Abstract:

The subseries of books “Atlas of New Research Based on EconLit (2006–2013)” uses the information regarding more than one million of publications from 1991–2013, derived from EconLit electronic bibliography. EconLit is the American Economic Association's comprehensive resource to the world's economic literature. The fifth volume of the subseries is devoted to JEL general category E “Macroeconomics and Monetary Economics”, which at the end of 2013 included 45 micro categories and reflected more than 270 thousand publications. The reader can find in this volume a composition of interconnected tables that contain:

1. The collection of bibliometric indicators that characterize the changes in general category E in 2006–2013 the changes in general category E in 2006–2013 from the point of view 20 macro, 127 meso and 822 micro categories.

2. Information of the 4,552 new subject links of 45 micro categories that belong to general category E within 2006–2013 and that are presented in 17,221 publications. The contributors discover bibliographic information and abstracts concerning the first works on the new intersections of the subject micro categories, as well as 20.5 thousand potential intersections at the end of 2013.

Appendices include summarizing data for all 45 micro categories, information about the publication containing many new subject links, Atlas Tables Guide, and example of dynamic frequency dictionary for the terms of general category E.

The publication is intended for economists, researchers, teachers, graduate students, undergraduates and university students specializing in economics.

The American Economic Association has given its permission to develop the presented set of derivative works based on EconLit and to publish our results in English and in Russian.

Макет библиографического описания:

Atlas of new research studies on the basis of EconLit (2006–2013) [Электронный ресурс]: в 19 т. / Новосибир. гос. ун-т, ИЭОПП СО РАН. – Новосибирск: ИПЦ НГУ, 2016–. – (Серия: Инновационный библиометрический анализ в экономических исследованиях). - На англ. яз., с фрагментами на рус. яз. – Microsoft Windows XP/Vista/7/8; Adobe Reader 9.0 и выше. ISBN 978-5-4437-0536-1 (серия).

T.5: JEL-категория E / [под ред. М.В. Лычагина, Г.М. Мкртчяна, В.И. Сулова, А.О. Баранова]. Электрон. дан. (37,3 Мб). - 2018. - 1 электрон. опт. диск (CD-R) - ISBN 978-5-4437-0583-5.

Аннотация:

Подсерия книг “Атлас новых исследований на основе EconLit (2006–2013)” использует информацию о более чем одном миллионе публикаций за 1991–2013 гг., извлеченную из электронной библиографии EconLit. EconLit создана Американской экономической ассоциацией и охватывает мировую экономическую литературу. Пятый том подсерии посвящен JEL-макрокатегории E “Макроэкономика и монетарная экономика”. В конце 2013 г. эта макрокатегория включала в себя 45 микрокатегорий и нашла свое отражение более чем в 270 тыс. публикациях. Читатель может найти в данном издании набор взаимосвязанных таблиц, которые содержат:

1. Совокупность библиометрических показателей, которые характеризуют изменения предметной области E в 2006–2013 гг. в разрезе 20 макро-, 127 мезо- и 822 микрокатегорий JEL.

2. Сведения о 4552 новых предметных связях 45 микрокатегорий макрокатегории E за 2006–2013 гг., представленных в 17221 публикации, с раскрытием библиографических сведений и рефератов первых работ на новых пересечениях предметных микрокатегорий. На конец 2013 г. указано 20,5 тыс. еще не использованных предметных пересечений.

Приложения содержат обобщающие данные по всем 45 микрокатегориям, сведения о работах со многими предметными связями, путеводитель по таблицам тома и пример динамического частотного словаря для терминов категории E.

Издание предназначено для экономистов, исследователей, преподавателей, аспирантов, магистрантов и студентов экономических специальностей вузов.

Американская экономическая ассоциация дала любезное разрешение осуществить совокупность производных работ на основе EconLit и опубликовать полученные результаты на английском и русском языках.

EDITORIAL PREFACE

The historical origins of the text statistical analysis could be found in the ancient Indian treatise “Arthashastra” (III in. BC. E.). In the last three decades the world of science including the economics have seen a significant increase in the interest for bibliometrics¹. It is possible to consider the series of digital books “Innovative Bibliometric Analysis in Economics” and its subseries as a response to this tendency.

This volume belongs to a subseries of 19 books under the title of “Atlas of new research based on EconLit. 2006–2013”. Each volume is devoted to one of the general categories of JEL subject classification. The subseries uses the information regarding more than one million of publications from 1991–2013, derived from EconLit electronic bibliography. EconLit is the American Economic Association's comprehensive resource to the world's economic literature. EconLit includes the most sought-after economics publications including peer-reviewed journal articles, working papers from leading universities, PhD dissertations, books, collective volume articles, conference proceedings, and book reviews — all expertly indexed, classified, and linkable to full-text library holdings (see www.aeaweb.org/econlit).

The fifth volume of the subseries is devoted to JEL general category E “Macroeconomics and Monetary Economics”, which at the end of 2013 included 45 micro categories and reflected more than 270 thousand publications. The reader can find in this volume a composition of interconnected tables that contain:

1. The collection of bibliometric indicators that characterize the changes in general category E in 2006–2013 the changes in general category E in 2006–2013 from the point of view 20 macro, 127 meso and 822 micro categories.

2. Information of the 4,552 new subject links of 45 micro categories that belong to general category E within 2006–2013 and that are presented in 17,221 publications. The contributors discover bibliographic information and abstracts concerning the first works on the new intersections of the subject micro categories, as well as 20.5 thousand potential intersections at the end of 2013.

Appendices include summarizing data for all 45 micro categories, information about the publication containing many new subject links, Atlas Tables Guide, and example of dynamic frequency dictionary for the terms of general category E.

Who can benefit from the proposed project?

1. Researchers will have an opportunity to assess the data from EconLit related to the areas of their research interest and to identify emerging areas of work as the intersection of their areas of study.

¹ See Application A1 in Lychagin, Mikhail V., Gagik M. Mkrtchyan, and Victor I. Suslov, eds. 2016. *Atlas of New Research based on EconLit (2006–2013): Vol. 1 JEL Category A (with fragments in Russian)*, Innovative Bibliometric Analysis in Economics series. Novosibirsk: Novosibirsk State University Press. URI: <http://www.nsu.ru/xmlui/handle/nsu/11392>.

2. PhD and post doctorate students, their supervisors, members of the dissertations councils and expert's boards, industry practitioners etc. The new information provides a way to evaluate the extent of a problem by applying the perspective of "Global Maps of Economic Research". We would like to highlight that the entry into EconLit provides an opportunity to be published not only in scientific journals but also in other types of publications such as books, articles in collections of papers etc.

3. The value for university and college education of these monographs and reference books is two-fold. First, as an opportunity to strengthen the research component for the course and graduation works. Second, quantitative evaluation of the existing links between subject areas, which will clarify the structure, and content of curriculum and academic programs.

Acknowledgements:

On behalf of the participants of this project, we are grateful to the American Economic Association team. The AEA constantly provided a great support to economic research and education around the world. Our very special thanks to Regina Montgomery, administrative director of the AEA for efficient resolution of organizational issues, and to Doug Quint, who were able to find ways to effectively support of our online version of EconLit.

Various aspects for bibliometric analysis have been discussed with colleagues from research organizations and higher educational institutions of Russia (Central Economic Mathematical Institute, State University – Higher School of Economics, Saint Petersburg State Polytechnic University, etc.) during scientific conferences, symposiums, individual interviews etc. We express our appreciation for the valuable advices, remarks and comments.

We appreciate the continued support of the two organizations, whose names are placed on the title page of each volume: Novosibirsk State University (NSU) and the Institute of Economics and Industrial Engineering of SB RAS (IEIE). We want to offer our gratitude to the NSU and IEIE academic libraries. Our thanks to Novosibirsk State University Press, which took over the responsibility of the project output to the completion.

Eugene V. Molodin, a member of the Union of Artists of Russia, did an original design for the front side of the discs with project volumes. The company "PIKTOGRAMMA-98" completed the process of recording information and printing creative labels.

This project would not be possible without the dedicated efforts and creative work of a large group of authors, which included students, undergraduates, graduate students, faculty and staff of NSU, IEIE SB RAS and some other organizations. To all of them, as well as our friendly members of the Editorial Board, we say, "Thank you!"

Mikhail V. Lychagin, Gagik M. Mkrtchayn,
Victor I. Suslov, and Alexander O. Baranov

ПРЕДИСЛОВИЕ РЕДАКТОРОВ

Истоки статистического анализа текста можно найти в древнеиндийском трактате “Артхашастра” (III в. до н. э.). В последние три десятилетия в мировой науке, в том числе и экономической, наблюдается резкий рост интереса к библиометрии². В ответ на эту тенденцию была задумана и стала публиковаться в электронной форме серия работ “Инновационный библиометрический анализ в экономических исследованиях”

Предлагаемый том входит в подсерию из 19 книг в электронной форме под общим названием “Атлас новых исследований на основе EconLit. 2006–2013”. Каждый том посвящен одной из макрокатегорий предметной классификации JEL³. В подсерии использована информация о более чем одном миллионе публикаций за 1991–2013 гг., извлеченную из электронной библиографии EconLit. EconLit является электронной библиографией, которая создана Американской экономической ассоциацией отражения мировой экономической литературы. EconLit включает наиболее известные научные экономические публикации: статьи из рецензируемых журналов, препринты ведущих университетов, диссертации на соискание ученой степени “доктор философии”, книги, сборники научных трудов, материалы конференций, рецензии на книги. Все источники индексируются и классифицируются экспертами и имеют ссылки на полные тексты соответствующих изданий (www.aeaweb.org/econlit).

Пятый том подсерии посвящен JEL-макратегории E “Макроэкономика и монетарная экономика”. В конце 2013 г. эта макрокатегория включала в себя 45 микрокатегорий и нашла свое отражение более чем в 270 тыс. публикациях. Читатель может найти в данном издании набор взаимосвязанных таблиц, которые содержат:

1. Совокупность библиометрических показателей, которые характеризуют изменения предметной области В в 2006–2013 гг. в разрезе 20 макро-, 127 мезо- и 822 микрокатегорий JEL.

2. Сведения о 4552 новых предметных связях 45 микрокатегорий макрокатегории E за 2006–2013 гг., представленных в 17221 публикации, с раскрытием библиографических сведений и рефератов первых работ на новых пересечениях предметных микрокатегорий. На конец 2013 г. указано 20,5 тыс. еще не использованных предметных пересечений.

Приложения содержат обобщающие данные по всем 45 микрокатегориям, сведения о работах со многими предметными связями, путеводитель по таблицам тома и пример динамического частотного словаря для терминов категории E.

Кому может принести пользу предлагаемый проект?

1. Экономистам-исследователям, у которых появится возможность с учетом данных EconLit дать оценку сложившимся областям исследований и выявить зарождающиеся направления работ на пересечениях предметных областей.

² См. приложение A2 в Atlas of New Research Based on EconLit (2006–2013) [Electronic resource]: with 19 vol. / [Novosibirsk State University; Institute of Economics and Industrial Engineering of SB RAS]. – Novosibirsk: Novosibirsk State University Press, 2016. Vol. 1: JEL Category A / [Lychagin, Mikhail V., Gagik M. Mkrtchyan, and Victor I. Suslov, eds.] - Атлас новых исследований на основе EconLit (2006–2013) [Электронный ресурс]: в 19 т. / Новосибир. гос. ун-т, ИЭОПП СО РАН. – Новосибирск : Новосиб. гос. ун-т, 2016. Т.1: JEL категория A / [под ред. М.В. Лычагина, Г.М. Мкртчяна, В.И. Сулова]. Номер госрегистрации: 0321603130. URI: <http://www.nsu.ru/xmlui/handle/nsu/11392>.

³ Наименования микрокатегорий на русском языке приведены в приложении С.

2. Соискателям ученых степеней, их научным руководителям, членам диссертационным и экспертных советов. Новые данные позволят проводить оценку степени разработанности проблемы с позиции “глобальной карты экономических исследований”. Очевидно, чем быстрее и активнее отечественные научные работы будут переводиться на английский язык и включаться в признанные библиографии (EconLit и др.), электронные библиотеки, индексы цитирования и т.п., тем более четко можно будет видеть российские достижения и нерешенные вопросы. Подчеркнем, что вхождение в EconLit предоставляет возможность не ограничиваться публикациями в журналах, а знакомить мир с другими видами публикаций (книги, статьи в сборниках трудов и т.д.).

3. Для высшего профессионального образования ценность предлагаемых монографий-справочников двойка. Во-первых, как в предыдущем пункте — это возможность усилить исследовательский компонент в курсовых и выпускных квалификационных работах. Во-вторых, количественная оценка сложившихся связей между предметными областями позволит уточнить структуру и наполнение учебных планов и программ.

Благодарности

От имени коллектива участников проекта выражаем признательность Американской экономической ассоциации, которая оказывает большое содействие развитию экономических исследований и образования во всем мире. Наша особая благодарность Регине Монтгомери, административному директору АЕА, за оперативное решение возникавших организационных вопросов, и Дугу Квинту, благодаря советам которого нам удавалось находить способы эффективного использования онлайн-варианта EconLit.

Отдельные стороны библиометрического анализа неоднократно обсуждались с коллегами из научно-исследовательских организаций и высших учебных заведений России (Центральный экономико-математический институт РАН, Государственный университет – Высшая школа экономики, Санкт-Петербургский политехнический университет Петра Великого и др.) в рамках научных конференций, симпозиумов, отдельных бесед. Выражаем им признательность за ценные советы и замечания.

Мы высоко ценим постоянную поддержку двух организаций, названия которых размещены на титульном листе каждого тома: Новосибирского государственного университета и Института экономики и организации промышленного производства СО РАН. Особо хотим поблагодарить научные библиотеки НГУ и ИЭОПП и редакционно-издательский отдел издательско-полиграфического центра НГУ, который взял на себя ответственность за вывод проекта на финишную прямую.

Компакт-диски с томами проекта радуют глаз благодаря Е. В. Молодину, члену Союза художников России, создавшему оригинальный дизайн лицевой стороны дисков, и сотрудникам ООО “ПИКТОГРАММА-98”, осуществившим процесс записи информации и оформления дисков.

Реализация данного проекта была бы невозможна без самоотверженной и творческой работы большого авторского коллектива, в который входили студенты, магистранты, аспиранты, преподаватели и сотрудники НГУ, ИЭОПП СО РАН и некоторых других организаций. Всем им, а также членам нашего дружного редакционного совета, мы говорим: “Большое спасибо!”.

М. В. Лычагин, Г. М. Мкртчян,
В. И. Суслов, А. О. Баранов

Year	DE	Title and Abstract
2006		
2006	E65 N01	Richardson, Gary. 2006. <i>Bank Distress during the Great Depression: The Illiquidity-Insolvency Debate Revisited</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 12717. During the contraction from 1929 through 1933, the Federal Reserve System tracked changes in the status of all banks operating in the United States and determined the cause of each bank suspension. This essay analyzes chronological patterns in aggregate series constructed from that data. The analysis demonstrates both illiquidity and insolvency were substantial sources of bank distress. Periods of heightened distress were correlated with periods of increased illiquidity. Contagion via correspondent networks and bank runs propagated the initial banking panics. As the depression deepened and asset values declined, insolvency loomed as the principal threat to depository institutions.
2006	F01	Maier, Philipp. 2006. <i>China in 2006: An economist's view</i> . Netherlands Central Bank, Research Department, DNB Occasional Studies. Since the start of the economic transformation in 1978, China has been growing at spectacular level. Given the size and growth of its economy, China is in a position to substantially influence world commodity prices and prices for various consumption goods. This report summarises insights from a trip to China, aimed at getting better understanding of how the Chinese economy 'works'. Based on talks with government officials, Chinese and foreign firms, we provide evidence that (i) through piecemeal introduction of market elements, China has successfully made the transition from a planned economy to a market economy; (ii) political stability is an important determining the attractiveness of China for foreign investors, and (iii) regional disparities are huge, which might at some point pose a concern to further growth. Also we note that China is primarily growing through use of more inputs, not through high productivity. Looking forward, input-based growth is typically not sustainable. As productivity does not tend to grow by 10 percent annually, China's economy will probably slow down at some point. Lastly, we expect that in the medium term, real wages will rise. The resulting expansion of China's domestic market would create new export opportunities for Western firms.
2006	G31	Philippon, Thomas. 2006. <i>The q-Theory of Investment</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 12462. I propose a new implementation of the q-theory of investment using corporate bond yields instead of equity prices. In q-theory, the optimal investment rate is a function of risk-adjusted discount rates and of future marginal profitability. Corporate bond prices also depend on these variables. I show that, when aggregate shocks are small, aggregate q is a linear combination of risk free rates and average yields on risky corporate debt. The yield-theory of investment, unlike its equity-based counterpart, is empirically successful: it can account for more than half of the volatility of investment in post-war US data, it drives out cash flows from the investment equation, and it delivers sensible estimates for the parameters of the adjustment cost function.
2006	N01	THE SAME AS E65 Richardson, Gary. 2006. <i>Bank Distress during the Great Depression: The Illiquidity-Insolvency Debate Revisited</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 12717.
2007		
2007	A32	Barnett, William A., and Apostolos Serletis, eds. 2007. <i>Functional Structure Inference, International Symposia in Economic Theory and Econometrics</i> , vol. 18. Amsterdam and Boston: Elsevier. Seventeen papers, most originally presented at a conference held by the Society for the Advancement of Economic Theory in Vigo, Spain, in July 2005, explore new research and innovations in microeconometrics, macroeconomics, and monetary and financial economics. Papers discuss testing the significance of the departures from weak separability; quantity constraints and violations of revealed preference; nonparametric tests of the necessary and sufficient conditions for separability; Bayesian estimation of flexible functional forms, curvature conditions, and the demand for assets; productivity and convergence trends in the OECD--evidence from a normalized quadratic variable profit function; the theoretical regularity properties of the normalized quadratic consumer demand model; Canada's exchange rate regime; tests of microeconomic foundations of an Australia/New Zealand common currency area; food demand in Sweden--a nonparametric approach; a systems approach to modeling asymmetric demand responses to energy price changes; rational seasonality; Hopf bifurcation within new Keynesian functional structure; insurance and asset prices in constrained markets; labor adjustment costs, shocks, and the real business cycle; optimal fiscal policy in an asymmetric small open economy; endogenous time preference, cash-in-advance constraints, and the Tobin effect; and the implications of different cash-in-advance constraints with endogenous labor.
2007	B24	CV; Dow, Sheila. 2007. "Heterodox Economics: A Common Challenge to Mainstream Economics?." In <i>Money, Distribution and Economic Policy: Alternatives to Orthodox Macroeconomics</i> , ed. Eckhard Hein and Achim Truger, 31-46. New Directions in Modern Economics. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2007	C01	DeJong, David N. 2007. <i>Structural Macroeconometrics</i> , With Chetan Dave. Princeton and Oxford: Princeton University Press. Provides a unified overview and in-depth treatment analysts need to apply current theoretical models and empirical techniques in time series econometrics. Discusses approximating and solving dynamic stochastic general equilibrium (DSGE) models; removing trends and isolating cycles; summarizing time series behavior; DSGE models--three examples; calibration; matching moments; maximum likelihood; Bayesian methods; nonlinear approximation methods; and implementing nonlinear approximations empirically.
2007	C01	Aldrich, John, and Anna Staszewska. 2007. "The Experiment in Macroeconometrics." <i>Journal of Economic Methodology</i> , 14(2): 143-66. This paper examines the experiment in macroeconometrics, the different forms it has taken and the rules that have been proposed for its proper conduct. Here an 'experiment' means putting a question to a model and getting an answer. Different types of experiment are distinguished and the justification that can be provided for a particular choice of experiment is discussed. Three types of macroeconomic modelling are considered: the Cowles (system of equations) approach, the vector autoregressive model approach and the computational experiment.
2007	D70	Tabellini, Guido. 2007. <i>Culture and Institutions</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 6589. How and why does distant political and economic history shape the functioning of current institutions? This paper argues that individual values and convictions about the scope of application of norms of good conduct provide the "missing link". Evidence from a variety of sources points to two main findings. First, individual values consistent with generalized (as opposed to limited) morality are widespread in societies that were ruled by non-despotic political institutions in the distant past. Second, well functioning institutions are often observed in countries or regions where individual values are consistent with generalized morality, and under different identifying assumptions this suggests a causal effect from values to institutional outcomes. The paper ends with a discussion of the implications for future research.

Year	DE	Title and Abstract
2007	F34	Saravia., Diego. 2007. <i>On the Role and Effects of IMF Seniority</i>. Instituto de Economía. Pontificia Universidad Católica de Chile., Documentos de Trabajo: 317. We analyze the IMF as a lender to countries in financial distress highlighting the fact that it is a senior creditor. An advantage of delegating senior lending in a single institution rather than on competitive markets is that it would be able to reach the socially optimal solution. This would require the IMF not to intervene when the crisis is severe enough. However, a commitment device might be needed to achieve the socially optimal solution. If IMF lending were done for all shocks, the country would be always ex-post better off but lenders would be worse off when the country situation is either good or weak, which is consistent with empirical evidence. Anticipation of senior lending might make the country better off by preventing inefficient liquidation. However it might actually hurt the country ex-ante and too much rescuing in the future could lead to too little lending in the present which is contrary to the moral hazard critique.
2007	J10	Cavalcanti, Tiago, and Jose Tavares. 2007. <i>The Output Cost of Gender Discrimination: A Model-Based Macroeconomic Estimate</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 6477. Gender-based discrimination is a pervasive and costly phenomenon. To a greater or lesser extent, all economies present a gender wage gap, associated with lower female labour force participation rates and higher fertility. This paper presents a growth model where saving, fertility and labour market participation are endogenously determined, and there is wage discrimination. The model is calibrated to mimic the performance of the U.S. economy, including the gender wage gap and relative female labour force participation. We then compute the output cost of an increase in discrimination, to find that a 50 percent increase in the gender wage gap leads to a decrease in income per capita of a quarter of the original output. We then compile independent estimates of the female to male earnings ratio for a wide cross-section of countries to construct a new economy, in line with the benchmark U.S. economy, except for the degree of discrimination. We compare the level of output per capita predicted by this model economy with the actual output per capita for each country. Higher discrimination leads to lower output per capita for two reasons: a direct decrease in female labour market participation and an indirect effect through an increase in fertility. We find that for several countries a large fraction of the actual difference in output per capita between the U.S. and the different economies is due to gender inequality. For countries such as Ireland and Saudi Arabia, wage discrimination actually explains all of the output difference with the U.S. Moreover, we find that the increase in fertility due to discrimination is responsible for almost half of the decrease in output per capita, and equivalent to the direct decrease in output due to lower female participation. Our basic model suggests the costs of gender discrimination are indeed quite substantial and should be a central concern in any macroeconomic policy aimed at increasing output per capita in the long-run.
2007	L16	Lin, Justin Yifu. 2007. "Wave Phenomenon and the Reconstruction of Macroeconomic Theories for Developing Countries. (In Chinese. With English summary.)." <i>Jingji Yanjiu/Economic Research Journal</i>, 42(1): 126-31. It is an implicit assumption in the existing macroeconomics that there is no consensus among firms about which the next promising industry will be in the process of economic growth. However, because of the advantages of backwardness, firms in a developing country find it easy to form a consensus about the next promising industry. The consensus often leads to a wave phenomenon in the firms' investments and results in over capacity in the new industry and a series of related economic problems. It is imperative to relax the above implicit assumption and reconstruct a new macroeconomics to explore the implications of the investments' wave phenomenon on prices, employment, economic growth, and business cycles in a developing country so as to provide the government with references for making fiscal, monetary, financial, trade, industrial development, and other macroeconomic management policies.
2008		
2008	D30	Mourougane, Annabelle, and Lukas Vogel. 2008. <i>Short-term distributional effects of structural reforms: selected simulations in a DGSE framework</i>. OECD Economics Department, OECD Economics Department Working Papers: 648. This paper examines the short-term distributional effects of a number of tax and labour market reforms in the euro area, drawing on simulations using a micro-founded dynamic general equilibrium model. A heterogeneous household sector with two groups of consumers is considered. The first group maximises intertemporal utility over an infinite horizon in the presence of habit persistence. The second group is liquidity constrained and has no access to financial markets for intertemporal income transfers. It thus spends its disposable income entirely on current consumption. Although the examined reforms are estimated to boost aggregate consumption and output immediately after implementation, they have sizeable distributional effects. In particular, liquidity-constrained households may incur transitional losses after a cut in the benefit replacement ratio. Lowering employment and/or price adjustment costs could markedly reduce these short-term costs. A suitable compensation scheme could also reduce the uneven distribution of transitional losses, but at the expense of lower aggregate gains in the long run.
2008	D31	Diss: D'Erasmo, Pablo. 2008. Essays in Dynamic Macroeconomics. PhD diss. University of Texas. The focus of my research is dynamic macroeconomics and how the economy responds to changes in government policy. During the last 30 years, the sovereign bond market in emerging economies has grown considerably and many large scale defaults were observed. Existing models of sovereign debt are unable to jointly explain the debt to output ratios and the default frequency in these countries. In the first chapter, to address this puzzle, I propose a standard small open economy model with the addition that the government transits through different political states and these transitions cannot be directly observed by lenders. Moreover, after a default, the government chooses when to renegotiate and it bargains with the lenders over the recovery rate. I show that government reputation and endogenous periods of exclusion and recovery rates play a crucial role in explaining this phenomenon. In the second chapter, I use a dynamic political economy model to evaluate whether the observed rise in wage inequality and decrease in median to mean wages can explain the increase in transfers to low earnings quintiles and increase in effective tax rates for high earnings quintiles in the U.S. over the past several decades. I conduct a welfare analysis by contrasting the solution from the political mechanism with those from a sequential utilitarian mechanism, as well as mechanisms with commitment. Finally, the third chapter focuses on explaining the dynamics of firms. I ask whether an entry/exit model like that pioneered by Hopenhayn (1992, Econometrica) with a capital accumulation decision and non-convex costs of adjustment can generate size and age dependence like that found in the data. In particular, conditional on size, growth, employment creation and destruction and volatility are decreasing in size. Moreover, conditional on size, growth, employment creation and destruction and volatility are decreasing in age. The main point of this chapter is to demonstrate that a model with no financial frictions parameterized to match the investment regularities of U.S. establishments is able to account for the simultaneous dependence of industry dynamics on size (once we condition on age) and on age (once we condition on size). To explain how the economy responds and conduct welfare analysis either one has to find natural experiments or one has to build computational models and run counterfactual experiments. My research follows the latter strategy.
2008	D86	Diss: Ordonez, Guillermo Luis. 2008. Essays on Learning and Macroeconomics. PhD diss. University of California, Los Angeles. This dissertation contains four essays that apply techniques of learning and implicit contracts to the analysis of macroeconomic problems. The first essay explores the role of borrowers' reputation concerns in the magnification of macroeconomic crises. The second essay investigates the importance of financial frictions in delaying the recovery of economies after crises. The third essay (coauthored with David Lagakos) develops an implicit contract model to understand the differences in wage smoothing across

Year	DE	Title and Abstract
		industries. The fourth essay studies the effects of different signalling technologies in the efficiency of organizations with career concerned managers.
2008	F36	Caporale, Guglielmo Maria, Davide Ciferri, and Alessandro Girardi. 2008. <i>Are the Baltic Countries Ready to Adopt the Euro? A Generalised Purchasing Power Parity Approach</i> . CESifo GmbH, CESifo Working Paper Series: CESifo Working Paper No. 2359. This paper focuses on macroeconomic interdependencies between the Euro area and three transition economies (Estonia, Lithuania and Latvia), with the aim of establishing whether the latter are ready to adopt the Euro. The theoretical framework is based on the Generalised Purchasing Power Parity (GPPP) hypothesis, which is empirically tested within a Vector Error Correction (VEC) model. Using both monthly and quarterly data over the period 1993-2005, it is found that GPPP holds for the real exchange rate vis-a-vis the Euro of each Baltic country, reflecting a degree of real convergence consistent with Optimum Currency Area criteria. Further, the adopted joint modelling approach for the real exchange rates of the Baltic region outperforms a number of alternative models in terms of out-of-sample forecasts.
2008	J21 J23	Dew-Becker, Ian, and Robert J. Gordon. 2008. <i>The Role of Labor Market Changes in the Slowdown of European Productivity Growth</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 13840. Throughout the postwar era until 1995 labor productivity grew faster in Europe than in the United States. Since 1995, productivity growth in the EU-15 has slowed while that in the United States has accelerated. But Europe's productivity growth slowdown was largely offset by faster growth in employment per capita, leaving little difference in growth of output per capita between the EU and US going back to 1980. This paper is about the strong negative tradeoff between productivity and employment growth within Europe. We document this tradeoff in the raw data, in regressions that control for the two-way causation between productivity and employment growth, and we show that there is a robust negative correlation between productivity and employment growth across countries and time. Our primary explanatory variables to explain both the revival of EU employment growth and the slowdown in productivity growth include six policy and institutional variables. We find that several of these variables have significant negative effects on employment per capita, both before and after 1995. We also find a significant time effect, that the increase in European employment per capita increased after 1995 for reasons that go beyond our six explanatory variables, and we link this time effect to a secular increase in the labor-force participation of women, particularly in southern European countries. We conclude by suggesting that evaluations of alternative policy reforms in Europe should take into account any offsetting effects on employment and productivity by examining the ultimate impact on changes in income per capita.
2008	Q50	Diss: Sikdar, Shiva. 2008. <i>Essays on Macroeconomics, International Trade, and the Environment</i> . PhD diss. Iowa State University.
2008	Z10	Guiso, Luigi, Paola Sapienza, and Luigi Zingales. 2008. <i>Social Capital as Good Culture</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 6657. To explain the extremely long-term persistence (more than 500 years) of positive historical experiences of cooperation (Putnam 1993), we model the intergenerational transmission of priors about the trustworthiness of others. We show that this transmission tends to be biased toward excessively conservative priors. As a result, societies can be trapped in a low-trust equilibrium. In this context, a temporary shock to the return to trusting can have a permanent effect on the level of trust. We validate the model by testing its predictions on the World Values Survey data and the German Socio Economic Panel. We also present some anecdotal evidence that differences in priors across regions are reflected in the spirit of the novels that originate from those regions.

2009	B54	Garba, P. Kassey, and Abdul-Ganiyu Garba. 2009. "Towards Engendered Macroeconomics for the Development of Africa." <i>Nigerian Journal of Economic and Social Studies</i> , 51(1): 45-58. This paper reviews mainstream efforts at engendering macroeconomics frameworks and deduced two main conclusions therefrom. First, that the engendering of macroeconomics may be building on the wrong foundations if the objective is to produce engendered macroeconomic policy that can deal with the multi-level and multi-dimensional problems of gender inequity, poverty and underdevelopment. Second, that the engendered macroeconomics that is desired could systematically begin from first principles by exploiting the visionary hopes of The General Theory while avoiding its weaknesses. The paper then argues that generating a desired engendered macroeconomics would require: (a) a reconsideration of the concept of value, (b) identification of new and more appropriate units of quantities/qualities for macro-global analysis consistent with current national and global realities, (c) a clear definition and categorization of variables of macro-global inquiry given current realities and the demands of gender equity and poverty reduction, (d) a robust debate on methodology, (e) clear specification of global, macro, meso and micro constraints, their interactions and welfare implications and (f) explicit analysis and estimation of externalities in generating a new system of national income accounting.
2009	C02	Farmer, Roger E. A., Tao Zha, and Daniel F. Waggoner. 2009. <i>Understanding Markov-Switching Rational Expectations Models</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 14710. We develop a set of necessary and sufficient conditions for equilibria to be determinate in a class of forward-looking Markov-switching rational expectations models and we develop an algorithm to check these conditions in practice. We use three examples, based on the new-Keynesian model of monetary policy, to illustrate our technique. Our work connects applied econometric models of Markov-switching with forward looking rational expectations models and allows an applied researcher to construct the likelihood function for models in this class over a parameter space that includes a determinate region and an indeterminate region.
2009	C20 E01 E27	Heim, John J. 2009. <i>The Real Exchange Rate And The U. S. Economy 2000-2008</i> . Rensselaer Polytechnic Institute, Department of Economics, Rensselaer Working Papers in Economics. This paper is a revision of Rensselaer Polytechnic Institute's Working Papers in Economics Series, No. 803, entitled "How Falling Exchange Rates 2000-2007 Have Affected the U.S. Economy and Trade Deficit (Evaluated Using the Federal Reserve's Real Broad Exchange Rate)". It expands the analysis to measure exchange rate effects on the U.S. economy through 2008. It also utilizes a significantly improved method for assessing the meaning of the regression coefficient on the exchange rate variable in consumption and investment functions, removing ambiguity as to whether they should be interpreted as income or substitution effects. The paper attempts econometrically, using a seven behavioral equation model, to determine the total impact during 2000-2008 of the U.S. real exchange rate's 13.8% decline. Using projections based on an econometric model of the U.S. economy 1960-2000, the paper suggests that the effect on demand for domestically produced consumer goods (and exports) is positive, but strongly negative for investment goods. The estimated overall negative effect of declining real exchange rates on the GDP is 1.9% over the eight years, or about a quarter percent decline a year. This revised estimate is less than half the estimated impact reported Working Paper 803. It is estimated the decline reduced the trade deficit \$189 billion from what it otherwise would have been, down from \$244 billion reported Working Paper 803.
2009	C20 E01 E27	Heim, John J. 2009. <i>Demand For Durable Goods, Nondurable Goods And Services</i> . Rensselaer Polytechnic Institute, Department of Economics, Rensselaer Working Papers in Economics. Separate macroeconomic consumption demand functions are developed and tested for (1) durable goods, (2) nondurable goods and (3) services. These are compared for consistency with econometric studies of total consumer demand. Key factors determining demand for these goods are tested using U.S. 1960-2000 data. The econometric

Year	DE	Title and Abstract
		method used was 2SLS with heteroskedasticity controls. Data in first differences are used to reduce multicollinearity, non stationarity and autocorrelation. The models explain 94% of the variance in demand for consumer durables, 86% of demand for nondurable consumer goods and 81% of services demand. Demand for durables like autos and appliances, was found to be driven by the disposable income, wealth, the exchange rate, availability of consumer credit, interest rates on consumer credit, demand for new housing, which affects appliance demand, and population growth. Demand for nondurable goods, such as groceries and clothes, was driven by the same factors, except for new housing demand and the exchange rate. Demand for consumer services such as laundry, restaurant, and entertainment services was found to be related to disposable income, wealth, and population growth, but not related to consumer credit availability, or consumer credit interest rates. However, mortgage interest rates paid by households did seem to affect the demand for services.
2009	E01	Garba, P. Kassey, and Abdul-Ganiyu Garba. 2009. "Towards Engendered Macroeconomics for the Development of Africa." <i>Nigerian Journal of Economic and Social Studies</i> , 51(1): 45-58. 2009	E25 J11	Feyrer, James. 2009. <i>The US Productivity Slowdown, the Baby Boom, and Management Quality</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 15474. This paper examines whether management changes caused by the entry of the baby boom into the workforce explain the US productivity slowdown in the 1970s and resurgence in the 1990s. Lucas (1978) suggests that the quality of managers plays a significant role in determining output. If there is heterogeneity across workers and management skill improves with experience, an influx of young workers will lower the overall quality of management and lower total factor productivity. Census data shows that the entry of the baby boom resulted in more managers being hired from the smaller, pre baby boom cohorts. These marginal managers were necessarily of lower quality. As the boomers aged and gained experience, this effect was reversed, increasing managerial quality and raising total factor productivity. Using the Lucas model as a framework, a calibrated model of managers, workers, and firms suggests that the management effects of the baby boom may explain roughly 20 percent of the observed productivity slowdown and resurgence.

2009	F14 F16 F23 K33 L26 L83 Q40	Shachmurove, Yochanan. 2009. <i>Entrepreneurship in Qatar</i> . Penn Institute for Economic Research, Department of Economics, University of Pennsylvania, PIER Working Paper Archive. The State of Qatar is driven mainly by hydrocarbon revenues, which are estimated to support this tiny country for hundreds of years. The Qatari economy is becoming diversified with industries such as manufacturing, banking, social services, and tourism. Additionally, government financed health and educational services have increased rapidly. However, the Qatari government is not able to establish necessary laws and procedures which business requires. Despite recent changes, Qatari laws and regulations are not always friendly towards business ventures or foreign investment, hindering economic growth. Furthermore, enforcement of existing business regulations and rules are occasionally lacking.
2009	F14 F16 F23 K33 L26 L83 Q40	Shachmurove, Yochanan. 2009. <i>Entrepreneurship in Oman</i> . Penn Institute for Economic Research, Department of Economics, University of Pennsylvania, PIER Working Paper Archive. The Sultanate of Oman has a diversified economy, unlike many of its neighboring nations that rely almost entirely on oil revenues. Natural gas and several non-energy business sectors, such as tourism, fishing, light manufacturing, and agriculture are expanding rapidly. The Omani economy is one of the freest in its region. A relatively stable government and low taxes make Oman a desirable location for entrepreneurial ventures. Furthermore, foreign direct investment is welcomed. Tourism is the most attractive area for international entrepreneurs. Oil revenues, coupled with increasing foreign investment are likely to both diversify the Omani economic base and strengthen it.
2009	F17	Cheung, Calista, and Stephanie Guichard. 2009. <i>Understanding the World Trade Collapse</i> . OECD, Economics Department, OECD Economics Department Working Papers: 729. The collapse in world trade volumes at the end of 2008 and beginning of 2009 was exceptional by historical standards. This paper shows that world demand (to which trade has become more responsive in recent decades) can explain most of the collapse in world trade, but that tight credit conditions have likely amplified the short-term trade response. Credit tightening likely accelerated the trade decline through trade finance constraints and its relatively larger impact on trade-intensive sectors. A portion of the trade decline remains unexplained, which may reflect a possible breakdown in global supply chains. Looking ahead, the pace of normalisation in financial conditions and the future evolution of global supply integration will affect the speed of recovery in trade and global output.

2009	G14	Bansal, Ravi, Dana Kiku, and Amir Yaron. 2009. <i>An Empirical Evaluation of the Long-Run Risks Model for Asset Prices</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 15504. We provide an empirical evaluation of the forward-looking long-run risks (LRR) model and highlight model differences with the backward-looking habit based asset pricing model. We feature three key results: (i) Consistent with the LRR model, there is considerable evidence in the data of time-varying expected consumption growth and volatility, (ii) The LRR model matches the key asset markets data features, (iii) In the data and in the LRR model accordingly, past consumption growth does not predict future asset prices, whereas lagged consumption in the habit model forecasts future price-dividend ratios with an R2 of over 40%. Overall, our evidence implies that the LRR model provides a coherent framework to analyze and interpret asset prices.

2009	G33	Mian, Atif R., and Amir Sufi. 2009. <i>House Prices, Home Equity-Based Borrowing, and the U.S. Household Leverage Crisis</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 15283. Using individual-level data on homeowner debt and defaults from 1997 to 2008, we show that borrowing against the increase in home equity by existing homeowners is responsible for a significant fraction of both the sharp rise in U.S. household leverage from 2002 to 2006 and the increase in defaults from 2006 to 2008. Employing land topology-based housing supply elasticity as an instrument for house price growth, we estimate that the average homeowner extracts 25 to 30 cents for every dollar increase in home equity. Money extracted from increased home equity is not used to purchase new real estate or pay down high credit card balances, which suggests that borrowed funds may be used for real outlays (i.e., consumption or home improvement). Home equity-based borrowing is stronger for younger households, households with low credit scores, and households with high initial credit card utilization rates. Homeowners in high house price appreciation areas experience a relative decline in default rates from 2002 to 2006 as they borrow heavily against their home equity, but experience very high default rates from 2006 to 2008. Our estimates suggest that home equity-based borrowing is equal to 2.8% of GDP every year from 2002 to 2006, and accounts for at least 34% of new defaults from 2006 to 2008.
2009	H31	Hollanders, D. A., and R. Vliegthart. 2009. <i>The Influence of Negative Newspaper Coverage on Consumer Confidence: The Dutch Case</i> . Tilburg University, Center for Economic Research, Discussion Paper: 2009-55. This paper studies the empirical relationship between the real economy, consumer confidence and economic news coverage in national newspapers for the Netherlands during the period 1990-2008. Media-attention for economic developments Granger-causes consumer confidence, with more negative news decreasing consumer confidence; this result holds when controlling for the real economy (stock-market). This suggests that in line with many popular concerns negative news is among factors influencing the hardness of the landing of the current credit-crisis, whereas positive news might have been a contributing factor in the build-up of asset- and housing bubbles.
2009	H61	Dadkhah, Kamran. 2009. <i>The Evolution of Macroeconomic Theory and Policy</i> , Dordrecht and New York: Springer. Presents an introduction to macroeconomic theory and policy as they relate to events and developments of the past eighty years, focusing mainly on the U.S. economy and its fiscal and monetary policies. Discusses the Great Depression and John Maynard Keynes; the postwar economic order; laying the foundations of Keynesian economics; Keynesian economics in action; macroeconomics of an open economy; the collapse of postwar international economic order; the new classical revolt against activist economic policy; business cycles--evidence, theory, and policy; money, monetary policy, and monetarism; government budget and fiscal policy; the Ronald Reagan-Margaret Thatcher revolution--the age of Friedrich Hayek and Joseph Schumpeter; macroeconomics of globalized economies; and the financial and economic crisis of 2007-09.

2009	L11	Clementi, Gian Luca, Thomas F. Cooley, and Sonia Di Giannatale. 2009. <i>A Theory of Firm Decline</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 15192. We study the problem of an investor who buys an equity stake in an entrepreneurial venture, under the assumption that the former cannot monitor the latter's operations. The dynamics implied by the optimal incentive scheme is rich and quite different from that induced by other models of repeated moral hazard. In particular, our framework generates a rationale for firm decline. As young firms accumulate capital, the claims of both investor (outside equity) and entrepreneur (inside equity) increase. At some juncture, however, even as the latter keeps on growing, invested capital and firm value start declining and so does the value of outside equity. The reason is that incentive provision is costlier the wealthier the entrepreneur (the greater is inside equity). In turn, this leads to a decline in the constrained--efficient level of effort and therefore to a drop in the return to investment
2009	L11	Eden, Benjamin, and Matthew Jaremski. 2009. <i>Rigidity, Dispersion and Discreteness in Chain Prices</i> . Department of Economics, Vanderbilt University, Working Papers: 0907. This paper studies price setting within a chain of grocery stores, using a scanner database that contains observations of retail prices for 435 products within 75 stores over 121 weeks. We find price dispersion within the chain. Although price dispersion is pervasive 75% of the prices are equal to the modal price. The mode changes frequently: 35% of the modes change in an average week. This suggests that the distribution of prices may react relatively fast to aggregate shocks. Stores differentiate themselves by the prices of relatively few items. Typically most prices in the store are at the mode of the cross sectional price distribution, some are above the mode and some are below the mode. The probability of a price change is 3.6% when the price is at the mode and 76.2% when the price is not at the mode. We explain the apparent attraction to the mode in terms of a model in which price discreteness plays an important role but there is no inertia. We also find that the probability of a price change is higher when the deviation from the mean of the cross sectional price distribution is large. But unlike conventional wisdom, the probability of a price change is higher for young prices

2009	L14 L26 M21 P31	Vuong, Quan-Hoang, and Tran Tri Dung. 2009. <i>The Cultural Dimensions of the Vietnamese Private Entrepreneurship</i> . Universite Libre de Bruxelles, Solvay Brussels School of Economics and Management, Centre Emile Bernheim (CEB), Working Papers CEB: 09-027.RS. In this essay, we explore cultural impacts on the private entrepreneurship in the post-Doi Moi Vietnam. Some important aspects of the traditional cultural values of the Vietnamese society are explored in conjunction with the socio-economic changes over the past two decades. Traditional cultural values continue to have strong impacts on the Vietnamese society, and to a large extent to adversely affect the entrepreneurial spirit of the community. Typical constraints private entrepreneurs face may have roots in the cultural facet as legacy of the Confucian society, such as relationship-based bank credit. Low quality business education is both victim and culprit of the long-standing tradition that looks down on the role of private entrepreneurship in the country.

