermediary (credit line, for instance) is pro-cyclical, while the degree of liquidity dependence (defined as liquidity demand divided by corporate investment) is counter-cyclical. These business cycle patterns are consistent with a stylized fact empirically verified in the lending view literature.

2006	F10 L79	Munro, John. 2006. <i>The Rise, Expansion, and Decline of the Italian Cloth Industries, 1100 - 1730: a study in conjuncture, transaction costs, and comparative advantage</i>. University of Toronto, Department of Economics, Working Papers. This study of the Italian wool-based textile industries (woollens, worsteds, and serges) seeks to examine its rise, expansion, and ultimate decline, over a period of five centuries (from ca. 1200 to ca. 1730) in the context of both international competition and economic conjuncture,

Year	DE	Title and Abstract
		<p>in the context of the major macro-economic and demographic changes that the European economy experienced during these five centuries. The story commences during the so-called 'Commercial Revolution' era of the thirteenth-century when the Franco-Flemish cloth industries of north-west Europe dominated the international markets in a very wide range of these textiles, even in the Mediterranean basin. From the 1290s, and then into the better know period of the Hundred Years' War (1337-1453) the European economy suffered from the ravages of ever more widespread and debilitating warfare, throughout the Mediterranean basin and western Europe, and then from various factors, including plagues, that led to serious depopulation. The consequences led to a severe rise in transportation and transaction costs that gravely undermined the profitability of long-distance trade in cheaper textiles. That, in turn forced most textile manufacturers dependent on long-distance trade, and especially those who had operated as price-takers, to re-orient their export-based production to far higher priced, indeed luxury textiles, which could better sustain the burden of rising transactions costs, especially in acting as 'price-makers' engaged in monopolistic competition. That industrial-commercial transformation can be seen in the textile industries of northern France, the Low Countries, and England; but also those in Catalonia and above all in Italy: principally Tuscany and Lombardy. In so far as warfare and rising transaction costs limited the importation of even luxury textiles from north-west Europe, the Italian cloth industries thereby gained a far larger share of Mediterranean markets. This study focuses in particular on the ensuring history of the Florentine woollen cloth industry in the later Middle Ages. One price that all of these luxury-oriented cloth industries had to pay was steeply rising tax burdens on exported English wools; for the prime determinant of luxury quality in these textiles was the use of the finer grade English wools, the best in the world, until the development (through breeding and management) of Spanish merino wools, which finally succeeded in rivalling and then surpassing the English by the later sixteenth century. By the sixteenth century, with a reduction in European warfare and with renewed population growth, substantial economic growth, and significant innovations in transportation, transactions costs fell, and fell enough to make long-distance trade in cheaper textiles once more profitable; and that is reflected in product changes in the Florentine textile industry, which increasingly used Spanish merino wools in place of the English. But the most important events in the history of the Italian textile industries was the sudden rise of the Venetian cloth industry from the early to mid-sixteenth century, reaching a peak in the early seventeenth century, and then experiencing an equally rapid decline, in the famous of English textile competition, by the agency of the new Levant Company, which gained major advantages over the Italians in the large Ottoman Empire. The study concludes by examining the nature of those English advantages, which lay far more in the commercial (and transportation sphere) than in the industrial sphere, in terms of both traditional heavy weight woollens (made from Spanish wools) and the lighter, coarser, and cheaper fabrics of the English New Draperies (benefiting from a transformation in English wool production, from the Tudor-Stuart Enclosures). In sum: a study of comparative advantage in five centuries of international trade, in wool-based textiles, in terms of transaction costs, inputs (wools), and commercial organization.</p>
2006	F17	<p>Beffy, Pierre-Olivier, Patrice Ollivaud, Pete Richardson, and Franck Sedillot. 2006. <i>New OECD Methods for Supply-side and Medium-term Assessments: A Capital Services Approach</i>. OECD Economics Department, OECD Economics Department Working Papers: 482. The OECD makes frequent use of the supply-side framework and associated measures of factor productivity, productive potential and associated output gaps in the assessment of the short-term conjunctural situation, comparative economic performance and longer-term growth determinants. This paper describes a number of recent changes and improvements in the methods used in estimating potential output for OECD countries and the systems in which they are used, notably for the production of medium-term economic scenarios. By and large, these reflect important changes and improvements in available statistical data sets, notably for measuring productive capital, as well as the development of more efficient model-based methods for making medium-term projections on a consistent international basis.</p>
2006	F24	<p>Diss: Vargas-Silva, Carlos Ivan. 2006. Determinants and Consequences of Workers' Remittances. PhD diss. Western Michigan University. In this dissertation we study the determinants and consequences of workers' remittances. It is important for developing countries to have a clear understanding of the motivations that migrants have to remit money home, in order to increase remittances inflows. It is also important to understand the impact of remittances in the receiving countries in order to develop policies that can maximize the benefits of remittances, while minimizing any possible detrimental effects. In this dissertation we concentrate on the relationship between remittances and macroeconomic variables in the receiving countries. To this end we use both individual and aggregate level data. In the third chapter of this dissertation we study the determinants of workers' remittances using individual level data. We use data from the legalized population survey and place special emphasis on the impact of exchange rate changes and exchange rate volatility on remittances. In the fourth chapter we use Mexican aggregate-level data to study the relationship between remittances, exchange rates and money demand at the macroeconomic level. Given that macroeconomic variables are often endogenous we emphasize the bi-directional relationship between remittances and the exchange rate. Finally, we study the business cycle characteristics of remittances. If remittances are counter-cyclical then receiving countries can use remittances to offset negative cyclical fluctuations in output. On the other hand, if remittances are procyclical then remittances cannot offset cyclical fluctuations in output. Data from Mexico are used to investigate this issue. The results using individual level data suggest that remittances respond positively to exchange rate depreciations and negatively to exchange rate uncertainty. The results imply that migrants will remit more if there are incentives that make their remittances more valuable in the receiving country. The results also indicate that a decrease in the level of risk of investments in the receiving country will result in more remittances. The results using macroeconomic level data suggest that there is a bi-directional relationship between remittances and the exchange rate. Remittances appear to appreciate Mexico's exchange rate which may result in dutch disease. Also, remittances seem to impact domestic money demand positively. Finally, our results suggest that remittances are countercyclical.</p>
2006	F24	<p>Chavez Gutierrez, Fernando J. 2006. "Tres aspectos de la evolucion de las remesas familiares en Mexico, segun la ENIGH, 1984-2004. (Three Aspects Associated with the Evolution of Family Remittances in Mexico, According to ENIGH, 1984-2004. With English summary.)" <i>Analisis Economico</i>, 21(46): 59-93. The article's central objective is to understand the type of relation that exists in Mexico between remittances and family income, on the basis of analyzing data from the National Household Income-Expenditure Survey (ENIGH), in its nine editions: 1984 and 2004. A theoretical and methodological precision is made as regards the concept of family remittances, in view of the fact that much confusion exists on this point in the Mexican literature. The relation between remittances and family incomes during five different periods are described, and explained in relation to the evolution of Mexico's economic cycle. The characteristics of the distribution of remittances vis a vis the profile of income distribution is considered, taking into account the size of the different localities (urban or rural).</p>