2009	L70	Dvir, Eyal, and Kenneth S. Rogoff. 2009. <i>Three Epochs of Oil</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 14927. We test for changes in price behavior in the longest crude oil price series available (1861-2008). We find strong evidence for changes in persistence and in volatility of price across three well defined periods. We argue that historically, the real price of oil has tended to be highly persistent and volatile whenever rapid industrialization in a major world economy coincided with uncertainty regarding access to supply. We present a modified commodity storage model that fully incorporates demand, and further can accommodate both transitory and permanent shocks. We show that the role of storage when demand is subject to persistent growth shocks is speculative, instead of its classic mitigating role. This result helps to account for the increased volatility of oil price we observe in these periods.

National Bureau of Economic Research, Inc. NBER Working Papers: 14641. More than a half century after its peak, the baby boom's causes remain a puzzle. A novel argument posits that rapid changes in household technology from 1940 to 1960 account for this large increase in fertility. We present new empirical evidence that is inconsistent with this claim. Rapid advances in household technology began long before 1940 while fertility declined, and differences and changes in appliance ownership and electrification in U.S. counties are negatively correlated with fertility rates from 1940 to 1960. Finally, the Amish, a group strictly limiting the use of modern technologies, experienced a coincident and sizable baby boom.

2009	R20 R21	Piazzesi, Monika, and Martin Schneider. 2009. <i>Momentum traders in the housing market: survey evidence and a search model</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 14669. This paper studies household beliefs during the recent US housing boom. The first part presents evidence from the Michigan Survey of Consumers. To characterize the heterogeneity in households' views about housing and the economy, we perform a cluster analysis on survey responses at different stages of the boom. The estimation always finds a small cluster of households who believe it is a good time to buy a house because house prices will rise further. The size of this "momentum" cluster doubled towards the end of the boom. The second part of the paper provides a simple search model of the housing market to show how a small number of optimistic investors can have a large effect on prices without buying a large share of the housing stock.
2009	R21	Fisher, Jonas, and Martin Gervais. 2009. <i>Why has home ownership fallen among the young?</i> . Institute for Fiscal Studies, IFS Working Papers: W09/08. We document that home ownership of households with 'heads' aged 25-44 years fell substantially between 1980 and 2000 and recovered only partially during the 2001-2005 housing boom. The 1980-2000 decline in young home ownership occurred as improvements in mortgage opportunities made it easier to purchase a home. This paper uses an equilibrium life-cycle model calibrated to micro and macro evidence to understand why young home ownership fell over a period when it became easier

Year	DE	Title and Abstract
		to own a home. Our findings indicate that a trend toward marrying later and the increase in household earnings risk that occurred after 1980 account for 3/5 to 4/5 of the decline in young home ownership.
2010		
2010	F13 F15	Diss: Ritter, Moritz. 2010. Essays on Money, Trade and the Labour Market. PhD diss. University of Toronto. This dissertation consists of three independent essays in Macroeconomics. The first essay assesses the impact of offshoring on aggregate productivity and on labour market outcomes by developing a dynamic general equilibrium model in which workers acquire task-specific human capital. The dynamic nature of the model allows for differentiation between short and long run effects. While the welfare effects are unambiguously positive and independent of the skill-content of the offshored and inshored tasks, the distribution of the gains from trade critically depends on the time horizon. Workers with human capital specific to the inshored tasks gain over those performing offshored tasks in the short term. In the long run, the gains from trade are equally distributed among ex-ante identical agents. The model is calibrated to the U.S. economy; welfare gains from increased offshoring are found to be substantial even after taking into account losses in specific human capital (and hence wages) for workers in the offshored occupations along the transition path. The second essay integrates the insight that exporting firms are typically more productive and employ higher skilled workers into a directed search model of the labour market. The model generates a skill premium as well as residual wage inequality among identical workers. Trade liberalization will cause a reallocation of workers both within and across industries, which will affect both types of inequality in a way that is consistent with findings from the empirical literature on trade and inequality. A calibrated version of the model can account for much of the effect of the Canada-U.S. Free Trade Agreement on the Canadian labour market. The final essay incorporates a distortionary tax into the microfoundations of a money framework and revisits the optimum quantity of money. An optimal policy may consist of both a positive tax rate and a positive nominal interest rate: if the buyer's surplus share is inefficiently small, the intensive margin is distorted and the constrained optimal policy combines a sales tax with a money growth rate above that prescribed by the Friedman rule. Monetary, but not fiscal, policy alters the agent's bargaining position, leaving a special role for a deviation from the Friedman rule.
2010	G18	Shachmurove, Yochanan. 2010. <i>The Next Financial Crisis</i>. Penn Institute for Economic Research, Department of Economics, University of Pennsylvania, PIER Working Paper Archive. The examination of U.S. crises reveals that the current financial crisis follows past patterns. An investment bubble creates excess demand for new financing instruments. During the railroad bubbles of the nineteenth century loans were issued at a pace higher than many companies could pay back. The current housing bubble originated from issuing sub-prime mortgages that assume that housing prices would only rise. The increased demand for credit induces financial innovations and instruments that circumvent existing regulations. Inevitably, the bubble bursts. The history of financial crises teaches that policy reforms and new regulations cannot prevent future financial crises.
2010	G24	Acemoglu, Daron, Kenneth Rogoff, and Michael Woodford, eds. 2010. <i>NBER Macroeconomics Annual 2009</i>, Chicago and London: University of Chicago Press. Seven papers, with comments, raise policy-relevant questions and highlight new development in macroeconomic analysis, focusing mainly on the sources of the recent financial crisis and possible policy responses to it. Papers discuss the leverage cycle (John Geanakoplos); reducing foreclosures--no easy answers (Christopher Foote, Kristopher Gerardi, Lorenz Goette, and Paul Willen); the credit rating crisis (Efraim Benmelech and Jennifer Dlugosz); a quantitative analysis of the evolution of the U.S. wage distribution--1970-2000 (Fatih Guvenen and Burhanettin Kuruscu); noisy business cycles (George-Marios Angeletos and Jennifer La'O); letting different views about business cycles compete (Paul Beaudry and Bernd Lucke); and the financial crisis and the Federal Reserve (Frederic S. Mishkin). No index.
2010	G38	Shachmurove, Yochanan. 2010. <i>The Next Financial Crisis</i>. Penn Institute for Economic Research, Department of Economics, University of Pennsylvania, PIER Working Paper Archive. The examination of U.S. crises reveals that the current financial crisis follows past patterns. An investment bubble creates excess demand for new financing instruments. During the railroad bubbles of the nineteenth century loans were issued at a pace higher than many companies could pay back. The current housing bubble originated from issuing sub-prime mortgages that assume that housing prices would only rise. The increased demand for credit induces financial innovations and instruments that circumvent existing regulations. Inevitably, the bubble bursts. The history of financial crises teaches that policy reforms and new regulations cannot prevent future financial crises.
2010	J70	Julio, Paulo, and Jose Tavares. 2010. <i>The Good, the Bad, and the Different: Can Gender Quotas Raise the Quality of Politicians?</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 7917. This paper models, for the first time, the relationship between gender quotas and the quality of elected public officials. In our economy, females and males can be either high or low-skill. The number of high-skill individuals elected for public office determines the overall quality of politicians. Women suffer from gender discrimination in the labor market and in the political market, and are underrepresented in elected political bodies in the status quo. Introducing a quota increases the probability of election for women and decreases it for men. The impact of the quota on quality depends on the skills of those individuals from the discriminated (over-represented) group that are encouraged (discouraged) to run for office. We demonstrate that a higher gender quota only decreases the overall quality of those elected when the rewards from public office are low, or when the rewards from public office are high but women are significantly discriminated against in the political market versus the labor market. In other cases, a quota either decreases quality only initially, but for sufficiently high values there is a positive effect on quality, or leads to immediate increases in quality. Our model also formalizes the role that policies fighting discrimination may have on the number and type of women elected.

2011	C58	Veldkamp, Laura L. 2011. <i>Information Choice in Macroeconomics and Finance</i>, Princeton and Oxford: Princeton University Press. Explores macroeconomics and finance models in terms of information choice. Discusses why to study information choice; Bayesian updating; measuring information flows; games with heterogeneous information; disclosing public information; informational inertia and price setting; information choice and investment choice; returns to scale in information; information as an aggregate shock; and testing information theories. Veldkamp is Associate Professor of Economics in the Stern School of Business at New York University. Index.
2011	C68	Gunn, Christopher M. 2011. <i>From growth to cycles through beliefs</i>. McMaster University, Department of Economics Working Papers. I present a theoretical model where the economy endogenously adopts the technological ideas of a slowly evolving technological frontier, and show that the presence of a "technological gap" between unadopted ideas and current productivity can lead to multiple equilibria and therefore the possibility that changes in beliefs can be self-fulfilling, often referred to as sunspots. In the model these sunspots take the form of beliefs about the value of adopting the new technological ideas, and unleash both a boom in aggregate quantities as well as eventual productivity growth, increasing the value of adoption and self-confirming the beliefs. Moreover, I demonstrate that the scope for these indeterminacies is a function of the steady-state growth rate of the underlying

Year	DE	Title and Abstract
		technological frontier of ideas, and that during times of low growth in ideas, the potential for indeterminacies disappears. Under this view, technology becomes important for cycles not necessarily because of sudden shifts in the technological frontier, but rather, because it defines a technological regime for the economy such that expectations about its value can produce aggregate fluctuations where in a different regime they could not.

2011	F33	Clarida, Richard H., and Francesco Giavazzi, eds. 2011. <i>NBER International Seminar on Macroeconomics 2010</i> , Chicago and London: University of Chicago Press; distributed by Chicago Distribution Center. Eight papers and fifteen comments, originally presented at the NBER International Seminar on Macroeconomics held in Amsterdam in June 2010, explore current issues in global macroeconomics, covering fiscal policy, monetary policy, global business cycles, and studies on the recent financial crisis. Papers discuss fiscal policy and interest rates--the role of sovereign default risk; technology-hours redux--tax changes and the measurement of technology shocks; asymmetric shocks in a currency union with monetary and fiscal handcuffs; evolving perceptions of central bank credibility--the European Central Bank experience; Pigou cycles in closed and open economies with matching frictions; globalization, the business cycle, and macroeconomic monitoring; financial cycles--what, how, and when; and currency carry trades.
2011	G28	Ashraf, Quamrul, Boris Gershman, and Peter Howitt. 2011. <i>Banks, Market Organization, and Macroeconomic Performance: An Agent-Based Computational Analysis</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 17102. This paper is an exploratory analysis of the role that banks play in supporting the mechanism of exchange. It considers a model economy in which exchange activities are facilitated and coordinated by a self-organizing network of entrepreneurial trading firms. Collectively, these firms play the part of the Walrasian auctioneer, matching buyers with sellers and helping the economy to approximate equilibrium prices that no individual is able to calculate. Banks affect macroeconomic performance in this economy because their lending activities facilitate entry of trading firms and also influence their exit decisions. Both entry and exit have conflicting effects on performance, and we resort to computational analysis to understand how they are resolved. Our analysis sheds new light on the conflict between micro-prudential bank regulation and macroeconomic stability. Specifically, it draws an important distinction between "normal" performance of the economy and "worst-case" scenarios, and shows that micro prudence conflicts with macro stability only in bad times. The analysis also shows that banks provide a "financial stabilizer" that in some respects can more than counteract the more familiar financial accelerator.
2011	H30	Sun, Hongfei. 2011. <i>Markets, Income and Policy in a Unified Macroeconomic Framework</i> . Queen's University, Department of Economics, Working Papers: 1262. I construct a unified macroeconomic framework by incorporating frictional markets in a neoclassical environment. This framework is analytically tractable despite search frictions, income risks and endogenous asset distributions. I use this framework to formalize a theory that the variety and the functioning of markets reflect the status of household income in an economy. In the model, households and firms have free access to goods markets with and without trading frictions, where the frictional markets are featured by competitive search. I characterize and prove the existence of a steady state. In equilibrium, the frictionless market is always active and used to smooth consumption, whereas the frictional market is active only if the household expected real income is sufficiently high. Uninsurable idiosyncratic income risks cause households to endogenously sort into various submarkets upon entry to a frictional market. Consequently, income inequality determines the dispersion of equilibrium trading protocols across frictional submarkets. Both monetary and fiscal policies have their distinctive implications for the intensive and extensive margins of frictional trading.
2011	H30 K20 R30	Kowalski, Tadeusz, and Yochanan Shachmurove. 2011. <i>An Historical Walk Through Recent Financial Crises</i> . Penn Institute for Economic Research, Department of Economics, University of Pennsylvania. PIER Working Paper Archive. This paper analyzes the causes and implications of recent financial crises. Financial crises in general lead to changes in both theory and practice of economics. The paper takes an historical overview. The global consensus of economic theory during the 20th century is discussed. The paper describes the Bretton Woods regime after World War II, details the era of adaptive expectations and motivates the emerging of the rational expectations school of thoughts. Various perspectives on the causes of the financial crisis are incorporated. The paper provides some policy suggestions and remarks on the consequences of ever-changing capital markets.
2011	J22	Ohanian, Lee E., and Andrea Raffo. 2011. <i>Aggregate Hours Worked in OECD Countries: New Measurement and Implications for Business Cycles</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 17420. We build a new quarterly dataset of aggregate hours worked consistent with standard NIPA constructs for 14 OECD countries over the last fifty years. We find that cyclical features of labor markets across countries differ markedly from the accepted empirical facts reported in the literature based on either just U.S. hours data, or based on cross-country employment data. We document that total hours worked in many OECD countries are about as volatile as output, that a relatively large fraction of labor market adjustment takes place along the intensive margin outside the United States, and that the volatility of total hours relative to output volatility has increased over time in almost all countries. We use these data to re-assess productivity and labor wedges during the Great Recession and during prior recessions. We find that the Great Recession in many OECD countries is a significant puzzle in that labor wedges are quite small, while those in the U.S. Great Recession--and those in previous European recessions--are much larger. These new data indicate that understanding cyclical labor fluctuations in OECD countries requires understanding why hours fluctuate so much more than previously considered, how and why labor markets changed so much in the last few years, why cyclical adjustment of hours per worker in countries with large firing costs is not even larger than observed, and why the Great Recession differs so much across countries.

2011	O00	Caselli, Francesco, and Antonio Ciccone. 2011. <i>A Note on Schooling in Development Accounting</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 17656. How much would output increase if underdeveloped economies were to increase their levels of schooling? We contribute to the development accounting literature by describing a non-parametric upper bound on the increase in output that can be generated by more schooling. The advantage of our approach is that the upper bound is valid for any number of schooling levels with arbitrary patterns of substitution/complementarity. We also quantify the upper bound for all economies with the necessary data, compare our results with the standard development accounting approach, and provide an update on the results using the standard approach for a large sample of countries.
2011	O13	Adamopoulos, Tasso, and Diego Restuccia. 2011. <i>The Size Distribution of Farms and International Productivity Differences</i> . University of Toronto, Department of Economics, Working Papers. There is a 34-fold difference in average farm size (land per farm) between rich and poor countries and striking differences in their size distributions. Since labor productivity is much higher in large relative to small farms, we study the determinants of farm-size differences across countries and their impact on agricultural and aggregate productivity. We develop a quantitative model of agriculture and non-agriculture that features a non-degenerate size distribution of farms. We find that measured aggregate factors such as capital, land, and economy-wide productivity cannot account for more than 1/4 of the observed differences in farm size and productivity. We argue that, among the possible explanations, farm-

Year	DE	Title and Abstract
		level policies that misallocate resources from large to small farms have the most potential to account for the remaining differences. Such farm-size distortions are prevalent in poor countries. We quantify the effects of two specific policies in developing countries: (a) a land reform that imposes a ceiling on farm size and (b) a progressive land tax. We find that each individual policy generates a reduction of 3 to 7% in average size and productivity.
2011	P24 P36	Diss: Ho, Yip Wai Alex. 2011. Three Essays on Financial Development, Consumption Risk Sharing and New Keynesian Price Setting Model. PhD diss. Boston University. This dissertation consists of three chapters on various topics in Macroeconomics. The first chapter investigates the effects of inflation, accessibility and depth of credit markets on wealth distribution. We find that from 1995 to 2002 in China, the inequality of wealth distribution decreased, the money-wealth ratio increased for all wealth levels and the aggregate money-output ratio increased. We develop a two-asset dynamic general equilibrium model in which households face a portfolio-adjustment cost and a borrowing constraint. The accessibility and depth are measured by the portfolio-adjustment cost and the borrowing constraint, respectively. Model calibration based on the Chinese data shows that the portfolio-adjustment cost was reduced and the borrowing constraint was relaxed from 1995 to 2002. We find that financial development lowers the inequality of wealth distribution by reducing the precautionary motive of households. In addition, tight monetary policy increases the value of money and, in turn, raises the money-wealth ratio for all wealth levels and the aggregate money-output ratio. The second chapter examines inter-provincial consumption risk sharing and intertemporal consumption smoothing across Chinese provinces before and after the 1979 economic reform. Our results indicate that the degree of consumption risk sharing among Chinese provinces is lower than that within the U.S. and across the national boundaries of OECD countries. On the other hand, the level of consumption smoothing among Chinese provinces is higher than that across OECD or EU countries, but lower than that in the U.S. Moreover, our results show that consumption risk sharing and smoothing in China have deteriorated since the 1979 economic reform. Finally, we show that eliminating consumption fluctuations yields substantial welfare gains, which suggests that stabilization policies are desirable for China. The third chapter compares continuous and discrete time sticky price models. For given menu costs, continuous time models imply shorter average contracts but larger real effects of inflation.

2012	A00	Gorton, Gary B., and Andrew Metrick. 2012. <i>Getting up to Speed on the Financial Crisis: A One-Weekend-Reader's Guide</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 17778. All economists should be conversant with "what happened?" during the financial crisis of 2007-2009. We select and summarize 16 documents, including academic papers and reports from regulatory and international agencies. This reading list covers the key facts and mechanisms in the build-up of risk, the panics in short-term-debt markets, the policy reactions, and the real effects of the financial crisis.
2012	D85	Kirman, Alan. 2012. "Can Artificial Economies Help Us Understand Real Economies?" <i>Revue de L'OFCE</i>, 0(124): 15-42. This paper argues that the path followed by modern macroeconomic theory excludes the analysis of major endogenous movements in macroeconomic variables. Rather than persist with models based on the idea that the economy behaves like a rational individual, we should build models of the economy as a complex system of interacting agents. Profiting from the advances made in computer science, we can now build agent based or computational models which allow us to model the out of equilibrium behaviour of such systems. They allow us to remove many of the restrictive assumptions of standard models and to incorporate the heterogeneity of economic agents and the evolution of the network that governs the interactions between the individuals and firms in the economy. Such models can help fill the theoretical void with which policymakers declare that they have been faced in the current crisis.

2012	I31	Nayyar, Deepak. 2012. "Macroeconomics and Human Development." <i>Journal of Human Development and Capabilities</i>, 13(1): 7-30. This article analyses the interactions between macroeconomics, in terms of objectives and policies, and human development, which is about the well-being of people. Each can, and often does, exercise a significant influence on the other. Macroeconomics matters for human development because it determines the level of employment, the degree of social protection and the public provision of services such as healthcare or education. Human development has implications and consequences for macroeconomics, for it can mobilize or claim resources to enlarge or diminish space for macroeconomic policies. The relationship exists, and matters, not only in poor countries but also in rich countries. Employment, even if neglected, provides the critical link. The paper shows that the causation runs in both directions and could be either positive or negative. It also reveals similarities and differences between developing countries and industrialized countries. The political context is significant, everywhere, as interests, ideology and institutions influence economic policies in both spheres to shape outcomes.
2012	J01	Stirati, Antonella. 2012. <i>Employment theory in the History of Economic thought: an overview</i>. Department of Economics - University Roma Tre, Departmental Working Papers of Economics - University Roma Tre': 0148. The theory of employment is clearly a central question in economic thought. Economists of all traditions and schools have always admitted short run fluctuations in aggregate employment levels associated with the business cycle and explained them with a variety of factors. Yet the central question is, of course, fluctuations around which long run level of employment? Focussing mainly on long run aspects of employment theory, this paper aims at providing an overview of different theoretical approaches that have been prominent in various phases in the history of economics up to the present. It necessarily summarizes and, hence, simplifies approaches and debates, but may be useful in suggesting that textbook accounts of past authors (including Keynes) and approaches may be wrong, or at least very controversial. It may thus stimulate a renewed interest in past authors and suggest the possibility of a different angle in reading past and present controversies.
2012	J32	Diss: Wong, Tsz-Nga. 2012. On Macroeconomics and Dynamic Incentives. PhD diss. Washington University in St. Louis. In Essay 1, "A New-Monetarist Phillips Curve", a model with labor search, limited recordkeeping and market segmentation, is provided to explain the correlations between inflation and real variables in the short run, and in the long run. A one-time money injection causes intensive-margin effects on employment, and reduces the unemployment rate in the short run. There are persistent liquidity effects on real variables, inflation and the nominal interest rate, as a result of search frictions in the labor market. Money injections in the long run raise the unemployment rate. The optimal monetary policy minimizes the distortion from labor-search frictions, and eliminates the intertemporal monetary distortion and the market segmentation friction. Essay 2, "Dynamic Defined-Contribution Pension Mechanisms with Adverse Selection and Moral Hazards", asks should contributions to a defined-contribution pension be subsidized? How? We study voluntary defined-contribution pension plans with asymmetric information. Agents are free to retire, quit a plan and choose between plans. Labor productivities throughout working life and the length of working life are private

Year	DE	Title and Abstract
		information. This leads to a dynamic incentive problem of early retirement and low contributions over time. The optimal incentive compatible mechanism can be implemented through transfers (sometimes negative) and contribution deductions from agents' pensions over time. The optimal mechanism features the punishment phase, the accumulation phase and the retirement phase. We find that the level of pension is higher under the optimal mechanism than under the laissez faire. Working agents enjoy higher consumption, contribute less, and retire later. We find that the result that it is optimal to deduct contributions is robust to different environments. Essay 3, "Long-term Loan Contracts with Short-Term Costly State Verification", studies optimal contracting between a risk averse borrower and a risk neutral lender over an infinite horizon. The borrower has private information on stochastic incomes from a project over continuous time, which can be verified for some random length of time at a cost. This version of costly state verification captures temporary take-over of the project by the lender. Unlike its static counterpart, in the dynamic environment the lender takes over the project after either low incomes or high incomes are reported for a sufficient length of time. The former works as a punishment device so as to discourage untruthful reports of low incomes as in the static case. The latter works as a reward for truthful reports of high incomes. The agent's promised continuation utility is reset to a lower level when the take-over ends.
2012	N40	Guiso, Luigi, and Paolo Pinotti. 2012. <i>Democratization and Civic Capital</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 8847. We document a sharp reversal in electoral participation between the North and the South of Italy after the 1912 enfranchisement which extended voting rights from a limited elite to (almost) all adult males. When voting was restricted to the elite, electoral turnout was higher in the South but falls significantly below that in the North after the enfranchisement. Furthermore the new gap is never bridged over the following century and participation remains lower in the South despite the enrichment of democratic institutions and further extension of voting rights to the female population during the post war democratic republic. This pattern in the data is consistent with a simple model where individuals' voting in political elections is affected by private benefits and by civic duty, only elites can grab private benefits from participation in politics and civic culture differs across communities. We also find that extension of voting rights to non-elites results in a significant transfer of power to their political organizations only among populations with a high sense of civic duties. Together with the very persistent gap in participation between North and South our findings suggest that democratization--a process of concession of democratic rights--can benefit non-elites only when the latter have already a high sense of civic capital and is unlikely to be a viable avenue for inducing norms of civic behavior.
2012	Q32	Hassler, John, Per Krusell, and Conny Olovsson. 2012. <i>Energy-Saving Technical Change</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 18456. We estimate an aggregate production function with constant elasticity of substitution between energy and a capital/labor composite using U.S. data. The implied measure of energy-saving technical change appears to respond strongly to the oil-price shocks in the 1970s and has a negative medium-run correlation with capital/labor-saving technical change. Our findings are suggestive of a model of directed technical change, with low short-run substitutability between energy and capital/labor but significant substitutability over longer periods through technical change. We construct such a model, calibrate it based on the historical data, and use it to discuss possibilities for the future.

2013	E02	Gorton, Gary B., and Guillermo Ordonez. 2013. <i>The Supply and Demand for Safe Assets</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 18732. There is a demand for safe assets, either government bonds or private substitutes, for use as collateral. Government bonds are safe assets, given the government's power to tax, but their supply is driven by fiscal considerations, and does not necessarily meet the private demand for safe assets. Unlike the government, the private sector cannot produce riskless collateral. When the private sector reaches its limit (the quality of private collateral), government bonds are net wealth, up to the government's own limits (taxation capacity). The economy is fragile to the extent that privately-produced safe assets are relied upon. In a crisis, government bonds can replace private assets that do not sustain borrowing anymore, raising welfare.
2013	H54	Acemoglu, Daron, Jonathan Parker, and Michael Woodford, eds. 2013. <i>NBER Macroeconomics Annual 2012, Number 27</i> . Chicago and London: University of Chicago Press. Papers discuss whether indivisible labor explains the difference between micro and macro elasticities--a metaanalysis of extensive margin elasticities; roads to prosperity or bridges to nowhere?--theory and evidence on the impact of

Year	DE	Title and Abstract
		public infrastructure investment; which financial frictions?--parsing the evidence from the financial crisis of 2007-09; individual price adjustment along the extensive margin; testing for Keynesian labor demand; risk heterogeneity and credit supply--evidence from the mortgage market; and revenge of the optimum currency area.
2013	I23	Vargas, Gustavo. 2013. "Relevant Macroeconomics for Developing Countries: A Contribution to Pluralist Macroeconomics." <i>International Journal of Pluralism and Economics Education</i> , 4(1): 61-77. This paper presents a proposal for teaching an introductory course in macroeconomics focused on understanding developing countries, with pedagogical suggestions as well as course content based on the author's teaching. This paper develops a pluralist and heterodox macro model of the economy that students can use in order to understand the world in which they live.
2013	J12	Greenwood, Jeremy, Philipp Kircher, Cezar Santos, and Michele Tertilt. 2013. <i>An Equilibrium Model of the African HIV/AIDS Epidemic</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 18953. Eleven percent of the Malawian population is HIV infected. Eighteen percent of sexual encounters are casual. A condom is used one quarter of the time. A choice-theoretic general equilibrium search model is constructed to analyze the Malawian epidemic. In the developed framework, people select between different sexual practices while knowing the inherent risk. The analysis suggests that the efficacy of public policy depends upon the induced behavioral changes and general equilibrium effects that are typically absent in epidemiological studies and small-scale field experiments. For some interventions (some forms of promoting condoms or marriage), the quantitative exercise suggests that these effects may increase HIV prevalence, while for others (such as male circumcision or increased incomes) they strengthen the effectiveness of the intervention. The underlying channels giving rise to these effects are discussed in detail.
2013	P48	Dort, Thibaut, Pierre-Guillaume Meon, and Khalid Sekkat. 2013. <i>Does investment spur growth everywhere? Not where institutions are weak</i> . ULB -- Université Libre de Bruxelles, Working Papers CEB: 13-030. We investigate the impact of investment on growth in a sample of developed and developing countries, conditioning the marginal effect of investment on institutional quality. The panel structure of our dataset allows controlling for unobserved heterogeneity and dealing with the risk of endogeneity bias. In line with our expectations, we find that investment increases growth more in countries with high institutional quality than in countries with defective institutions. The results are essentially driven by government instability, corruption, and the rule of law.

NL(J) — number of new links in the year J (J = 2006, ..., 2013).

Table E01.F Examples of Publications according to New Links in 2006—2013

Year	DE	Title and Abstract
2006		
2006	B16	Haig, Bryan. 2006. "Sir Timothy Coghlan and the Development of National Accounts." <i>History of Political Economy</i>, 38(2): 339-75.
2006	C10	Boivin, Jean, and Marc Giannoni. 2006. <i>DSGE Models in a Data-Rich Environment</i>. National Bureau of Economic Research, Inc. NBER Technical Working Papers: 0332. Standard practice for the estimation of dynamic stochastic general equilibrium (DSGE) models maintains the assumption that economic variables are properly measured by a single indicator, and that all relevant information for the estimation is summarized by a small number of data series. However, recent empirical research on factor models has shown that information contained in large data sets is relevant for the evolution of important macroeconomic series. This suggests that conventional model estimates and inference based on estimated DSGE models might be distorted. In this paper, we propose an empirical framework for the estimation of DSGE models that exploits the relevant information from a data-rich environment. This framework provides an interpretation of all information contained in a large data set, and in particular of the latent factors, through the lenses of a DSGE model. The estimation involves Markov-Chain Monte-Carlo (MCMC) methods. We apply this estimation approach to a state-of-the-art DSGE monetary model. We find evidence of imperfect measurement of the model's theoretical concepts, in particular for inflation. We show that exploiting more information is important for accurate estimation of the model's concepts and shocks, and that it implies different conclusions about key structural parameters and the sources of economic fluctuations.
2006	C11	Garratt, Anthony, Gary Koop, and Shaun P. Vahey. 2006. <i>Forecasting Substantial Data Revisions in the Presence of Model Uncertainty</i>. Birkbeck, School of Economics, Mathematics & Statistics, Birkbeck Working Papers in Economics and Finance: 0617. A recent revision to the preliminary measurement of GDP(E) growth for 2003Q2 caused considerable press attention, provoked a public enquiry and prompted a number of reforms to UK statistical reporting procedures. In this paper, we compute the probability of "substantial revisions" that are greater (in absolute value) than the controversial 2003 revision. The predictive densities are derived from Bayesian model averaging over a wide set of forecasting models including linear, structural break and regime-switching models with and without heteroskedasticity. Ignoring the nonlinearities and model uncertainty yields misleading predictions and obscures recent improvements in the quality of preliminary UK macroeconomic measurements.
2006	C83	Durrant, Gabriele B. 2006. "Missing Data Methods in Official Statistics in the United Kingdom: Some Recent Developments." <i>Allgemeines Statistisches Archiv/Journal of the German Statistical Society</i>, 90(4): 577-93. In recent years an increase in nonresponse rates in major government and social surveys has been observed. It is thought that decreasing response

Year	DE	Title and Abstract
		rates and changes in nonresponse bias may affect, potentially severely, the quality of survey data. This paper discusses the problem of unit and item nonresponse in government surveys from an applied perspective and highlights some newer developments in this field with a focus on official statistics in the United Kingdom (UK). The main focus of the paper is on post-survey adjustment methods, in particular adjustment for item nonresponse. The use of various imputation and weighting methods is discussed in an example. The application also illustrates the close relationship between missing data and measurement error.
2006	D14 O12	Rao, K. S. Ramachandra, Ramesh Jangili, and Abhiman Das. 2006. "State-Wise Estimates of Financial Savings of Household Sector--An Exploratory Study." <i>Journal of Income and Wealth</i> , 28(1): 3-24. Traditionally, domestic savings are not compiled at state level by the Central Statistical Organization. Among the institutional sectors, estimates of saving of public sector are to some extent available at state level. But for the private corporate and household sectors, the saving estimates are compiled only at all-India level. Of these two sectors, household sector is the only surplus sector whose savings exceeds investment and the surplus resources are lent to deficit and needy sectors. In this paper, an attempt is made to estimate state-wise financial savings of the household sector. Like state domestic product, domestic savings is expected to vary widely across states depending on the overall economic activity of the region. Such estimates are helpful in studying the structural changes in state economies. As illustration, the methodology proposed in this paper is used for estimating state-wise financial savings of households for 2002-03, 2003-04 and 2004-05. The spatial and inter-temporal distribution of household savings presented in the paper provides important insights of the savings-investments nexus of the economy.
2006	E41	Bosker, E. M. 2006. "On the Aggregation of Eurozone Data." <i>Economics Letters</i> , 90(2): 260-65. Constructing eurozone aggregates is common practice in empirical studies. This study shows that the choice of aggregation method does not only matter on a theoretical basis. A brief study on eurozone money demand indicates the empirical importance of choosing the correct aggregation method as different aggregates give substantially different outcomes.
2006	E44	Blancas, Andres. 2006. "Interinstitutional Linkage Analysis: A Social Accounting Matrix Multiplier Approach for the Mexican Economy." <i>Economic Systems Research</i> , 18(1): 29-59. By analogy to inter-industry analysis, this paper addresses the inter-institutional linkage analysis through an accounting multiplier approach and a social accounting matrix framework that has a flow of funds. Such an analysis provides a useful tool to identify and quantify structural features of an economy in terms of productive and financial backward and forward linkage indices, which are estimated from the accounting multipliers. As an empirical application of this analysis, we identify and measure the accounting multipliers and the respective linkage indices for the Mexican economy. The results may help to improve the quality of policy decisions by detecting key linkage and partial linkage accounts (production sectors or institutions) and by providing a better understanding of how an impact of an initial exogenous injection runs within a complex economic structure.
2006	E44	Darne, Olivier, and Claude Diebolt. 2006. "Chocs temporaires et permanents dans le PIB de la France, du Royaume-Uni et des Etats-Unis. (Temporary and Permanent Shocks in GDP for France, the United Kingdom and the United States. With English summary)." <i>Revue d'Economie Politique</i> , 116(1): 65-78. In this paper, infrequent large temporary and permanent shocks that have affected the quarterly GDP series for France, the United Kingdom and the United States are analyzed in the post-World War II period using the outlier method. Strong proof of permanent and/or transitory shocks are found, resulting from (national and international) economic, political and monetary events. We show that the persistence in GDP for France and the United States is associated to infrequent large shocks as well as permanent shocks that are assumed to be randomly generated every observation period as in the case of a random walk.
2006	F23 G34	Peleg, Soli, and Shimon Arieli. 2006. "Problems of Measurement and Analysis in the National Accounts under Rapidly Growing Globalization." <i>Statistical Journal</i> , 23(2-3): 143-53. Important problems of measurement and analysis in the national accounts have emerged in recent years due to rapidly growing globalisation of production, expanding trade in services, performance of international transactions and flow of information over the internet. The paper addresses the measurement problems in connection with: joint international production, outsourcing across borders, growing flows of services and transactions that are not covered by existing surveys and administrative data, complicated transactions in connection with for example mergers and swaps of stocks. The problems of analysis of growth and productivity under growing globalisation of production are also presented. International recommendations for coverage and methods of measurement currently do not give satisfactory solutions to these problems. The experience with these difficulties in Israel have resulted in the development of possible solutions, which include use of new sources and measurement methods, construction of decision trees for registration of certain transactions, and linkage to statistical frameworks abroad.
2006	F23	van Stokrom, Nico, Frank Bongor, Leslie Nootenboom, and Wim Tebbens. 2006. "Globalisation and the Effect on National Accounts: Practical Examples." <i>Statistical Journal</i> , 23(2-3): 167-78. Globalization makes an accurate description of the national economy increasingly difficult. Two parallel processes characterise Dutch firms: on the one hand developing into companies with activities abroad and on the other hand being affiliated to foreign multinational companies. Many of these companies are considered 'complex companies' since their operations have led to major inconsistencies among several source statistics of the National Accounts of Statistics Netherlands. The interpretation of the source statistics related to multinational enterprises is problematic. In National Accounts consistency of data is of prime importance. The System of National Accounts (SNA) and the European System of Accounts (ESA) provide guidelines and definitions to measure the domestic economy and the links between an economy and the rest of the world. However, in many cases SNA and ESA do not offer a solution to the problems created by multinational enterprises. Statistics Netherlands is devising tailor-made solutions to solve these problems.

This paper uses the disaggregated nature of a Social Accounting Matrix (SAM) to analyze the income redistribution structure of the Korean economy. I explicitly construct a schematic structure of an 'aggregated SAM' (Macro SAM) based on a mapping of the economy-wide circular income flow. The Macro SAM reports values that are consistent with the 2000 National Accounts. I then disaggregate selected accounts of the Macro SAM by using

Year	DE	Title and Abstract
		Input-Output tables and Korean Household Income and Expenditure Surveys. In particular, households have been disaggregated according to yearly income decile. I identify the changes in the relative income of economic agents due to the multiplier process of the linear general equilibrium model. First, I find that low-income households benefit relatively less from all production activities, and that they benefit relatively less from an equivalent income increase for all household income classes. Second, I analyze the role of government in income redistribution. It is found that short-term government intervention targeting the underprivileged, such as the current Korean National Basic Livelihood Act, which entered into effect from October 2000, makes a positive contribution to low-income households, while it has a negative effect on production activities and high-income households. Third, by introducing the government as an endogenous account in the model of multipliers, it is observed that the income inflows in public service areas such as education, health and social work generate gains in the relative income of households except for those in the lowest decile income group.

2006	O53	Bai, Chong-En, Chang-Tai Hsieh, and Yingyi Qian. 2006. <i>The Return to Capital in China</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 12755. China's investment rate is one of the highest in the world, which naturally leads one to suspect that the return to capital in China must be quite low. Using the data from China's national accounts, we estimate the rate of return to capital in China. We find that the aggregate rate of return to capital averaged 25% during 1978-1993, fell during 1993-1998, and has become flat at roughly 20% since 1998. This evidence suggests that the aggregate return to capital in China does not appear to be significantly lower than the return to capital in the rest of the world. We also find that the standard deviation of the rate of return to capital across Chinese provinces has fallen since 1978.

The local public services have been interested for many years by a process of institutional changes that have not carried to a stable order yet. At the same time a number of remarkable changes from an entrepreneurial and industrial point of view have been recorded, and such changes have been reflected in the industry economic and financial courses. In the first part of this paper the evolution of the rules--with a particular reference to the bill n. 772 decayed with the end of the former legislature--is briefly described. On the basis of a critical analysis of this provision, some guidelines for a future reform programme, are proposed. In the second part, the main organizational processes and the entrepreneurial and industrial strategies, which have been characterizing the management of the local public services, are analyzed with a reference to the formal privatization, the aggregation and fusion policies, the success of multi utility solutions. At last, a quantification of the dimension of the industry is given, in comparison with the data of national accounting and to those of the main Italian companies as well as the situation and the economic courses of the last years.
2007	E40	Hallegatte, Stephane, and Michael Ghil. 2007. <i>Endogenous Business Cycles and the Economic Response to Exogenous Shocks</i> . Fondazione Eni Enrico Mattei, Working Papers: 2007.20. In this paper, we investigate the macroeconomic response to exogenous shocks, namely natural disasters and stochastic productivity shocks. To do so, we make use of an endogenous business cycle model in which cyclical behavior arises from the investment-profit instability; the amplitude of this instability is constrained by the increase in labor costs and the inertia of production capacity and thus results in a finite-amplitude business cycle. This model is found to exhibit a larger response to natural disasters during expansions than during recessions, because the exogenous shock amplifies pre-existing disequilibria when occurring during expansions, while the existence of unused resources during recessions allows for damping the shock. Our model also shows a higher output variability in response to stochastic productivity shocks during expansions than during recessions. This finding is at odds with the classical real-cycle theory, but it is supported by the analysis of quarterly U.S. Gross Domestic Product series; the latter series exhibits, on average, a variability that is 2.6 times larger during expansions than during recessions.

2007	F29 F42	Jha, Raghendra, and T. Palanivel. 2007. <i>Resource Augmentation for Meeting the Millennium Development Goals in the Asia Pacific Region</i> . Australian National University, Economics RSPAS, Departmental Working Papers. This paper examines whether the resource positions of the developing countries in the Asia Pacific region and the support they are receiving from donor countries are adequate to ensure that the MDG will be attained by 2015. It begins by examining the extant record of economic growth and emphasises the need for higher economic growth in order to accelerate the pace of poverty reduction. It argues that neither the level of economic growth nor its current structure can ensure that MDG1 is attained by 2015. The paper argues that domestic savings and investment rates in most large developing countries in the Asia Pacific region are not high enough for growth rates to rise high enough to ensure that MDG1 (halving poverty measured at \$1 PPP per capita over the period 1990-2015) is attained. Further, the ICOR in most of these countries has been stagnant or rising in many of these countries so that it would be unrealistic to expect sharp enough rises in the productivity of capital to ensure that existing investment rates can ensure that MDG1 is attained by 2015. The paper then examines some of the reasons for this lacklustre performance. Tax revenues have been stagnant and public expenditures on education and health have been low whereas many developing countries in the Asia Pacific region bear substantial burdens of debt servicing. Many of these countries also face considerable capital flight, exacerbating already tentative external situations. Furthermore whereas the current outlook for FDI looks promising for some Asian countries, international aid has been stagnant and in, many cases, net financial flows into developing countries has been negative. The paper then considers avenues for increasing the resource base for these countries. It considers a variety of measures including tax reform and expenditure switching policies. It advances policies to reduce capital flight and argues that international debt reduction should accompany any policy to increase international aid to the developing countries of the Asia Pacific region. It lists a number of additional sources of multilateral aid that could replenish developing country resources but argues that measures to increase the absorptive capacity of developing countries as well as reduction in the volatility of aid must accompany to increase international aid. Further, increases in international aid should ensure that the real exchange rates of the recipient countries should not rise. If the real exchange rates were to rise, some of these countries could be exposed to Dutch disease type of phenomena.

"A Method for Improved Capital Measurement by Combining Accounts and Firm Investment Data." <i>Review of Income and Wealth</i> , 53(3): 397-421. We propose a new method for estimating capital stocks at the firm level by combining business accounts information and investment data. The method also produces capital estimates at the sector or industry level by summing individual firms' capital stocks and appropriately inflating this sum to account for firms not included in the data set. Our approach has two major advantages compared with the much used Perpetual Inventory Method (PIM). First, long investment series are not necessary. Second, sector capital estimates are automatically adjusted for changes in the capital stock because of entry and exit of firms. While capital growth rates in Norwegian manufacturing were only 1 percent on average during 1993-2004 according to national accounts figures, our method yields much higher growth rates of 5.5 percent on average.

A Comparative Analysis of the Size and Structure of the Public Sectors in Canada and the United States, 1929-2004." <i>Canadian Public Policy</i> , 33(2): 173-206. We compare the size and structure of the public sectors of Canada and the United States from 1929 to 2004 using national accounting and employment data. The challenge of defining the public sector for comparative purposes is explored and illustrated.

Year	DE	Title and Abstract
		especially with respect to the treatment of non-profits, and a number of intriguing similarities and differences in the comparative evolution of the public sectors are identified that remain to be explained. Use of a new Fisher-type government deflator for Canada indicates that, as of 2003, real government spending relative to real income was about 27 percent of Gross Domestic Product (GDP) in both countries.
2007	N44	O'Hara, Glen. 2007. "Towards a New Bradshaw? Economic Statistics and the British State in the 1950s and 1960s." <i>Economic History Review</i> , 60(1): 1-34. This article outlines the attempts of British central government to react to the perceived inadequacy of official economic statistics. A huge amount of work went into this project, the main aim of which was to speed up the production of statistics so that the economy could be analysed in more detail, and thus better managed. If this was to work, more data was required on the labour market, on productivity, on production, and on the interlinkages between those indicators. British official statistics clearly were more comprehensive and more detailed at the end of this period than they had been at the start. Even so, the effort was usually thought to have been a failure by the early 1970s. More detail took time to produce; it was difficult to recruit the necessary staff; successive administrative reorganizations also absorbed energies. The devolved informality of British government hampered the emergence of an overall picture. Businesses and trade unions resisted attempts to collect more data, especially when it showed them in an unflattering light. Above all, the elite, specialist, and technical nature of the reform process meant that very little political and popular pressure built up to force through further changes.
2007	O51 Q40	Li, Minqi. 2007. <i>U.S., China, and the Unraveling of Global Imbalances</i> . Political Economy Research Institute, University of Massachusetts at Amherst, Working Papers. Since 2003, world economic growth has accelerated and there has been strong improvement in corporate profitability. The U.S. current account deficits and China's dramatic economic rise have been the two pillars underpinning the current global economic expansion. The coming years are likely to see the unraveling of the external and internal imbalances of the U.S. economy and the Chinese economy has been characterized by excessive dependence on investment and exports. Whether global economic expansion can be sustained to a large extent depends on whether the Chinese economy can be successfully restructured to be led by domestic consumption and to effectively address the question of long-term ecological sustainability.
2007	P27	Spevacek, Vojtech. 2007. "Ceska ekonomika ve svetle alternativnich ukazatelu ekonomicke vykonnosti a blahobytu. (Czech Economy in the Light of Alternative Indicators of Economic Performance and Welfare. With English summary.)" <i>Ekonomicky Casopis/Journal of Economics</i> , 55(7): 676-96. An overall assessment of economic development of the country is to be based not only on the gross domestic product, which is considered as the most important indicator, but on the comprehensive system of indicators which show different aspects of economic life. These indicators are contained in the system of national accounts. The article explains and analyses the national income which takes into account net outflow of primary incomes from the country, net domestic product (GDP less consumption of fixed capital) and indicators of real income which are influenced by the changes in the terms of trade. Indicators of final consumption, disposable income and savings of households are taken as proxy for the characteristics of welfare. The development of the Czech economy in the period 1995-2005 can be assessed differently by using different indicators. The formation of economic policy needs integrated picture based also on alternative indicators.

Presents a special section focusing on carbon dioxide emissions. Includes a world table; regional tables; income-group tables; and country tables of indicators relating to agriculture, forests and biodiversity, energy, emissions and pollution, water and sanitation, environment and health, and national accounting aggregates.
2007	Q20	Sengupta, Ramprasad, and Shalini Saksena. 2007. "Macroeconomics and Sustainable Accounting of Resources and Income." <i>India Macroeconomics Annual</i> , 0(0): 39-103. This article focuses on the conceptual and methodological issues relating to the sustainable accounting of income and wealth with illustrative examples in the macroeconomic context. The key macroeconomic performance indicators like Gross Domestic Product (GDP) and Net Domestic Product (NDP) and other aggregates, on which the Standard National Accounts (SNA) of UN focus, have their conceptual basis on the short-run Keynesian macroeconomic models and not on any long-run growth theory. The conventional SNA definition and its coverage of National Accounts do not, in fact, take account of the environmental consequences of economic activities and their feedback impact on their sustainability. This article provides the rationale for enlargement of the scope and coverage of National Accounts of income and wealth so as to include the natural resource (asset) accounting as a component in it as following from the very concept of sustainable development. The article further shows with illustration how the physical and hybrid flow accounts, which would depict the environment-economy interaction along with the material balances, can be developed by using the input-output modelling framework of analysis. It finally derives from such accounts the environmentally adjusted indicators of macroeconomic development like GDP, NDP savings, and so forth, and points to the usefulness of the integration of environmental and economic accounting for the development of sustainable development policies. It describes the satellite System of Environmental-Economic Accounting (SEEA) of the UN for such integration of accounts, and reviews the state of its implementation in India.
2007	Q23 Q31	Datta, Soumyendra Kishore. 2007. "Degradation of Natural Resources and Changes in Net Adjusted Savings--A Panel Data Analysis." <i>Journal of Quantitative Economics, New Series</i> , 5(1): 48-64. Depletion/degradation of natural resources has long been neglected in conventional national accounting system. Only recently loss of rent due to depletion of some of these resources has been considered in the new notion of net adjusted savings (NAS). There exist optimal conditions concerning degradation of natural resources consistent with positive NAS and sustainable utility. In reality however, these conditions are rarely met Panel data reveal an inverse relation of NAS in several countries with scale of deforestation, export of ores and metals, CO2 emission etc. A sound policy is essential to arrest such degradation for obtaining better NAS.

2008		
2008	A11	Atkinson, Glen. 2008. "Purpose and Measurement of National Income and Product." <i>Journal of Economic Issues</i>, 42(2): 303-16. Institutional economists were leaders in the development of national income and product accounts. The accounts were created to assist in understanding such issues as the effects of the rise of corporate ownership on the distribution of income, the causes of modern business cycles and war finance on the performance of the economy. This article reviews the assumptions to develop these accounts and how they shaped our understanding of the economy. Readers are encouraged to review these assumptions and consider ways that we might improve our measurements to deal more effectively with current problems.
2008	D33	Hoffmann, Rodolfo, and Marlon Gomes Ney. 2008. "A recente queda da desigualdade de renda no Brasil: Análise de dados da PNAD, do Censo Demográfico e das Contas Nacionais. (The Recent Reduction in Income Inequality in Brazil: Analysis of National Household Surveys, Census and National Accounts Data. With English summary.)" <i>Economica (Fluminense Federal University)</i>, 10(1): 7-39. Account taken of the classical concepts regarding the functional distribution of income, this article examines the main limitations of the data from Brazil's national household sample surveys PNAD, demographic census and system of national accounts (SNA) when they are used to study the inequality that characterizes Brazilian income distribution. We analyze to what extent such limitations can affect the diagnosis about how such inequality changed in the new century. Amongst the mentioned limitations, we draw attention to the fact that the sum under the heading "income from work" ("renda do trabalho") in the household sample surveys includes not only earnings of the labor force of relatively poor people--a progressive (in the sense defined in the article) component of total income--but also highly regressive incomes represented by the salaries of the highest echelons of managers and administrators, as well as profits and land rent. The recent reduction in inequality is real and confirmed by the data, and it can be explained by the lowering of the concentration ratio of various components of the total household income, in particular "income from work of employees" (or wages and salaries), income under the heading "interests and low income families' stipend", and pensions. Thus, by decomposing the Gini index, it is shown that a reduction in inequality is compatible with a slight decline in the relative share of "remuneration of employees" and a small increase in the share of "gross operational surplus" ("excedente operacional bruto") in GDP, as registered by the national accounts.
2008	D40	Deaton, Angus, and Alan Heston. 2008. <i>Understanding PPPs and PPP-based national accounts</i>. Princeton University, Woodrow Wilson School of Public and International Affairs, Research Program in Development Studies., Working Papers: 1120. PPP-based national accounts have become an important part of the database for macroeconomists, development economists, and economic historians. Frequently used global data come from the Penn World Table (PWT) and the World Bank's World Development Indicators; a substantial fraction of the world is also covered in the PPP accounts produced by the OECD and the European Union. This paper provides an overview of how these data are constructed, and discusses both the theory and the practical problems of implementing it. All of these data are underpinned by the International Comparison Program (ICP), which collects data on prices worldwide. The most recent round of the ICP was for 2005 with final results published in early 2008; version 7.0 of the Penn World Table will soon incorporate these results. The 2005 ICP, like earlier rounds, involved substantial revisions to previous data, most notably revising downwards the size of the Chinese (40 percent smaller) and Indian (36 percent) economies. We discuss the reasons for the revisions, and assess their plausibility. We focus on four important areas: how to handle international differences in quality, the treatment of urban and rural areas of large countries such as China, India, and Brazil, how to estimate prices for government services, health, and education, and the effects of the regional structure of the ICP. All of these affect the interpretation of previous data, as well as the current revisions. We discuss previous revisions of the PWT, and their effects on various kinds of econometric analysis. The paper concludes with health warnings that should be kept in mind when using these data, which are not always suitable for the purposes to which they are put. Some international comparisons are close to impossible, even in theory, and in others, the practical difficulties make comparison exceedingly hazardous.
2008	E13	Gomme, Paul, B. Ravikumar, and Peter Rupert. 2008. <i>The Return to Capital and the Business Cycle</i>. Concordia University, Department of Economics, Working Papers: 08002. We measure the return to capital directly from the NIPA and BEA data and examine the return implications of the real business cycle model. Specifically, we construct a quarterly time series of the after-tax return to business capital. The business cycle properties of this return differs considerably from those of the S&P 500 returns. First, its volatility is considerably smaller than that of S&P 500 returns. Second, our measured return is procyclical and leads output by one quarter; S&P 500 returns are countercyclical and lead the cycle by four quarters. The standard business cycle model captures almost 50% of the volatility in the return to capital (relative to the volatility of output), and does well in capturing the lead-lag pattern. We consider several departures from the benchmark model; the model with stochastic taxes captures nearly 85% of the relative volatility in the return to capital and the model with high risk aversion captures 80% of the relative volatility. We then include capital gains in our measurement and use a model with investment specific technological change to address the higher volatility in the return to capital. This model accounts for more than 80% of the return volatility, and essentially all of the relative volatility.

It is investigated whether euro area variables can be forecast better based on synthetic time series for the pre-euro period or by using just data from Germany for the pre-euro period. Our forecast comparison is based on quarterly data for the period 1970Q1-2003Q4 for 10 macroeconomic variables. The years 2000-2003 are used as forecasting period. A range of different univariate forecasting methods is applied. Some of them are based on linear autoregressive models and we also use some nonlinear or time-varying coefficient models. It turns out that most variables which have a similar level for Germany and the euro area such as prices can be better predicted based on German data, while aggregated European data are preferable for forecasting variables which need considerable adjustments in their levels when joining German and European

Year	DE	Title and Abstract
		Monetary Union (EMU) data. These results suggest that for variables which have a similar level for Germany and the euro area it may be reasonable to consider the German pre-EMU data for studying economic problems in the euro area.

2008	H23 H77	Aronsson, Thomas. 2008. "Social Accounting and the Public Sector." <i>International Economic Review</i> , 49(1): 349-75. This article contributes to the theory of social accounting. As such, it tries to extend earlier literature on the welfare equivalence of the comprehensive net national product in two main directions, both of which refer to the public sector. One is by considering welfare measurement problems associated with public good provision and redistributive policy, respectively, when the public revenues are raised by distortionary taxes. The other is by addressing the consequences of a "federation-like" decision structure, where independent tax and expenditure decisions are made both by the central government and by lower level governments.

2008	J61	Clemens, Michael A., and Lant Pritchett. 2008. "Income per Natural: Measuring Development for People Rather Than Places." <i>Population and Development Review</i> , 34(3): 395-434. It is easy to learn the average income of a resident of El Salvador or Albania. But there is no systematic source of information on the average income of a Salvadoran or Albanian. We estimate a new statistic: income per natural--the mean annual income of all people born in a given country, regardless of where those people now reside. Income per natural often differs substantially from income per resident, both in its mean and in its distribution. A large part of this difference is caused by movement across borders. Indeed, for people from a number of developing countries, departing their country of birth is one of the most important sources of poverty reduction and material advancement. If economic development is that which raises human well-being, then crossing international borders is not an alternative to economic development; it is a form of economic development.
2008	J61	Keramidas, Dimitris, Charalambos Economidis, and Nikos Stroplos. 2008. "The Participation of Migrants in the Greek Economy: An Input-Output Analysis." <i>Bulletin of Political Economy</i> , 2(1): 79-108. This paper presents an effort to estimate the participation of migrants in the Greek Economy with the help of the input-output analysis. Several characteristics were estimated, relating mainly to the number, income, expenditure, savings and investments of migrants, along with the corresponding data for Greeks. The study reveals some aspects about the economic status of migrants in terms of consumption patterns, compared to that of Greeks, and their distance from the poverty threshold. Moreover, within the context of the social accounting matrix (SAM) model, we split the household column for the year 2005 into two sub-columns, one for migrants and one for Greek households. The general conclusion of the paper is that migrants make a positive contribution to the Greek economy, mainly through their contribution to production.

2008	O14	Rajeswari, T. 2008. "Measurement of Capital Stock, Depreciation and Wealth." <i>Journal of Income and Wealth</i> , 30(2): 18-26. In this paper, an attempt has been made to generate estimates of capital stock and depreciation for the manufacturing industry based on retirement functions. In doing so, the estimates of the growth in capital stock, capital wealth, and depreciation have been compared with the estimates published in the National Accounts Statistics (NAS)-2008. In the first instance, estimates of retirements using a discard function for assets have been worked out. This is then used to estimate the gross fixed capital stock. Then a depreciation model is used to produce estimates of economic depreciation and wealth stock. Aim of this paper is to show that assuming a mortality function and taking into account of the retirements of a cohort of assets would reduce the values of consumption of fixed capital presently used in the NAS, thereby impacting the GDP/NDP.

In 2006, China's National Bureau of Statistics undertook a benchmark revision of national income and product accounts statistics based on the findings of the 2004 economic census. The benchmark revision covers primarily the years 1993-2004 with revised economy-wide and sectoral output values. The new data have three implications. First, despite all the hype only a few years ago about data falsification by local statistical authorities in China, the 2004 economic census results validate the provincial aggregate output values and invalidate the centre's national ones. Second, at the national level, economy-wide as well as sectoral nominal values were revised but real growth rates of some sectors remained unchanged. That is not plausible, and implies that at least the secondary sector real growth rates are erroneous. And finally, the benchmark revision raises questions about the quality and meaning of a large body of official statistics. Ultimately, it casts doubt on the professionalism and sincerity of China's statistical authority.

2009	B10	Natoli, Riccardo, and Segu Zuhair. 2009. "Tracing the Evolution of Wealth Measurement Approaches: Illustrating the Nature of Knowledge Production." <i>Journal of Interdisciplinary Economics</i>, 21(4): 379-406. The purpose of this paper is to briefly trace the main protagonists who have contributed to defining and measuring wealth, starting from the Stone Age up until the present day. It illustrates the changing nature of knowledge production in forming crucial concepts, where different economic theorists utilised different definitions and evaluations. These different economic theories, while defining economies, highlight a more important issue of recognising that the neoclassical concept that exists today is not an incontestable concept reflective of the present day economy, but a theoretical proposition that can be subject to change and alternative formulation. This continues to this very day with the onset of the knowledge revolution, and issues of environmental sustainability and social development. These all form an important part of wealth measurement but do not avail themselves to a study under the traditional economic theory. This limitation needs to be set against the pattern exhibited throughout this paper, namely, that wealth measurements were transformed in response to a need, to make them more appropriate to the actual facts of a changing, complex economic situation. It is no different now. The awareness of this factor is what makes an historical narrative of wealth and its measurement so important. By demonstrating this, it permits approaches to economics from a standpoint other than neoclassical.

This paper reviews mainstream efforts at engendering macroeconomics frameworks and deduced two main conclusions therefrom. First, that the engendering of macroeconomics may be building on the wrong foundations if the objective is to produce engendered macroeconomic policy that can deal with the multi-level and multi-dimensional problems of gender inequity, poverty and underdevelopment. Second, that the engendered macroeconomics that is desired could systematically begin from first principles by exploiting the visionary hopes of The General Theory while avoiding its weaknesses. The paper then argues that generating a desired engendered macroeconomics would require: (a) a reconsideration of the concept of value, (b) identification of new and more appropriate units of quantities/qualities for macro-global analysis consistent with current national and global realities, (c) a clear definition and categorization of variables of macro-global inquiry given current realities and the demands of gender equity and poverty reduction, (d) a robust debate on methodology, (e) clear specification of global, macro, meso and micro constraints, their interactions and welfare implications and (f) explicit analysis and estimation of externalities in generating a new system of national income accounting.
2009	C01 N25	Chow, Gregory. 2009. <i>Important Lessons from Studying the Chinese Economy</i>. Princeton University, Department of Economics, Center for Economic Policy Studies, Working Papers: 1198. In 1979 the United States and China established normal diplomatic relations, allowing me to visit China and study the Chinese economy. After doing so for thirty years since and advising the government of Taiwan in the 1960s and the 1970s and the government of the People's Republic of China in the 1980s and the 1990s this is an opportune moment for me to summarize the important lessons that I have learned. The lessons will be summarized in four parts: on economic science, on formulating economic policy and providing economic advice, on the special characteristics of the Chinese economy and on the experience of China's economic reform. At the beginning I should comment on the quality of Chinese official data on which almost all quantitative studies referred to in this article were based. Chow (2006(a)) has presented the view that by and large the official data are useful and fairly accurate. The main justification is that every time I tested an economic hypothesis or estimated an economic relation using the official data the result confirmed the well-established economic theory. It would be a miracle if I had the power to make the Chinese official statisticians fabricate data to support my hypotheses. Even if I had had the power, most of the data had already been published for years before I conceived the ideas of the studies reported in this article.
2009	C20 E00	Heim, John J. 2009. <i>The Real Exchange Rate And The U. S. Economy 2000-2008</i>. Rensselaer Polytechnic Institute, Department of Economics, Rensselaer Working Papers in Economics. This paper is a revision of Rensselaer Polytechnic Institute's Working Papers in Economics Series, No. 803, entitled "How Falling Exchange Rates 2000-2007 Have Affected the U.S. Economy and Trade Deficit (Evaluated Using the Federal Reserve's Real Broad Exchange Rate)". It expands the analysis to measure exchange rate effects on the U.S. economy through 2008. It also utilizes a significantly improved method for assessing the meaning of the regression coefficient on the exchange rate variable in consumption and investment functions, removing ambiguity as to whether they should be interpreted as income or substitution effects. The paper attempts econometrically, using a seven behavioral equation model, to determine the total impact during 2000-2008 of the U.S. real exchange rate's 13.8% decline. Using projections based on an econometric model of the U.S. economy 1960-2000, the paper suggests that the effect on demand for domestically produced consumer goods (and exports) is positive, but strongly negative for investment goods. The estimated overall negative effect of declining real exchange rates on the GDP is 1.9% over the eight years, or about a quarter percent decline a year. This revised estimate is less than half the estimated impact reported Working Paper 803. It is estimated the decline reduced the trade deficit \$189 billion from what it otherwise would have been, down from \$244 billion reported Working Paper 803.
2009	C20 E00	Heim, John J. 2009. <i>Demand For Durable Goods, Nondurable Goods And Services</i>. Rensselaer Polytechnic Institute, Department of Economics, Rensselaer Working Papers in Economics. Separate macroeconomic consumption demand functions are developed and tested for (1) durable goods, (2) nondurable goods and (3) services. These are compared for consistency with econometric

Year	DE	Title and Abstract
		studies of total consumer demand. Key factors determining demand for these goods are tested using U.S. 19602000 data. The econometric method used was 2SLS with heteroskedasticity controls. Data in first differences are used to reduce multicollinearity, non stationarity and autocorrelation. The models explain 94% of the variance in demand for consumer durables, 86% of demand for nondurable consumer goods and 81% of services demand. Demand for durables like autos and appliances, was found to be driven by the disposable income, wealth, the exchange rate, availability of consumer credit, interest rates on consumer credit, demand for new housing, which affects appliance demand, and population growth. Demand for nondurable goods, such as groceries and clothes, was driven by the same factors, except for new housing demand and the exchange rate. Demand for consumer services such as laundry, restaurant, and entertainment services was found to be related to disposable income, wealth, and population growth, but not related to consumer credit availability, or consumer credit interest rates. However, mortgage interest rates paid by households did seem to affect the demand for services.

Since the State has emerged as one of the body's identity of the society, the owners of the money and capital holders have found themselves in circumvention of its legal and financial commitments with the society and the state, one of the mechanisms of accumulation and reproduction its economic wealth. Recently, we have identified numerous economic activities bordering on corruption and that though they are a big component of the Product Economic countries and the Grow World Economic, not appearing in their accounts. But the multilateral efforts aimed at limiting the fields of action of such activities are focused in a specific way in a few, allowing even scenarios where rinse-off significant amounts of money in a transnational environment, free from barriers and societal controls. It is the interest of this academic exercise Identify those limits that prevent approximate knowledge of the sources and amounts of wealth that mobilize these economies, and submerged underground. Therefore, the interest of this academic exercise, identify those limits that prevent approximate knowledge of the sources and amounts of wealth that mobilize these economies, and submerged underground.
2009	D90	Layard, Richard, Guy Mayraz, and Stephen Nickell. 2009. <i>Does Relative Income Matter? Are the Critics Right?</i> . Centre for Economic Performance, LSE, CEP Discussion Papers. Do other peoples' incomes reduce the happiness which people in advanced countries experience from any given income? And does this help to explain why in the U.S., Germany and some other advanced countries, happiness has been constant for many decades? The answer to both questions is 'Yes'. We provide 4 main pieces of evidence. 1) In the U.S. General Survey (repeated samples since 1972) comparator income has a negative effect on happiness equal in magnitude to the positive effect of own income. 2) In the West German Socio-Economic Panel since 1984 the same is true but with life satisfaction as the dependent variable. We also use the Panel to compare the effect of income comparisons and of adaptation as factors explaining the stable level of life-satisfaction: income comparisons emerge as much the more important. 3) When in our U.S. analysis we introduce "perceived" relative income as a potential explanatory variable, its effect is as large as the effect of actual relative income--further supporting the view that comparisons matter. 4) Finally, for a panel of European countries since 1973 we estimate the effect of average income upon average life satisfaction, splitting income into two components: trend and cycle. The effect of trend income is small and ill-defined. Our conclusions relate to time series and to advanced countries only. They differ from those drawn in recent studies by Deaton and Stevenson/Wolfers, but those studies are largely cross-sectional and mostly include non-advanced as well as advanced countries.

2009	F41	Nakamura, Emi, and Jon Steinsson. 2009. <i>Lost in Transit: Product Replacement Bias and Pricing to Market</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 15359. Product replacement is frequent in the micro-data that underlie U.S. import and export price indices, while price changes are infrequent. Consequently, over 40% of price series in the data have no

Year	DE	Title and Abstract
		price changes and roughly 70% have two price changes or less. In constructing price indices, price adjustments that occur at the time of product replacements tend to be dropped. If price adjustments disproportionately occur at the time of product replacements then price adjustments are disproportionately unobserved. We show that this "product replacement bias" may distort the measured long-run relationship between import and export prices and the exchange rate by a factor of between 1.7 and 2.2. Accounting for this bias, we find that the price of non-oil U.S. imports (relative to domestic consumption) responds by 0.6-0.7% for each 1% change in the U.S. real exchange rate, while the price of U.S. exports (relative to foreign consumption) responds by roughly 0.8%. This contrasts with conventional pass-through estimates of 0.2-0.4% for non-oil import prices and 0.9% for export prices. Thus, we find that the degree of pricing to market for U.S. imports and exports is more symmetric and the degree of pricing to market for U.S. imports more moderate than conventional measures suggest. Adjusting for product replacement bias also substantially raises the volatility of the terms of trade. These results improve the fit of the data to standard models.

2009	P44	Rada, Codrina. 2009. <i>Formal and Informal Sectors in China and India: An Accounting-Based Approach</i>. University of Utah, Department of Economics, Working Paper Series, Department of Economics, University of Utah. This paper discusses the estimation of a social accounting matrix that distinguishes between formal and informal activities for China and India for 2000 and 1998-99 respectively. Wage shares for the formal/informal employment for China and net domestic product shares for the formal/informal sectors for India are being applied as weights to the input-output tables and flow of funds tables provided by official statistics. While some estimation techniques used in this paper remain vulnerable to criticism, the proposed methodology is a first step towards an integrated approach to account for the dualism of many economies in the developing world. The results are important data input for any policy-driven CGE model for developing countries.

2010	A10 B40	Caballero, Ricardo J. 2010. <i>Macroeconomics after the Crisis: Time to Deal with the Pretense-of-Knowledge Syndrome</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 16429. In this paper I argue that the current core of macroeconomics--by which I mainly mean the so-called dynamic stochastic general equilibrium approach--has become so mesmerized with its own internal logic that it has begun to confuse the precision it has achieved about its own world with the precision that it has about the real one. This is dangerous for both methodological and policy reasons. On the methodology front, macroeconomic research has been in "fine-tuning" mode within the local-maximum of the dynamic stochastic general equilibrium world, when we should be in "broad-exploration" mode. We are too far from absolute truth to be so specialized and to make the kind of confident quantitative claims that often emerge from the core. On the policy front, this confused precision creates the illusion that a minor adjustment in the standard policy framework will prevent future crises, and by doing so it leaves us overly exposed to the new and unexpected.
2010	A10 D00	Levine, David K. 2010. <i>Production Chains</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 16571. More advanced technologies demand higher degrees of specialization--and longer chains of production connecting raw inputs to final outputs. Longer production chains are subject to a "weakest link" effect: they are more fragile and more prone to failure. Optimal chain length is determined by the trade-off between the gains to specialization and the higher failure rate associated with longer chain length. There is a kind of reverse "Keynesian multiplier" that magnifies the effect of real shocks. Consequently, more advanced economies should have higher unemployment rates and be more prone to crisis. The implications of the theory both for measurement and government policy are examined.

Are natural resources a "curse" or a "blessing"? The empirical evidence suggests either outcome is possible. The paper surveys a variety of hypotheses and supporting evidence for why some countries benefit and others lose

Year	DE	Title and Abstract
	F43	from the presence of natural resources. These include that a resource bonanza induces appreciation of the real exchange rate, deindustrialization and bad growth prospects, and that these adverse effects are more severe in volatile countries with bad institutions and lack of rule of law, corruption, presidential democracies, and underdeveloped financial systems. Another hypothesis is that a resource boom reinforces rent grabbing and civil conflict especially if institutions are bad, induces corruption especially in non-democratic countries, and keeps in place bad policies. Finally, resource rich developing economies seem unable to successfully convert their depleting exhaustible resources into other productive assets. The survey also offers some welfare-based fiscal rules for harnessing resource windfalls in developed and developing economies.
2010	C38	Onatski, Alexei. 2010. "Determining the Number of Factors from Empirical Distribution of Eigenvalues." <i>Review of Economics and Statistics</i> , 92(4): 1004-16. We develop a new estimator of the number of factors in the approximate factor models. The estimator works well even when the idiosyncratic terms are substantially correlated. It is based on the fact, established in the paper, that any finite number of the largest "idiosyncratic" eigenvalues of the sample covariance matrix cluster around a single point. In contrast, all the "systematic" eigenvalues, the number of which equals the number of factors, diverge to infinity. The estimator consistently separates the diverging eigenvalues from the cluster and counts the number of the separated eigenvalues. We consider a macroeconomic and a financial application.

In 1961, Nicholas Kaldor highlighted six "stylized" facts to summarize the patterns that economists had discovered in national income accounts and to shape the growth models being developed to explain them. Redoing this exercise today shows just how much progress we have made. In contrast to Kaldor's facts, which revolved around a single state variable, physical capital, our updated facts force consideration of four far more interesting variables: ideas, institutions, population, and human capital. Dynamic models have uncovered subtle interactions among these variables, generating important insights about such big questions as: why has growth accelerated and why are there gains from trade?
2010	D20	Portes, Alejandro, and Lori Smith. 2010. <i>Institutions and National Development in Latin America: A Comparative Study</i> . Princeton University, Woodrow Wilson School of Public and International Affairs, Center for Migration and Development. Working Papers: 1234. We review the theoretical and empirical literatures on the role of institutions on national development as a prelude to present a more rigorous and measurable definition of the concept and a methodology to study this relationship at the national and subnational levels. The existing research literature features conflicting definitions of the concept of "institutions" and empirical tests based mostly on reputational indices, with countries as units of analysis. The present study's methodology is based on a set of five strategic organizations studied comparatively in five Latin American countries. These include key federal agencies, public administrative organizations, and stock exchanges. Systematic analysis of results show a pattern of differences between economically-oriented institutions and those entrusted with providing basic services to the general population. Consistent differences in institutional quality also emerge across countries, despite similar levels of economic development. Using the algebraic methods developed by Ragin, we test six hypotheses about factors determining the developmental character of particular institutions. Implications of results for theory and for methodological practices of future studies in this field are discussed.

2010	F43	Fernald, John, and Brent Neiman. 2010. <i>Growth Accounting with Misallocation: Or, Doing Less with More in Singapore</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 16043. We derive aggregate growth-accounting implications for a two-sector economy with heterogeneous capital subsidies and monopoly power. In this economy, measures of total factor productivity (TFP) growth in terms of quantities (the primal) and real factor prices (the dual) can diverge from each other as well as from true technology growth. These distortions potentially give rise to dynamic reallocation effects that imply that change in technology needs to be measured from the bottom up rather than the top down. We show an example, for Singapore, of how incomplete data can be used to obtain estimates of aggregate and sectoral technology growth as well as reallocation effects. We also apply our framework to reconcile divergent TFP estimates in Singapore and to resolve other empirical puzzles regarding Asian development.
2010	F43	MacDonald, Ryan. 2010. "Real Gross Domestic Income, Relative Prices, and Economic Performance across the OECD." <i>Review of Income and Wealth</i> , 56(3): 498-518. This paper uses OECD data to examine changes in labor productivity, real gross domestic product (GDP) and real gross domestic income (GDI), economic aggregates, and relative economic growth over time. Real GDI combines changes in production (real GDP) with a trading gain derived from relative price changes. The paper considers two sources of trading gains: the terms of trade, and the real exchange rate. For OECD countries, the terms of trade is the more important price ratio, making a contribution to real income growth that is, on average, an order of magnitude larger than the real exchange rate. Over long time periods, the most important source of real income growth is changes in production. Over shorter time horizons, however, the trading gain can make noteworthy contributions. Changes in aggregates like real private consumption, or the relative economic performance of nations, are shown to be particularly dependent on the trading gain during the large swings in resource prices that occurred post-2002.

In 1993, a new page was turned in national accounting. The United Nations Standards of National Accounting recommended a new standard for the measurement of output from the public sector. Implementation has recently begun in many countries, in Europe based on a European Union directive. In the U.K. the Atkinson Review in 2005 came up with a series of recommendations. This article examines its recommendations concerning the definition and valuation of government outputs. For the non-market sector a market analog is recommended by the Review. However, several of its recommendations are inconsistent with that, championing social value as a basis for definitions and measurement. If taken seriously it will lead to arbitrary and politically controversial factors inserted into national accounts. The article highlights the norm that GDP is a measure of production, and advocates adhering to the market analog and following well recognized practices of national accounting.
2010	I00	Deaton, Angus. 2010. <i>Understanding the Mechanisms of Economic Development</i> . Princeton University, Woodrow Wilson School of Public and International Affairs, Research Program in Development Studies., Working Papers: 1225. I argue that progress in understanding economic development (as in other branches of economics) must come from the investigation of mechanisms; the associated empirical analysis can usefully employ a wide range of experimental and non-experimental methods. I discuss three different areas of research: the life-cycle saving hypothesis and its implication that economic growth drives higher rates of national saving, the theory of speculative commodity storage and its implications for the time-series behavior of commodity prices, and the relationship between economic growth and nutritional improvement. None of these projects has yet been entirely successful in offering a coherent account of the evidence, but all illustrate a process of trial and error, in which although mechanisms are often rejected, unlikely theoretical propositions are sometimes surprisingly verified, while in all cases there is a process of learning about and subsequently modifying our understanding of the underlying mechanisms.

The aim of this paper is, firstly, to highlight the structural importance of the car "business" in Spain from the viewpoint of supply and demand by analyzing the magnitudes of the National Accounts of Spain (CN) and later, building on the methodology provided by the analysis input-output to observe the interrelationships with the rest of the economy. Secondly, to analyze the economic impact of the current crisis on the "sector", using the model IO as a tool for simulation.
2010	N00 N32 N92	Park, Haelim M., and Gary Richardson. 2010. <i>Retail Trade by Federal Reserve District, 1919 to 1939: A Statistical History</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 16617. Soon after beginning operations, the Federal Reserve established a nationwide network for collecting information about the economy. In 1919, the Fed began tabulating data by about retail sales, which it viewed as a fundamental measure of consumption. From 1920 until 1929, the Federal Reserve published data about retail sales each month by Federal Reserve district, but ceased to do so after 1929. It continued to compile monthly data on retail sales by reserve district, but this data remained in house. We collected these in-house reports from the archives of the Board of Governors and constructed a consistent series on retail trade at the district level. The new series enhances our understanding of economic trends during the Roaring '20s and Great Depression.
2010	N11	Gordon, Robert J. 2010. <i>Revisiting U. S. Productivity Growth over the Past Century with a View of the Future</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 15834. This paper provides three perspectives on long-run growth rates of labor productivity (LP) and of multi-factor productivity (MFP) for the U. S. economy. It extracts statistical growth trends for labor productivity from quarterly data for the total economy going back to 1952, provides new estimates of MFP growth extending back to 1891, and tackles the problem of forecasting LP and MFP twenty years into the future.

2010	N42	Gordon, Robert J., and Robert Krenn. 2010. <i>The End of the Great Depression 1939-41: Policy Contributions and Fiscal Multipliers</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 16380. This paper is about the size of fiscal multipliers and the sources of recovery from the Great Depression. Its baseline result is that 89.1 percent of the 1939:Q1-1941:Q4 recovery can be attributed to fiscal policy innovations, 34.1 percent to monetary policy innovations and the remaining -23.2 percent to the combined effect of the basic VAR dynamic forecast and innovations in non-government components of GDP. Traditional Keynesian multipliers assume that there are no capacity constraints to impede a fiscal-driven expansion in aggregate demand. On the contrary, we find ample evidence of capacity constraints in 1941, particularly in the second half of that year. As a result our preferred government spending multiplier is 1.80 when the time period ends in 1941:Q2 but only 0.88 when the time period ends in supply-constrained 1941:Q4. Only the 1.80 multiplier is relevant to situations like 2009-10 when capacity constraints are absent across the economy. Two sets of new insights emerge from a review of contemporary print media. We document that the American economy went to war starting in June 1940, fully 18 months before Pearl Harbor. We also detail the bifurcated nature of the 1941

Year	DE	Title and Abstract
		economy, with excess capacity in its labor market but capacity constraints in many of the key manufacturing industries. By July 1941, the American economy was in a state of perceived national emergency.

2011	B11	Erba, Alighiero. 2011. "Economic Structure and National Accounting: G. Ortes' Contribution to Economic Science." <i>History of Economic Ideas</i>, 19(1): 55-83. The article aims to illustrate the contribution made to economic science by the Venetian Giammaria Ortes (1713-1790). At the root of Ortes' work is the problem of poverty caused by the unbalanced distribution of goods produced in a nation, thus resulting in the suffering of a small or large portion of its population. For this reason, and with inspiration from W Petty, Ortes proposed Political Geometry to obtain, thanks to set theoretical principles, reliable estimates of the most significant macroeconomic figures. For this purpose, Ortes carried out an exhaustive ten-year study into the Venetian State of the late 1700s to measure the amount of goods required to ensure the decent subsistence of each of its citizens. By meticulously analysing the productive structure as well as the techniques then in use and with the help of experts in human physiology and other disciplines, Ortes attempted to collect the data needed to construct a system of indicators to establish a socio-economic balance in the Veneto.
2011	B51	Tregenna, Fiona. 2011. "What Does the 'Services Sector' Mean in Marxian Terms?" <i>Review of Political Economy</i>, 23(2): 281-98. The services sector has grown as a share of GDP and employment in most countries in recent years, and there has been increasing interest in understanding this sector and in its growth potential. This article analyses the meaning and nature of the 'services sector' from a Marxian perspective. Marx did not analyse 'services' as such (although he did discuss certain types of activities that are currently classified as services), and 'sectors' are not the units of his economic analysis. From a Marxian approach, an activity needs to be analysed in terms of its location in the circuit of capital and its relationship with the production of surplus-value. The 'services sector' includes activities that are highly heterogeneous in these terms, including activities in which surplus-value is directly produced, activities that facilitate the production of surplus-value elsewhere (or increase the rate at which it is produced), and activities that stand outside of the circuit of capital. Marxian tools of analysis yield particular insights into the nature of various types of service activities, and these insights are helpful in understanding sectoral structure and the potential implications of changes therein.
2011	C31	Cheung, Yin-Wong, and Eiji Fujii. 2011. <i>Exchange Rate Misalignment Estimates--Sources of Differences</i>. CESifo Group Munich, CESifo Working Paper Series: 3555. We study the differences of currency misalignment estimates obtained from alternative datasets derived from two International Comparison Program (ICP) surveys. A decomposition exercise reveals that the year 2005 misalignment estimates are substantially affected by the ICP price revision. Further, we find that differences in misalignment estimates are systematically affected by a country's participation status in the ICP survey and its data quality--a finding that casts doubt on the economic and policy relevance of these misalignment estimates. The patterns of changes in the estimated degree of misalignment across individual countries, as illustrated by the BRIC economies, are quite variable.
2011	C87	Van Tongeren, J. W., and J. R. Magnus. 2011. <i>Bayesian Integration of Large Scale SNA Data Frameworks with an Application to Guatemala</i>. Tilburg University, Center for Economic Research, Discussion Paper: 2011-022. We present a Bayesian estimation method applied to an extended set of national accounts data and estimates of approximately 2500 variables. The method is based on conventional national accounts frameworks as compiled by countries in Central America, in particular Guatemala, and on concepts that are defined in the international standards of the System of National Accounts. Identities between the variables are exactly satisfied by the estimates. The method uses ratios between the variables as Bayesian conditions, and introduces prior reliabilities of values of basic data and ratios as criteria to adjust these values in order to satisfy the conditions. The paper not only presents estimates and precisions, but also discusses alternative conditions and reliabilities, in order to test the impact of framework assumptions and carry out sensitivity analyses. These tests involve, among others, the impact on Bayesian estimates of limited annual availability of data, of very low reliabilities (close to non-availability) of price indices, of limited availability of important administrative and survey data, and also the impact of aggregation of the basic data. We introduce the concept of 'tentative' estimates that are close to conventional national accounts estimates, in order to establish a close link between the Bayesian estimation approach and conventional national accounting.

2011	J10	CV: Sheikh, Munir A. 2011. "Good Data and Intelligent Government." In <i>New Directions for Intelligent Government in Canada: Papers in Honour of Ian Stewart</i> . Ian Stewart, 305-35. Edited by Fred Gorbet and Andrew Sharpe. Ottawa: Centre for the Study of Living Standards.
2011	L33	Mahecha Ordonez, Marco Tulio. 2011. "Colombia: Nueva base de las Cuentas Nacionales, año 2005. (With English summary)." <i>IB Informacion Basica en Estadistica</i> , 1(1): 130-67. Change of the reference year of the National Accounts means to move forward in the investigation of the different branches of the economy trying to establish a new dimension of the national economy, to update its productive structure and to introduce the methodological advances implicit in the recent international recommendations. Also, its purpose is to incorporate the most recent advances in the matter of basic statistics, specially in the outcomes by-product of the investigations of a large-scale study like the Census and socioeconomic surveys. It is normal that the benchmark to measure the economy be affected across the time by different causes like economic, institutional and statistical alterations. For instance, the modifications in the techno-economic relations of production are the consequence of the sectoral dynamic. Privatization of enterprises brings about changes in the public and private aggregates. Modifications on the tributary rates affect the levels of prices of the goods and services and the availability of the economic statistics and the effectiveness in the control of the profits of the enterprises and persons by the tax bureau (DIAN), the superintendence bureaus and the general account bureau. The outcomes in the new reference year of the National Accounts are not evidence of fundamental changes in relation to base 2000: GDP is increased by just 4%. Nonetheless, changes appear more meaningful in the levels of inventories (-73.2%) and in importations (-9.5). Otherwise, there are modifications of the productive structure at a sectoral scale of 2005, explained by changes in the relative importance of the sectoral production and by the behavior of some technical relations of production of the economic activities.
2011	L94	Muller, Nicholas Z., Robert Mendelsohn, and William Nordhaus. 2011. "Environmental Accounting for Pollution in the United States Economy." <i>American Economic Review</i> , 101(5): 1649-75. This study presents a framework to include environmental externalities into a system of national accounts. The paper estimates the air pollution damages for each industry in the United States. An integrated-assessment model quantifies the marginal damages of air pollution emissions for the US which are multiplied times the quantity of emissions by industry to compute gross damages. Solid waste combustion, sewage treatment, stone quarrying, marinas, and oil and coal-fired power plants have air pollution damages larger than their value added. The largest industrial contributor to external costs is coal-fired electric generation, whose damages range from 0.8 to 5.6 times value added.
2011	M42 M48	Rauch, Bernhard, Max Gottsche, Gernot Braehler, and Stefan Engel. 2011. "Fact and Fiction in EU-Governmental Economic Data." <i>German Economic Review</i> , 12(3): 243-55. To detect manipulations or fraud in accounting data, auditors have successfully used Benford's law as part of their fraud detection processes. Benford's law proposes a distribution for first digits of numbers in naturally occurring data. Government accounting and statistics are similar in nature to financial accounting. In the European Union (EU), there is pressure to comply with the Stability and Growth Pact criteria. Therefore, like firms, governments might try to make their economic situation seem better. In this paper, we use a Benford test to investigate the quality of macroeconomic data relevant to the deficit criteria reported to Eurostat by the EU member states. We find that the data reported by Greece shows the greatest deviation from Benford's law among all euro states.
2011	O00	Caselli, Francesco, and Antonio Ciccone. 2011. <i>A Note on Schooling in Development Accounting</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 17656. How much would output increase if underdeveloped economies were to increase their levels of schooling? We contribute to the development accounting literature by describing a non-parametric upper bound on the increase in output that can be generated by more schooling. The advantage of our approach is that the upper bound is valid for any number of schooling levels with arbitrary patterns of substitution/complementarity. We also quantify the upper bound for all economies with the necessary data, compare our results with the standard development accounting approach, and provide an update on the results using the standard approach for a large sample of countries.

2011	Q33	Gregory, R. G. 2011. <i>Living Standards, Terms of Trade and Foreign Ownership: Reflections on the Australian Mining Boom</i> . Centre for Economic Policy Research, Research School of Economics, Australian National University, CEPR Discussion Papers: 656. Australia is experiencing its largest mining boom for more than a century and a half. This paper explores, from a national perspective, important economic differences that arise when a mining boom, such as the current one, is generated by sustained export price increases (trading gains) rather than export volume increases. Since 2003 the terms of trade changes--through their direct trading gain effect and indirect real GDP effects--have increased Australian living standards. The increase, measured from official data and relative to the US, is about 25 per cent; an increase which probably places Australian living standards well above those of the US. But official data inadequately adjusts for foreign ownership of mining resources suggesting that this estimate is probably a little too high.
2011	R23	Hoshino, Masashi. 2011. <i>Measurement of GDP per capita and regional disparities in China, 1979-2009</i> . Research Institute for Economics & Business Administration, Kobe University, Discussion Paper Series: DP2011-17. This paper analyzes provincial GDP per capita disparities in China from 1979 to 2009. Provincial GDP per capita of official statistical materials have several problems such as data correctness and reliability, because the data are composed of the huji population and the changzhu population. The differences both population data are inter-province migration patterns. We compare result using our modified changzhu population GDP per capita data with results using official statistical materials. The empirical results as follows: (1) Previous studies since the 1990s have overestimated inter-province disparities; (2) inter-province disparities decrease from 2005; (3) Western region increase in intra-regional disparities since 2002. These results suggest that we should use provincial GDP per capita statistics more carefully.