2006	G29	<p>Boissay, Frederic. 2006. <i>Credit chains and the propagation of financial distress</i>. European Central Bank, Working Paper Series: 573. The purpose of this paper is to analyze how shocks propagate through a network of firms that borrow from, and lend to, each other in a trade credit chain, and to quantify the effects of financial contagion across firms. I develop a theoretical model of financial contagion, in which the default of one firm may cause a chain reaction such that its creditors also get into financial difficulties, even though they are sound in the first place. I calibrate and simulate the model using US annual data over the period 1986-2004. At the microeconomic level, I find that, when customers of a sound firm are financially distressed, then this firm gets into financial</p>

Year	DE	Title and Abstract
		difficulties with probability that ranges from 4.1% to 12.8% (depending on the business cycle and the underlying economic scenario). Looking at the macroeconomic level, I find that defaults on trade debts lower aggregate GDP by at least 0.4%. During the second half of the 90's, these deadweight losses doubled and reached a high of 0.9% to 2.3% of GDP (depending on the underlying economic scenario) before the recession of 2001. The results of the simulations also suggest that financial contagion across businesses had been 25% higher during the last recession than during the recession of the early 90's.

2006	L26	Ebner, Alexander. 2006. "Schumpeterian Entrepreneurship Revisited: Historical Specificity and the Phases of Capitalist Development." <i>Journal of the History of Economic Thought</i> , 28(3): 315-32.
2006	L26	Fuss, Roland, and Andrea Alexandra Nowak. 2006. "Venture Capital Cycles: Empirical Evidence from the USA." <i>Kredit und Kapital</i> , 39(2): 183-210. Due to their high innovative ability and flexibility, young technology ventures facilitate structural change in the economy. This results in the creation of new jobs and the opening up of the new sectors. In this context, venture capital companies play a central role by providing new firms with the required funds. However, the objective of venture capital investments is more than simply making venture capital available. Venture capitalists also help businesses to develop their management team, and enter into a temporary strategic partnership with the capital acquirer by taking seats on the board of the company. Venture capital financing represents a typical time-limited minority stake that is executed in iterative stages. The innovative thrust of this study is not only to identify significant cyclical patterns in the US venture capital market but also to ascertain the length of economic cycles, an aspect often neglected in previous studies. By way of contrast, the research shows that both the ARIMA technique and spectral analysis capture short-term fluctuation of between two and three quarters, corresponding to cycle length as identified by Gehrig and Stenbacka (2004) during the stage of project selection. The second cycle of 7.69 quarters located in this study is associated with the theory of the full investment process, which involves a period of between two and seven years. Overall, there is evidence that the US venture capital market constitutes a fully developed market with cyclical properties. Thus, it is expected, that the current market consolidation will once again increase in intensity. In addition, venture capital investments are investigated for a range of different industries, with contradictory results. While one low and one high cycle dominates the time series for some sectors, stable cycles occurred more often in other industries.