2012	A12	Ismail, Rosmini, Vicky Forgie, and Khalizul Khalid. 2012. "Bridging the Environmental Accounting Gap between the Accounting and Economics Disciplines." <i>American Journal of Finance and Accounting</i>, 2(4): 297-310. This paper discusses how to find the 'real' return for a tourism site by constructing accounting statements that take into account financial and environmental expenses, assets and liabilities. The concept of environmental accounting (EA) allows businesses and nations to report financial/economic and environmental activity in the same framework. This paper proposes an EA reporting tool which comprises an income statement, balance sheet and physical unit statement (incorporating environmental assets and liabilities in financial terms) referred to as 'environmentally sustainable accounting statements' (ESAS). To produce the ESAS, techniques from environmental economics and national accounting are integrated into regular financial accounts using methodologies that align with standard accounting principles as far as possible.
2012	B00 D41 P00	Kregel, Jan. 2012. "Diversity and Uniformity in Economic Theory as an Explanation of the Recent Economic Crisis". Levy Economics Institute, The, Economics Working Paper Archive. Market economies and command economies have long been differentiated by the presence of alternative choice in the form of diversity. Yet most mainstream economic theory is premised on the existence of uniformity. This paper develops the implications of this contradiction for the theory of prices, income creation, and the analysis of the recent financial crisis, and provides a critique of traditional theory from an institutionalist perspective developed by J. Fagg Foster.
2012	C34 J39	Lichard, Tomas, Jan Hanousek, and Randall K. Filer. 2012. <i>Measuring the Shadow Economy: Endogenous Switching Regression with Unobserved Separation</i>. Hunter College: Department of Economics, Hunter College Department of Economics Working Papers: 438. We develop an estimator of unreported income, perhaps due to tax evasion, that does not depend on as strict identifying assumptions as previous estimators based on microeconomic data. The standard identifying assumption that the self-employed underreport income whereas wage and salary workers do not is likely to fail in countries where employees are often paid under the table or engage in corrupt activities. Assuming that evading individuals have a higher consumption-income gap than non-evading ones due to underreporting both to tax authorities and in surveys, an endogenous switching model with unknown sample separation enables the estimation of consumption-income gaps for both underreporting and truthful households. This avoids the need to identify non-evading and evading groups ex ante. This methodology is applied to data from Czech and Slovak household budget surveys and shows that estimated evasion is substantially higher than found using previous methodologies.

2012	D69	Benjamin, Daniel J., Ori Heffetz, Miles S. Kimball, and Nichole Szembrot. 2012. <i>Beyond Happiness and Satisfaction: Toward Well-Being Indices Based on Stated Preference</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 18374. This paper helps provide foundations for survey-based tracking of well-being. First, we propose a theory in which utility depends on "fundamental aspects" of well-being, measurable with surveys. Second, drawing from psychologists, philosophers, and economists, we compile a comprehensive list of such aspects. Third, to estimate the aspects' marginal utilities--a necessary input for constructing an individual-level well-being index--we conduct a survey in which ~4,600 U.S. respondents state their preference between pairs of aspect bundles. We estimate high relative marginal utilities not only for traditional happiness and life satisfaction measures, but even more for aspects related to family, health, security, values, and freedoms.
2012	E16	Hernandez, Gustavo. 2012. "Matrices insumo-producto y analisis de multiplicadores: Una aplicacion para Colombia. (Input-Output Matrices and Multiplier Analysis: An Application for Colombia. With English summary)." <i>Revista de Economia Institucional</i>, 14(26): 203-21. Input-output analysis is widely used in different scenarios, because it is easy to implement and interpret. Nevertheless, it is important to note that input-output coefficients should be built with caution, especially in the case of secondary production, as this may imply negative coefficients. To overcome this problem the coefficients were constructed indirectly, applying this methodology using data from the 2007 national accounts, base 2000. Using these new coefficients, we performed a traditional multiplier analysis to obtain the key sectors of the economy. This analysis is sensitive to the level of disaggregation used.
2012	E16	Pyatt, Graham, and Jeffery I. Round. 2012. "Distributional Invariance and the Design of SAMs." <i>Economic Systems Research</i>, 24(3): 251-73. The decomposition of a matrix multiplier derived from a social accounting matrix (SAM) by Pyatt and Round [(1979). Accounting and Fixed Price Multipliers in a Social Accounting Matrix Framework. <i>Economic Journal</i> , 89, 850-873] has prompted a number of subsequent applications. In one of the earliest examples Stone [(1985). The Disaggregation of the Household Sector in the National Accounts, Chapter 8. In: G. Pyatt and J.I. Round (eds.) <i>Social Accounting Matrices: A Basis for Planning</i> . Washington, DC, The World Bank, 145-185] made the intriguing observation that the higher order (circular) effects of an exogenous change in final demand on the distribution of income and the structure of production were more or less independent of the sectoral composition of the initial injection. Our initial objective in this article is to explore this phenomenon of distributional invariance and to derive sufficient conditions for it. We then argue that these conditions have important implications for the design of SAMs, for the taxonomies they adopt and for levels of disaggregation, all of which strongly condition the quality of results that can be generated via subsequent modelling.
2012	E42	Buitier, Willem H., and Ebrahim Rahbari. 2012. <i>Target2 Redux: The simple accountancy and slightly more complex economics of Bundesbank loss exposure through the Eurosystem</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 9211. This study shows that Target2 net claims are a poor measure of Bundesbank loss exposure, and even more so of German loss exposure to the rest of the Eurozone. This is true even under plausible assumptions about a comprehensive break-up scenario that leaves Germany as the only member of the euro area and the Bundesbank as the sole owner of the ECB. In this implausible scenario, the discrepancy between the Bundesbank's Target2 net credit balance and its likely loss exposure has two principal sources. First, the 16 national central banks (NCBs) that exit the Eurosystem (which will on balance be net Target2 debtors) and their sovereigns will not automatically walk away completely from their Target2 debts--defaulting on their debts with a zero recovery rate for the Bundesbank. Legally, the Target2 claims are not extinguished by exit from the Eurosystem by the debtor NCBs. Politically and realistically, many of the exiting NCBs would be able and willing to honour their obligations to Target2 in part or even in full. Second, in the comprehensive break-up scenario, future seigniorage revenues of the Bundesbank would likely go up, as it would

Year	DE	Title and Abstract
		be left with a larger share (in our example 100 percent) of the ownership of the ECB. Changes in German exposure to the rest of the euro area (or to the periphery) can differ in magnitude and in sign from Bundesbank exposure.

Net state and local government saving increased \$14.9 billion to -\$112.7 billion.
2012	H20	Cebula, Richard J., and Maggie Foley. 2012. "A Panel Data Study of the Effects of Economic Freedom, Regulatory Quality, and Taxation on the Growth Rate of Per Capita Real GDP." <i>Journal of Public Finance and Public Choice/Economia delle Scelte Pubbliche</i> , 30(1-3): 103-22. This study empirically investigates three hypotheses. The first is that higher levels of economic freedom in an economy promote a higher growth rate of economic activity and hence yield a higher growth rate of per capita real GDP in that economy. The second hypothesis is that higher quality government regulation leads to a more efficient economic system, in large part by interfering less with market functioning and in part by not adding unnecessarily to the cost of conducting business in the marketplace, and thereby leads to a higher per capita real GDP growth rate. The third hypothesis is that the higher the taxation level/burden relative to GDP in an economy, the lower the growth rate of private sector spending and hence the lower the growth rate of per capita real GDP in that economy. Using a panel dataset for OECD nations over the 2003 through 2006 period, fixed effects PLS estimations find compelling evidence in support of all three of these hypotheses.

2012	J39	Torosyan, Karine, and Randall K. Filer. 2012. <i>Tax Reform in Georgia and the Size of the Shadow Economy</i> . Hunter College: Department of Economics, Hunter College Department of Economics Working Papers: 439. This paper applies three different methods widely used in the literature to track changes in shadow economic activity in Georgia following a drastic tax reform in 2005. The first method is a currency demand approach based on macro level data. The second and third methods rely on micro data from household surveys. Overall, we find evidence that the amount of income underreporting decreased in the years following the reform. The biggest change is observed for households headed by a farmer, followed by "other" types of households where the head does not report any working status. Employed and self-employed households appear very similar before the tax reform and show minimal adjustment in income reporting in the post-reform period. Results, however, suggest that much of any difference may have come from increased enforcement efforts rather than rate changes.

With English summary)." <i>CIRIEC-Espana, Revista de Economia Publica, Social y Cooperativa</i> , 0(74): 5-37. The main aim of this paper is to build the satellite accounts of the social economy enterprises in Asturias for 2005, in order to ascertain the chief macroeconomic dimensions so that the importance, strengths and weaknesses of this sector may be explored. These accounts are drawn up according to type of activity and enterprise. A prior descriptive analysis of the social economy of Asturias has been made, both at the level of sector enterprises and the employment it generates; likewise, a geographical study of where these third sector enterprises are located and their characteristics has also been undertaken. To enrich the data, a comparative study of the importance of the social economy in relation to the "rest" of the economy of Asturias and with the social economy nationally was also made.

2012	Q15	Diss: Storeygard, Adam. 2012. Urban Growth and Economic Development. PhD diss. Brown University. This dissertation explores three topics related to urban growth and economic development. The first chapter asks how transport costs to a port affect the level of economic activity in hinterland cities in sub-Saharan Africa. It focuses on countries whose largest city is a port, and uses two new datasets. Satellite data on lights at night proxy for city economic activity, and the shortest routes between cities are calculated on a new road network dataset. Cost per unit distance is identified by world oil prices. The results show that an oil price increase of the magnitude experienced between 2002 and 2008 induces the income of a given city to increase by six percent relative to otherwise identical cities one standard deviation farther from a major port. Combined with external estimates, this implies an elasticity of city economic activity with respect to transport costs of -0.2 at that distance. Cities connected to the port by more paved roads are chiefly affected by transport costs to the port, while connections to secondary centers influence the remainder more. The second chapter introduces the satellite data on night lights used in the first chapter, and develops a statistical framework in which they augment official national income growth measures. For countries with poor national income accounts, the optimal estimate of growth is a composite with roughly equal weights on conventionally measured growth and growth predicted from lights. The combined estimates differ from official data by up to three percentage points annually. The third chapter examines the effect of local precipitation shocks on crime against women using annual data from 583 districts in India over the period 2002-2007, finding that dry shocks increase reported domestic violence and dowry deaths, as well as dowry payments. These patterns are consistent with a model of consumption smoothing by those exposed to weather risks, but inconsistent with an alternative hypothesis that general unrest causes these crimes to increase. Regarding mitigation strategies, there is no evidence that female political representation affects these risks, while access to groundwater irrigation worsens the effects of dry shocks and allays those of wet shocks.
2012	Q18	Lindberg, G., P. Midmore, and Y. Surry. 2012. "Agriculture's Inter-industry Linkages, Aggregation Bias and Rural Policy Reforms." <i>Journal of Agricultural Economics</i>, 63(3): 552-75. As agricultural policy reform and its effects have become increasingly territorialised, analyses that attempt to explain or predict impacts need to be both more localised and to identify spill-over effects. Local and regional general equilibrium approaches have become increasingly popular because they can extend predictions of policy shocks obtainable from partial equilibrium sectoral models to identify the wider effects. However, agriculture is usually described as a single sector in input-output accounts, whereas policy shocks that affect constituent commodities with differential impacts will have inter-industry effects that are different to those implied by average input-output coefficients. Regionalisation of aggregated input-output tables adds further to these difficulties. The objective of this study is to develop a practical method for dealing with these problems. It describes the theoretical basis of aggregation bias and shows how it can be measured, in two contrasting case study regions in the UK and Sweden. Having established that this is a significant issue, a simple but effective procedure is demonstrated, based on additional information on variable costs, which transforms policy shocks from a direct change in agricultural output to that transmitted to the suppliers of inputs. This method provides an impact close to that which could be calculated if the general equilibrium system had indeed been disaggregated, and supports use of this approach in impact studies where insufficient time or funding are available for complete disaggregation of an agricultural sector's regional accounts.

2013	B24	Olsen, Erik K. 2013. "The Comparability of the Aggregates Revisited." <i>European Journal of the History of Economic Thought</i>, 20(3): 489-512. This article addresses a longstanding controversy over the comparability of the economic accounting aggregates used by Marx in Capital with those used by Keynes in the General Theory. It demonstrates that Tsuru's highly-regarded works on this issue, which are the standard references on the topic, contain significant errors. These errors led several influential readers to conclude either that there are significant differences between the two sets of aggregates that do not actually exist, or that Marx's aggregates are fundamentally flawed and, by implication, that his entire theoretical schema is also. The effect of these problems has been to obscure the relation between Marxian and Keynesian theories rather than clarify it, as well as to foster confusion over some very basic issues in Marxian theory. This paper identifies the mistakes in Tsuru's work, and provides the correct mapping between the two sets of aggregates.
2013	C61	Strobel, Thomas, Stefan Sauer, and Klaus Wohlrabe. 2013. <i>The Ifo Investment Database</i>. CESifo Group Munich, CESifo Working Paper Series: 4154. In this paper we present the Ifo Investment Database, which provides annual investment data for 12 investment assets in 50 German industries from 1991 onward. The data is consistent with national accounts statistics provided by the German Federal Statistical Office and is based on investments in 88 different sub-assets. This disaggregated level of information allows allocating investments by asset type to each industry, using an investment flow matrix. The database enables researchers to analyze structural investment behavior on the industry level and to identify changes in the importance of investment assets. It additionally collects leasing data from the Ifo Investment Survey Leasing, which enables the conversion of the investment data from the owner to the user concept. This unique feature allows the researcher to examine changes in financing of investments. We describe the structure and methodology of the database and illustrate its variety and strengths by looking at some descriptive examples. Finally, we outline how the data can be accessed.
2013	D30	Honkkila, Juha, and Ilja Kristian Kavonius. 2013. <i>Micro and macro analysis on household income, wealth and saving in the euro area</i>. European Central Bank, Working Paper Series: 1619. The report on the Measurement of Economic Performance and Social Progress by Stiglitz, Sen and Fitoussi concludes that in the measurement of household welfare all material components should be covered, i.e. consumption, income and wealth, from both the micro as well as the macro perspective. Additionally, several other initiatives like the G20 finance ministers' and central bank governors' data gap initiative have emphasised to have an integrated micro-macro framework where consumption, income and wealth can be analysed. Current researches linking macro and micro information for the households have focused on income and consumption as these are the areas where most data sources are available. This paper extends the focus to household wealth using both survey data and financial accounts. It builds a link between wealth survey and national accounts' income concepts. This paper aims to create a first set of macroeconomic accounts that include wealth broken down by household groups.
2013	D46	Foley, Duncan K. 2013. "Rethinking Financial Capitalism and the "Information" Economy." <i>Review of Radical Political Economics</i>, 45(3): 257-68. This talk examines the popular idea that "economic growth" can continue indefinitely in post-industrial capitalist economies through the shift of labor to "service" sectors, particularly finance and information-based activities, in the light of the classical-Marxian theory of value and the related categories of productive and unproductive labor. As the generally accepted classical theory of land rent exemplifies, many types of income in capitalist economies, including interest, financial fees,

Year	DE	Title and Abstract
		speculative trading profits, and intellectual property royalties, arise as parts of the surplus value generated by the exploitation of productive labor appropriated through the assertion of various property rights. The dramatic phenomena of highly profitable "business models" based on network externalities associated with the internet and other information-based technologies do not represent new modes of value production, but modes (in some cases not particularly new) of participation in the pool of surplus value. National income accounting conventions that impute a fictitious output as a counterpart to incomes generated in sectors such as finance, professional and business services, education and health, and government, where there are no market-based measures of output create a distorted and misleading picture of value production and growth in advanced capitalist economies. A clear understanding of the origin of value in the expenditure of productive labor and of surplus value in the exploitation of productive labor is essential to thinking through the problems of post-industrial capitalist growth, distribution, resource conservation, and environmental protection.
2013	D71	Fleurbaey, Marc, and Didier Blanchet. 2013. <i>Beyond GDP: Measuring Welfare and Assessing Sustainability</i>, Oxford and New York: Oxford University Press. Examines recent developments in the fields of social choice, fair allocation, sustainability, and happiness, and explores how the construction of a reasonable alternative to gross domestic product can be imagined. Discusses a wealth of indicators; measuring sustainability; a price for everything?; equivalent income, or how to value what has no price; is happiness all that matters?; and empowering capabilities.
2013	D92	Diewert, Erwin. 2013. <i>Voyage Accounting, User Costs and the Treatment of Financial Transactions in the Theory of the Firm</i>, Vancouver School of Economics, Economics Working Papers. The paper considers some of the problems associated with the indirectly measured components of financial service outputs in the System of National Accounts (SNA), termed FISIM (Financial Intermediation Services Indirectly Measured). The paper considers how to integrate financial transactions into the balance sheet and production accounts of a firm. In order to minimize the role of imputations, the paper considers a firm that raises capital at the beginning of the accounting period, engages in some form of productive activity during the period and then distributes the initial capital and any profits back to the capitalists who financed the firm. This situation corresponds roughly to merchant trading voyages made some centuries ago.
2013	F44	Diebold, Francis, and Kamil Yilmaz. 2013. <i>Measuring the Dynamics of Global Business Cycle Connectedness</i>, Penn Institute for Economic Research, Department of Economics, University of Pennsylvania, PIER Working Paper Archive. Using a connectedness-measurement technology fundamentally grounded in modern network theory, we measure real output connectedness for a set of six developed countries, 1962-2010. We show that global connectedness is sizable and time-varying over the business cycle, and we study the nature of the time variation relative to the ongoing discussion about the changing nature of the global business cycle. We also show that connectedness corresponding to transmissions to others from the United States and Japan is disproportionately important.
2013	F55 N20	Tomz, Michael, and Mark L. J. Wright. 2013. <i>Empirical Research on Sovereign Debt and Default</i>, National Bureau of Economic Research, Inc, NBER Working Papers: 18855. 2013	H24 N43	Thompson, S. J. 2013. "The First Income Tax, Political Arithmetic, and the Measurement of Economic Growth." <i>Economic History Review</i>, 66(3): 873-94. The imposition of the world's first modern income tax in 1799 prompted a revival of interest in national accounting. This article examines the extent to which William Pitt the Younger, who proposed the new tax, modelled his estimates of national wealth on those produced a century earlier by the pioneers in this field, Sir William Petty, Charles Davenant, and Gregory King. In addition, the calculations of Benjamin Bell and Henry Beeke, two of Pitt's contemporaries, are analysed in detail to highlight the fragility of these contemporary estimates of national income. This analysis has important implications for economic historians who have used this material to try to establish the structure and growth of national output. National accountants during the long eighteenth century were not, for the most part, concerned with structural change. Rather, their descriptions of economic structure should be understood as reflecting a particular set of a priori claims about what they deemed to be the proper mode and distribution of taxation.
2013	H24	Piketty, Thomas, and Emmanuel Saez. 2013. "Top Incomes and the Great Recession: Recent Evolutions and Policy Implications." <i>IMF Economic Review</i>, 61(3): 456-78. This paper presents new findings from the World Top Incomes Database and discusses some of their policy implications. In particular, the paper provides updated top income series for the United States—including new estimates through 2010, showing a strong rebound of the top 1 percent income share, following the 2008-09 sharp fall. It also presents updated income series for other developed countries (including the United Kingdom, France, Germany, and Japan) and new series on wealth-income ratios. In light of this extended set of country series, the paper analyzes the relative importance of market and institutional forces in explaining observed cross-country trends, and the likely impact of the Great recession on these long-term evolutions. It discusses the policy implications of the findings, both in terms of optimal tax policy and regarding the interplay between inequality and macroeconomic fragility.

2013	N37	Fourie, Johan, and Jan Luiten van Zanden. 2013. "GDP in the Dutch Cape Colony: The National Accounts of a Slave-Based Society." <i>South African Journal of Economics</i> , 81(4): 467-90. New estimates of the gross domestic product of the Dutch Cape Colony (1652-1795) suggest that the Cape was one of the most prosperous regions during the eighteenth century. This stands in sharp contrast to the perceived view that the Cape was an "economic and social backwater," a slave economy with slow growth and little progress. Following a national accounts framework, we find that Cape settlers' per capita income is similar to the most prosperous countries of the time--Holland and England. We trace the roots of this result, showing that it is partly explained by a highly skewed population structure and very low dependency ratio of slavery, and attempt to link the eighteenth-century Cape Colony experience to twentieth-century South African income levels.

2013	O44	El Serafy, Salah. 2013. <i>Macroeconomics and the Environment: Essays on Green Accounting</i> . Cheltenham, U.K. and Northampton, Mass.: Elgar. Presents an argument in favor of the case for greening the conventional estimates of national income based on economic grounds. Discusses breaking the ground; green accounting--history and prospects; the environment as capital; income, capital, and wealth; rent and royalty; Sir John Hicks's income and Hicksian income; income from extracting petroleum and controversies over keeping capital intact; adjusting for disinvestment--in the wake of the Brundtland Commission; proper calculation of income from depletable natural resources; disagreements and misunderstandings; John Hartwick's contribution; depletable resources--fixed capital or inventories?; sustainability and substitutability--defending weak sustainability; growth rate after adjustment; pricing the invaluable--services of the world's ecosystems; population and national income; green accounting and economic policy; the "resource curse"--institutions and Dutch disease; natural resources in World Bank country economic work and Indonesia's experience; and sovereign funds.
2013	O56	Lim, Guay C., Chew Lian Chua, and Viet H. Nguyen. 2013. "Review of the Australian Economy 2012-13: A Tale of Two Relativities." <i>Australian Economic Review</i> , 46(1): 1-13.
2013	P36	Kryuchkova, I. 2013. "Elimination of Distortions in the Institutional Structure of Ukraine's GDI. (In Ukrainian. With English summary)." <i>Economy and Forecasting</i> , 0(4): 20-32. The author proves, that in Ukraine, in recent years, due to the violation of macro-proportions in the sectoral structure of gross disposable income (GDI), a disinvestment model of economic development has emerged and consolidated, which lowered the competitiveness of the domestic producers leading to increased loss of their presence both on the foreign and on the domestic markets. Further retaining of the low level of GDI in the sector of non-financial corporations leads to the underfunding of the renewal of the fixed assets and threatens with this country's economic decay even in case of a revival of the international trade. At the same time, the article shows that the considerable decline of the GDI level in the sector of general state management is taking place due to the accumulation of the excesses in the rates of cumulative dynamics of the legally established social standards meant to match the increases in consumer prices, which expands the gap between the volumes of social contributions and social transfers with a corresponding impact on the increase in the sector's deficit.

New York and Heidelberg: Springer.
2013	Q24	Barbier, Edward B. 2013. "Wealth Accounting, Ecological Capital and Ecosystem Services." <i>Environment and Development Economics</i> , 18(2): 133-61. This paper develops a methodology for including ecosystem services in a wealth accounting framework. Accounting for ecosystems and their services leads to adjusting net domestic product (NDP) for the direct benefits provided by the current stock of ecosystems but not for their indirect contributions in terms of protecting or supporting economic activity, property and human lives. When ecosystems are irreversibly converted for economic development, NDP must be further modified to reflect any capital revaluation that occurs with the current conversion of ecological capital to other land uses. The risk of collapse also requires adjustments to NDP, as any capital revaluation associated with ecosystem conversion must be adjusted for this risk, and the discounted minimum value of ecosystems associated with collapse must be subtracted from NDP. These various contributions of ecological capital to wealth accounts are illustrated with the example of mangroves in Thailand over the period 1970-2009.
2013	Q48	CV: Edwards, Geoff. 2013. "Regions and Innovation: A Reflection." In <i>Regional Advantage and Innovation: Achieving Australia's National Outcomes</i> , ed. Susan Kinnear, Kate Charters and Peter Vitaras, 151-68. New York and Heidelberg: Springer, Physica.
2013	Q48	Reilly, John. 2013. "Achieving a Low-Carbon Society." <i>Climate Policy</i> , 13(0): S155-58. Climate change is perhaps the central challenge that faces humanity. If the concept of green growth is to be anything more than a mere rebranding of the concept of sustainability, then it must elucidate the relationship between economic activity and pollution and provide a more detailed

Year	DE	Title and Abstract
		economic account of it. The articles in this Special Issue focus on ways in which GHG emissions may be reduced while satisfying the increasing demand for energy: from global, technological or economic solutions, to sub-national, financial or regulatory ones. Although the wide disparity in income between the least and most wealthy makes it difficult to reach a consensus on the best way to achieve a low-carbon society, the scale and potential effects of climate change make it imperative that one is reached.
2013	R30	Hudson, Michael. 2013. "Capital Gains, Total Returns and Saving Rates." <i>European Journal of Economics and Economic Policies: Intervention</i> , 10(2): 221-30. To focus on the dynamics of how financial wealth is created, obtained, and valued, this paper (1) distinguishes capital gains from income by measuring total returns, and (2) contrasts the capitalized value of renter income (rent extraction rights and privileges from land, natural resources, and monopolies) from that of industrial profits on tangible capital investment.

 Muhina, Irina K. — Мухина Ирина Константиновна — 0.55 AS;
 Popov, Ilya Y. — Попов Илья Юрьевич — 0.45 AS;
 Slepukova, Juliya M. — Слепенкова Юлия Михайловна — 0.55 AS;
 Suslov, Victor I. — Суслов Виктор Иванович — 0.55 AS.

The total volume of derivative works for E01 is equal to 5.78 AS.

Общий объем раздела E01 — 5,78 авторских (уч.-изд.) л.

² AS — Author's Sheet — unit of measuring the volume of a literary work; equal to 40,000 characters (including the spaces between words), or 3,000 sq cm of illustrations (maps) like the table E01.E.

E02 Institutions and the Macroeconomy ¹

2005	F21 L26 M14 O43 P31 Z13	CV: Dima, Bogdan, Marilen Pirtea, and Aurora Murgea. 2005. "Culture and Entrepreneurship." In <i>Entrepreneurship and Macroeconomic Management: Conference Proceedings</i> . ""Dr. Mijo Mirkovic" Faculty of Economics and Tourism, 254-67. Pula: Faculty of Economics and Tourism ""Dr. Mijo Mirkovic". THIS PUBLICATION IN 2005 IS FOR COMPARISON
2007		
2007	B12 B31 D63	de Mattos, Laura Valladao. 2007. "As razoes do laissez-faire: Uma analise do ataque ao mercantilismo e da defesa da liberdade economica na Riqueza das Nacoes. (The Reasons of the Laissez-Faire: An Analysis of the Attack to Mercantilism and of the Defense of Economic Liberty in the Wealth of Nations. With English summary)." <i>Revista de Economia Politica/Brazilian Journal of Political Economy</i> , 27(1): 108-29. The main reasons presented in The Wealth of Nations to advocate the system of economic liberty and reject mercantilism are analyzed. These two systems are evaluated considering basically their impact on the annual product, and the degree of liberty and justice they engender. Based on his views of man and of capital hierarchy, Smith defends

Year	DE	Title and Abstract
		the superiority of economic liberty in what concerns the growth of the annual product. This system is also considered superior to mercantilism in terms of justice since it does not privilege any sector of society and allows a great level of liberty to the individuals.
2007	D63 D72	Nobre, Marcos. 2007. "Novas polarizacoes--Ainda sobre esquerda e direita. (With English summary.)." <i>Economica (Fluminense Federal University)</i> , 9(2): 341-51. Arguing against any form of dogmatism and sectarianism in the discussion, the paper takes as its starting point the idea that the distinctive feature of the Left-Right divide has always been the priority given either to liberty or to equality. The paper argues further that this is still the major divide today, with the important distinction nevertheless that the Right sticks to the priority of liberty as the Left moved to a position in which the priority cannot be decided beforehand, but should be the decided in concrete disputes following the principle of which one promotes the autonomy of citizenship the most in each particular case. This is presented as the result of the acceptance by the Left of the Rule of Law not only as a common ground for the political disputes with the Right but also as presenting emancipatory potentials to be fulfilled.
2007	D82 E12 E13	CV: Ferreiro, Jesus, and Felipe Serrano. 2007. "New Institutions for a New Economic Policy." In <i>Money, Distribution and Economic Policy: Alternatives to Orthodox Macroeconomics</i> , ed. Eckhard Hein and Achim Truger, 141-57. New Directions in Modern Economics. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2007	O13 Q33 Q43	Dietsche, Evelyn. 2007. "Why the Quality of Institutions Is Not a Cure for the "Resource Curse"." <i>Journal of Energy and Development</i> , 32(2): 262-82.
2008		
2008	F54 N17 N47 O47	Austin, Gareth. 2008. "Symposium: Historical Roots of Poverty: The 'Reversal of Fortune' Thesis and the Compression of History: Perspectives from African and Comparative Economic History." <i>Journal of International Development</i> , 20(8): 996-1027. Acemoglu, Johnson and Robinson have dramatically challenged the tendency of economists to confine their empirical search for the causes of economic growth to the recent past. They argue that the kind of institutions established by European colonialists, either protecting private property or extracting rents, resulted in the poorer parts of the pre-colonial world becoming some of the richest economies of today; while transforming some of the more prosperous parts of the non-European world of 1500 into the poorest economies today. This view has been further elaborated for Africa by Nunn, with reference to slave trading. Drawing on African and comparative economic historiography, the present paper endorses the importance of examining growth theories against long-term history: revealing relationships that recur because the situations are similar, as well as because of path dependence as such. But it also argues that the causal relationships involved are more differentiated than is recognised in AJR's formulations. By compressing different historical periods and paths, the reversal thesis over-simplifies the causation. Relatively low labour productivity was a premise of the external slave trades; though the latter greatly reinforced the relative poverty of many Sub-Saharan economies. Again, it is important to distinguish settler and non-settler economies within colonial Africa itself. In the latter case it was in the interests of colonial regimes to support, rather than simply extract from, African economic enterprise. Finally, economic rent and economic growth have often been joint products, including in pre-colonial and colonial Africa; the kinds of institutions that favoured economic growth in certain historical contexts were not necessarily optimal for that purpose in others. AJR have done much to bring development economics and economic history together. The next step is a more flexible conceptual framework, and a more complex explanation.
2008	O33	Tebaldi, Edinaldo, and Bruce Elmslie. 2008. "Institutions, Innovation and Economic Growth." <i>Journal of Economic Development</i> , 33(2): 27-53. This article contributes to the growth literature by developing a formal growth model that provides the basis for studying institutions and technological innovation and examining how human capital and institutional constraints affect the transitional and steady state growth rates of output. The model developed in this article shows that the reason that growth models a la Romer (1990) generate endogenous growth is the use of a set of restrictive and unrealistic assumptions regarding the role of institutions in the economy. The baseline model developed in this article shows that the long-run growth of the economy is intrinsically linked to institutions and suggests that an economy with institutions that retard or prevent the utilization of newly invented inputs will experience low levels and low growth rates of output. The model also predicts that countries with institutional barriers that prevent or restrict the adoption of newly invented technologies will allocate a relative small share of human capital in the R&D sector. Moreover, both the baseline and the extended version of the model suggest that sustainable growth in human capital, not an increase in the stock of human capital, generates a growth effect.
2008	O47	THE SAME AS F54 Austin, Gareth. 2008. "Symposium: Historical Roots of Poverty: The 'Reversal of Fortune' Thesis and the Compression of History: Perspectives from African and Comparative Economic History." <i>Journal of International Development</i> , 20(8): 996-1027
2009		
2009	A12 K00	Vatiero, Massimiliano. 2009. <i>Understanding Power: A 'Law and Economics' Approach</i> , Saarbrücken: VDM Verlag Dr. Müller. Explores the concept of power from the perspective of law and economics. Discusses jurial positionality; the Commonsian transaction; the path-dependence of power--spontaneous and designed order; contractual incompleteness and the meaning of liberty and freedom; market dominance; firm hierarchy; and state intervention.
2009	C92 O41	Capra, C. Monica, Tomomi Tanaka, Colin F. Camerer, Lauren Feiler, Veronica Sovero, and Charles N. Noussair. 2009. "The Impact of Simple Institutions in Experimental Economies with Poverty Traps." <i>Economic Journal</i> , 119(539): 977-1009. We introduce an experimental approach to study the effect of institutions on economic growth. In each period, agents produce and trade output in a market, and allocate it to consumption and investment. Productivity is higher if total capital stock is above a threshold. The threshold externality generates two steady states--a suboptimal 'poverty trap' and an optimal steady state. In a baseline treatment, the economies converge to the poverty trap. However, the ability to make public announcements or to vote on competing and binding policies, increases output, welfare, and capital stock. Combining these two simple institutions guarantees that the economies escape the poverty trap.
2009	E44 E52	Pedersen, Lasse Heje. 2009. <i>When Everyone Runs for the Exit</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 15297. The dangers of shouting "fire" in a crowded theater are well understood, but the dangers of rushing to the exit in the financial markets are more complex. Yet, the two events share several features, and I analyze why people crowd into theaters and trades, why they run, what determines the risk, whether to return to the theater or trade when the dust settles, and how much to pay for assets (or tickets) in light of this risk. These theoretical considerations shed light on the recent global liquidity crisis and, in particular, the quant event of 2007.

Year	DE	Title and Abstract
2009	E62 H11 H40 H71 H72 H75 H76 O11 O32 Q32	Caselli, Francesco, and Guy Michaels. 2009. <i>Do Oil Windfalls Improve Living Standards? Evidence from Brazil</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 15550. We use variation in oil output among Brazilian municipalities to investigate the effects of resource windfalls. We find muted effects of oil through market channels: offshore oil has no effect on municipal non-oil GDP or its composition, while onshore oil has only modest effects on non-oil GDP composition. However, oil abundance causes municipal revenues and reported spending on a range of budgetary items to increase, mainly as a result of royalties paid by Petrobras. Nevertheless, survey-based measures of social transfers, public good provision, infrastructure, and household income increase less (if at all) than one might expect given the increase in reported spending. To explain why oil windfalls contribute little to local living standards, we use data from the Brazilian media and federal police to document that very large oil output increases alleged instances of illegal activities associated with mayors.

2009	F34	Faria, Andre, and Paolo Mauro. 2009. "Institutions and the External Capital Structure of Countries." <i>Journal of International Money and Finance</i> , 28(3): 367-91. A widespread view holds that countries that finance themselves through foreign direct investment and portfolio equity, rather than bonds and loans, are less prone to crises. But what determines countries' external capital structures? In a cross-section of advanced economies, emerging markets, and developing countries, we find that equity-like liabilities as a share of countries' total external liabilities are positively and significantly associated with indicators of educational attainment, openness, natural resource abundance and, especially, institutional quality. These relationships are robust to attempts to control for possible endogeneity, suggesting that better institutional quality may help improve countries' external capital structures.

National Bureau of Economic Research, Inc, NBER Working Papers: 15209. The future looked bright for Argentina in the early twentieth century. It had already achieved high levels of income per capita and was moving away from authoritarian government towards a more open democracy. Unfortunately, Argentina never finished the transition. The turning point occurred in the 1930s when to stay in power, the Conservatives in the Pampas resorted to electoral fraud, which neither the legislative, executive, or judicial branches checked. The decade of unchecked electoral fraud led to the support for Juan Peron and subsequently to political and economic instability.

We examine the distribution of hours of work across industrial sectors in OECD countries. We find large disparities when sectors are divided into three groups: one that produces goods without home substitutes and two others that have home substitutes--health and socialwork, and all others. We attribute the disparities to the countries' tax and subsidy policies. High taxation substantially reduces hours in sectors that have close home substitutes but less so in other sectors. Health and social care subsidies increase hours in that sector. We compute these effects for nineteen OECD countries.

National Bureau of Economic Research, Inc, NBER Working Papers: 15490. This paper combines different strands of the productivity literature to investigate the effect of idiosyncratic (firm-level) policy distortions on aggregate outcomes. On the one hand, a growing body of empirical research has been relating cross-country differences in key economic outcomes, such as productivity or output per capita, to differences in policies and institutions that shape the business environment. On the other hand, a branch of empirical research has attempted to shed light on the determinants of productivity at the firm level and the evolution of the distribution of productivity across firms within each industry. In this paper, we exploit a rich source of data with harmonized statistics on firm level variation within industries for a number of countries. Our key empirical finding is that there is substantial variation in the within-industry covariance between size and productivity across countries, but this covariance varies significantly across countries and is affected by the presence of idiosyncratic distortions. We develop a model in which heterogeneous firms face adjustment frictions (overhead labor and quasi-fixed capital) and idiosyncratic distortions. We show that the model can be readily calibrated to match the observed cross-country patterns of the within-industry covariance between productivity and size and thus help to explain the observed differences in aggregate performance.

"The Impact of the Political Liberalization-Economic Freedom Nexus on Economic Growth, 1970-2000." <i>Applied Econometrics and International Development</i> , 9(2): 21-30. The role of institutions in economic growth has recently begun to receive greater attention in academic circles. Although the impact of institutions has been acknowledged by most, definitive conclusions still remain a question, particularly given the problem of endogeneity. We use panel least squares estimation to consider the nexus between political liberalization and economic freedom. We seek to avoid the problem of endogeneity as well as examine the different aspects of institutional roles. We find conclusions for different aspects when controlling political liberalization or economic freedom.
2009	O17	Fabro, Gema, and Jose Aixala. 2009. "Economic Growth and Institutional Quality: Global and Income-Level Analyses." <i>Journal of Economic Issues</i> , 43(4): 997-1023. The aim of this paper is to quantify the importance of institutions in economic growth and to identify the factors that determine institutional quality. For this purpose, we estimate a system of simultaneous equations with an income equation and another one of institutional quality and use a broad sample of countries with very different levels of development. The analysis is also carried out for three sub-samples of different income levels. In addition, a test of the robustness of the results to econometric techniques is performed.

2010	A10 B25 B52 D02 D21 D23	Underhill, Geoffrey R. D. 2010. <i>Theory and the Market after the Crisis: the Endogeneity of Financial Governance</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 8164. The inheritance of contemporary financial economics invites us to consider financial stability as integral to a liberal market setting. The crisis however demonstrated that financial markets may prove highly dysfunctional in the absence of adequate mechanisms of regulation and governance. This implies that economic theory requires an enhanced understanding of the intersection of economic rationality with the rationality of governance. This article extends the insights of institutional economics to demonstrate that the emergence of the institutions of financial governance is endogenous to the utility-maximising behaviour of competing economic agents. Utility-maximising behaviour and conflict over the terms of competition in the market generate both the formal and informal institutions and processes of governance such as regulation and dispute settlement. The model is illustrated by the case of international finance, predicting forms of policy rent seeking in a market environment: private interests embedded in public policy processes simultaneously reshaped both market and governance in line with their own perceived utility functions. The model predicts that similar policy rent seeking will dominate the reform process. Successful reform will require a conceptual understanding of this link between governance and market competition, and appropriate changes in the nature of the policy process so as to reshape markets to avoid financial instability in the future.
2010	B52	Lee, Cassey. 2010. "An Institutional Perspective of National Competitiveness." <i>Singapore Economic Review</i> , 55(4): 671-83. The literature on the role of institutions in economic growth and development is well-established. In contrast, the relationship between institutional quality and competitiveness, while important, received much less attention until recently, when there has been a growing interest in incorporating variables representing institutional quality into country competitiveness indices. Such attempts take cognizance of the results from cross-country empirical findings. However, any attempt to construct a satisfactory mapping of institutions to competitiveness is fraught with difficulties, including data consistencies, omission of causal factors and the lack of theoretical foundations. Some of these difficulties stem from differences in the overall objectives of the research literature and the development of competitiveness indices. The research literature can explain why, whether and what type of institutions are important, but such findings do not lend themselves to the construction of appropriate policy variables.
2010	B59 E50 E61	Bibow, Jorg. 2010. <i>A Post Keynesian Perspective on the Rise of Central Bank Independence: A Dubious Success Story in Monetary Economics</i> . Levy Economics Institute, The Economics Working Paper Archive. This paper critically assesses the rise of central bank independence (CBI) as an apparent success story in modern monetary economics. As to the observed rise in CBI since the late 1980s, we single out the role of peculiar German traditions in spreading CBI across continental Europe, while its global spread may be largely attributable to the rise of neoliberalism. As to the empirical evidence alleged to support CBI, we are struck by the nonexistence of any compelling evidence for such a case. The theoretical support for CBI ostensibly provided by modeling exercises on the so-called time-inconsistency problem in monetary policy is found equally wanting. Ironically, New Classical modelers promoting the idea of maximum CBI unwittingly reinstalled a (New Classical) "benevolent dictator" fiction in disguise. Post Keynesian critiques of CBI focus on the money neutrality postulate as well as potential conflicts between CBI and fundamental democratic values. John Maynard Keynes's own contributions on the issue of CBI are found worth revisiting.

"Including U.S. State Government Regulation in the Economic Freedom of North America Index." <i>Journal of Private Enterprise</i> , 25(2): 165-86. The paper examines the Economic Freedom Index of North America (EFNA) and its ability to predict income in U.S. states. We show that including state government regulatory spending, using U.S. Census Bureau data on "Protective Inspection and Regulation, NEC" as the measure of regulation, improves the predictive power of our models. We conduct a number of robustness checks and construct a factor analysis model to show that the regulation spending variable contributes information that is currently not included in the EFNA. We argue that since regulation adds to the predictive power of EFNA, and is a theoretically essential component of economic freedom, it should be considered alongside the EFNA.
2010	D02 H52	Bertocchi, Graziella, and Arcangelo Dimico. 2010. <i>Slavery, Education, and Inequality</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 8073. We investigate the impact of slavery on the current performances of the US economy. Over a cross section of counties, we find that the legacy of slavery does not affect current income per capita, but does affect current income inequality. In other words, those counties that displayed a higher proportion of slaves are currently not poorer, but more unequal. Moreover, we find that the impact of slavery on current income inequality is determined by racial inequality. We test three alternative channels of transmission between slavery and inequality: a land inequality theory, a racial discrimination theory and a human capital theory. We find support for the third theory, i. e., even after controlling for potential endogeneity, current inequality is primarily influenced by slavery through the unequal educational attainment of blacks and whites. To improve our understanding of the dynamics of racial inequality along the educational dimension, we complete our investigation by analyzing a panel dataset covering the 1940-2000 period at the state level. Consistently with our previous findings, we find that the educational racial gap significantly depends on the initial gap, which was indeed larger in the former slave states.
2010	D02	Lee, Cassey. 2010. "An Institutional Perspective of National Competitiveness." <i>Singapore Economic Review</i> , 55(4): 671-83. 2010	D02 D86 G30 H70 O10 O53 P36	Xu, Cheng-Gang. 2010. <i>The Institutional Foundations of China's Reforms and Development</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 7654. China's economic reforms have resulted in spectacular growth and poverty reduction. However, China's institutions look ill-suited to achieve such a result, and they indeed suffer from serious shortcomings. To solve "China puzzle" this paper analyses China's institution--a regionally decentralized authoritarian system. The central government has control over personnel, whereas sub-national governments run the bulk of the economy; and they initiate, negotiate, implement, divert and resist reforms, policies, rules and laws. China's reform trajectories have been shaped by regional decentralization. Spectacular performance on the one hand and grave problems on the other hand are all determined by this governance structure.

2010	E23	Mahmood, Khalid, Toseef Azid, Imran Sharif Chaudhry, and Muhammad Zahir Faridi . 2010. "Impact of Economic Freedom on Economic Growth: The Case of Some Selected SAARC Member Countries." <i>International Research Journal of Finance and Economics</i> , 0(52): 7-16. This research paper in general focuses on the significance of economic freedom for growth in South Asian countries using the panel data of five SAARC member countries. The study employs econometric technique like Auto Regressive Distributive Lag (ARDL) Model to investigate the long run relationship between concerned variables. The analysis shows that the level of economic freedom robustly, positively and significantly affects the GDP per capita of five SAARC member countries; the impact of two control variables openness and foreign direct investment on growth of five SAARC member countries are also positive and statistically significant. Empirical evidences suggest that existence of free private markets where individuals make decision on their behalf is very conducive to growth in five SAARC countries.
2010	E26	Schneider, Friedrich . 2010. "The Influence of Public Institutions on the Shadow Economy: An Empirical Investigation for OECD Countries." <i>Review of Law and Economics</i> , 6(3). The size and development of the shadow economy of 21 OECD countries is estimated, using the MIMIC estimation procedure. The analysis finds that an increased burden of taxation and social security payments, combined with intensive labor market regulation, quality of state institutions, and tax morale, are the driving forces for the shadow economy. The public institution of federalism has no statistically significant effect on the shadow economy. Finally, on the one side, incentive-oriented policy means are suggested so that any "black" value added can be transformed into official value added, and on the other side, it is important to have public institutions which work efficiently and act as a constraint for selfish politicians.
2010	E30 E50 J20 J60	Christiano, Lawrence J., Mathias Trabandt, and Karl Walentin . 2010. <i>Involuntary Unemployment and the Business Cycle</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 15801. We propose a monetary model in which the unemployed satisfy the official US definition of unemployment: they are people without jobs who are (i) currently making concrete efforts to find work and (ii) willing and able to work. In addition, our model has the property that people searching for jobs are better off if they find a job than if they do not (i.e., unemployment is 'involuntary'). We integrate our model of involuntary unemployment into the simple New Keynesian framework with no capital and use the resulting model to discuss the concept of the 'non-accelerating inflation rate of unemployment'. We then integrate the model into a medium sized DSGE model with capital and show that the resulting model does as well as existing models at accounting for the response of standard macroeconomic variables to monetary policy shocks and two technology shocks. In addition, the model does well at accounting for the response of the labor force and unemployment rate to the three shocks.
2010	E31	Blinder, Alan . 2010. <i>Quantitative Easing: Entrance and Exit Strategies</i> . Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 1219. Apparently, it can happen here. On December 16, 2008, the Federal Open Market Committee (FOMC), in an effort to fight what was shaping up to be the worst recession since 1937, reduced the federal funds rate to nearly zero. From then on, with all of its conventional ammunition spent, the Federal Reserve was squarely in the brave new world of quantitative easing. Chairman Ben Bernanke tried to call the Fed's new policies credit easing, probably to differentiate them from what the Bank of Japan had done earlier in the decade, but the label did not stick.
2010	E31	Ito, Takatoshi . 2010. <i>Great Inflation and Central Bank Independence in Japan</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 15726. Japan suffered a very high inflation rate in 1973-74. The CPI inflation rate rose to near 30% in 1974, the highest rate in the postwar Japanese history after the chaotic hyperinflation following the end of the Second World War. Traditionally, the oil crisis is blamed for the 1973-74 high inflation. However, due to monetary policy decisions in 1972-73, the inflation rate had already exceeded 10% before the onset of the oil crisis in October 1973. These decisions include the interest rate cut of June 1972 and the interest rate hike of April 1973, which in retrospect proved too small. Concern about the rapid yen appreciation produced political pressure on the Bank of Japan to continue easing. The Bank of Japan came out of the Great Inflation of 1973 with a stronger voice. The Bank successfully argued that its recommendation to tighten monetary policy should not be overruled or the high inflation would be repeated. By this logic, the Bank of Japan obtained /de facto/ independence after 1975. When faced with the next economic recovery in 1979, again accompanied by oil price increases, the Bank of Japan was able to tighten monetary policy and to contain the inflation rate under 10 percent. The interest rate in the 1972-75 period was well below, by as much as 25 percentage points in 1973, the interest rate suggested by a modified monthly Taylor rule regression.
2010	E31 J51	Lopez, Monica Correa, Agustin Garcia Serrador, and Ana Cristina Mingorance . 2010. <i>Product Market Competition and Inflation Dynamics: Evidence from a Panel of OECD Countries</i> . BBVA Bank, Economic Research Department, Working Papers: 1025. We analyse the impact of product market competition on the responsiveness of inflation to macroeconomic imbalances. Results based on a 20-country OECD panel estimated for the period 1961-2006 show that if product market competition is high the response of inflation to lagged inflation and unemployment is reduced, while inflation is more responsive to changes in productivity growth in countries in which competition is above the OECD average. When product market competition is measured by barriers to firms' entry, we also find that low entry barriers dampen the effect on inflation of movements in import prices. These results are attributed to temporary mark-up changes after demand- and supply-side shocks.
2010	E32	Alpanda, Sami, and Adam Honig . 2010. "Political Monetary Cycles and a De Facto Ranking of Central Bank Independence." <i>Journal of International Money and Finance</i> , 29(6): 1003-23. Political monetary cycles are less likely to occur in countries with independent central banks. Independent central banks can withstand political pressure to stimulate the economy before elections or finance election-related increases in government spending. Based on this logic and supporting evidence, we construct a de facto ranking of central bank independence derived from the extent to which monetary policy varies with the electoral cycle. The ranking avoids well-known problems with existing measures of central bank independence and provides independent information about average inflation and inflation volatility differences across countries.
2010	E42 E50 E60 G21	Blinder, Alan . 2010. <i>How Central Should the Central Bank Be?</i> . Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 1202. About six years ago, I published a small book entitled <i>The Quiet Revolution</i> (Blinder 2004). Though its subtitle was Central Banking Goes Modern, I never imagined the half of it. Since March 2008, the Federal Reserve has gone post-modern with a bewildering variety of unprecedented actions that have either changed the nature and scope of the central bank's role or stretched it beyond the breaking point, depending on your point of view. And that leads straight to the central question of this essay: What should--and shouldn't--the Federal Reserve do?

In this study we find that the set of policies that favor liberalization in credit markets (regulatory quality) are negatively correlated with countries' resilience to the recent recession as measured by output growth in 2008 and 2009.
2010	F01	Laibson, David, and Johanna Mollerstrom. 2010. <i>Capital Flows, Consumption Booms and Asset Bubbles: A Behavioural Alternative to the Savings Glut Hypothesis</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 15759. Bernanke (2005) hypothesized that a "global savings glut" was causing large trade imbalances. However, we show that the global savings rates did not show a robust upward trend during the relevant period. Moreover, if there had been a global savings glut there should have been a large investment boom in the countries that imported capital. Instead, those countries experienced consumption booms. National asset bubbles explain the international imbalances. The bubbles raised consumption, resulting in large trade deficits. In a sample of 18 OECD countries plus China, movements in home prices alone explain half of the variation in trade deficits.
2010	F15	Sarrion Esteve, Joaquin. 2010. "Social Rights Protection Problems in Conflicting Situations with Market Freedoms in European Union Law." <i>Revista Universitaria Europea</i> , 0(13): 85-101. Fundamental rights protection in European Union has changed with the years. At first, the Treaties constituting European Communities were silent on human rights protection, and European Court of Justice (ECJ) had to make it possible. Unlike fundamental rights, market freedoms have always enjoyed an explicit relevance in the Treaties as instruments to serve European economic integration. But, ECJ must resolve conflicting situations between a fundamental right and a market freedom. We try to study the balance between social rights, as fundamental rights, and market freedoms in the jurisprudence of the European Court of Justice, and find fundamental rights protection problems. Nevertheless, fundamental rights have become more relevant since the Charter of Fundamental Rights of the European Union entered into force, so it seems to be an excellent time to consider the protection of fundamental rights, in particular social rights, at conflicting situations with market freedoms.

2010	F55 J30 L61	Glassner, Vera, and Toralf Pusch. 2010. <i>The Emergence of Wage Coordination in the Central Western European Metal Sector and its Relationship to European Economic Policy</i> . Halle Institute for Economic Research, IWH Discussion Papers: 13-10. In the European Monetary Union the transnational coordination of collective wage bargaining has acquired increased importance on the trade union agenda. The metal sector has been at the forefront of these developments. This paper addresses the issue of crossborder coordination of wage setting in the metal sector in the central western European region, that is, in Germany, the Netherlands and Belgium, where coordination practices have become firmly established in comparison to other sectors. When testing the interaction of wage developments in the metal sector of these three countries, relevant macroeconomic (inflation and labour productivity) and sector-related variables (employment, export-dependence) are considered with reference to the wage policy guidelines of the European Commission and the European Metalworkers' Federation. Empirical evidence can be found for a wage coordination effect in the form of increasing compliance with the wage policy guidelines of the European Metalworkers' Federation. The evidence for compliance with the stability-oriented wage guideline of the European Commission is weaker.
2010	G11	Jones, Samuel Kyle, and Michael D. Stroup. 2010. "Closed-End Country Fund Premiums and Economic Freedom." <i>Applied Financial Economics</i> , 20(19-21): 1639-49. The Economic Freedom Index (EFI) is a measure of a country's institutional characteristics that promote economic activity, including the security of private property, openness to international trade, stability of the monetary system and lack of credit market manipulation. We use this index as a proxy for the degree of market segmentation and test the hypothesis that closed-end country fund premiums can be partially explained by a country's EFI value. Using panel data analysis, we find that EFI is significant in explaining observed variability in country fund premiums.
2010	G21 J23 O16	Ozgen, Eren, and Lane Eckis. 2010. "The Influence of the Institutional Structure on Self-Efficacy and Female Opportunity Driven Entrepreneurial Activities in LDCs vs. MDCs." <i>Journal of International Management Studies</i> , 10(4): 59-70. Opportunity driven entrepreneurship is considered crucial in economic growth and job creation. Previous research indicates a need to underpin the distinctive features of the female opportunity driven entrepreneurial activities in a cross country setting. To date how the socio-cultural, environmental and socio-economic structure influences self-efficacy and female opportunity driven entrepreneurial activity in a cross-country research is relatively unstudied. In this paper we will study how socio-cultural, environmental and socio-economic institutions are mediated by self-efficacy and play a role in the rate of the female opportunity driven entrepreneurial activities. We will also make comparisons between the conductivity of the environment for female entrepreneurs in more developed

Year	DE	Title and Abstract
		nations versus less developed ones. Building on this framework we will suggest policy implications and present several research areas for the future.

Department of Economics, West Virginia University, Working Papers: 10-04. US banks are thought to have become increasingly fragile and exposed during the lead-up to the recent financial crisis. However, commercial bank leverage actually decreased during this period. To resolve this discrepancy, we explore another dimension of bank balance sheets: the effective maturity mismatch between assets and liabilities. Although banks assets are generally longer in term than their liabilities, we find evidence of a structural break in the mid-1990s when equity markets begin pricing banks as relatively longer-funded. Categories of bank assets such as real estate loans (i.e., mortgages and MBSs) and consumer loans were perceived as having become effectively shorter-term.

2010	I14 I24 O15	Osmani, S. R. 2010. "Realising the Right to Development in Bangladesh: Progress and Challenges." <i>Bangladesh Development Studies</i>, 33(1-2): 25-90. By signing and ratifying various human rights instruments, the State of Bangladesh has committed itself to pursuing socio-economic policies in a way that would promote its peoples right to development, understood as integrated realisation of the whole range of human rights--including economic, social, and cultural rights on the one hand and civil and political rights on the other. But does the development policy of Bangladesh actually conform to the demands of the right to development? This is the question investigated in the present paper. The paper first develops a methodology for answering the question, and then applies it to three specific rights--viz., the right to food, the right to health, and the right to education--by drawing upon three case studies on the realisation of these rights in Bangladesh. The investigation finds that while Bangladesh can claim to have made a lot of progress in each of the three areas in terms of standard socio-economic indicators, serious deficiencies remain when judged by the criteria of human rights norms. The major areas of concern relate to the principles of equity, participation, and accountability. Although successive governments have paid lip service to all three of these principles, the policies they have pursued in practice have actually undermined them more often than not. Fundamental reorientation is needed in the way the government functions before the development policy of the State of Bangladesh can be said to conform to the demands of the right to development approach.
2010	I14 O15	Shahabuddin, Quazi. 2010. "The Right to Food: Bangladesh Perspectives." <i>Bangladesh Development Studies</i>, 33(1-2): 91-138. A large number of the people in Bangladesh are deprived of basic economic and social rights. The poor in Bangladesh do not even meet the minimum nutritional requirement to maintain a healthy body. Hence, poverty in Bangladesh, as elsewhere, is synonymous with hunger and malnutrition. An attempt has been made in this paper to evaluate the performance of Bangladesh on the implementation of the right to food in the light of the commitments made by the State. In particular, the paper has examined whether the process of policy formulation, implementation and monitoring is consistent with the requirements of the rights-based approach. The paper has also suggested possible directions that the State of Bangladesh needs to follow for enhanced implementation of the right to food in the country.
2010	I14 O15	Chowdhury, Omar Haider, and S. R. Osmani. 2010. "Towards Achieving the Right to Health: The Case of Bangladesh." <i>Bangladesh Development Studies</i>, 33(1-2): 205-73. Bangladesh has made great strides in improving the health of its population, much more than a country at its level of development can be expected to do. Serious problems still remain in reducing child malnutrition and maternal mortality in particular; nonetheless, the aggregative results achieved in the last three decades are quite impressive. These achievements have certainly have gone a long way towards fulfilling the right to health in Bangladesh. This paper argues, however, that despite overall progress the health sector of Bangladesh suffers from a number of inadequacies that militate against the rights-based approach to health. These include persistent inequities in access to healthcare (including gender inequity, and inequity along the poor versus non-poor divide), lack of meaningful participation of citizens in the running of the health system, and the absence of effective accountability mechanisms through which the providers of healthcare can be held responsible for their actions.
2010	I24 I28 O15	Mujeri, Mustafa K. 2010. "The Rights-Based Approach to Education in Bangladesh." <i>Bangladesh Development Studies</i>, 33(1-2): 139-203. The study examines Bangladesh's record in implementing the right to education in terms of three dimensions of policy-making, e.g., the process of formulation, the contents, and monitoring of implementation. In the context of the human rights approach to education, the study reviews the overall record of progress in the education sector with emphasis on primary education and literacy. The analysis highlights the possible directions that the State of Bangladesh can pursue for enhanced implementation of the right to education in the country. Analysing the follow-up action plan of the Dakar Conference 2000, the study suggests what more needs to be done in order to streamline the country's education process in accordance with human rights principles. The study concludes that the rights-based approach having well-defined principles of participation, accountability, transparency, equality, non-discrimination, universality, and indivisibility can have significant value addition in the education sector in Bangladesh.
2010	I25 J13 O15	Dao, Minh Quang. 2010. "Distribution and Development in Developing Countries: An Empirical Assessment." <i>European Research Studies</i>, 13(1): 25-32. This paper examines the effect of income distribution on growth in developing countries. Based on data from the World Bank and the United Nations Development Programme, we use a sample of twenty-eight developing economies and find that income distribution does not affect growth in these countries, unlike the results of previous studies by Alesina and Rodrik (1994). Neither do we find that the level of democracy in a country has a statistically significant impact on growth. We observe that the coefficient estimate of one independent variable does not have the anticipated sign due to the severe degree of

Year	DE	Title and Abstract
		multicollinearity among statistically significant explanatory variables. Regression results show that the total fertility rate, the initial level of per capita GDP, and the ratio of female to male literacy rate, taken together, do linearly influence growth in developing economies. Statistical results of such empirical examination will assist governments in those countries identify areas that need to be improved upon in order to stimulate economic development. Data for all variables are from the 1978 World Development Report, the World in 2007, and the 1999, 2000, and 2007/08 Human Development Reports. We apply the least-squares estimation technique in a multivariate linear regression. We also note that the severe degree of multicollinearity among explanatory variables may have caused their coefficient estimates to have the wrong sign.

2010	I32	Sengupta, Arjun. 2010. "Extreme Poverty and Human Rights: A Case Study of the United States of America." <i>Bangladesh Development Studies</i> , 33(1-2): 275-310. This paper presents the problems of poverty in the U.S. from the perspective of the notion of "extreme poverty," regarded as a violation of human rights. By choosing the United States as the case study, this paper seeks to illustrate that extreme poverty is a pervasive societal problem, irrespective of the level of income of a country. The case of the United States is particularly interesting as it presented an apparent paradox: the wealthiest country on earth has also the highest incidence of poverty amongst the rich industrialised nations and even higher than many developing countries. The conditions of extreme poverty in a country such as the US, with both the resources and the institutions to solve the problem but unwilling to do so due to the lack of political motivation, can be, much more plausibly than in any other country, considered as violation of human rights. The paper provides a broad overview of various dimensions of extreme poverty in the United States through the lens of the human rights framework and offers some policy suggestions.

"Labour Market Trends during Post-socialist Transformation: The Cases of the Czech Republic, Hungary and Russia." <i>QA: Rivista dell' Associazione Rossi-Doria</i> , 0(4): 61-98. The paper analyzes the factors behind the evolution of employment and wages during the first decade of post-socialist transformation. It focuses on three countries: Hungary, Russia, and the Czech Republic. We propose an explanation of the development of labour market trends in line with institutional approaches, which take the differences between countries to be accounted for by the role played by national features in the process of institutional and systemic change. Factors such as history, policies and labour market institutions and the role of the State, are taken into account in order to illustrate these three transformation paths.
2010	J48 P23 P27 P37	Tridico, Pasquale, and Maria Lissowska. 2010. "Approaches, Hopes and Reality in Transition Economies." <i>QA: Rivista dell' Associazione Rossi-Doria</i> , 0(4): 7-32. More than twenty years have now passed since the fall of the Berlin wall. Transition from planned economy towards market economy was supposed to bring success in both democracy and economic development. However, many transition economies have not become richer yet, nor more democratic, and fundamental cleavages among transition paths can be observed. The relatively better transition of most of the Central and Eastern European Countries than of the former Soviet Republics, in both economic and political terms, can be explained on the basis of different levels of social capital, trust, civil society involvement, transformation strategies, labour market performance and changes, and the emergence of a middle class, leading to different levels of democracy and development.

2010	L86	Gius, Mark, and Wendy Ceccucci. 2010. "Economic Freedom and Internet Use: A Cross-Country Comparison." <i>Journal of Business and Economic Studies</i> , 16(2): 49-55. The present study examined the role that economic freedom plays in the availability and usage of the Internet. Using data from the World Bank and the Heritage Foundation, the present study estimated a model of Internet usage. In addition to various socioeconomic attributes of nations that may affect Internet usage, measures of economic freedom also were used in order to determine if government policies that impede economic growth and retard entrepreneurial activity also make it more difficult to develop the necessary infrastructure for an Internet system. Results of the present study generally confirmed the following hypothesis: nations that retard economic activity have less Internet usage, holding all other variables

Year	DE	Title and Abstract
		constant. In addition, nations with greater human development, as measured by the Human Development Index, have greater Internet usage. Regarding other important determinants of Internet usage, results suggest that those nations with more fixed phone lines per capita and greater per capita gross national income also have higher levels of Internet usage.
2010	N15	Ito, Takatoshi. 2010. <i>Great Inflation and Central Bank Independence in Japan</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 15726. Japan suffered a very high inflation rate in 1973-74. The CPI inflation rate rose to near 30% in 1974, the highest rate in the postwar Japanese history after the chaotic hyperinflation following the end of the Second World War. Traditionally, the oil crisis is blamed for the 1973-74 high inflation. However, due to monetary policy decisions in 1972-73, the inflation rate had already exceeded 10% before the onset of the oil crisis in October 1973. These decisions include the interest rate cut of June 1972 and the interest rate hike of April 1973, which in retrospect proved too small. Concern about the rapid yen appreciation produced political pressure on the Bank of Japan to continue easing. The Bank of Japan came out of the Great Inflation of 1973 with a stronger voice. The Bank successfully argued that its recommendation to tighten monetary policy should not be overruled or the high inflation would be repeated. By this logic, the Bank of Japan obtained /de facto/ independence after 1975. When faced with the next economic recovery in 1979, again accompanied by oil price increases, the Bank of Japan was able to tighten monetary policy and to contain the inflation rate under 10 percent. The interest rate in the 1972-75 period was well below, by as much as 25 percentage points in 1973, the interest rate suggested by a modified monthly Taylor rule regression.
2010	N43 P16	Bosker, Maarten, Eltjo Buringh, and Jan Luiten van Zanden. 2010. <i>The Rise and Decline of European Parliaments, 1188-1789</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 7809. : Starting in Spain in the twelfth century, parliaments gradually spread over the Latin West. The paper quantifies the activity of medieval and early-modern parliaments, which also makes it possible to analyse the influence of this institutional innovation. In the early-modern period parliaments declined in influence in southern and central Europe and gained in importance in the Netherlands and Britain. From the sixteenth century onwards active parliaments, which function as constraints on the executive, had a positive effect on city growth and appear to have been instrumental in stabilizing the currency. Active pre-1800 parliaments also enhanced the quality of democratic institutions in the nineteenth and early twentieth century.

2010	O15	Marks, Stephen P. 2010. "Human Rights in Development: Claims and Controversies." <i>Bangladesh Development Studies</i> , 33(1-2): 1-23. Despite recent efforts to integrate the human rights perspective into development thinking, many still view the language of rights as irrelevant, and possibly even inimical, to the cause of development. The plausible reasons for this skepticism and the possible modes of overcoming it constitute the principal theme of this paper. The paper argues that, the claims and counterclaims notwithstanding, a careful scrutiny of the actual behaviour of the principal actors in the global political economy supports the proposition that the process of development requires serious attention to realising human rights. The argument focuses on the policy implications of two claims regarding the introduction of development issues into the human rights agenda and four claims regarding the introduction of human rights into the development agenda. Building on these claims, the paper argues that, in the ultimate analysis, human rights and development share a common finality and a concern with the potential of empowerment, suggesting a more hopeful role for human rights in development, as a vehicle for empowerment and social transformation in which human rights are development objectives.

2011	B11	Dupuy, Romuald. 2011. "Liberte et rationalite chez Quesnay. (With English summary)." <i>Revue de Philosophie Economique/Review of Economic Philosophy</i> , 12(1): 117-42. The thought of Quesnay and physiocrats is ambivalent: on the one hand, it promotes free trade, on the other it develops a political doctrine based on despotism. Would there be a discontinuity of physiocratic thought where the economy is the only space of freedom? For Quesnay, liberty is not absence of constraints; it is an opportunity for calculation and the expression of rationality. It analyzes the origins of this concept through Malebranche, Spinoza, Leibniz and Locke. The relation between liberty and natural right is analyzed to understand the coherence of physiocratic thought. Thus we understand better the link between liberty and order.
2011	B22	Wray, L. Randall. 2011. <i>Financial Keynesianism and Market Instability</i> . Levy Economics Institute, The, Economics Working Paper Archive. In this paper I will follow Hyman Minsky in arguing that the postwar period has seen a slow transformation of the economy from a structure that could be characterized as "robust" to one that is "fragile." While many economists and policymakers have argued that "no one saw it coming," Minsky and his followers certainly did! While some of the details might have surprised Minsky, certainly the general contours of this crisis were foreseen by him a half century ago. I will focus on two main points: first, the past four decades have seen the return of "finance capitalism"; and second, the collapse that began two years ago is a classic "Fisher-Minsky" debt deflation. The appropriate way to analyze this transformation and collapse is from the perspective of what Minsky called "financial Keynesianism"--a label he preferred over Post Keynesian because it emphasized the financial nature of the capitalist economy he analyzed.
2011	B22	Wray, L. Randall. 2011. <i>A Minskyan Road to Financial Reform</i> . Levy Economics Institute, The, Economics Working Paper Archive. In the aftermath of the global financial collapse that began in 2007, governments around the world have responded with reform. The outlines of Basel III have been announced, although some have already dismissed its reform agenda as being too little (and too late!). Like the proposed reforms in the United States, it is argued, Basel III would not have prevented the financial crisis even if it had been in place. The problem is that the architects of reform are working around the edges, taking current bank activities as somehow appropriate and trying to eliminate only the worst excesses of the 2000s. Hyman Minsky would not be impressed. Before we can reform the financial system, we need to understand what the financial system does--or, better, what it should do. To put it as simply as possible, Minsky always insisted that the proper role of the financial system is to promote the "capital development" of the economy. By this he did not simply mean that banks should finance investment in physical capital. Rather, he was concerned with creating a financial structure that would be conducive to economic development to improve living standards, broadly defined. In this paper, we first examine Minsky's general proposals for reform of the economy--how to restore stable growth that promotes job creation and rising living standards. We then turn to his proposals for financial reform. We will focus on his writing in the early 1990s, when he was engaged in a project at the Levy Economics Institute on reconstituting the financial system (Minsky 1992a, 1992b, 1993, 1996). As part of that project, he offered his insights on the fundamental functions of a financial system. These thoughts lead quite naturally to a critique of the financial practices that precipitated the global financial crisis, and offer a path toward thorough-going reform.
2011	B50	Boyer, Robert. 2011. "Are There Laws of Motion of Capitalism?" <i>Socio-Economic Review</i> , 9(1): 59-81. This article takes seriously the conflict of paradigms between a market economy approach and a capitalism approach. The first has recurrently shown its inability to explain the major stylized facts of the last two decades. The second now receives more attention as a possible alternative but the field has been so underexplored by so few people that the task is somehow Promethean. Is it possible to explicitly state laws of motion of capitalism? Previous failed attempts justify some scepticism. A review of the multiplicity of meanings and conceptualizations of 'economic laws' suggests first that the existence of general quantitative regularities, which economists are fond of, is quite unlikely. Second, it is possible to identify explicit partial and temporary regularities that are indexed upon a given institutional configuration of capitalism. Third, mobilizing the results of past historical analyses and building upon the contributions of some key economists and social scientists--Marx, Polanyi, Schumpeter, Kaldor, Wallerstein and Kindleberger--the article proposes seven conjectures about possible 'laws of motion of capitalism'.
2011	B51 E25	Block, Fred. 2011. "Crisis and Renewal: The Outlines of a Twenty-First Century New Deal." <i>Socio-Economic Review</i> , 9(1): 31-57. Most analyses of the US financial crisis of 2007-2009 focus on the proximate causes. This article sees the crisis as a consequence of the decline of a long-term pattern of accumulation in the USA and seeks to outline the requirements for a new period of dynamic economic growth. Drawing on work done by the French Regulation theorists and the US analysts of Social Structures of Accumulation, the paper attempts to describe the types of institutional changes that would be needed to spark a new period of stable economic growth in the USA and in the rest of the world economy. The paper outlines what a green mass consumption economy might involve.
2011	B51 E25	Deutschmann, Christoph. 2011. "A Pragmatist Theory of Capitalism." <i>Socio-Economic Review</i> , 9(1): 83-106. This article explores the potential of pragmatist social theory (Dewey and Mead) for elaborating and clarifying the classical analyses of capitalism by Marx, Schumpeter, Sombart and Weber. It shows how a reinterpretation in the context of pragmatist discourse can overcome the rationalist shortcomings of Weber's theory of capitalism and formulate key Marxist concepts like 'capital' or 'reification' more convincingly. It also outlines a multi-level approach for analysing the dynamics of capitalism, focusing on the interaction between class structures, individual creativity and the communication of innovative paradigms.

2011	D12 O12	Hobbes, Marieke, Wouter T. De Groot, Ester Van Der Voet, and Sukanya Sarkhel. 2011. "Freely Disposable Time: A Time and Money Integrated Measure of Poverty and Freedom." <i>World Development</i> , 39(12): 2055-68. This paper develops, tests, and discusses a metric for livelihood assessment that integrates cash flow and time use households. It expresses how much time the household adults have left after satisfying the household's basic needs (e.g., for food, sleep, care, consumables, and leisure). This "freely disposable time" (FDT) may be put to any use available and allowed in the local context, such as above-basic leisure, work to acquire above-basic consumer goods, or investments in the future such as education or soil conservation. Thus, FDT represents people's freedoms and a key condition for any out-of-poverty strategy. The FDT methodology is illustrated with a number of characteristic livelihood strategies and tested on peri-urban farming livelihoods in India and some typical Dutch households. The FDT outcomes, methodology, strengths, and limitations are compared with those of an allied, "discretionary time" indicator, paired time/money indicators, and purely monetary (e.g., income or expenditure) indicators of poverty and welfare.
2011	D24 P26 P34	Sufian, Fadzlan, and Muzafar Shah Habibullah. 2011. "Opening the Black Box on Bank Efficiency in China: Does Economic Freedom Matter?" <i>Global Economic Review</i> , 40(3): 269-98. The paper provides, for the first time, empirical evidence on the impact of economic freedom on bank efficiency in a developing economy. We employ the data envelopment analysis method to compute the efficiency of the Chinese banking sector during 2000-2008. The empirical findings indicate that the inefficiency of the Chinese banking sector stems largely from scale rather than pure technical. By examining different dimensions of economic freedom, we find that not all are equally regressive on bank efficiency. We find that the impact of business freedom to be positive, implying that higher (lower) freedom for entrepreneurs to start businesses increases (reduces) bank efficiency. Similarly, monetary freedom is positively related to bank efficiency levels, indicating the importance of a stable and reliable monetary policy to business environment. On the other hand, the impact of financial freedom is negative, implying that higher (lower) financial freedom reduces (increases) the efficiency of banks operating in the Chinese banking sector.
2011	D24 F13	Berument, Hakan, N. Nergiz Dincer, and Zafer Mustafaoglu. 2011. "Total Factor Productivity and Macroeconomic Instability." <i>Journal of International Trade and Economic Development</i> , 20(5): 605-29. Total factor productivity (TFP) is an important component of growth for most countries. This article assesses the role of macroeconomic instability on TFP growth. We consider volatility in inflation, openness of an economy and financial market deepness as measures of macroeconomic instability. Empirical evidence provided from Turkey suggests that volatility of openness and financial market deepness reduce TFP growth, whereas volatility of inflation increases TFP growth.
2011	D24	Commander, Simon, and Zlatko Nikoloski. 2011. "Institutions and Economic Performance: What Can Be Explained?" <i>Review of Economics and Institutions</i> , 2(2): . Institutions are now widely believed to be important in explaining performance. In this paper, we analyze whether commonly used measures of institutions have any significant, measurable impact on performance, whether of countries or firms. We look at three 'levels' of institutions and associated conjectures. The first concerns whether the political system affects performance. The second concerns whether the business and investment environment affects the performance of countries and the third concerns whether perceived business constraints directly affect the performance of firms. In all instances, we find little evidence of a robust link between widely used measures of institutions and our indicators of performance. We consider why this might be the case and argue that mis-measurement, mis-specification, complexity, and non-linearity are all relevant factors.

2011	D41	Iguiniz Echeverria, Javier M. 2011. "Libertad para competir en el mercado: Recursos, procesos y resultados. (Freedom to Compete in the Market: Resources, Processes, and Results. With English summary)." <i>Economia (Pontifical Catholic University of Peru)</i> , 34(68): 170-91. Herein we analyze three concepts of market competition. Although the different aspects of freedom can be appreciated in each one of them, they make an especial contribution to some of them. We propose that the 'neoclassical general equilibrium' chiefly contributes to the discussion of the outcomes of an economic activity; the 'barriers to entry' approach calls for a study of the resources necessary to compete; and the 'competition as a process' approach emphasizes the competitive activity itself. Moreover, as we move from the first onwards, enriching the meaning of competition, the possibility of losing opportunities to participate in the market becomes more evident. Entry and exit are part of the competitive process. Each concept of competition responds to theories that specify or allude to certain types and distribution of economic agents' freedoms to manoeuvre. Throughout this study, we often quote Amartya Sen with the purpose of building bridges between the study of competition and the approach of 'development as freedom'.
2011	D73	Gediz Oral, Burcu. 2011. "Yolsuzlukla Uluslararası Alanda Mucadele ve Türkiye'de Yolsuzlukla Mucadenin Kurumsal Yapısı. (The Fight against Corruption in the International Field and Institutional Structure of Anti-corruption Efforts in Turkey. With English summary)." <i>Marmara Üniversitesi İktisadi ve İdari Bilimler Fakültesi Dergisi</i> , 30(1): 163-92. Fight against corruption requires continuity, and its application in all areas. In this sense, the execution of the fight against corruption both at national and international level is essential. In the study, it is aimed to give a general overview about the importance of the national and international institutions in fighting against corruption. Success would come with a determined struggle supported by public opinion.

Changes in credit market architecture are an important but unobservable structural influence on economic activity. For Australian data, we model non-price credit supply conditions within equilibrium correction models of consumption, house prices, mortgage credit and housing equity withdrawal. Our "latent interactive variable equation system" (LIVES) employs a single latent variable to capture evolutionary shifts (in credit conditions) that affect not only the intercept of each equation, but also interact with key economic variables. We show that credit conditions impact on consumption by: (i) lowering the mortgage downpayment constraint facing young households; (ii) introducing a housing collateral channel from house prices to real activity; and (iii) facilitating intertemporal consumption smoothing.

2011	E21 E22 E27 E66 J24 J68 L50 L93 L96 L98 N75	Herd, Richard, Paul Conway, Sam Hill, Vincent Koen, and Thomas Chalaux. 2011. <i>Can India Achieve Double-digit growth?</i> OECD Publishing, OECD Economics Department Working Papers: 883. In recent years, India has enjoyed one of the highest growth rates worldwide, weathering the global financial crisis better than many other countries. Prudent macroeconomic policies will be critical to prolonging the current expansion, given the risks associated with high inflation and volatile capital flows. A steadfast commitment to fiscal consolidation is needed to continue to reduce the large deficit that emerged in the aftermath of the slowdown and avoid crowding out private investment. Stepping up structural reforms will also be necessary if double-digit growth rates are to be achievable over the coming decade or so. Indeed, the operating environment for private business remains challenging. While infrastructure is improving in key sectors, partly thanks to greater private investment, bottlenecks endure and efforts to intensify competition and ensure continued strong investment are required. Labour market reforms are also required to promote job creation. Rapid economic development has boosted living standards and reduced poverty but poverty remains high. There is a need to strengthen social welfare systems and access to health and education to ensure widespread benefits from continued high growth. This Working Paper relates to the 2011 OECD Economic Survey of India (www.oecd.org/ecco/surveys/india)

"The Interactive Effect of Remittances and Civil Liberties on Investment and Consumption." <i>International Journal of Development Issues</i>, 10(1): 20-33. The purpose of this paper is to investigate the level of influence that civil liberties has on the marginal effect of remittances on gross domestic investment and consumption separately and measures it across all levels of civil liberties. The authors employ a two-stage system generalized method of moments procedure and the civil liberties subset of the Freedom in the World Index as a proxy for civil liberty. The findings indicate a substitution effect from investment to consumption as civil liberties deteriorate for developing south economies, though not for emerging economies. In addition, the marginal effect of remittances on investment diminishes less quickly as economies become less free than it increases for consumption indicating that the substitution is not quite one-for-one.

2011	E21 E22 F32	Kerdrain, Clovis, Isabell Koske, and Isabelle Wanner. 2011. "Current Account Imbalances: Can Structural Reforms Help to Reduce Them?" <i>OECD Journal: Economic Studies</i>, 2011(0): 31-74. This article explores the impact of structural policies on saving, investment, and current accounts in OECD and non-OECD economies. Since the current account effects of structural reforms are often complex and ambiguous from a theoretical perspective, new OECD empirical analysis is carried out. Reduced-form equations are estimated for a panel of 30 OECD countries as well as for a panel/cross-section of 117 OECD and non- OECD countries that relate saving, investment and current accounts to policy indicators and a set of macroeconomic control variables. This work suggests that structural reforms may influence saving, investment and current accounts through their impact on macroeconomic conditions such as productivity growth or public revenues and expenditures, but also more directly: (i) higher social spending (in particular on health care) is found to lower the saving rate and thereby to weaken the current account, most likely reflecting lower precautionary saving; (ii) product market liberalisation temporarily boosts investment and thus also weakens the current account; (iii) financial market deregulation may lower the saving rate, though only in less developed countries; (iv) stricter employment protection may be associated with lower saving rates if unemployment benefits are low, as well as with higher investment rates possibly due to greater substitution of capital for labour. A scenario analysis indicates that fiscal consolidation and structural reforms in the main world economies could significantly reduce current global imbalances, possibly by about one-third.
2011	E22 F23 F35 O19	Tiwari, Aviral Kumar. 2011. "Foreign Aid, FDI, Economic Freedom and Economic Growth in Asian Countries." <i>Global Economy Journal</i>, 11(3). This study examines the effectiveness of foreign aid, foreign direct investment, and economic freedom for selected 28 Asian countries in a panel framework. The model includes foreign aid, foreign direct investment, economic freedom, labor force, and capital stock. The estimation procedure was carried out on pooled annual time series data for the period 1998-2007. For the purpose of analysis, we used static and dynamic panel data techniques. The results indicated that an increase in the fiscal freedom, financial freedom, and domestic capital stock were significant factors positively affecting economic growth. Freedom from corruption, inflow of foreign direct investment and foreign aid were significant factors negatively affecting economic growth. Further, we found that life expectancy played a significant and positive role in economic growth. Foreign aid had a non-linear impact (negative impact of high aid flows) upon economic growth.

We study the determinants of the level and the evolution of per capita hours worked in a panel of OECD countries since the 1970s. Following Pesaran (2006), our empirical strategy allows for the possibility of cross-sectionally correlated error terms due to unobserved common factors, which are potentially nonstationary. We find that much of the variation in per capita hours worked across countries and over time can be explained by differences in the level and structure of taxes and government expenditures. Differences in (the evolution of) labor and product market institutions have much less of a role to play. Our results show that a careful treatment of the time-series properties of the data is crucial.

Sonderforschungsbereich 649, Humboldt University, Berlin, Germany, SFB 649 Discussion Papers: SFB649DP2011-068. This paper investigates determinants of changes of the labor share in developed countries with a focus on Western Europe. Using a country-industry panel that covers the private sector, the paper focuses on long and short-run changes within industries. The results show a large and time-persistent impact of increasing globalization on the labor share, especially if the within-industry changes are considered. Openness seems to be the driving force for downward movements in the industry level labor shares while technological and institutional forces impact these shares positively. Furthermore, while investments into information and communication technology (ICT) increase productivity of

Year	DE	Title and Abstract
		workers, it has a negative impact on the labor share as it enables higher economic integration which lowers the labor share. Economic integration has stronger impact on the polarization in Western European labor markets than ICT.

F. de Groot. 2011. <i>The Crisis Sensitivity of European Countries and Regions: Stylized Facts and Spatial Heterogeneity</i> . Tinbergen Institute. Tinbergen Institute Discussion Papers: 11-071/3. This paper investigates the impact of the recent global recession on European countries and regions. We first present several stylized facts as to the heterogeneous impact of the global recession on individual European countries and regions. We then offer an investigation of three main classes of explanations for spatial heterogeneity in the severity of the crisis. The first is the extent to which countries are integrated in the global economy via financial and trade linkages. A second class of potential explanations is found in differences in the institutional framework of countries. A third possible cause why some countries and notably also regions are more affected than others is differences in their sectoral composition. We show that especially variation in the sectoral composition contributes to the variation in the effects of the current crisis, both at the country level and at the detailed regional level across the EU.

2011	F02	Cesaroni, Francesca Maria, and Domenico Consoli. 2011. "The Global E-Democracy in a Context of Information-Based Society." <i>Scientific Annals of the "Alexandru Ioan Cuza" University of Iasi</i> , 58(0): 245-56. The globalization involves not only the exchange of physical goods but also and especially of information and relationships between people. The globalization is the intensification of worldwide social relations. In the globalization era, there are cultural mechanisms of integration, a growing consciousness of the whole world, an holistic vision that facilitate the interdependence and the social integration. Citizens of "global village", by ICT and web 2.0 tools, can interact among themselves, creating a collective intelligence to improve the life quality and public rules. Citizens express opinions and suggestions on services of public administration and they contribute, in a pro-active way, in their improvement and to birth of a new e-democracy. In a globalized context it's necessary to eliminate digital divide between industrialized countries and no, the rich and the poor, north and south of the world.
2011	F11 F14	Nicolini, Marcella, and Alessia Paccagnini. 2011. "Does Trade Foster Institutions? An Empirical Assessment." <i>Review of Economics and Institutions</i> , 2(2) The relationship between trade and institutions has been extensively debated by trade economists and political scientists. The aim of the present paper is to provide some empirical evidence on the causal relationship between institutions and trade flows in a panel framework. We present a Granger causality test (1969) as well as a Hurlin and Venet (2001) test for panel data using a bilateral trade flows panel that covers 29 years. The issue of zero flows of trade is handled by using a panel Poisson Pseudo-Maximum Likelihood estimator.

2011	F13 O23	Ibarra, David. 2011. "O neoliberalismo na america Latina. (Neoliberalism in Latin America. With English summary.)." <i>Revista de Economia Politica/Brazilian Journal of Political Economy</i> , 31(2): 238-48. Neoliberalism and globalization had decisive influence in shaping public policies both internal and foreign in Latin-America. Less state, trade and market freedoms, social goals subordinated to economic criteria, are part and parcel of the neoliberal utopia. Price stability was erected as the main social objective; import substitution resulted replaced by exports as the main source of growth. The neoliberal net results as applied to Latin-America are: less growth, deindustrialization, income concentration and precarious employments. Therefore, countries public policies should try to gain autonomy to use jointly markets and public intervention in a constructive and innovative fashion.
2011	F14 O19 O24	Nambiar, Shankaran. 2011. "Trade, Investment and Reform: Challenges for Malaysia." <i>Journal of Economic Cooperation and Development</i> , 32(1): 31-54. The purpose of this paper is to argue that Malaysia needs to reform some institutional aspects of the economy that impact on its trade policy. This is an important exercise because Malaysia is a very open, trade-dependent economy. The manner in which the Malaysian economy was impacted by the global financial and economic crisis of 2008 attests to the fact that Malaysia should be watchful of its trade policy to remain favourable to foreign investors. Since it depends on the developed economies for foreign direct investment there is an urgent need to introduce institutional reform. Accordingly, it is now incumbent on Malaysia to introduce competition policy; to reform and liberalise its government procurement policy; and, generally, to relax those policies that are perceived as being protectionist.
2011	F14	Hall, Joshua C., Robert Lawson, and Chuck Skipton. 2011. "Estimating the Size of the Trade Sector in the Economic Freedom of the World Index." <i>Economics Bulletin</i> , 31(1): 466-72. The Economic Freedom of the World (EFW) index measures the extent to which nations allow their citizens economic freedom. The freedom of people to trade internationally is a featured area within the index. One component of this area is the size of the trade sector, or rather the deviation of a country's trade sector from its expected size. This note explains the basic methodology used to estimate the model and create the ratings for the deviation of a country's trade sector from its expected size component of the EFW index.

2011	F35	Diss: Connors, Joseph. 2011. Global Poverty: The Role of Economic Freedom, Democracy, and Foreign Aid. PhD diss. Florida State University. This research is an empirical study of how economic freedom, democratic political institutions, and foreign aid influence global poverty rates. The updated extreme and moderate poverty rates recently released by the World Bank indicate that significant reductions in global poverty occurred during 1980-2005. Chapter two regularizes these data for statistical analysis in later chapters. This chapter also looks at global poverty trends over time, both in aggregate and for various regions. The data indicate that Asia had remarkable reductions in poverty during 1980-2005. The world's two most populous countries, China and India, were the primary drivers of these reductions. Latin America also experienced reductions in poverty rates over the period while sub-Saharan Africa achieved very little reductions in poverty. Using the World Bank poverty rates, chapter three examines the impact of economic freedom on global poverty during 1980-2005. Prior research indicates that economic freedom is a significant determinant of economic growth. Some argue that only the wealthy are able to take advantage of movements toward increased economic freedom. The results of this chapter indicate that the poor benefit from economic freedom as well. Countries with more economic freedom over the period 1980-2005 had lower poverty rates in 2005. Moreover, movements toward institutions consistent with economic freedom corresponded to larger reductions in poverty over the period. This was especially true for changes in economic freedom that occurred earlier in the period. Prior research indicates that democratic political institutions exert very little influence on economic outcomes after accounting for the impact of economic freedom. Chapter four examines whether democratic political institutions exert an indirect impact on reductions in poverty through economic freedom. Milton Friedman and others have argued that political institutions exert an impact on economic freedom. This research provides some evidence in support of this view. Movements toward democratic political institutions in one decade corresponded to increases in economic freedom in the subsequent decade. After accounting for the indirect impact of political institutions, the results indicate that movements toward democracy exert an influence on subsequent reductions in extreme poverty through economic freedom. A similar result was not found for reductions in moderate poverty. Chapter five examines the impact of foreign aid on global poverty during 1980-2005. Over the last half century, a significant amount of foreign aid was given to developing countries to reduce the incidence of poverty. The results of this chapter indicate that a country's poverty rate is an important determinant of the amount of aid received. Economic and political institutions of a recipient country had little to no impact on the allocation of foreign aid. The results also indicate that foreign aid exerted little influence on movements toward economic freedom or democracy. Lastly, the results of this chapter indicate that foreign aid exerted little to no impact on reductions in either extreme or moderate poverty during 1980-2005. These results indicate that poor countries receive foreign aid, but do not become economically free or democratic. Moreover, it appears that aid, as historically practiced, exerted little impact on global poverty. Chapter six is the concluding chapter. The empirical results are summarized and placed in context. This research indicates that economic freedom is a significant determinant of reductions in poverty. Democratic political institutions facilitate reductions in the extreme poverty rate through changes in economic freedom. Lastly, no evidence was found that foreign aid exerted a significant impact on either institutions or poverty.

2011	F50 H63 H87	Skaperdas, Stergios. 2011. <i>Seven Myths about the Greek Debt Crisis</i> . University of California-Irvine, Department of Economics Working Papers: 111201. In Greece and other countries of the eurozone there are a number of misconceptions about the debt crisis. I argue against seven of such misconceptions (or, myths) about the effects of default, the primary cause of the crisis, the likely effects of an exit from the eurozone, the bargaining power of the Greek government in its negotiations with the EU/ECB/IMF troika, and others. Default and exit from the eurozone appears to be the most viable alternative in the long run; such a move would seem to require considerable preparation under short time constraints and a government with broad political support.

"Economic and Social Rights within the Inter-American Human Rights System: Thinking New Strategies for Obtaining Judicial Protection." <i>Internacional Law: Revista Colombiana de Derecho Internacional</i> , 0(18): 117-54. After more than half a century of existence of international human rights regimes, a differential degree of protection is still received by the so-called economic and social rights, when compared to the ones named civil and political. However, this article aims to show that certain strategies used within the Inter-American Human Rights System, IAHRs, have proved to be relatively successful for granting judiciable character to economic and social rights. Moreover, the paper discusses alternative paths that could be tried in order to obtain an improved judicial protection for these rights within the Americas.
2011	F53	Howarth, David, and Tal Sadeh. 2011. "In the Vanguard of Globalization: The OECD and International Capital Liberalization." <i>Review of International Political Economy</i> , 18(5): 622-45. A survey of the literature on the political economy of global financial liberalization shows how little has been written on the role of the OECD, and how the principal-agent (PA) theory, complemented by constructivist tools, can be applied helpfully to analyse this process. We show that the OECD's Committee on Capital Movements and Invisible Transactions (CMIT) played an entrepreneurial role in encouraging the liberalization of capital flows. In particular, we argue that the CMIT slipped by acting beyond its core delegation roles and against the preferences of the OECD member states' governments. This was done by discussing and seeking to expand the list of issue areas on which controls should be lifted to include short-term capital movements and the right of establishment, to adopt an extended understanding of reciprocity, and to eliminate a range of additional discriminatory measures on capital flows. Acting as institutional entrepreneurs, the CMIT members took advantage of the overlap among the networks in which they were engaged to spread their ideas to the member states. The CMIT's work affected the member states' willingness to make irrevocable, multilateral commitments through a combination of peer pressure and vertical institutional interconnectedness. Through the work of the CMIT, the OECD was an important actor in capital liberalization, in addition to the role played by other international organizations.

National Bureau of Economic Research, Inc, NBER Working Papers: 16777. In a model with heterogeneous-risk-aversion agents facing margin constraints, we show how securities' required returns are characterized both by their betas and their margin requirements. Negative shocks to fundamentals make margin constraints bind, lowering risk-free rates and raising Sharpe ratios of risky securities, especially for high-margin securities. Such a funding-liquidity crisis gives rise to "bases," that is, price gaps between securities with identical cash-flows but different margins. In the time series, bases depend on the shadow cost of capital, which can be captured through the interest-rate spread between collateralized and uncollateralized loans, and, in the cross section, they depend on relative margins. We test the model empirically using the CDS-bond bases and other deviations from the Law of One Price, and use it to evaluate central banks' lending facilities.
2011	G28	Johnson, William F. 2011. "International Economic Freedoms, Banks and the Market Crisis of 2007-2009." <i>Journal of Banking Regulation</i> , 12(3): 195-209. The objective of this article is to test whether banks in highly regulated countries performed better than banks in less regulated countries during the market crisis of 2007-2009. Bank index returns from 46 countries were examined from 1 October 2007 to 3 March 2009. The analysis revealed that high levels of government and fiscal freedoms, measured by the Heritage foundation freedom rankings, resulted in higher banking index returns that were highly significant. In contrast, high levels of financial freedom from regulation resulted in lower banking index returns that were marginally significant. The results suggest that regulators must find a delicate balance between improving the regulatory structure while not increasing the government or fiscal involvement in the economy. The results also indicate that simply increasing financial regulation will not reduce or eliminate the magnitude of future market crisis as regulation was only marginally significant in explaining banking index returns during the market crises.
2011	G34 K22	Ugur, Mehmet, and David Sunderland, eds. 2011. <i>Does Economic Governance Matter? Governance Institutions and Outcomes</i> , New Directions in Modern Economics. Cheltenham, U.K. and Northampton, Mass.: Elgar. Nine papers, originally presented at a conference held at the University of Greenwich in June 2010, explore the relationship between governance quality and macroeconomic outcomes such as growth, investment, and income inequality, and consider how the impact of governance quality unfolds at the microeconomic level to affect individual or corporate behavior. Papers discuss governance and asymmetric power; norms, advice networks, and joint economic governance—the case of conflicts among shareholders at the Commercial Court of Paris; legal versus reputational penalties in deterring corporate misconduct; strategies of transnational companies in the context of the governance systems of nation-states; the effects of convergence in governance on capital accumulation in the Black Sea Economic Cooperation countries; taxes, foreign aid, and quality of governance institutions; economic governance and full employment; the political economy of deregulation in the U.S. gas distribution market; and electricity sector reforms and the tariff review process in Brazil.
2011	H23	Diss: Corvalan, Alejandro. 2011. Essays in Democracy. PhD diss. New York University. This thesis studies the connection between democracy and economic fundamentals as income or inequality. The causal relation between development and institutions is twofold. First, development creates the economic conditions to support some particular type of institutions. According to the Modernization Theory, democracy is created and consolidated in affluent societies. The first part of this thesis provides empirical tests for the nexus between income and democracy. While recent studies cast doubt on this relation, we reestablished the nexus after controlling for country fixed effects. We also provide estimations that correct at first order the incidental parameter bias. Second, democracy is affecting development through several channels. In particular, democracy empowers a poor median voter, and thus has an effect through redistributive taxation. The second part of the thesis studies the problem of redistribution under democracy. We use the citizen-candidate model, where entry is costly and the winners implement their preferred policies, to study stylized facts about the economic identity of the ruling class. Even under a perfect credit market, high cost of entry implies only rich candidates at equilibrium and a negative effect of inequality on taxation.
2011	H23 P52	Iversen, Torben, and David Soskice. 2011. "Inequality and Redistribution: A Unified Approach to the Role of Economic and Political Institutions." <i>Revue Economique</i> , 62(4): 629-49. This paper explains the enduring disparities in inequality and welfare states across advanced economies in terms of varieties of capitalism and political systems. Where capitalism is coordinated as in much of Northern Europe, political systems are consensus-based with pre elections; consensus politics and coordinated capitalism reinforce each other in generating relatively low inequality and strong welfare states. Where capitalism is liberal—the Anglo-Saxon countries—political systems are competitive with majoritarian voting: mutual reinforcement of politics and capitalism generates

Year	DE	Title and Abstract
		relatively inegalitarian outcomes and safety-net welfare states. Both systems sustain potentially internationally competitive economies, with different comparative institutional advantages and success in different sectors of world markets.

2011	H74	Feld, Lars P., Gebhard Kirchgassner, and Christoph A. Schaltegger. 2011. "Municipal Debt in Switzerland: New Empirical Results." <i>Public Choice</i> , 149(1-2): 49-64. Switzerland has experienced extensive institutional reforms at the local level that could influence local debt. These reforms have included municipal mergers, greater inter-communal cooperation, reformed political decision-making mechanisms, and the introduction of new public management measures. Many of these reforms originated at the cantonal level. However, the institutional diversity among Swiss municipalities hardly has diminished. A cross-sectional analysis for the 137 largest Swiss cities and villages in 2004 shows that direct democratic rights and a high degree of fiscal autonomy lead to a lower level of local debt. There is no statistical support for the hypothesis that reforms following the new public management guidelines had an effect on debt levels.
2011	H77	Buser, Whitney. 2011. "The Impact of Fiscal Decentralization on Economics Performance in High-Income OECD Nations: An Institutional Approach." <i>Public Choice</i> , 149(1-2): 31-48. This paper examines the impact of public sector decentralization on per capita income. Controlling for differences in institutional arrangements among countries, panel data regressions on a sample of observations from 20 high-income OECD nations spanning the years 1972 to 2005 indicate that decentralization is positively related to income. The empirical analysis shows that institutions consistent with economic freedom enhance the positive income effects of decentralization. Thus, the impact of public sector decentralization is dependent upon a nation's institutional environment.
2011	H83 P35	Zurga, Gordana. 2011. "Public Administration's Added Value to the Competitiveness of National Economy." <i>Zbornik Radova Ekonomskog Fakulteta u Rijeci: Casopis za Ekonomsku Teoriju i Praksu/Proceedings of Rijeka School of Economics: Journal of Economics and Business</i> , 29(1): 193-223. The paper presents an explorative study in respect to the public administrations' added value to the competitiveness of national economies in the context of the Lisbon Strategy. The main research goal was to explore role of governments and their administration in sustaining competitiveness of national economy and to discuss it from different perspectives. As the research methodology we combined comparative analysis of two consecutive studies on public administrations' added value to the Lisbon Strategy goals performed in 2008 and 2010, with analysis of Lisbon Strategy evaluation conducted by the European Commission, and practical illustration on the case of Slovenia in the context of the Lisbon Strategy and the Europe 2020. Three main components of the hypothesis: (1) need for incorporation of the public administration modernisation and development into developmental goals of the state, (2) monitoring and adjusting the implementation, and (3) identification of interconnections and complementarities for better use of resources were explored and verified in the contexts of Lisbon Strategy adding value to the national competitiveness. Within the research, the hypothesis was proved, as well as the relevance of all three components, especially in the circumstances of the global economic crisis. The main contribution of this paper is explorative description of how governments may, through their public administrations and by implementing and integrating their various roles and activities, add value to competitiveness of their national economies. In the paper, some institutional implications are presented, as well as possible areas for further investigation and research.
2011	H83	Badinger, Harald, and Volker Nitsch. 2011. <i>National Representation in Multinational Institutions: The Case of the European Central Bank</i> . CESifo Group Munich, CESifo Working Paper Series: 3573. Multinational institutions face an important trade-off when hiring personnel. On the one hand, hiring decisions are based, as in most organizations, on a candidate's professional qualifications. On the other hand, multinational institutions often aim for broad national representation. Reviewing evidence from the European Central Bank, we show that nationality is indeed relevant for both hiring and decision-making. Specifically, we identify various country-specific features that determine national representation in the top management of the ECB. Further, there is evidence for the existence of national networks between adjacent management layers. Finally, monetary policy decisions seem to be linked to national representation in the core business areas of the ECB. Examining a sample of 14 European countries over the period from 1999 to 2008, we estimate Taylor rules for alternative sets of euro area aggregates derived from different weighting schemes of national macroeconomic data. Our results indicate that weights based on national representation in the mid-level management of the ECB's core business areas best describe the central bank's interest-rate setting behavior.

"Conceptualizing the Role of Politics in the Economy: Industries and Their Institutionalizations." <i>Review of International Political Economy</i> , 18(3): 358-83. Recent literature on the persistence or transformation of economic models frequently evokes the role of politics. However, such publications rarely set out precisely what politics is and how it plays out within specific sites of economic activity, particularly individual industries. In order to show that politics is the cause of both change within industries and difference between them, this article develops an institutionalist framework

Year	DE	Title and Abstract
		of analysis which seeks to elucidate the 'thickness' of the relationship between economic and political activities. Politics is first conceptualized in a way that opens up for research the emergence and evolution of the institutions which constrain and make industrial activity possible: behaviour that both discursively and interactively seeks to change or reproduce institutions by mobilizing values. Building upon existing institutionalist approaches in political economy and economic sociology, but also constructivist strands of political science, this definition is then used to set out a research design with which to conduct in-depth empirical study of the 'political work' undertaken within industries that lie behind perpetual processes of institutionalization. This work, and the intermediary concepts developed to study it--problematization and politicization--are illustrated throughout the piece by examples from two industries: automobile distribution and wine.

2011	N00 N10	Bayoumi, Tamim, and Trung Bui. 2011. <i>Apocalypse Then: The Evolution of the North Atlantic Economy and the Global Crisis</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 8688. The financial crisis that struck the global economy in late 2008 had its origins in excesses in the US housing market. Its reverberations, however, were felt around the world and nowhere more keenly than in Western Europe. While North Atlantic trade links were in relative stasis, the North Atlantic furnished a uniquely close relationship across financial institutions, as a combination of dominant US financial markets, European competition policy, and differences in financial regulation made the European banking system heavily dependent on dollar wholesale funding. Empirical estimates and macroeconomic model simulations indicate that growth spillovers predominantly flow westwards across the North Atlantic. The bellwether nature of US financial markets creates uniquely large spillovers to the rest of the world even in normal times, and these spillovers are only enhanced if disruptions to bank wholesale funding markets are added--as occurred during the recent global crisis.

National Bureau of Economic Research, Inc, NBER Working Papers: 17437. In 1931, a financial crisis began in Austria, struck numerous European nations, forced Britain to abandon the gold standard, and spread across the Atlantic. This article describes how banks in New York City, the central money market of the United States, reacted to events in Europe. An array of data sources--including memos detailing private conversations between leading bankers the governors of the New York Federal Reserve, articles written by prominent commentators, and financial data drawn from the balance sheets of commercial banks--tell a consistent tale. Banks in New York anticipated events in Europe, prepared for them by accumulating substantial reserves, and during the crisis, continued business as usual. Leading international bankers deliberately and collectively decided on the business-as-usual policy in order to minimize the impact of the panic in the United States and Europe.
2011	N13 N14 P17	Weede, Erich. 2011. "Long-Run Economic Performance in the European Periphery: Russia and Turkey." <i>Kyklos</i>, 64(1): 138-56. This paper first analyzes the question why did Czarist Russia and Ottoman Turkey fall behind the West? It is argued that interstate rivalry forced West European rulers to respect the private property rights of producers and subjects earlier and to a greater degree than czars or sultans ruling over huge contiguous territories ever had to. Incentives to work were better in Europe than elsewhere. The mobilization of available knowledge for productive purposes was easier than elsewhere. Limited government implied less political obstacles to innovation. Comparatively secure private property ownership in the means of production made the establishment of scarcity prices and the rational allocation of resources easier than elsewhere. Whereas the Western past was feudal, the Russian or Turkish past was patrimonial or even sultanistic. Feudalism is a much better starting point for establishing the rule of law and safe property rights than patrimonialism. The second issue has been the question why Czarist Russia could outperform Ottoman Turkey. Here the political consequences of the Muslim tolerance of slavery and polygyny matter. Being slaves, many members of Ottoman ruling elites were at the mercy of their owner, the sultan. Therefore, they became tools of arbitrary rule. Moreover, the practice of polygyny generated downward social mobility and political instability and thereby added another obstacle to the establishment of safe property rights for producers or merchants. The final issue is the economic prospects of Russia or Turkey. Economic freedom is better in Turkey than in Russia. Moreover, Russia is graying, whereas Turkey may look forward to a growing labor force. Although a rich endowment in natural resources seems to favor Russia, the resource curse has prevented other resource rich countries from developing. Therefore, the Turkish prospect looks much brighter than the Russian one.

2011	N40	Boix, Carles. 2011. "Democracy, Development, and the International System." <i>American Political Science Review</i>. 105(4): 809-28. Resolving a controversy on the relationship of development to democratization, this article expands the time period under study with panel data running from the early nineteenth century (a time where hardly any country was democratic) to the end of the twentieth century, and shows a positive and significant effect of income on the likelihood of democratic transitions and democratic consolidations. The estimations hold after I control for country and time effects and instrument for income. Results reveal that the effect of income varies across income levels and across eras. First, income has a decreasing marginal effect on democratization. In already developed (and democratized) countries, any extra growth has no further effect on the level of democracy. Second, the structure of the international system affects the resources and strategies of pro-authoritarian and pro-democratic factions in client states. The proportion of liberal democracies peaks under international orders governed by democratic hegemons, such as the post-Cold War period, and bottoms out when authoritarian great powers such as the Holy Alliance control the world system.

2011	O12	Green, Alan. 2011. "Institutions Matter, but in Surprising Ways: New Evidence on Institutions in Africa." <i>Kyklos</i>, 64(1): 87-105. Estimation of the effects of institutions on long-term growth is severely limited by the endogeneity of institutions to the choices of governments. I thus approach the model from the household level and estimate the effects of aggregate institutions on household wealth. Under the benign assumption that institutions are exogenous to household choices this model gives unbiased estimates of multiple institutional variables. Issues then arise of the basic concepts and measurements of institutional variables. I revisit these issues and present new regional level institutional variables that are representative of 151 regions in thirteen African countries and measure clear concepts of institutions. I find that regional level institutions have significant effects on household wealth in a nonlinear fashion. Fear of crime, expectations of law enforcement and corruption at multiple levels are all estimated to have significant nonlinear effects on household wealth.

2011	O19 O24	le Roux, P., and V. Gorlach. 2011. "An Econometric Analysis of the Impact of Economic Freedom on Economic Growth in the SADC." <i>Journal for Studies in Economics and Econometrics</i>, 35(2): 1-14. The SADC is attempting to achieve development and economic growth. By improving economic freedom, a country can experience sustained economic growth without increasing fundamental inputs i.e., labour and capital. This study tests the effects of population growth, openness, and economic freedom on economic growth as well as the causality between economic freedom and economic growth. A panel data model is used due to the lack of data for individual SADC countries. The fixed effects model is statistically significant and allows county-specific differences, arising from independent variables, to be measured. Results reveal that population growth positively affects economic growth although it is not significant. Openness is positively related to economic growth. However, the magnitude of this openness relationship is relatively small. Economic freedom has a significantly favourable effect on economic growth, stronger than that of openness. The Granger causality test confirms the direction of causality, economic freedom precedes economic growth.
2011	O19	Bilquess, Faiz, Tahir Mukhtar, and Sidra Sohail. 2011. "What Matters for Financial Development in D-8 Countries? Capital Flows, Trade Openness and Institutions." <i>Journal of Economic Cooperation and Development</i>, 32(1): 71-91. There is a broad consensus in the finance-growth literature that, with few exceptions, there exists a positive long run relationship between financial development and economic growth. As a result of this widespread consensus, the finance-growth literature has recently begun to shift its attention towards the determinants of financial development. The present study has been conducted to examine the impact of capital flows, trade openness and institutions on the financial development of D-8 countries. Using dynamic panel data techniques for the period 1985 to 2008, the study finds that capital flows, trade openness and institutions are the significant determinants of financial development in D-8 countries. The findings of the study are robust to alternative measures of financial development, as well as estimation method.

As per the positivist economic approach, development is only an economic issue and it excludes the social and cultural aspects of the concept. This is the reason that they have been undermining the significance of human rights friendly definition of IPRs. According to Article 1 of International Covenant on Civil and Political Rights 1966 "Self determination is the right to freely determine political status and to freely pursue economic, social, and cultural development. "The western approach concentrates more on progress of science and ignores totally the existence of science. So the study of IPRs without human rights approach is not complete in itself. As the new IP regimes will have wide ranging socio-economic, technological, and political impact, so the study of IPRs in human rights context is inevitable. The paper concentrates on this very aspect while highlighting the human right to health and IPR related human rights aspects of indigenous communities including right to culture, self determination, food, and subsistence, etc.
2011	O52	Draskovic, Veselin. 2011. "The Real Institutionalization as a Condition of the Efficient Economic Politics and Economic Development." <i>Montenegrin Journal of Economics</i>, 7(1): 5-20. During the period of the post-socialism transition, the whole system of the inhibiting factors has been working and caused forming conglomerate system dysfunctionality. The mentioned effect was synergetic and destructive. The combination of a global and local factors gives the modern financial and economic crisis a specificity and uniqueness. The aim of this paper is to point to the urgent need of the consistent anti-crisis economic policy creation, which must take into account local and global crisis and risks factors. This article discusses the influence of real institutionalization on the quality and efficiency of the economic policy. It points out at a primary significance of institutionalization on economic policy as well as on a destructive effect of pseudo-institutes on economic policy and valorisation of economic resources. Departs from the hypotheses that the creation efficient anti-crisis economic policy requires a correct and timely identification of the problems and crisis process, formulating their monitoring, defining the necessary measures and creating a development strategy, which should be based on innovative-institutional modeling. The starting point in the paper is a hypothesis that the combination of global and local factors immanently reduced the critical mass of the propulsive developing factors in the post-socialism economies of the and seriously damaged their forthcoming economical growth and development. In addition to this, the article is providing

Year	DE	Title and Abstract
		evidence that monistic pseudo-market reforms in the period of post-socialist transition haven't succeeded in compensating for a vast institutional vacuum, and that they have even led to its spreading and turning into a quasi-institutionalization.

2011	P11	Ferencak, Ivan. 2011. "Kompelij o (neo)liberalizmu. (Compendium on [Neo]liberalism. With English summary.)." <i>Ekonomski Vjesnik</i> , 24(2): 337-47. Capitalism cannot exist without a certain degree of liberalism. However, according to critics, neoliberalism has gone too far and has exceeded the framework of "adequate freedom" of capitalism. Neoliberalism brings to life the classic liberal doubt about the ability of the state to manage the economy. Aversion to "great government" and state intervention has acquired different theoretical forms. Monetarism, public choice theory, rational expectations, and supply economics have expressed their doubts about state intervention and its efficiency in different ways and for different reasons. Obviously, the government (state) is not perfect. However, the market is also not perfect, which is admitted by both liberals and neoliberals. Thus, there will be continued attempts by both supporters of so-called free market and supporters of state intervention to "fix" this imperfect, capitalist world.

2011	P21 P26	Apolte, Thomas. 2011. "Democracy and Prosperity in Two Decades of Transition." <i>Economics of Transition</i> , 19(4): 693-722. This article revisits the relationship between democracy, liberalization and prosperity in transition countries, using a panel of 25 countries over 20 years. Earlier investigations found political and economic liberalization to be positively correlated although the relationship between political liberalization and prosperity remained unclear. In this article, the results are ambiguous regarding the relationship between democracy indicators by Freedom House and the Polity Project on one hand and growth on the other. This contribution therefore investigates the component variables of these indicators to determine their degree of influence. The findings suggest that basic constitutional rights and constraints on the government rather than political competition as such may be conducive to both economic liberalization and prosperity in the transition countries.
2011	P24 P26	Jaksic, Miomir. 2011. "Makroekonomija, politika i ekonomske performanse. (With English summary.)." <i>Ekonomске ideje i praksa</i> , 0(1): 9-25. Growth and development are reversible processes, warranted success doesn't exist without institutional changes that are a key success factor, a precondition of continuous growth, environment for innovations, changes, and learning. The key role of institutions is securing stability and continuity. Institutional innovativeness is confirmed in great historical events as transition to capitalism, the Great Depression, and postwar reconstruction. Such institutional innovativeness manifests itself in time consistent monetary policy, independent and accountable key economic institutions, such as the central bank. Realisation of economic rules that are preconditions for resolving the current economic crisis worldwide and in Serbia, too. Good institutions are characterized with three attributes: first, they establish and protect property rights; second, they restrict social elites who strive to expropriate income and property of others members of society; and third, they provide equal chances for employment, social security, and civil rights to all individuals. Good institutions contribute to political stability, successful macroeconomic policy, and enhance initiatives. No single factor is responsible for democratization exists, different factors are responsible for establishment and consolidation of democracy, there exists a clash of interests between public and elites, public favours democratic, whilst elites favour repressive order, social outcomes are uncertain, as at least two outcomes are a possible transition from democracy towards repression and vice versa.
2011	P24	Wu, Congsheng. 2011. "Economic Freedom, Economic Growth, and China." <i>Chinese Economy</i> , 44(5): 104-19. Cross-country data and the Index of Economic Freedom show that improvements in economic freedom are associated positively with real gross domestic product (GDP) growth, a finding at odds with the situation in China. The Chinese economy grew about 10 percent per year during the sample period, but its rapid economic growth was accompanied by a relatively undeveloped legal and financial system, lack of economic freedom, and a high level of corruption. China's rating for economic freedom is regularly below the world average and has not improved over time. Ranked only 124th in the 2008 Index of Economic Freedom, China seems to be an exception to the rule in the realms of law, institutions, economic freedom, and economic growth.

Focuses on the value of freedom; freedom and the law; and freedom in the welfare state.
2011	P26	Kinzelbach, Katrin, and Hatla Thelle. 2011. "Taking Human Rights to China: An Assessment of the EU's Approach." <i>China Quarterly</i> , 0(205): 60-79. A human rights dialogue between the European Union and China has been going on since 1995. It runs on three tracks and includes a diplomatic level, expert seminars and technical co-operation projects. The three levels are supposed to interact with and benefit from each other. This article focuses on the conduct of the dialogue and the interaction between the three levels, and aims to investigate the merits and obstacles of the set-up. It also discusses how the dynamic of this interaction affects the collaboration between European and Chinese human rights experts. The conclusion is that the dialogue's three-tiered set-up is counterproductive and the aims of the two sides are too different to fully attain the envisaged goals.

(Freedom Space as a Synthetic Measure of Sustainable Territorial Development. With English summary.)." <i>Revue Tiers Monde</i>, 0(207): 61-77. By discussing the concept of development itself, authors propose two synthetic indexes relying on estimation of potential: Development Space Value and Development Space Creation under the weak hypothesis that any successful development improves future possibilities, changes in potential are a good development measure. In their path, authors show how development space is tied with freedom: a shrink in it results mechanically in indexes fall. So, "sustainable" and "economic" become two sides of same piece rather than enemies. Reliable in simulations, the approach is to be tested in real conditions, to verify full data availability and to secure calculating methods.

2011	R23	Cebula, Richard J., and J. R. Clark. 2011. "Migration, Economic Freedom, and Personal Freedom: An Empirical Analysis." <i>Journal of Private Enterprise</i>, 27(1): 43-62. Economic freedom increases market efficiency, growth, development, and individual prosperity. This study empirically investigates whether higher levels of economic freedom, as well as higher levels of personal freedom, act like magnets for persons residing in a free society to move. In other words, do the prospects of both greater economic and personal freedom in any given state vis-a-vis other states act to induce a greater influx of migrants? This empirical study of domestic migration between 2000 and 2008 finds clear evidence that migrants prefer to move to those states with greater economic freedom on the one hand and greater personal freedom on the other hand.
2011	R31	Case, Karl E., John M. Quigley, and Robert J. Shiller. 2011. <i>Wealth Effects Revisited 1978-2009</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 16848. We re-examine the link between changes in housing wealth, financial wealth, and consumer spending. We extend a panel of U.S. states observed quarterly during the seventeen-year period, 1982 through 1999, to the thirty-one year period, 1978 through 2009. Using techniques reported previously, we impute the aggregate value of owner-occupied housing, the value of financial assets, and measures of aggregate consumption for each of the geographic units over time. We estimate regression models in levels, first differences and in error-correction form, relating per capita consumption to per capita income and wealth. We find a statistically significant and rather large effect of housing wealth upon household consumption. This effect is consistently larger than the effect of stock market wealth upon consumption. This reinforces the conclusions reported in our previous analysis. In contrast to our previous analysis, however, we do find--based on data which include the recent volatility in asset markets--that the effects of declines in housing wealth in reducing consumption are at least as large as the effects of increases in housing wealth in increasing the course of household consumption.

2012	A13 P51	Graafland, J. J., and B. Compen. 2012. <i>Economic Freedom and Life Satisfaction: A Cross Country Analysis</i>. Tilburg University, Center for Economic Research, Discussion Paper: 2012-038. Abstract: This paper estimates the relationship between various sub-indicators of economic freedom and life satisfaction for 122 countries. The estimation results show that life satisfaction is positively related to the quality of the legal system and protection of property rights. For poor countries, freedom of trade fosters life satisfaction as well. Life satisfaction is independent from the size of the government and sound money and tends to be negatively related to low regulation. If the relationship between life satisfaction and economic freedom is controlled for income per capita, life satisfaction is independent from economic freedom. This indicates that the relationship between life satisfaction and economic freedom is mediated by income per capita.

2012	D80	Rosa, Jean-Jacques, and Xavier de Vanssay. 2012. "Information, Organization, and Freedom: Explaining the Great Reversal." <i>Review of Austrian Economics</i>, 25(4): 329-50. We suggest, in a Coase-Demsetz perspective, that the social demand for individual rights--or freedoms (whether civil, political or economic)--is derived from, because complementary to, the changing size of hierarchical organizations. The general downsizing and decentralization process observed worldwide after 1975 is itself the result of the information revolution and the resulting abundance of information. It follows that social demand for freedoms depends in turn--and inversely--on the cost of information (and thus on market imperfection) as well as on traditional determinants such as the distribution of resources and human capital. This implies that freedoms are adopted, implemented, or "produced" by various political regimes according to an objectively observable and contingent determinant. We believe this approach can shed light on the reason for the waxing and waning of freedoms in modern history.
2012	D83	Klein, Daniel B. 2012. <i>Knowledge and Coordination: A Liberal Interpretation</i>, Oxford and New York: Oxford University Press. Presents a reexamination of the elements of economic liberalism, focusing on an interpretation of Friedrich Hayek's notion of spontaneous order from the aestheticized perspective of an allegorical Smithian spectator. Discusses rickonomics--a window on spontaneous order; discovery factors of economic freedom; a view from a raft in the currents of liberal economics; concatenate coordination and mutual coordination; joy and the matrix of concatenate and mutual; light shed by the two coordinations; discovery and the deepself; experiment on entrepreneurial discovery; being pluralist on entrepreneurship; knowledge flat-talk--a conceit of supposed experts and a seduction to all; urban transit--planning and the two coordinations; the integrity of you and your trading partners--the demand for, and the supply of, assurance; outstripped by unknowns--intervention and the pace of technology; unfolding the allegory behind market communication and social error and correction; and liberalism these past 250 years.
2012	D83	Emami, Zohreh. 2012. "Social Economics and Evolutionary Learning." <i>Review of Social Economy</i>, 70(4): 401-20. The major premise of this paper is that social and individual well-being depends significantly on people's capacity to learn and unlearn in communication with each other. This paper builds on social economic traditions that see communication and conversation as evolutionary generative and adaptive mechanisms through which individual and social learning occurs. Drawing on educational psychology and organizational behavior scholarship, five dynamic processes of conversational learning are introduced with the contention that they can help social economists understand at a micro level more deeply and more concretely how learning happens in the give-and-take of conversation. The paper explores the role of the state, organizations, and communities in fostering individual freedom and dignity, human rights, and economic democracy and concludes that the investment of value in people and their capability for purposeful action as social economic stakeholders can be enhanced through conversation as learning.
2012	E20	Benhabib, Jess, and Pengfei Wang. 2012. <i>Financial Constraints, Endogenous Markups, and Self-fulfilling Equilibria</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 18074. We show that self-fulfilling equilibria and indeterminacy can easily arise in a simple financial accelerator model with reasonable parameter calibrations and without increasing returns in production. A key feature for generating indeterminacy in our model is the countercyclical markup due to the procyclical loan to output ratio. We illustrate, via simulations, that our financial accelerator model can generate rich business cycle dynamics, including hump-shaped output in response to demand shocks as well as serial autocorrelation in output growth rates.
2012	E41	Gorton, Gary B., Stefan Lewellen, and Andrew Metrick. 2012. <i>The Safe-Asset Share</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 17777. We document that the percentage of all U.S. assets that are "safe" has remained stable at about 33 percent since 1952. This stable ratio is a rare example of calm in a rapidly changing financial world. Over the same time period, the ratio of U.S. assets to GDP has increased by a factor of 2.5, and the main supplier of safe financial debt has shifted from commercial banks to the "shadow banking system." We analyze this pattern of stylized facts and offer some tentative conclusions about the composition of the safe-asset share and its role within the overall economy.
2012	E51 F36	Dubois, Robert. 2012. "The European Central Bank and Why Things Are the Way They Are: A Historic Monetary Policy Pivotal Point and Moment of (Relative) Clarity". Levy Economics Institute, The Economics Working Paper Archive. Not since the Great Depression have monetary policy matters and institutions weighed so heavily in commercial, financial, and political arenas. Apart from the eurozone crisis and global monetary policy issues, for nearly two years all else has counted for little more than noise on a relative risk basis. In major developed economies, a hypermature secular decline in interest rates is pancaking against a hard, roughly zero lower-rate bound (i.e., barring imposition of rather extreme policies such as a tax on cash holdings, which could conceivably drive rates deeply negative). Relentlessly mounting aggregate debt loads are rendering monetary- and fiscal policy-impaired governments and segments of society insolvent and struggling to escape liquidity quicksands and stubbornly low or negative growth and employment trends. At the center of the current crisis is the European Monetary Union (EMU)-a monetary union lacking fiscal and political integration. Such partial integration limits policy alternatives relative to either full federal integration of member-states or no integration at all. As we have witnessed since spring 2008, this operationally constrained middle

Year	DE	Title and Abstract
		ground progressively magnifies economic divergence and political and social discord across member-states. Given the scale and scope of the eurozone crisis, policy and actions taken (or not taken) by the European Central Bank (ECB) meaningfully impact markets large and small, and ripple with force through every major monetary policy domain. History, for the moment, has rendered the ECB the world's most important monetary policy pivot point. Since November 2011, the ECB has taken on an arguably activist liquidity-provider role relative to private banks (and, in some important measure, indirectly to sovereigns) while maintaining its long-held post as rhetorical promoter of staunch fiscal discipline relative to sovereignty-encased "peripheral" states lacking full monetary and fiscal integration. In December 2011, the ECB made clear its intention to inject massive liquidity when faced with crises of scale in future. Already demonstratively disposed toward easing due to conditions on their respective domestic fronts, other major central banks have mobilized since the third quarter of 2011. The collective global central banking policy posture has thus become more homogenized, synchronized, and directionally clear than at any time since early 2009.

2012	F41	Castro Olaya, Juanita, Juliana Castro Olaya, and Indira Jaller Cueter. 2012. "Internationalization Patterns of Multilatinas." <i>AD-minister</i> , 0(21): 33-54. The following paper addresses an issue that has been gaining importance in today's world: Multilatinas. Those are companies that have emerged from Latin American developing economies and that during the last decades have been growing really fast in the national and the international field. Through this paper, we studied the importance of Multilatinas in the region, their common characteristics, and their internationalization processes in order to identify if there is a common pattern in their international moves. Actually, the economic openness of Latin America in the 1990s left two options for enterprises: to modernize or to disappear. Therefore, Multilatinas represent the survivors from this phenomenon that flourished in adverse conditions through a process of "learning-by-doing."
2012	F41	Frankel, Jeffrey A., Carlos A. Vegh, and Guillermo Vuletin. 2012. <i>On Graduation from Fiscal Procyclicality</i> . Harvard University, John F. Kennedy School of Government, Working Paper Series. In the past, industrial countries have tended to pursue countercyclical or, at worst, acyclical fiscal policy. In sharp contrast, emerging and developing countries have followed procyclical fiscal policy, thus exacerbating the underlying business cycle. We show that, over the last decade, about a third of the developing world has been able to escape the procyclicality trap and actually become countercyclical. In line with existing literature, we confirm the role of increased financial integration and lower output volatility in reducing overall procyclicality. In this paper, however, we focus on the role played by the quality of institutions. Indeed, the quality of institutions seems to be a key determinant of a country's ability to graduate. We provide a formal analysis, controlling for the endogeneity of institutions and other determinants of fiscal procyclicality, that strongly suggests that there is a causal link running from stronger institutions to less procyclical or more countercyclical fiscal policy.
2012	F65	Nano, Dorjana, and Teuta Llukani. 2012. "Thresholds in the Process of Financial Integration of Albania--How Far Away Is Albania from Greece?" <i>Regional Science Inquiry</i> , 4(1): 63-79. Recent global financial crises have caused immense debate about costs and benefits of financial integration. Overall, evidences show that industrial economies utilize benefits of financial openness and export their problems to the emerging and less developed countries. There is a substantial and empirical literature that define certain thresholds levels of financial and institutional characteristics beyond which the trade-off improves and makes opening of the capital account beneficial and less risky, especially for a developing country like Albania. The main aim of this study is to analyse institutional quality, financial sector development, macroeconomic policies, and trade openness as thresholds that must be satisfied in order to foster further financial integration and making it work for good, particularly for Albania and Greece. In addition, the comparison of economic characteristics and institutional development between these countries and the minimum standard will be also estimated, in order to reveal their discrepancy and deficiencies and as well to develop several policy proposals. The main objectives of this study are: to analyse the importance of institutional quality, financial sector development, macroeconomic policies, and trade openness in the process of financial integration; to estimate the above mentioned economic and institutional indicators for Albania and Greece and to use the standards level of this indicators (Prasad 2009) as a benchmark in order to reveal deficiencies, the most problematic aspects, as well as future challenges for each country; and to draw and assess policy implications and recommendations for improving economic characteristics in Albania and Greece, in order to fully utilise the benefits of financial integration.
2012	G24 G32	Wang, Lanfang, and Susheng Wang. 2012. "Economic Freedom and Cross-Border Venture Capital Performance." <i>Journal of Empirical Finance</i> , 19(1): 26-50. We investigate the determinants of cross-border venture capital (VC) performance using a large sample of 10,205 cross-border VC investments by 1906 foreign VC firms (VCs) in 6535 domestic portfolio companies. We focus on the impact of a domestic country's economic freedom on the performance of both VC investments and portfolio companies using a probit model and the Cox hazard model. After controlling for other related factors of domestic countries, portfolio companies, VCs and the global VC market, as well as year and industry fixed effects, we find that a domestic country's economic freedom is crucial to cross-border VC performance. In particular, in a more economically free country, as measured by the raw values of, quartiles of or the ranking in the index of economic freedom (IEF), a foreign VC-backed portfolio company is more likely to pull off a successful exit through an IPO (initial public offering) or an M&A (merger and acquisition), and a foreign VC firm is likely to spend a shorter investment duration in the portfolio company. We also identify interesting evidence on the impact of many other level factors of domestic countries, portfolio companies, VCs and the global VC market on cross-border VC performance.
2012	H12	Buiter, Willem H., and Ebrahim Rahbari. 2012. <i>The ECB as Lender of Last Resort for Sovereigns in the Euro Area</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 8974. The paper establishes that sovereigns, like banks, need a lender of last resort (LoLR). In the euro area the ECB, with its estimated 3.4 trillion euro non-inflationary loss absorption capacity, is the only credible sovereign LoLR. The ECB/Eurosystem has been acting as sovereign LoLR through its SMP purchases of periphery sovereign debt in the secondary markets. It has also contributed, through the deeply subsidised bank funding it provided through the 3-year LTROs, half of a mechanism to purchase periphery sovereign debt in the primary issue markets. The other half has been financial repression

Year	DE	Title and Abstract
		requiring banks in Italy and Spain to purchase more of their own government's debt than they would voluntarily and at below-market yields. We expect that, once Spain and Italy are under troika programmes, the Eurosystem will also lend to these sovereigns indirectly, through loans by the national central banks to the IMF which on-lends them to these sovereigns. We recommend that, to increase its effectiveness as LoLR, the ESM be given a banking license. To reduce the illegitimate and unaccountable abuse of the ECB/Eurosystem as a quasi-fiscal actor, we propose that all its credit risk-related losses be jointly and severally guaranteed/indemnified by the 17 euro area member states.
2012	H21	Beynet, Pierre, and Rafal Kierzenkowski. 2012. <i>Ensuring Debt Sustainability Amid Strong Economic Uncertainty in Hungary</i>. OECD Publishing, OECD Economics Department Working Papers: 958. Despite a deep recession in 2009 and weak growth in subsequent years, Hungary's fiscal position compares favourably with many other OECD countries. Nonetheless, the underlying fiscal balance started deteriorating in 2010 and 2011. Recognising this, Hungary's government launched an ambitious set of fiscal consolidation measures in spring 2011, the Szell Kalman plan, which is rightly focused on curbing public expenditure. This plan, together with subsequent significant revenue-increasing measures, should help restore fiscal adjustment in 2012 and 2013. However, ensuring the sustainability of Hungarian public debt remains challenging in the context of the persistence of the sovereign debt crisis in many European economies since shifts in market sentiment could lead to unsustainable debt servicing costs. In this context, increasing the credibility of fiscal consolidation requires using several policy levers. First, the cost/risk assessment of the debt management strategy should be reassessed by taking into account lessons from the current crisis: the share of government borrowing in foreign currency will likely need to be drastically reduced. Second, additional consolidation efforts should focus more strongly on the spending side and avoid raising distortive taxes. Third, the fiscal framework should be improved by making fiscal rules less pro-cyclical and by raising the profile and political acceptance of the fiscal council through better analytical support and an enlarged mandate, while removing its power to veto the budget. This Working Paper relates to the 2012 OECD Economic Survey of Hungary (www.oecd.org/eco/surveys/hungary).

We argue that civil liberties enhance voice and accountability, thereby placing political pressure on a country's leaders; therefore, countries with greater respect for civil liberties will have a larger percentage of the population with access to an improved water source. We find that a one-level improvement in civil liberties translates into about a 2.5% increase in the population in rural areas with access to water; this result does not hold for urban centers. The dichotomy between the results may simply be an issue related to the data.

2012	H62	Peev, Evgeni, and Dennis C. Mueller. 2012. "Democracy, Economic Freedom and Growth in Transition Economies." <i>Kyklos</i>, 65(3): 371-407. This article examines the interrelationships between democracy, economic freedoms, and economic growth. We study 24 post-communist economies over the period 1990-2007, and find that strong democratic institutions are associated with greater economic freedoms and larger public sectors and public deficits. Stronger economic freedoms lead to more rapid growth, but large public sectors and public deficits have adverse effects on growth. We identify trade freedom, monetary freedom and freedom from corruption as the most important indicators of economic freedom for growth in transition countries over the period 1994-2007. Some of the factors associated with faster growth prior to the crisis were associated with greater declines in growth during the first years of the financial crisis (2008-2009).
2012	I10	Fogli, Alessandra, and Laura Veldkamp. 2012. <i>Germs, Social Networks and Growth</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 9188. Does the pattern of social connections between individuals matter for macroeconomic outcomes? If so, how does this effect operate and how big is it? Using network analysis tools, we explore how different social structures affect technology diffusion and thereby a country's rate of technological progress. The network model also explains why societies with a high prevalence of contagious disease might evolve toward growth-inhibiting social institutions and how small initial differences can produce large divergence in incomes. Empirical work uses differences in the prevalence of diseases spread by human contact and the prevalence of other diseases as an instrument to identify an effect of social structure on technology diffusion.

2012	I30	Tausch, Arno, and Almas Heshmati. 2012. "Migration, Openness and the Global Preconditions of 'Smart Development'." <i>Bogazici Journal: Review of Social, Economic and Administrative Studies</i>, 26(2): 1-62. In this article, we present a first empirical reflection on 'smart development,' its measurement, possible 'drivers' and 'bottlenecks.' We first provide cross-national data on how much ecological footprint is used in the nations of the world system to 'deliver' a given amount of democracy, economic growth, gender equality, human development, research and development, and social cohesion. To this end, we first developed UNDP-type performance indicators on these six main dimensions of development and on their combined performance. We then show the non-linear regression trade-offs between ecological footprints per capita on these six dimensions of development and their combined performance index. The residuals from these regressions are our new measures of smart development: a country experiences smart development, if it achieves a maximum of development with a minimum of ecological footprint. We then look at the cross-national drivers and bottlenecks of this 'smart development' and compare their predictive power using stepwise regression procedures. Apart from important variables and indicators, derived from sociological dependency and world systems theories, we also test the predictive power of several other predictors as well. Our estimates underline the enormous importance of the transfer of resources from the center to the periphery, brought about by migration, with huge statistical observed positive effects of received worker remittances on smart human development, Happy Life Years, smart gender justice, smart R&D, and both formulations of the smart development index.
2012	I30	Fukuyama, Francis, Larry Diamond, and Marc F. Plattner, eds. 2012. <i>Poverty, Inequality, and Democracy</i>. A Journal of Democracy Book. Baltimore: Johns Hopkins University Press. Thirteen papers, several originally presented at a conference held by the Network of Democracy Research Institutes in Bratislava in April 2009, examine the philosophical and moral issues surrounding the distribution of economic goods in free societies as well as the empirical relationships between democratization and trends in poverty and inequality, focusing on the rise of populism in newer democracies in Latin America, Eastern Europe, Africa, and Asia. Papers discuss dealing with inequality; whether electoral democracy boosts economic equality; why democracies fail; Latin America--democracy with development; the Latin American experience; aiding Latin America's poor; postcommunist welfare states; East-

2012	J21 J58	Bouis, Romain, Orsetta Causa, Lilas Demmou, Romain Duval, and Aleksandra Zdzienicka. 2012. <i>The Short-Term Effects of Structural Reforms: An Empirical Analysis</i>. OECD Publishing, OECD Economics Department Working Papers: 949. Drawing on new empirical analysis of 30 years of structural reforms across the OECD, this paper sheds light on the impact of reforms over time, identifies the horizon over which their full effects materialise, and investigates whether such effects vary with prevailing economic conditions and institutions. Impulse responses of aggregate outcomes (GDP growth, employment rate) to various labour, product market and tax reforms are estimated at different horizons. This analysis indicates that the benefits from reforms typically take time to fully materialise. When significant effects are found in the short run, reforms seldom involve significant aggregate economic losses; on the contrary they often deliver some benefits. The absence of major depressing effects does not lend support to the view that reforms should be in general accompanied by substantial macroeconomic policy easing in order to deliver some short-term gains. Nevertheless, there is also tentative evidence that some labour market reforms (e.g. of unemployment benefit systems and job protection) pay off more quickly in good times than in bad times, and can even entail short-term losses in severely depressed economies.
2012	J64	Krusell, Per, and Leena Rudanko. 2012. <i>Unions in a Frictional Labor Market</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 18218. We analyze a labor market with search and matching frictions where wage setting is controlled by a monopoly union. We take a benevolent view of the union, assuming it to care equally about employed and unemployed workers, to treat identical workers in identical jobs the same, as well as to be fully rational, taking job creation into account when making its wage demands. Under these assumptions, if the union is able to fully commit to future wages, it achieves an efficient level of long-run unemployment. In the short run, however, the union raises current wages above the efficient level, in order to appropriate surpluses from firms with existing matches. The union wage policy is thus time-inconsistent. Without commitment, and in a Markov-perfect equilibrium, not only is unemployment well above its efficient level, but the union wage also exhibits endogenous real stickiness, which leads to increased volatility in the labor market. We consider extensions to partial unionization and collective bargaining between the union and an employers' association.
2012	J64	Rudanko, Leena, and Per Krusell. 2012. <i>Unions in a Frictional Labor Market</i>. Boston University - Department of Economics, Boston University - Department of Economics - Working Papers Series: WP2012-014. We analyze a labor market with search and matching frictions where wage setting is controlled by a monopoly union. We take a benevolent view of the union in assuming it to care equally about employed and unemployed workers and we assume, moreover, that it is fully rational, thus taking job creation into account when making its wage demands. Under these assumptions, if the union is also able to fully commit to future wages it generates an efficient level of long-run unemployment. However, in the short run, it uses its market power to collect surpluses from firms with existing matches by raising current wages above the efficient level. These elements give rise to a time inconsistency. Without commitment, and in a Markov-perfect equilibrium, not only is unemployment well above its efficient level, but the union wage also exhibits endogenous real stickiness which amplifies the responses of vacancy creation and unemployment to shocks. We consider extensions to partial unionization and collective bargaining between a labor union and an employers' association.

The following paper addresses an issue that has been gaining importance in today's world: Multilatinas. Those are companies that have emerged from Latin American developing economies and that during the last decades have been growing really fast in the national and the international field. Through this paper, we studied the importance of Multilatinas in the region, their common characteristics, and their internationalization processes in order to identify if there is a common pattern in their international moves. Actually, the economic openness of Latin America in the 1990s left two options for enterprises: to modernize or to disappear. Therefore, Multilatinas represent the survivors from this phenomenon that flourished in adverse conditions through a process of "learning-by-doing."

2012	L94	Erdogdu, Erkan. 2012. <i>A cross country analysis of electricity market reforms: potential contribution of New Institutional Economics</i>. Faculty of Economics, University of Cambridge, Cambridge Working Papers in Economics.

Year	DE	Title and Abstract
		The paper explores whether the question of why some countries are able to implement more extensive reforms is closely related to the question of why some countries have better institutions than others. We analyse this question by using an empirical econometric model based on Poisson regression with cross-section data covering 51 US states, 13 Canada states and 51 other countries. The results show that both the background of the chairperson of electricity market regulatory agency when reforms started and the minister/governor at that time and institutional endowments of a country are important determinants of how far reforms have gone in a country. Our results also suggest that any improvement in the investment environment contributes to the scope of reforms. On the other hand, there seems to be a negative relationship between reform progress and civil liberties, which may prove that reforms may be limited in democratic countries with strong civil society institutions such as trade unions or other organized structures in the society that may consider reforms as 'harmful' to their self-interest.

With English summary)." <i>Economia (Pontifical Catholic University of Peru)</i> , 35(69): 204-30. This essay examines three recent historical approaches to the political economy of Latin America's relative economic backwardness. All three locate the origins of contemporary underdevelopment in defective colonial institutions linked to inequality. The contrasting view offered here affirms the significance of institutional constraints, but argues that they did not arise from colonial inequalities, but from the adaptation of Iberian practices to the American colonies under conditions of imperial weakness. Colonial inequality varied across the Americas; while it was not correlated with colonial economic performance, it mattered because it determined the extent of elite resistance to institutional modernization after independence. The onset of economic growth in the mid to late nineteenth century brought economic elites to political power, but excluding majorities as inequality increased restrained the region's twentieth-century growth rates and prevented convergence.
2012	N44	Bonefeld, Werner. 2012. "Freedom and the Strong State: On German Ordoliberalism." <i>New Political Economy</i> , 17(5): 633-56. Ordoliberalism is the theory behind the German social market economy. Its theoretical stance developed in the context of the economic crisis and political turmoil of the Weimar Republic in the late 1920s. It is premised on the strong state as the locus of liberal governance, and holds that economic freedom derives from political authority. In the context of the crisis of neoliberal political economy and austerity, and debates about the resurgence of the state vis-a-vis the economy, the article introduces the ordoliberal argument that the free economy presupposes the exercise of strong state authority, and that economic liberty is a practice of liberal governance. This practice is fundamentally one of social policy to secure the sociological and ethical preconditions of free markets. The study of ordoliberalism brings to the fore a tradition of a state-centric neoliberalism, one that says that economic freedom is ordered freedom, one that argues that the strong state is the political form of free markets, and one that conceives of competition and enterprise as a political task.
2012	N70 O14	Ozak, Omer. 2012. <i>Distance to the Technological Frontier and Economic Development</i> . Southern Methodist University, Department of Economics, Departmental Working Papers: 1201. This research proposes that the geographical distance from the location of the pre-industrial technological frontier has a non-monotonic and persistent effect on development. While remoteness from this frontier diminished imitation, it fostered the emergence of a culture conducive to innovation and knowledge creation, which has persisted into the modern era even after barriers to movement dissipated. I construct a novel measure of geographical distance in the pre-industrial era, which measures the travel time along the optimal route between any two locations. Using this measure I show that the distance to the technological frontier in the past has a robust and persistent U-shaped relation with measures of economic development both in the pre-industrial and modern eras. Furthermore, a distance of 6 weeks of travel, which is roughly the distance from Ethiopia to the UK, is the least desirable distance from the technological frontier in the pre-industrial era as it generates the largest adverse effects on contemporary development.
2012	O20	Houda, Ben Abdennaji, and Chkoundali Ridha. 2012. "Developpement Humain et Gouvernance: Cas du Monde Arabe. (Human Development and Governance: The Arab World at a Glance. With English summary)." <i>New Medir: Mediterranean Journal of Economics, Agriculture and Environment</i> , 11(2): 29-38. The objective of this research is to show that development is dependent not only on the economic or social sphere but also on the institutional sphere, and that the backwardness of Arab countries in terms of development is explained by poor governance, in particular the absence of civil and political freedom. For the year 2009, we develop a comparative analysis of the ranks of Arab countries according to the gross domestic product/capita (WB), the Human Development Index (UNDP) and Governance Indicators (KKZ) compared to a group of countries that are part of developed countries, the CEECs, Latin America, and Asia, supposedly as a benchmark or model country in order to explain the difference between their developmental trajectories. The analysis shows that the only reference to per capita income or HDI does not explain the differences in development between countries but also institutional quality is the source of this difference. To explain the delayed development of Arab countries compared to the benchmark countries we propose to identify key institutional factors which are responsible for the delay. The statistical tool proposed is the factor analysis.
2012	O30	Kantor, Rhonda. 2012. "Innovation, Economic Freedom and Happiness." <i>World Review of Entrepreneurship, Management and Sustainable Development</i> , 8(3): 375-85. As entrepreneurship is recognised as vital to the global economy, issues surrounding individual economic freedom are of increasing concern. The need to understand the principles and considerations that govern today's local and international business practices is thus more important than ever. Jeremy Bentham's inventions, for example the word 'international' as well as his views on innovation, economics and entrepreneurship, were precursors to many ideas and practices now commonplace. This paper takes the approach that reflecting on past ideas provides insight in understanding today's business practices. It is also a necessary step in discovering innovative ideas and to stimulating creative and sustainable problem solving.
2012	O31	DiPietro, William R. 2012. "Favorable and Unfavorable Conditions for Innovation: Some Cross Country Evidence." <i>Asian Economic and Financial Review</i> , 2(1): 14-19. The paper employs cross-country regression analysis to estimate the effect of democracy and income inequality, adjusting for the level of income and other variables, on country innovation. It finds that both of these variables are of consequence for innovation. Different countries innovate at different rates. Some countries are very creative while other countries are not. Innovation is of vital importance to economic activity. The long term health of the economy depends on innovation, as creativity and innovation are the key drivers of economic growth. Understanding the determinants of creativity and innovation is, therefore, a serious endeavor. While it is common to study the reasons for differences in creativity and innovation across firms and countries by knowledge production function inputs such as dollar expenditure on research and development, looking for more fundamental underlying socio-political variables at the country level that may lead to more favorable or less

Year	DE	Title and Abstract
		favorable environmental conditions for innovation is less common. National socio-political country conditions are not the direct determinants of innovation such as those at the firm level, but, rather, they are the behind the scenes forces influencing the development of these direct components. For instance, greater freedom and democracy may create individuals who are more autonomous, independent, and entrepreneurial. If, at the firm level, certain corporate cultural characteristics are the key to innovation, then some country characteristics will provide a more favorable milieu for their evolution and appearance, while others will not. The purpose of this paper is to focus on two socio-political variables, democracy and income inequality, as potential determinants of innovation. In pursuit of this undertaking, the paper is divided into five parts. The first part looks at potential theoretical reasons why democracy and income inequality and a few other country variables may have relevance for innovation. The second section discusses the measures that are employed in the empirical analysis and identifies data sources. The third part shows the outcomes of regression runs on innovation and democracy and on innovation and income inequality adjusting for the level of economic development and for other variables. The final section concludes.
2012	O31	Ozak, Omer. 2012. <i>Distance to the Technological Frontier and Economic Development</i>. Southern Methodist University, Department of Economics, Departmental Working Papers: 1201. This research proposes that the geographical distance from the location of the pre-industrial technological frontier has a non-monotonic and persistent effect on development. While remoteness from this frontier diminished imitation, it fostered the emergence of a culture conducive to innovation and knowledge creation, which has persisted into the modern era even after barriers to movement dissipated. 2012	P30	Draskovic, Veselin, and Mimo Draskovic. 2012. "Institutional Nihilism of the Post-socialist Transition." <i>Montenegrin Journal of Economics</i>, 8(2): 191-206. Private initiative in an environment of well protected property rights and a good legal system, high quality performance of institutions, clear rules of the game, and consensus building capacity of the society regarding the importance of economic freedom can bring in significant differences in economic development between particular countries. During the period of the post-socialism transition, the whole system of inhibiting institutional and other factors has caused the dysfunctional conglomerate system. The effect was synergetic, destructive, and anti-development. Two decades of intense crisis, with all the accompanying events, has not been sufficient warning to holders of (vulgarised neoliberal) economic policy in the post-socialism states that something is wrong and that the antidevelopment model ultimately needs to be changed. This paper discusses the causes and conditions that have disabled the pluralistic and even monistic acting of economic institutes in the practice of transitional countries and have led to their objective substitution by the quasi-institutes and meta-institutes of a sociopathological nature. It emphasizes the primary significance of institutionalization for economic policy, as well as the negative effect of pseudo-institutes on economic policy and the valorisation of economic resources. In addition, the article provides evidence that monistic pseudo-market reforms in the period of post-socialist transition have not succeeded in compensating for a vast institutional vacuum, and that they have even led to its spreading and turning into a quasi-institutionalization, and institutional nihilism. The paper explains that the institute of civil society as an instrument of people protection from the government doesn't work universally. It's denied by variety of national, corporate, and informal groups ("elites"), which are superior in wealth and power and limiting the individuals. Uncontrolled power centers abuse the institute of state regulation and, paradoxically and ironically, preach and conduct marauding ideology of neoliberalism as an institutional monism. We start from the hypothesis that the institutional nihilism is the main cause of unsuccessful postsocial transition and anti-development and vulgarized neoliberal economic policy. We also start from the hypothesis that the neoliberal myth about "mini" state was the interest cover by privileged individuals for their promotion and choice implementation, which reduced the choice of the vast majority of people, and therefore denied their (propagated) economic freedom, competition, private property, and entrepreneurship as a mass phenomenon.
2012	P33	Stojcic, Nebojsa. 2012. "Two Decades of Croatian Transition: A Retrospective Analysis." <i>South East European Journal of Economics and Business</i>, 7(2): 63-76. Over the past two decades many Central and South East European countries underwent the process of transition from a centrally-planned towards a market economy. Among them, the case of Croatia stands out as particularly interesting. Owing to a number of reasons Croatia had the potential to be among the forerunners of transition. However, in realising this potential the country was constrained by numerous political and social turbulences which made its transition path somewhat unique. The objective of this paper is to explore to what extent the favourable initial conditions of Croatian transition have been exploited over the past two decades. The focus of the analysis is on four dimensions of transition: institutional reforms, macroeconomic performance, changes in economic structure and international trade. The general message yielded by the analysis is that much of Croatia's initial advantage was lost over the past two decades because of war, the unfavourable political climate in the 1990s, late integration into regional, European and global economic institutions and the slow restructuring of enterprises.
2012	P51	THE SAME AS A13 Graafland, J. J., and B. Compen. 2012. <i>Economic Freedom and Life Satisfaction: A Cross Country Analysis</i>. Tilburg University, Center for Economic Research, Discussion Paper: 2012-038.
2012	Q25	Biser, Jennis J., and Jeffrey A. Edwards. 2012. "Civil Liberties and Access to Water: Analysis of 193 Countries." <i>Applied Econometrics and International Development</i>, 12(1): 19-34. We argue that civil liberties enhance voice and accountability, thereby placing political pressure on a country's leaders; therefore, countries with greater respect for civil liberties will have a larger percentage of the population with access to an improved water source. We find that a one-level improvement in civil liberties translates into about a 2.5% increase in the population in rural areas with access to water; this result does not hold for urban centers. The dichotomy between the results may simply be an issue related to the data.
2012	Q50	Becchetti, Leonardo. 2012. "Voting with the Wallet." <i>International Review of Economics</i>, 59(3): 245-68. The vote with the wallet is a new, emerging feature of economic participation and democracy in the globally integrated market economy. This expression identifies the pivotal role that responsible consumption and investment can play in addressing social and environmental emergencies which have been aggravated by the asymmetry of power between domestic institutions and global corporations. In this paper, we examine (both in general and by using examples drawn from the financial and non-financial sectors) how "voting" for producers which are at the forefront of a three-sided efficiency which reconciles the creation of economic value with social and environmental responsibility may generate contagion effects by triggering ethical imitation of traditional profit-maximizing actors, thereby enhancing the production of positive social and environmental externalities. Within this new framework, policies that reduce the search and information costs of voting with the wallet may help socioeconomic systems to exploit the bottom-up market forces of other-regarding preferences, thereby enhancing opportunities to achieve well-being with reduced top-down government intervention.
2012	Q57	Tausch, Arno, and Almas Heshmati. 2012. "Migration, Openness and the Global Preconditions of 'Smart Development'." <i>Bogazici Journal: Review of Social, Economic and Administrative Studies</i>, 26(2): 1-62. In this article, we present a first empirical reflection

Year	DE	Title and Abstract
		on 'smart development,' its measurement, possible 'drivers' and 'bottlenecks.' We first provide cross-national data on how much ecological footprint is used in the nations of the world system to 'deliver' a given amount of democracy, economic growth, gender equality, human development, research and development, and social cohesion. To this end, we first developed UNDP-type performance indicators on these six main dimensions of development and on their combined performance. We then show the non-linear regression trade-offs between ecological footprints per capita on these six dimensions of development and their combined performance index. The residuals from these regressions are our new measures of smart development: a country experiences smart development, if it achieves a maximum of development with a minimum of ecological footprint. We then look at the cross-national drivers and bottlenecks of this 'smart development' and compare their predictive power using stepwise regression procedures. Apart from important variables and indicators, derived from sociological dependency and world systems theories, we also test the predictive power of several other predictors as well. Our estimates underline the enormous importance of the transfer of resources from the center to the periphery, brought about by migration, with huge statistical observed positive effects of received worker remittances on smart human development, Happy Life Years, smart gender justice, smart R&D, and both formulations of the smart development index.
2012	R12	Pearson, Dennis, Dong Nyonna, and Kil-Joong Kim. 2012. "The Relationship between Economic Freedom, State Growth and Foreign Direct Investment in US States." <i>International Journal of Economics and Finance</i>, 4(10): 140-46. Researchers have identified economic freedom, growth rate of the economy, per capita income, unemployment rate, etc as determinants of foreign direct investment (FDI) inflows into the United States as a country. Whether or not these economic variables also determine FDI at the states' level is often excluded from the literature. This paper attempts to fill that gap by using a panel data from 1984 through 2007 for all 50 states. We employ the random effects regression model and find that both economic freedom and growth rate in each state are significant positive determinants of FDI inflows. This result is consistent with that of Ray (1989) who shows that high economic growth in the U. S. leads to more FDI inflows. Bengoa and Sanchez-Robles (2003), and Kapuria-Foreman (2007) document similar results for Latin American countries. In addition, we show that both per capita income and unemployment rate exhibit significant negative relations with FDI. These results are consistent with that of Edwards (1992) and Jaspersen, Aylward, and Knox (2000), but inconsistent with that of Tsai (1994) and Lipsey (1999). We attribute the negative relation between FDI and per capita income to the fact that states with higher per capita income tend to discourage FDI inflows since higher per capita income translates into higher wages. The observed inverse relation between FDI and unemployment rate is due to the fact that states with high unemployment rates are more prone to crime, and therefore deters risk-averse foreign investors from assuming a lasting interest in those states.
2012	Z10	Banai, Moshe. 2012. "Cultural, Political, and Economic Antecedents of Country Risk in Sixty-Two Countries." <i>Journal of Financial Transformation</i>, 0(34): 89-98. This study presents and empirically tests a model of the relationships between cultural, political, and economic measures and business practices in sixty-two countries. GLOBE study's nine dimensions of culture's scores are regressed along scores on democracy, religiousness, GDP, corruption, and country risk. The results indicate that in-group collectivism and humane orientation are good predictors of democracy, religion, and corruption; performance orientation and uncertainty avoidance are good predictors of societal institutions; and corruption and societal institutions are good predictors of country risk. Implications for scholars and practitioners are offered.

2013	A21	Harrison, Ashley S., Mark C. Schug, and J. R. Clark. 2013. "Battling the Forces of Darkness: How Can Economic Freedom Be Effectively Taught in the Pre-college Curriculum?" <i>Journal of Private Enterprise</i>, 29(1): 87-100. How can the institutions of a free-market economy be sustained if teachers and students fail to grasp a basic economic understanding? This article describes the current status of economic education at the pre-college levels including teacher knowledge, student knowledge, and the status of economics in the school curriculum. Concern is expressed that the weak status of economics at the pre-college level may have contributed to the recent decline of economic freedom in the United States. Next, we will examine steps that can be taken to strengthen economics at the kindergarten to grade 12 level. We suggest three approaches: changes in pedagogy, curriculum, and teacher training. We believe that taking actions along these lines will deepen young people's understanding of free markets and strengthen their support for economic freedom.
2013	B15 B20	Marchionatti, Roberto, Francesco Cassata, Giandomenica Becchio, and Fiorenzo Mornati. 2013. "When Italian Economics "Was Second to None": Luigi Einaudi and the Turin School of Economics." <i>European Journal of the History of Economic Thought</i>, 20(5): 776-811. The article is dedicated to the work of a group of economists that was an important expression of a fertile season of Italian economics, in the period from the mid-1890s to the end of 1930s, which developed around the figure of Luigi Einaudi, and earlier, around that of his master Cognetti de Martiis. This School expressed a range of thought of high value in the political and economic sphere. In the economic field, the school established a fertile relation between historical-empirical work and economic theory; in the political field it investigated the relation between freedom and economic order.
2013	B30	Hayek, F. A. 2013. <i>The Fortunes of Liberalism: Essays on Austrian Economics and the Ideal of Freedom</i>, Edited by Peter G. Klein. The Collected Works of F. A. Hayek, vol. 4. Chicago and London: University of Chicago Press. Presents the intellectual roots of Friedrich A. Hayek from the Austrian School of the 1920s to the modern rebirth of classical liberal or libertarian thought. Discusses the economics of the 1920s as seen from Vienna; the Austrian school of economics; Carl Menger (1840-1921); Friedrich von Wieser (1851-1926); Ludwig von Mises (1881-1973); Joseph Schumpeter (1883-1950); Ewald Schams (1899-1955) and Richard von Strigl (1891-1942); Ernst Mach (1838-1916) and the social sciences in Vienna; the rediscovery of freedom--personal recollections; historians and the future of Europe; the Actonian revival--on Lord Acton (1834-1902); whether there is a German nation; a plan for the future of Germany; the opening address to a conference at Mont Pelerin; the tragedy of organized humanity--Bertrand de Jouvenel on power; and Bruno Leoni (1913-67) and Leonard Read (1898-1983). The late Hayek was the recipient of the Presidential Medal of Freedom and the cowinner of the Nobel Prize in Economics in 1974.
2013	C31 F12	Bailey, Natalia, Sean Holly, and Hashem Pesaran. 2013. <i>A Two Stage Approach to Spatiotemporal Analysis with Strong and weak cross Sectional Dependence</i>. Faculty of Economics, University of Cambridge, Cambridge Working Papers in Economics. An understanding of the spatial dimension of economic and social activity requires methods that can separate out the relationship between spatial units that is due to the effect of common factors from that which is purely spatial even in an abstract sense. The same applies to the empirical analysis of networks in general. We are able to distinguish between cross sectional strong dependence and weak dependence. Strong dependence in turn suggests that there are common factors. we use cross unit averages to extract common factors and contrast this to a principal components approach widely used in the literature. We then use a multiple testing procedure to determine significant bilateral correlations (signifying connections) between spatial units and compare this to an approach that just uses distance to determine units that are neighbours. We apply these methods to real house price changes at the

Year	DE	Title and Abstract
		level of Metropolitan statistical Areas in the USA, and estimate a heterogeneous spatiotemporal model for the de-factored real house price changes and obtain significant evidence of spatial connections, both positive and negative.
2013	C53	Hefner, Frank, and Mark David Witte. 2013. "A Random Walk to Economic Freedom?" <i>European Journal of Comparative Economics</i> , 10(1): 27-47. Given the wide use of economic freedom in economic literature it is imperative to understand how economic freedom evolves. Results suggest that levels of economic freedom are dominated by random shocks. Using a test for stationarity devised by Westerlund and Larsson (2012), we are unable to reject the null hypothesis of a random walk. The changes to economic freedom also are mostly driven by random shocks with only a minor role played by country specific characteristics. Additionally, changes to economic freedom are partially reversed as increases (decreases) in one year are partially offset by decreases (increases) in the next year.

2013	D14	Nowakowski, Krystian. 2013. "The Institutional Matrices Theory as the Basis of Explanation of Real Estate Bubble." <i>Managerial Economics</i> , 0(14): 113-35. The increase of prices that could not be explained on the basis of fundamentals is still a very complex process. The economic bubbles have occurred over hundreds of years. Multiplicity of markets, geographical spread and variety of items influenced by bubble makes them still poorly understood. Insufficiency of actual structures for understanding and predicting the economic bubble was the reason for an explanation based on the grounds of new institutional economy. In the article factors creating the real estate bubble are examined using the institutional matrices theory. The research is performed through the analysis of data and identification of factors conducive in the formation of enormous price increase in the United States, Spain and Poland. The study confirms that the lack of balanced combination of dominant and complementary matrices institutions leads to the creation of real estate bubbles. Besides, it was confirmed that the combination of dominant Y-matrix with their basic institutions is the necessary condition of the growth beyond the fundamentals. The examined institutions distorting the market growth and turning it into the bubble have been divided into two groups. First, unintended effects of intervention in market mechanism, has been examined by the identification of housing finance organization in the United States and analysis of the effects of their activity, analysis of social housing policy in Spain and Poland, and finally by the analysis of tax and subsidies systems. A second group, wrongly understood full "liberalization" and deregulation of all market processes, has been examined at two levels: creation of debt for the customers and financing banks themselves. Research was performed in this group in the area of bank lending standards, securitization process and capital requirements for banks. The activities of intervention in the market mechanism were against the dominant matrix and were planned for stabilization and stimulation of the real estate market. But in fact supports the speculation and blow of the bubble due to the inappropriate design of institutions of complementary matrix. The activities of wrongly understood full "liberalization" were intended for absolute deregulation by elimination of institutions of complementary matrix. Research confirms that liberalization is possible in the healthy economy however it does not mean for sure that the market mechanism could work without any institutions.
2013	D14	Rezai, Armon. 2013. "Cycles of Demand and Distribution and Monetary Policy in the U.S. Economy." <i>Journal of Post Keynesian Economics</i> , 36(2): 231-50. The role of monetary policy in the cyclical behavior of the labor share and capacity utilization in the U.S. economy is studied empirically. Previous estimation results remain robust; the inclusion of the rate of interest does not alter the underlying specification of the distributive demand regime. The role of monetary policy in net borrowing flows for four institutional sectors is analyzed. Interest rate effects appear most important for households. Based on this finding, implications for countercyclical stabilization policy are spelled out.
2013	D14 J47 J82	O'Connell Davidson, Julia. 2013. "Troubling Freedom: Migration, Debt, and Modern Slavery." <i>Migration Studies</i> , 1(2): 176-95. This article is concerned with the role of debt in contemporary practices of mobility. It explores how the phenomenon of debt-financed migration disturbs the trafficking/smuggling, illegal/legal, and forced/voluntary dyads that are widely used to make sense of migration and troubles the liberal construction of 'freedom' and 'slavery' as oppositional categories. The research literature reveals that while debt can lock migrants into highly asymmetrical, personalistic, and often violent relations of power and dependency sometimes for several years, it is also a means by which many seek to extend and secure their future freedoms. Financing migration through debt can be an active choice without also being a 'voluntary' or 'autonomous' choice, and migrants' decisions to take on debts that will imply heavy restrictions on their freedom are taken in the context of migration and other policies that severely constrain their alternatives. Vulnerability to abuse and exploitation is also politically constructed, and even migrant-debtors whose movement is state sanctioned often lack protections both as workers and as debtors. Indeed, large numbers of migrants are excluded from the rights and freedoms that in theory constitute the opposite of slavery. As argued in the conclusion, this illustrates the contemporary relevance of Losurdo's historical account of the fundamentally illiberal realities of self-conceived liberal societies. There remain 'exclusion clauses' in the social contract that supposedly affords universal equality and freedom, clauses that are of enormous consequence for many groups of migrants, and that also deleteriously affect those citizens who are poor and/or otherwise marginalized.
2013	D78	Dickovick, J. Tyler, and Kent H. Eaton. 2013. "Latin America's Resurgent Centre: National Government Strategies after Decentralisation." <i>Journal of Development Studies</i> , 49(11): 1453-66. This article identifies the 'menu of options' available to national governments as they seek to re-assert the centre's prerogatives in the aftermath of decentralisation. These include policy strategies, bureaucratic strategies, institutional strategies and societal strategies, each of which has afforded opportunities for the centre to reclaim the role of protagonist that it lost as a result of decentralisation. Illustrated through the use of examples from across Latin America, our survey of these options shows that, short of outright recentralisation, national politicians and bureaucrats have been highly creative in their search for strategies to re-centre politics.
2013	E00	Gorton, Gary B., and Guillermo Ordonez. 2013. <i>The Supply and Demand for Safe Assets</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 18732. There is a demand for safe assets, either government bonds or private substitutes, for use as collateral. Government bonds are safe assets, given the government's power to tax, but their supply is driven by fiscal considerations, and does not necessarily meet the private demand for safe assets. Unlike the government, the private sector cannot produce riskless collateral. When the private sector reaches its limit (the quality of private collateral), government bonds are net wealth, up to the government's own limits (taxation capacity). The economy is fragile to the extent that privately-produced safe assets are relied upon. In a crisis, government bonds can replace private assets that do not sustain borrowing anymore, raising welfare.
2013	E40	Cour-Thimann, Philippine, and Bernhard Winkler. 2013. <i>The ECB's non-standard monetary policy measures: the role of institutional factors and financial structure</i> . European Central Bank, Working Paper Series: 1528. This paper aims to make two contributions: to review the ECB's non-standard monetary policy measures in response to the financial and sovereign debt crisis against the background of the institutional framework and financial structure of the euro area; and to interpret this response from a

Year	DE	Title and Abstract
		flow-of-funds perspective. The paper highlights how the rationale behind the ECB's nonstandard measures differs from that underlying quantitative easing policies. As a complement to rather than a substitute for standard interest rate decisions, the non-standard measures are aimed at supporting the effective transmission of monetary policy to the economy rather than at delivering additional direct monetary stimulus. The flow-of-funds analysis proposes an interpretation of central banks' crisis responses as fulfilling their traditional role as lender of last resort to the banking system and, more broadly, reflecting their capacity to act as the "ultimate sector" that can take on leverage when other sectors are under pressure to deleverage. It also provides examples that trace the impact of non-standard measures across different sectors and markets.
2013	E40	Dequech, David. 2013. "Is Money a Convention and/or a Creature of the State? The Convention of Acceptability, the State, Contracts, and Taxes." <i>Journal of Post Keynesian Economics</i> , 36(2): 251-73. This article begins by presenting the idea of money as a convention, first in the economics of conventions and then in post Keynesian economics, also examining whether and how one can reconcile money as a convention with Keynes's essential properties of money. The article then considers the view of money as a creature of the state, in two versions, which connect money to contracts or to taxes, respectively. Finally, it further explores the monetary foundations of a market economy, the conventional foundation of money, and the role of the state. Acknowledging that money is ultimately or fundamentally a convention requires recognizing limits to the state's ability to impose its money on the private agents. At the same time, the state is usually in a much better position than any private agent to influence the process through which the convention of acceptability of money emerges and is reproduced. A stronger proposition is that without state money there would be no stable money in a market economy. Both the fundamental conventionality of money and the essential role of the state can be thus emphasized.
2013	E40	Gorton, Gary B., and Guillermo Ordóñez. 2013. <i>The Supply and Demand for Safe Assets</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 18732. 2013	E47	Drometer, Marcus, Thomas Siemsen, and Sebastian Watzka. 2013. <i>The Monetary Policy of the ECB: A Robin Hood Approach?</i> . CESifo Group Munich, CESifo Working Paper Series: 4178. We derive four sets of counterfactual national interest rate paths for the 17 Euro Area countries for the time period 1999 to 2012. They approximate desirable national interest rates countries would have liked to implement if they could still conduct independent monetary policy. We find that prior to the financial crisis the counterfactual interest rates for Germany trace the realized EONIA rate very closely, while monetary policy has been too loose especially for the southern European countries. This situation was inverted with the onset of the financial crisis. To shed light on the underlying decision rule of the ECB, we rank different rules according to their ability to aggregate the national counterfactual paths to the EONIA rate. In addition to previous literature we find that those mechanisms which care for countries who fare economically worse than the Euro Area average perform best.

2013	F12	Levchenko, Andrei A. 2013. "International Trade and Institutional Change." <i>Journal of Law, Economics, and Organization</i> , 29(5): 1145-81. This article analyzes the impact of international trade on the quality of institutions, such as contract enforcement or property rights. It presents a model in which imperfect institutions create rents for some parties within the economy and are a source of comparative advantage in trade. Institutional quality is determined as an equilibrium of a political economy game. When countries share the same technology, there is a "race to the top" in institutional quality: both trade partners are forced to improve institutions after opening. On the other hand, domestic institutions will not improve in either country when one of the countries has a strong enough technological comparative advantage in the institutionally intensive good. While time series results are not statistically significant, a related cross-sectional prediction of the model is consistent with the data. Countries whose exogenous geographical characteristics predispose them to exporting in institutionally intensive sectors exhibit significantly higher institutional quality.
2013	F40 G15	Reinhart, Carmen M., and Takeshi Tashiro. 2013. <i>Crowding Out Redefined: The Role of Reserve Accumulation</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 19652. It is well understood that investment serves as a shock absorber at the time of crisis. The duration of the drag on investment, however, is perplexing. For the nine Asian economies we focus on in this study, average investment/GDP is about 6 percentage points lower during 1998-2012 than its average level in the decade before the crisis; if China and India are excluded, the estimated decline exceeds 9 percent. We document how in the wake of crisis home bias in finance usually increases markedly as public and private sectors look inward when external financing becomes prohibitively costly, altogether impossible, or just plain undesirable from a financial stability perspective. Also, previous studies have not made a connection between the sustained reserve accumulation and the persistent and significantly lower levels of investment in the region. Put differently, reserve accumulation involves an official institution (i.e., the central bank) funneling domestic saving abroad and thus competing with domestic borrowers in the market for loanable funds. We suggest a broader definition of crowding out, driven importantly by increased "liability" home bias in finance and by official capital outflows. We present evidence from Asia to support this interpretation.
2013	F42	Zielenkiewicz, Malgorzata. 2013. "European Integration and Changes in Public Regulation Sphere." <i>Actual Problems of Economics</i> , 149(11): 357-68. European integration affects different areas of economies. The paper focuses on the public regulation sphere. The EU has a common policy in some areas, whereas there are still different models of capitalism among the EU countries. The aim of the paper is to examine if the EU are converging in terms of economic freedom (measured by Index of Economic Freedom). The analysis is based on the data for the EU countries from 2001 to 2010. The research methods adopted are Euclidean distance and other methods of statistical description.
2013	F60	Hunter, Murray. 2013. "How Culture Creates and Transfers Entrepreneurial and Innovative Potential: A Topographical Map." <i>Journal of Self-Governance and Management Economics</i> , 1(1): 28-63. A culture is a medium, through which we generate stories and share information. Our entrepreneurial and innovative potential is dependent upon the beliefs and values we have. It's a social phenomenon and relates to how we see the world and solve our problems. Culture and the narratives that are generated within it is the medium of our collective knowledge which hosts a potential towards entrepreneurship. This paper maps out the topographical structure where culture is generated and transferred across society.

Year	DE	Title and Abstract
2013	F60	Veenhoven, Ruut, and Maarten Berg. 2013. "Has Modernisation Gone Too Far? Modernity and Happiness in 141 Contemporary Nations." <i>International Journal of Happiness and Development</i> , 1(2): 172-95. Modern society comes in for a great deal of criticism, such as about increasing individualisation, globalisation and technologisation, which is seen to reduce the quality of life. This claim was investigated in a comparative study of 141 present-day countries. Eight aspects of modernity were considered: industrialisation, size of the service sector, economic freedom, real income per capita, globalisation, level of education, political democracy and urbanisation. Happiness in different countries was measured as the average response to survey questions on life-satisfaction, affect and contentment. Analysis shows that people living in most modern countries are substantially happier than people in the less modern countries are. The patterns are generally linear. In a subset of western nations, greater modernity still goes with greater happiness. Although the advantages of societal modernisation may be finite, modernisation has not yet undermined human happiness.
2013	F60	Ban, Cornel. 2013. "Beyond the Usual Suspects: Rethinking the Mechanisms of Paradigm Shifts in Macroeconomic Policy." <i>Oeconomica</i> , 22(1): 49-70. Economists and political economists emphasize the importance of exogenous shocks, international economic competition, policy conditionality and partisan politics as the main drivers of literature on economic policy change. This paper evaluates the explanatory robustness of these factors and stresses the importance of incorporating economic ideas as a fruitful new direction in research on this topic.
2013	F62	Braunerhjelm, Pontus, and Magnus Henrekson. 2013. "Entrepreneurship, Institutions, and Economic Dynamism: Lessons from a Comparison of the United States and Sweden." <i>Industrial and Corporate Change</i> , 22(1): 107-30. The purpose of the research endeavor published in this special section is to further our understanding of the extent, character, and orientation of entrepreneurial activity in today's wealthy countries. This is done by means of several detailed studies of institutions of particular importance for entrepreneurship and innovation-based firm growth, and its impact on the economy. All coauthors are renowned specialists in the area with deep knowledge of the pertinent institutions in Sweden and the United States, the two countries compared.
2013	F64	Sharma, Pawan Kumar. 2013. "Ecological Economy and Sustainability: The Futures." <i>International Journal of Research in Commerce, Economics and Management</i> , 3(11): 21-22. Today the neo-liberal policies of globalization and commercialization have assumed the dimension of a 'grand narrative' which refuses to share any space with any kind of alternative vision or philosophy. Instead of upholding and celebrating the postmodern philosophic percepts of 'difference' and diversity, the reality of the modern globalized world, founded on the principles of Western ethos of market economy, negates and subverts all kinds of alternative narratives and beliefs which could have ensured a better socio-economic and socio-natural relationships. The contemporary discourse leaves no space for the ecology of languages; the diversity of species; the existence of community living based on its own belief-patterns; the sovereignty of nations and cultures; and so on and so forth. This all works as a constraining force and hinders, in a way, the emergence of more temporarily and spatially focused attempts to reconstruct economic institutional routines and socio-natural relationships. From the dropping of the atom bombs and Chernobyl disaster to the oil spillage and industrial contamination--everything as a consequence of a certain cultural ordering or preferred socio-economic arrangements has to be an essential part of any viable discourse on ecology or economy. Ecological economics provides an adequate answer to this dilemma and moves beyond the dominant global techno-managerial mode of economics and seek to uncover possibilities for alternative trajectories with strong cultural-political and socio-economic underpinnings.
2013	G15	THE SAME AS F40 Reinhart, Carmen M., and Takeshi Tashiro. 2013. <i>Crowding Out Redefined: The Role of Reserve Accumulation</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 19652.
2013	H20	Mura, Petru-Ovidiu. 2013. "Democracy, Economic Freedom and Taxation in the European Union." <i>Timisoara Journal of Economics and Business</i> , 6(19): 5-23. The purpose of this paper is to study empirically how democracy, taxation, and economic freedom interact within the European Union (EU-27), European old member states (EU-15), and European new member states (EU-NMS), using VAR methodology, with panel data for 24 countries and yearly observations for the period 1995-2008. The main findings show for EU-27 that democracy amplifies the level of taxation and it discourages economic freedom, while economic freedom has an almost insignificant, but positive effect on the level of taxation, and a small, positive effect on democracy. As for EU 15, taxation and economic freedom seem to discourage each other; finally, in the case of EU-NMS, the results are similar to EU-27. In respect to policy implication, governments should protect and support private property and initiative, the only ones able to provide functionality for the market's "invisible hand."
2013	H20	Dequech, David. 2013. "Is Money a Convention and/or a Creature of the State? The Convention of Acceptability, the State, Contracts, and Taxes." <i>Journal of Post Keynesian Economics</i> , 36(2): 251-73. With English summary.)" <i>Actual Problems of Economics</i> , 147(9): 49-56. The article grounds the necessity for formation of an institutional mechanism for state property regulation within national economy. It is demonstrated that there is a significant influence upon the state regulatory activities from the side of legitimate interaction of fundamental institutions of the national economy.
2013	I15	Barro, Robert J. 2013. "Health and Economic Growth." <i>Annals of Economics and Finance</i> , 14(2): 305-42.
2013	I21	Mulholland, Sean E., and Rey Hernandez-Julian. 2013. "Does Economic Freedom Lead to Selective Migration by Education?" <i>Journal of Regional Analysis and Policy</i> , 43(1): 65-87. Using a spatial Durbin model (SDM), we estimate the migratory response of those with various levels of education to state differences in economic freedom. We find that states with greater overall economic freedom attract those with a secondary education and, to a lesser extent, those with some college experience. States with greater government expenditures as a percent of gross state product witness a net in-migration of those with college experience and out-migration of those with only an elementary education. The opposite is true for transfers and subsidies. States with greater union density witness non-selective out-migration.

2013	I21	Buehn, Andreas, and Mohammad Reza Farzanegan. 2013. "Impact of Education on the Shadow Economy: Institutions Matter." <i>Economics Bulletin</i> , 33(3): 2052-63. Using panel data for more than 80 countries from 1999-2007 this paper studies the marginal effect of education on the shadow economy, particularly considering the quality of institutions. The results show that higher levels of education fuel the shadow economy in an environment of weak political institutions.
2013	J08	Freeman, Richard B. 2013. "Failing the Test? The Flexible U.S. Job Market in the Great Recession." <i>Annals of the American Academy of Political and Social Science</i> , 650(0): 78-97. The Great Recession tested the ability of the "great U.S. jobs machine" to limit the severity of unemployment in a major economic downturn and to restore full employment quickly afterward. In the crisis the American labor market failed to live up to expectations. The level and duration of unemployment increased substantially in the downturn, and the growth of jobs was slow and anemic in the recovery. This article documents these failures and their consequences for workers. The U.S. performance in the Great Recession contravenes conventional views of the virtues of market-driven flexibility compared to institution-driven labor adjustments and the notion that weak labor institutions and greater market flexibility offer the best road to economic success in a modern capitalist economy.
2013	J08	Pizzuti, Felice Roberto. 2013. "Crisi, istituzioni e politiche sociali. (Crisis, Institutions and Social Policies. With English summary.)." <i>Economia e Lavoro</i> , 47(2): 5-30. In the first part of the article--which draws on the findings of the Report on the Welfare State 2013. Crisis, Institutions, Common Goods and Welfare State--analysis focuses on the specific evolution of the crisis in Europe, the causes and consequences at the institutional level, and the interest that the failures of the market and the community policies have stimulated in the issue of common goods. While debate on the issue remains a potential source of new, positive contributions towards readjustment of economic, legal, social and political relations, due to certain incongruities in its analytic and applicative aspects it risks being tangential to the market-institutions issue, of central importance for analysis of the crisis. In the second and third parts of the article analysis turns to the social policies recently implemented in the European union and in Italy. And in the particular case of Italy, together with analysis of the latest labour market and welfare system reforms, specific indications are offered for readjustment of the pension and health systems.

2013	L10	Acemoglu, Daron, Ufuk Akcigit, Nicholas Bloom, and William R. Kerr. 2013. <i>Innovation, Reallocation and Growth</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 18993. We build a model of firm-level innovation, productivity growth and reallocation featuring endogenous entry and exit. A key feature is the selection between high- and low-type firms, which differ in terms of their innovative capacity. We estimate the parameters of the model using detailed US Census micro data on firm-level output, R&D and patenting. The model provides a good fit to the dynamics of firm entry and exit, output and R&D, and its implied elasticities are in the ballpark of a range of micro estimates. We find industrial policy subsidizing either the R&D or the continued operation of incumbents reduces growth and welfare. For example, a subsidy to incumbent R&D equivalent to 5% of GDP reduces welfare by about 1.5% because it deters entry of new high-type firms. On the contrary, substantial improvements (of the order of 5% improvement in welfare) are possible if the continued operation of incumbents is taxed while at the same time R&D by incumbents and new entrants is subsidized. This is because of a strong selection effect: R&D resources (skilled labor) are inefficiently used by low-type incumbent firms. Subsidies to incumbents encourage the survival and expansion of these firms at the expense of potential high-type entrants. We show that optimal policy encourages the exit of low-type firms and supports R&D by high-type incumbents and entry.
2013	L33	Harrison, Ashley S., Mark C. Schug, and J. R. Clark. 2013. "Battling the Forces of Darkness: How Can Economic Freedom Be Effectively Taught in the Pre-college Curriculum?" <i>Journal of Private Enterprise</i> , 29(1): 87-100. How can the institutions of a free-market economy be sustained if teachers and students fail to grasp a basic economic understanding? This article describes the current status of economic education at the pre-college levels including teacher knowledge, student knowledge, and the status of economics in the school curriculum. Concern is expressed that the weak status of economics at the pre-college level may have contributed to the recent decline of economic freedom in the United States. Next, we will examine steps that can be taken to strengthen economics at the kindergarten to grade 12 level. We suggest three approaches: changes in pedagogy, curriculum, and teacher training. We believe that taking actions along these lines will deepen young people's understanding of free markets and strengthen their support for economic freedom.
2013	L60	Posso, Alberto. 2013. "What Is It about Democracies That Pays Higher Wages?" <i>Applied Economics Quarterly</i> , 59(1): 63-84. Democracy and democratisation are associated with higher manufacturing wages. However, classifying a country as democratic does not highlight what institutional characteristics (if any) may be leading to higher wages within democracies. In order to shed light on this issue, this paper uses a dataset that "decomposes" democracy into six different governance indicators in a panel of 84 countries over the period 1996 to 2009. The evidence suggests that in poor and middle-income countries, greater voice and accountability as well as rule of law will lead to increments in manufacturing wages. It is argued that these characteristics increase wages by allowing for freedom of association and assembly as well as by encouraging greater respect for labour laws. The paper also uncovers some evidence to suggest that greater voice and accountability and rule of law can lead to a fall in wages in more developed nations. It is argued that since more developed countries are undergoing a process of deindustrialisation, more democratic wage bargaining activities will lead to faster downward adjustment of manufacturing wages.
2013	N33	Bertocchi, Graziella, and Monica Bozzano. 2013. <i>Family Structure and the Education Gender Gap: Evidence from Italian Provinces</i> . CESifo Group Munich, CESifo Working Paper Series: 4460. We investigate the determinants of the education gender gap in Italy in historical perspective with a focus on the influence of family structure. We capture the latter with two indicators: residential habits (nuclear vs. complex families) and inheritance rules (partition vs. primogeniture). After controlling for economic, institutional, religious, and cultural factors, we find that family structure is a driver of the education gender gap, with a higher female to male enrollment rate ratio in upper primary schools being associated with nuclear residential habits and equal partition of inheritance. The effect tends to persist through the present day.
2013	N33	Bertocchi, Graziella, and Monica Bozzano. 2013. <i>Women, Medieval Commerce, and the Education Gender Gap</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 9359. We investigate the historical determinants of the education gender gap in Italy in the late nineteenth century, immediately following the country's Unification. We use a comprehensive newly-assembled database including 69 provinces over twenty-year sub-samples covering the 1861-1901 period. We find robust evidence that female primary school attainment, relative to that of males, is positively associated with the medieval pattern of commerce, along the routes that connected Italian cities among themselves and with the rest of the world. The effect of medieval commerce is particularly strong at the non-compulsory upper-primary level and persists even after controlling for alternative long-term determinants reflecting the geographic, economic, political, and cultural differentiation of medieval Italy. The long-term influence of medieval commerce

Year	DE	Title and Abstract
		quickly dissipates after national compulsory primary schooling is imposed at Unification, suggesting that the channel of transmission was the larger provision of education for girls in commercial centers.
2013	N45	Facchini, Francois. 2013. "Economic Freedom in Muslim Countries: An Explanation Using the Theory of Institutional Path Dependency." <i>European Journal of Law and Economics</i> , 36(1): 139-67. This article explains the level of economic freedom in Muslim countries through the theory of institutional path dependency. Islamic countries are generally not free and they have a poor record regarding property rights. To explain these realities we use the institutional history of Muslim countries. We define three steps: the Arab and Ottoman Empires when Islamic law was of great importance, European colonisation, and the contemporary era with its movement towards a revival of Islam. Islamic law is not liberal. This explains why in general Muslim countries are not free. Colonisation radically changed institutional life in the twentieth century. British colonisation proved to be better than did French or Soviet colonisation. This explains why the Persian Gulf countries are freer. The collapse of the Soviet model explains the speed of liberalisation in former socialist countries (such as Albania, Kyrgyz Republic, and Kazakhstan). Nevertheless, the twentieth century was not just the century of Westernisation. It was also the century of the revival of Islam. The article concludes that the history of the twentieth century does not explain the way in which Muslim countries are attracted by the ideal of the Muslim city. The revival of Islamic intellectual innovations and the evolution of Muslim opinion sustain this thesis. Therefore, there is a dependency on the past and on an imagined future. Islam acts, like yesterday, on the world of institutional possibilities.
2013	O18	Pattanaik, Falguni, and Narayan Chandra Nayak. 2013. "Economic Freedom and Employment in India." <i>South Asian Journal of Macroeconomics and Public Finance</i> , 2(1): 59-79. The recent move of Indian policymakers towards a more open economy with less government control is said to have brought about considerable changes in the policy structure with respect to the size of the government--expenditures, taxes, and enterprises--legal structure and security of property rights, regulation of labour and business. Economic freedom, which encompasses these indicators, may have a potential impact on, and may facilitate better integration of, labour market outcomes such as labour quality and creating employment opportunities in India. In a federal system like India's, economic and political institutions such as business regulation, taxation, and government spending differ significantly across states. This study, considering 20 major Indian states, tests the hypothesis that greater economic freedom may lead to higher rates of employment for these states. The results indicate that economic freedom is likely to have a favourable impact on employment. The most important dimensions are strong rule of law and flexible regulations governing credit, labour, and product markets. The rise in income per capita is a critical factor in this set-up.
2013	O44	Sharma, Pawan Kumar. 2013. "Ecological Economy and Sustainability: The Futures." <i>International Journal of Research in Commerce, Economics and Management</i> , 3(11): 21-22. Today the neo-liberal policies of globalization and commercialization have assumed the dimension of a 'grand narrative' which refuses to share any space with any kind of alternative vision or philosophy. Instead of upholding and celebrating the postmodern philosophic percepts of 'differance' and diversity, the reality of the modern globalized world, founded on the principles of Western ethos of market economy, negates and subverts all kinds of alternative narratives and beliefs which could have ensured a better socio-economic and socio-natural relationships. The contemporary discourse leaves no space for the ecology of languages; the diversity of species; the existence of community living based on its own belief-patterns; the sovereignty of nations and cultures; and so on and so forth. This all works as a constraining force and hinders, in a way, the emergence of more temporarily and spatially focused attempts to reconstruct economic institutional routines and socio-natural relationships. From the dropping of the atom bombs and Chernobyl disaster to the oil spillage and industrial contamination--everything as a consequence of a certain cultural ordering or preferred socio-economic arrangements has to be an essential part of any viable discourse on ecology or economy. Ecological economics provides an adequate answer to this dilemma and moves beyond the dominant global techno-managerial mode of economics and seek to uncover possibilities for alternative trajectories with strong cultural-political and socio-economic underpinnings.
2013	P20	Dollar, David, and Benjamin F. Jones. 2013. <i>China: An Institutional View of an Unusual Macroeconomy</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 19662. China presents several macroeconomic patterns that appear inconsistent with standard stylized facts about economic development and hence inconsistent with the standard neoclassical growth model. We show that Chinese macroeconomic patterns instead appear consistent with an environment where state control of factor markets can promote aggressive output goals. We consider the micro-institutional features that can sustain this behavior, emphasizing the hukou system and state control over capital allocation, and present a simple model built on these features. The model can explain several puzzling facts about the Chinese economy, including its unusually low labor share and unusually high saving and investment rates. Interestingly, the model also shows that free-market reforms can initially take the economy further from global macroeconomic norms.
2013	P47	Gatzia, Dimitria Electra. 2013. "The Problem of Unemployment." <i>Journal of Self-Governance and Management Economics</i> , 1(4): 7-25. The aim of this paper is to address the problem of unemployment. Economists generally agree that a zero rate of unemployment is not only unattainable but also undesirable within capitalism. This is problematic because, as it will be shown, unemployment has adverse effects on both individuals and societies. Assuming that the primary aim of economics is to improve people's lives, it behooves us to find a solution to the problem of unemployment. Two solutions will be offered. The first works within the confines of the capitalist system--it requires instituting welfare policies that alleviate the adverse effects of unemployment. The second involves a paradigm change--it requires replacing capitalism with an alternative economic system that is consistent with a zero rate of unemployment.
2013	Q34 Q38	Elbadawi, Ibrahim Ahmed, and Raimundo Soto. 2013. <i>Resource Rents, Institutions and Violent Civil Conflicts</i> . Instituto de Economía. Pontificia Universidad Católica de Chile., Documentos de Trabajo: 438. Natural resources have been blamed for inducing slow growth and sparking civil conflicts and violence. This paper first develops a model to account for the hazard of armed civil conflicts as a manifestation of the natural resource curse which is mediated by the quality of both economic and political institutions. We then use recently published data on institutional quality and natural resource rents to measure the potential impact of the resource curse on violent civil conflicts using a panel of data for over 100 countries in the period 1970-2010. Our model explicitly accounts for the role of good economic and political institutions in deterring the recourse to violence as well as the extent to which they might weaken the resource rents effect.
2013	Q41 Q48	Shankar, Uday, and Surendra Sharma. 2013. "Access to Energy: Looking through the Prism of Human Rights--The Indian Experience." <i>Journal of Energy and Development</i> , 38(1-2): 221-39. The paper attempts to identify the right of access to energy on the landscape of human rights using India as the case study. The contents of what comprises human rights increasingly are expanding and evolving to keep pace not only with societal needs but also with individuals' expectations and perceptions. We begin with an analysis of the evolution of human rights, the expansion of the discourse on human rights, and the identification of new rights. In particular, we examine these issues by evaluating the development of India's laws and most pertinent cases regarding this subject. We continue with a discussion of why the access to energy itself constitutes an element of human rights. In conclusion, the paper presents the importance of the right to energy within the overall discussion on human rights.

2013	Q54	Al Mahmud Titumir, Rashed, and Mustafa Kamal. 2013. "Growing Together Sustainably: A Zero-Poverty Post-2015 Development Framework." <i>Development</i>, 56(2): 172-84. The article argues that proper attention to five major emerging trends will be crucial for the success of any development framework beyond 2015: (a) poverty and inequality; (b) economic crisis and job loss; (c) trade, finance, and aid; (d) rights, violation, and violence; and (e) climate change. The article goes on to use these trends to review the latest proposals on the post-2015, and provides a set of indicators based on new five fundamental principles of rights, equality, justice, sustainability, and partnership for development through historic responsibility.

Table E03.F Examples of Publications according to New Links in 2013—2014

It is necessary to take into account that in 2014 the micro category D03 “Behavioral Microeconomics: Underlying Principles” was transformed into micro category D91 “Micro-Based Behavioral Economics: Role and Effects of Psychological, Emotional, Social, and Cognitive Factors on Decision Making”.

Year	DE	Title and Abstract
2013		
2013	B22 D03	King, John E. 2013. "Should Post-Keynesians Make a Behavioural Turn?" <i>European Journal of Economics and Economic Policies: Intervention</i> , 10(2): 231-42. This paper deals with the relationship between post-Keynesian and behavioural economics. I begin by responding critically to Paul Davidson's claim that Keynes was the first behavioural economist. Then I discuss some recent work in behavioural macroeconomics, which reveals some important strengths but also some fundamental weaknesses. Next I outline what (old) behavioural economists have had to say about macroeconomics, beginning with the father of the school, Herbert Simon, and considering the contributions of some of his disciples. I then reverse the question and ask what post-Keynesians have had to say about behavioural economics, old and new. I conclude by identifying some potential sources of difficulty and also suggesting some areas of macroeconomics where cooperation between post-Keynesians and behavioural economists seems especially promising.
2013	B31 D03	Doring, Thomas. 2013. "John Maynard Keynes als Verhaltensökonom--Illustriert anhand seiner Analyse des Versailler Vertrags. (John Maynard Keynes as Behavioral Economist--Represented by His Analysis of the Treaty of Versailles. With English summary.)." <i>ORDO: Jahrbuch für die Ordnung von Wirtschaft und Gesellschaft</i> , 64(0): 27-51. With his analysis of the Treaty of Versailles John Maynard Keynes became one of celebrated Economists of his time. As a member of the British delegation and therefore participant in the Paris Peace Conference he predicted that the principal product of the conference, the Treaty of

Year	DE	Title and Abstract
		Versailles, will fail to realize any of the major goals of its framers. Concerning this matter Keynes points to the cognitive errors and oversights of the negotiators as a primary cause. Against this background the logic of his reasoning is re-examined in light of recent research of behavioral economics. It reveals that Keynes' approach is actually very consistent with and anticipating the results of recent economic works on cognitive heuristics, illusions and biases with respect to human information processing, judgment and choice in complex situations.

2014		
2014	A12 B21	Heuvelom, Floris. 2014. <i>Behavioral Economics: A History, Historical Perspectives on Modern Economics series</i> . Cambridge and New York: Cambridge University Press. Examines the history of behavioral economics and its effect on the study of economics as a whole. Discusses understanding human behavior; the incorporation of von Neumann and Morgenstern's behavioral axioms in economics and psychology; how "measurement theory in psychology is behavior theory"; Kahneman and Tversky--heuristics, biases, and prospects for psychology and economics; incorporating psychological experiments in economics and the construction of behavioral economics; and building and defining behavioral economics.
2014	A23 I31 Z13	Cartwright, Edward. 2014. <i>Behavioral Economics, Second edition</i> . Routledge Advanced Texts in Economics and Finance, vol. 22. London and New York: Taylor and Francis, Routledge. Updated and expanded second edition of a graduate or advanced undergraduate textbook presents topics in behavioral economics such as neuroeconomics, emotions, deception, and the contrast between group and individual behavior. Discusses simple heuristics for complex choices; choice with risk; choosing when to act; learning from new information; interacting with others; social preferences; evolution and culture; neuroeconomics; happiness and utility; and policy and behavior.
2014	B21	THE SAME AS A12 Heuvelom, Floris. 2014. <i>Behavioral Economics: A History, Historical Perspectives on Modern Economics series</i> . Cambridge and New York: Cambridge University Press.
2014	D10 E21 O12 Q50	Southerton, Dale, and Alistair Ulph, eds. 2014. <i>Sustainable Consumption: Multi-Disciplinary Perspectives in Honour of Professor Sir Partha Dasgupta</i> , Oxford and New York: Oxford University Press. Thirteen papers based on presentations at a conference entitled "Sustainable Consumption--Multidisciplinary Perspectives" and held in March 2012, develop a conceptualization of consumption that draws insights from cross-disciplinary thinking about consumer behavior, resource and environmental economics, and sustainable consumption. Papers discuss sustainability and the determinants of personal consumption (Dasgupta); the value to the environmental movement of the new literature on the economics of happiness (Andrew J. Oswald); consumption, stability, and sustainability in social-ecological systems (Ann Kinzig and Charles Perrings); how benefits and costs should be discounted in an intergenerational context (Maureen Cropper); the hungry brain (Paul Fletcher); consuming at the wrong rate--lessons from the Harvard game (Drazen Prelec); the psychology of sustainable consumption (Geoff Beattie and Laura McGuire); behavioral economics in water management--an overview of behavioral economics applications to residential water demand (Richard Correia and Catarina Roseta-Palma); the politics of nudging--dilemmas in implementing policies for sustainable consumption (Gerry Stoker); past and present--historical perspectives on inequality and collective provision in modern consumption (Frank Trentmann); sociology, consumption, and habit (Alan Warde); the body in consumption--perspectives from India (Harold Wilhite); and consumer cultures--past, present, and future (Richard R. Wilk).
2014	D78 L51	Lunn, Pete. 2014. <i>Regulatory Policy and Behavioural Economics</i> , Paris and Washington, D.C.: Organisation for Economic Co-operation and Development. Reviews approximately 60 instances when behavioral economics influences policy in OECD countries, concentrating primarily on regulatory policy. Discusses the growing influence of behavioral economics on policy; behavioral economics and policy design; and regulatory delivery.
2014	E10 E31	Eyster, Erik, Kristof Madarasz, and Pascal Michaillat. 2014. <i>The Curse of Inflation</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 10286. This paper proposes a model that explains the nonneutrality of money from two well-documented psychological assumptions. The model incorporates into the general-equilibrium monopolistic-competition framework of Blanchard and Kiyotaki [1987] the psychological assumptions that (1) consumers dislike paying a price that exceeds some "fair" markup on firms' marginal costs, and (2) consumers do not know firms' marginal costs and fail to infer them from prices. The first assumption in isolation renders the economy more competitive without changing any of its qualitative properties; in particular, money remains neutral. The two assumptions together cause money to be nonneutral: greater money supply induces lower monopolistic markups, higher hours worked, and higher output. Whereas an increase in money supply is expansionary, it decreases the fairness of transactions perceived by consumers to such an extent that it reduces overall welfare. The cost of inflation is a psychological one that derives from a mistaken belief by consumers that transactions have become less fair. In fact, it is this misperception that makes an increase in money supply expansionary: consumers misattribute the higher prices arising from higher money supply to higher markups; the misperception of higher markups angers them and makes their demand for goods more elastic; in response, monopolists reduce their markups, thus stimulating economic activity. Through a similar mechanism, an increase in technology induces higher output but higher monopolistic markups and lower hours worked.
2014	E12	Driscoll, John C., and Steinar Holden. 2014. "Behavioral Economics and Macroeconomic Models." <i>Journal of Macroeconomics</i> , 41(0): 133-47. Over the past 20 years, macroeconomists have incorporated more and more results from behavioral economics into their models. We argue that doing so has helped fixed deficiencies with standard approaches to modeling the economy--for example, the counterfactual absence of inertia in the standard New Keynesian model of economic fluctuations. We survey efforts to use behavioral economics to improve some of the underpinnings of the New Keynesian model--specifically, consumption, the formation of expectations and determination of wages and employment that underlie aggregate supply, and the possibility of multiple equilibria and asset price bubbles. We also discuss more broadly the advantages and disadvantages of using behavioral economics features in macroeconomic models.
2014	E12 E13	Baddeley, Michelle. 2014. "Rethinking the Micro-foundations of Macroeconomics: Insights from Behavioural Economics." <i>European Journal of Economics and Economic Policies: Intervention</i> , 11(1): 99-112. In the aftermath of the financial

Year	DE	Title and Abstract
	E62 Z13	crisis, macroeconomics is at a crossroads: on the one hand, the analytically rigorous, assumption-based approaches based on dynamic stochastic general equilibrium (DSGE) models lack intuitive plausibility and predictive power; on the other hand, alternative models lack an underlying analytical core. Behavioural economics offers a potential solution if it can unify intuition and analytical rigour. The aim of this paper is to assess the extent to which macroeconomics can embed behavioural and psychological insights from behavioural microeconomic analysis in order to build a rigorous and intuitively plausible understanding of how economic systems, including the macroeconomy and the financial system, work.

E03: Balance of Links

6	Links in 2013
18	New links in 2014
798	Potential links at the end of 2014
822	Total

The date of final verification: December 12, 2016.

E03 — Contributors — Авторы

Varanov, Alexander O. — Баранов Александр Олегович — 0.18 AS²;
 Lychagin, Anton M. — Лычагин Антон Михайлович — 0.34 AS;
 Lychagin, Dmitry M. — Лычагин Дмитрий Михайлович — 0.16 AS;
 Lychagin, Mikhail V. — Лычагин Михаил Васильевич — 0.36 AS;
 Mkrtchyan, Gagik M. — Мкртчян Гагик Мкртичевич — 0.18 AS;
 Muhina, Irina K. — Мухина Ирина Константиновна — 0.18 AS;
 Popov, Ilya Y. — Попов Илья Юрьевич — 0.16 AS;
 Suslov, Victor I. — Суслов Виктор Иванович — 0.18 AS.

The total volume of derivative works for E03 is equal to 1.74 AS.

Общий объем раздела E03 — 1,74 авторских (уч.-изд.) л.

² AS — Author's Sheet — unit of measuring the volume of a literary work; equal to 40,000 characters (including the spaces between words), or 3,000 sq cm of illustrations (maps) like the table E03.E.

Table E10.F Examples of Publications according to New Links in 2006—2013

Year	DE	Title and Abstract
2006		
2006	C12	van der Ploeg, Frederick. 2006. <i>Challenges and Opportunities for Resource Rich Economies</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 5688. The political economy of resource rich countries is surveyed. The empirical evidence suggests that countries with a large share of primary exports in GNP have bad growth records and high inequality, especially if the quality of institutions and the rule of law are bad. The economic argument that a resource bonanza induces appreciation of the real exchange rate and a decline of non-resource export sectors may have some relevance. More important, a resource boom reinforces rent grabbing, especially if institutions are bad, and keeps in place bad policies. Optimal resource management may make use of the Hotelling rule and the Hartwick rule. However, a recent World Bank study suggests that resource rich economies squander their natural resource wealth and more often have negative genuine saving rates. Still, countries such as Botswana, Canada, Australia and Norway suggest it is possible to escape the resource curse. Some practical suggestions for a better management of natural resources are offered.
2006	C78	Shi, Shouyong. 2006. <i>Search Theory: Current Perspectives</i> . University of Toronto, Department of Economics, Working Papers. In this article I briefly review recent developments in search theory. Particular attention is given to the framework of directed search.

Year	DE	Title and Abstract
		I first illustrate the inefficiency that arises in the equilibrium of standard (undirected) search models. Then I provide a formulation of directed search and show that the resulting equilibrium eliminates the inefficiency. Examples of directed search with price posting and auction are provided both for the market with a finite number of individuals and for a large market. After describing the application of search models in monetary theory, I conclude with a remark on the future research.
2006	L40	Arestis, Philip, John McCombie, and Roger Vickerman, eds. 2006. <i>Growth and Economic Development: Essays in Honour of A. P. Thirlwall</i> , Cheltenham, U.K. and Northampton, Mass.: Elgar. Fourteen papers explore A. P. Thirlwall's contribution to economics over the last forty years. Papers discuss the implications of Thirlwall's Law for Africa's development challenges; Thirlwall's Law and Palley's pitfalls--a reconsideration; specifying the demand for imports in macroeconomic models; Keynes, post-Keynesian analysis, and the open economies of the twenty-first century; cycles, aggregate demand, and growth; modeling historical growth--a contribution to the debate; endogenous growth theory--a partial critique; the nature of economic growth and the neoclassical approach; the core of macroeconomic theory; the crisis of the stability pact and a proposal; narrowing the options--the macroeconomic and financial framework for EU enlargement; competition and competition policy in emerging markets--international and developmental dimensions; models of saving, income, and the macroeconomics of developing countries in the post-Keynesian tradition; and the influence of Keynes on development economics.
2007		
2007	B53	Fillieule, Renaud. 2007. "A Formal Model in Hayekian Macroeconomics: The Proportional Goods-in-Process Structure of Production." <i>Quarterly Journal of Austrian Economics</i> , 10(3): 193-208. The core concept of Austrian macroeconomics is the structure of production, which makes it possible to analyze the intertemporal dimension of an economic system and to understand aspects of equilibrium, growth, and trade cycle that are neglected by usual-Keynesian and Neoclassical-macroeconomic models. This concept and a very convenient graphical illustration have been introduced by Hayek (1935, 1941), and then developed mainly by Rothbard (1962), Skousen (1990), Reisman (1996) and Garrison (2001). Reisman has offered one of the most detailed expositions and most thoroughgoing utilizations of the concept of structure of production so far (1996, chaps. 15-17). The present paper seeks to formalize some aspects of his approach in the important case of a proportional goods-in-process structure. "Goods-in-process" means that only circulating capital is taken into account, and "proportional" means that the proportion between capital goods and ordinary factors is the same in all stages. In this context are presented, first a systematic method for the calculation and illustration of the structures, second a series of mathematical formulas that relate the main macroeconomic variables (consumption and investment spending, interest rate, aggregate income of ordinary factors), third a very simple and previously unnoticed formula for the average length of the structure [$\lambda = I(1 + i)/C$], and fourth an application of the model to the complex issue of macroeconomic dynamics, i.e., an analysis of how, at each stage, the rate of return and investment change during the deformation of a structure.
2007	F22	Izquierdo, Mario, Juan Jimeno, and Juan Rojas. 2007. <i>On the aggregate effects of immigration in Spain</i> . Banco de Espana, Banco de Espana Working Papers: 0714. This paper presents a dynamic general equilibrium model designed to compute the aggregate impact of immigration, accounting for relevant supply and demand effects. We calibrate the model to the Spanish economy, allowing for enough heterogeneity in the demographic characteristics of immigrant and native workers. We consider an initial steady state characterized by the age structure of the Spanish population in 1995 and study the effects of several immigration scenarios on several macroeconomic variables (GDP, employment, productivity, etc.).
2007	L22 L23 L25 L26	Chatterjee, Satyajit, and Esteban Rossi-Hansberg. 2007. <i>Spin-offs and the Market for Ideas</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 13198. We propose a theory of firm dynamics in which workers have ideas for new projects that can be sold in a market to existing firms or implemented in new firms: spin-offs. Workers have private information about the quality of their ideas. Because of an adverse selection problem, workers can sell their ideas to existing firms only at a price that is not contingent on their information. We show that the option to spin off in the future is valuable so only workers with very good ideas decide to spin off and set up a new firm. Since entrepreneurs of existing firms pay a price for the ideas sold in the market that implies zero expected profits for them, firms' project selection is independent of their size, which, under some assumptions, leads to scale-independent growth. The entry and growth process of firms in this economy leads to an invariant distribution that resembles the one in the US economy.
2008		
2008	C02	Flaschel, Peter, and Michael Landesmann, eds. 2008. <i>Mathematical Economics and the Dynamics of Capitalism: Goodwin's Legacy Continued</i> , Routledge Frontiers of Political Economy. London and New York: Taylor and Francis, Routledge. Fourteen papers explore the macroeconomic, structural, and microeconomic contributions of Richard Goodwin to the field of economics. Papers discuss coexistence of multiple business cycles in Goodwin's 1951 model; an encompassing theory of macroeconomic growth and fluctuation; Kaleckian investment and employment cycles in postwar industrialized economies; a Goodwin cycle with changing regimes of industrial relations; varieties of capitalism--the flexicurity model; Goodwin cycles and the U.S. economy, 1948-2004; the classical growth cycle after fifteen years of new observations; debt-equity cycles in the twentieth century--empirical evidence and a dynamic Keynesian model; monetary policy rules in small open economies--a Keynesian perspective; semistructural Keynes-Goodwin modeling--elaboration and calibration of a baseline theoretical framework; decomposition methods for analyzing intraregional and interregional income distribution; computational explorations of vertically coupled markets; microfounded animal spirits and Goodwinian income distribution dynamics; and Goodwin's structural economic dynamics in the context of globalization.

2009	Q00	FAGNART, Jean-Francois, and Marc GERMAIN. 2009. <i>On the Feasibility of Perpetual Growth in a Decentralized Economy Subject to Environmental Constraints</i>. Universite catholique de Louvain, Institut de Recherches Economiques et Sociales (IRES), Discussion Papers (IRES - Institut de Recherches Economiques et Sociales): 2009037. We propose an endogenous growth model of a decentralized economy subject to environmental constraints. In a basic version, we consider an economy where final production requires some material input and where research activities allow simultaneously productive firms to reduce the dependency of their production process on this input and to improve the quality of their output. We adopt a material balance approach and, in spite of the optimistic assumption that the material input is perfectly recyclable (and thus never exhausted), we show that material output growth is always a transitory phenomenon. When it exists, a balanced growth path is necessarily characterized by constant values of the material variables, long term economic growth taking exclusively the form of perpetual improvements in the quality of consumption goods. The material resource constraint is not solely a long term issue since it is also shown to affect the whole transitory dynamics of the (material) growth process. Renewable energy is introduced in an extension of our basic model. This extension does not affect qualitatively the features of a feasible balanced growth path but make its conditions of existence more restrictive.

2010	B24	Camara-Neto, Alcino F., and Matias Vernengo. 2010. <i>Keynes after Sraffa and Kaldor: Effective demand, accumulation and productivity growth</i>. University of Utah, Department of Economics, Working Paper Series, Department of Economics, University of Utah. This paper analyzes to what extent John Maynard Keynes was successful in showing that the economic system tends to fluctuate around a position of equilibrium below full employment in the long run. It is argued that a successful extension of Keynes's principle of effective demand to the long run requires the understanding of the contributions by Piero Sraffa and Nicholas Kaldor. Sraffa provides the basis for the proper dismissal of the natural rate of interest, while the incorporation by Kaldor of the supermultiplier and Verdoorn's Law allows for a theory of the rate of change of the capacity limit of the economy.
2010	C01	Fernandez-Villaverde, Jesus, and Juan Rubio-Ramirez. 2010. <i>Macroeconomics and Volatility: Data, Models, and Estimation</i>. National Bureau of Economic Research, Inc., NBER Working Papers: 16618. One basic feature of aggregate data is the presence of time-varying variance in real and nominal variables. Periods of high volatility are followed by periods of low volatility. For instance, the turbulent 1970s were followed by the much more tranquil times of the great moderation from 1984 to 2007. Modeling these movements in volatility is important to understand the source of aggregate fluctuations, the evolution of the economy, and for policy analysis. In this chapter, we first review the different mechanisms proposed in the literature to generate changes in volatility similar to the ones observed in the data. Second, we document the quantitative importance of time-varying volatility in aggregate time series. Third, we present a prototype business cycle model with time-varying volatility and explain how it can be computed and how it can be taken to the data using likelihood-based methods and non-linear filtering theory. Fourth, we present two "real life" applications. We conclude by summarizing what we know and what we do not know about volatility in macroeconomics and by pointing out some directions for future research.
2010	C25	Gaiha, Raghav, Raghendra Jha, and Vani S. Kulkarni. 2010. <i>Obesity, Affluence and Urbanisation in India</i>. Australian National University, Australia South Asia Research Centre, ASARC Working Papers. Based on data collected from a representative national sample, India Human Development Survey 2005, this paper investigates the links between obesity among children and among adults with a number of socio economic characteristics as well as household and location specific variables. Both child and adult obesity are far from negligible, which is a matter of concern, given the links between obesity and some diseases. There are strong links between socio-economic indicators and risk of obesity. In particular, affluence has a robust link to obesity. Among children, taller children in more affluent households are more prone to obesity. Some demographic characteristics matter too, for example, both child and adult obesity rise with age but at a diminishing rate. Location also influences chances of obesity. Relative food price effects matter too through calorie, protein, fat and other nutrient intakes. A number of policy conclusions are also advanced.
2010	D53	Diss: Hoelle, Matthew. 2010. <i>Bankruptcy and Transaction Costs in General Financial Models</i> . PhD diss. University of Pennsylvania. General financial models have become workhorse models in the fields of macroeconomics and finance. These models have been developed and extensively studied by general equilibrium theorists. What makes them so applicable for macroeconomics and finance is the well accepted fact that models with a representative agent and without financial frictions yield equilibrium outcomes that are inconsistent with the empirical realities of financial markets. The general financial models are characterized by two main features: heterogeneous agents and financial frictions. The ability of these models to be applied in the fields of macroeconomics and finance in the future depends upon the frontier research in general equilibrium today. Over the past 20 years, research in general equilibrium has predominantly focused on a single friction: incomplete financial markets. The papers contained in this dissertation will analyze the equilibrium effects, both positive and normative, of two seldom researched frictions: bankruptcy and transaction costs. It is the hope that by studying financial frictions in isolation, we may learn which frictions have the greatest effect on welfare, which frictions are most able to be controlled by the government, and how to satisfactorily analyze the equilibrium of a process that is concurrently being restrained by several frictions.
2010	L20 M13	Audretsch, D. B., and A. R. Thurik. 2010. <i>Unraveling the Shift to the Entrepreneurial Economy</i>. Tinbergen Institute, Tinbergen Institute Discussion Papers: 10-080/3. A recent literature has emerged providing compelling evidence that a major shift in the organization of the developed economies has been taking place: away from what has been characterized as the managed economy towards the entrepreneurial economy. In particular, the empirical evidence provides consistent support that (1) the role of entrepreneurship has significantly increased, and (2) a positive relationship exists between entrepreneurial activity and economic performance. However, the factors underlying this observed shift have not been identified in a systematic manner. The purpose of this paper is to suggest some of the factors leading to this shift and implications for public policy. In particular, we find that a fundamental catalyst underlying the shift from the managed to the entrepreneurial economy involved the role of technological change. However, we also find that it was not just technological change but rather involved a number of supporting factors, ranging from the demise of the communist system, increased globalization, new competition for multinational firms and higher levels of prosperity. Recognition of the causes of the shift from the managed to the entrepreneurial economy suggests a rethinking of the public policy approach. Rather than the focus of directly and exclusively on promoting startups and SMEs, it may be that the current approach to entrepreneurship policy is misguided. The priority should not be on entrepreneurship policy but rather a more pervasive and encompassing approach, policy consistent with an entrepreneurial economy.

Year	DE	Title and Abstract
2010	N00	Fernandez-Villaverde, Jesus, Jeremy Greenwood, and Nezih Guner. 2010. <i>From Shame to Game in One Hundred Years: An Economic Model of the Rise in Premarital Sex and its De-Stigmatization</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 15677. Societies socialize children about many things, including sex. Socialization is costly. It uses scarce resources, such as time and effort. Parents weigh the marginal gains from socialization against its costs. Those at the lower end of the socioeconomic scale indoctrinate their daughters less than others about the perils of premarital sex, because the latter will lose less from an out-of-wedlock birth. Modern contraceptives have profoundly affected the calculus for instilling sexual mores, leading to a de-stigmatization of sex. As contraception has become more effective there is less need for parents, churches and states to inculcate sexual mores. Technology affects culture.
2010	R00 R13	Desmet, Klaus, and Esteban Rossi-Hansberg. 2010. <i>Urban Accounting and Welfare</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 16615. This paper proposes a simple theory of a system of cities that decomposes the determinants of the city size distribution into three main components: efficiency, amenities, and frictions. Higher efficiency and better amenities lead to larger cities, but also to greater frictions through congestion and other negative effects of agglomeration. Using data on MSAs in the United States, we parametrize the model and empirically estimate efficiency, amenities and frictions. Counterfactual exercises show that all three characteristics are important in that eliminating any of them leads to large population reallocations, though the welfare effects from these reallocations are small. Overall, we find that the gains from worker mobility across cities are modest. When allowing for externalities, we find an important city selection effect: eliminating differences in any of the city characteristics causes many cities to exit. We apply the same methodology to Chinese cities and find welfare effects that are many times larger than in the U.S.
2010	Z12	Kates, Steven, ed. 2010. <i>Macroeconomic Theory and Its Failings: Alternative Perspectives on the Global Financial Crisis</i>. Cheltenham, U.K. and Northampton, Mass.: Elgar. Fourteen papers examine the global financial crisis and the economic theories used to understand its causes and contain its damage, making a case against the use of mainstream neoclassical economic models. Papers discuss the ordinary economics of an extraordinary crisis; whether Ben Bernanke's "creditorism" aggravated the financial crisis of 2008; toward a new sustainable economy; looking at the crisis through Karl Marx; incentive divergence and the global financial crisis; the microeconomic foundations of macroeconomic disorder--an Austrian perspective on the Great Recession of 2008; the crisis in economic theory--the dead end of Keynesian economics; the coming depression and the end of economic delusion; reflections on the global financial crisis; an Islamic economic perspective on the global financial crisis; bankers gone wild--the crash of 2008; the governance of financial transactions; excess debt and asset deflation; an institutionalist perspective on the global financial crisis; and Hyman Minsky, the global money-manager crisis, and the return of big government.

2011	D86	Wren-Lewis, Simon. 2011. "Internal Consistency, Price Rigidity and the Microfoundations of Macroeconomics." <i>Journal of Economic Methodology</i>, 18(2): 129-46. Macromodels based on microfoundations represent the dominant approach in macroeconomics. These models appear to adopt a clear methodological approach, which promotes internal consistency above external consistency as a necessary condition of admissibility. This paper develops two arguments. The first is that internal consistency makes the development of microfounded macromodels dependent on the pace of theoretical innovation. This had led to an internal debate between 'pragmatists' who argue for limited departures from internal consistency, and 'purists' who claim that this would compromise methodological integrity. The second argument is directly relevant to this debate. It is that the inclusion of price rigidity into these models via short-cuts like Calvo contracts has required a key modification of the microfoundations methodology, such that internal consistency can only be claimed indirectly by appeal to theory developed elsewhere. This modification has repercussions that imply that the microfoundations project is not as unblemished as the 'purists' imagine.
2011	G17	Ross, Stephen A. 2011. <i>The Recovery Theorem</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 17323. We can only estimate the distribution of stock returns but we observe the distribution of risk neutral state prices. Risk neutral state prices are the product of risk aversion--the pricing kernel--and the natural probability distribution. The Recovery Theorem enables us to separate these and to determine the market's forecast of returns and the market's risk aversion from state prices alone. Among other things, this allows us to determine the pricing kernel, the market risk premium, the probability of a catastrophe, and to construct model free tests of the efficient market hypothesis.
2012		
2012	I25	Restuccia, Diego, and Guillaume Vandenbroucke. 2012. <i>A Century of Human Capital and Hours</i>. University of Toronto, Department of Economics, Working Papers. An average person born in the United States in the second half of the nineteenth century completed 7 years of schooling and spent 58 hours a week working in the market. By contrast, an average person born at the end of the twentieth century completed 14 years of schooling and spent 40 hours a week working. In the span of 100 years, completed years of schooling doubled and working hours decreased by 30 percent. What explains these trends? We consider a model of human capital and labor supply to quantitatively assess the contribution of exogenous variations in productivity (wage) and life expectancy in accounting for the secular trends in educational attainment and hours of work. We find that the observed increase in wages and life expectancy account for 80 percent of the increase in years of schooling and 88 percent of the reduction in hours of work. Rising wages alone account for 75 percent of the increase in schooling and almost all the decrease in hours in the model, whereas rising life expectancy alone accounts for 25 percent of the increase in schooling and almost none of the decrease in hours of work. In addition, we show that the mechanism emphasized in the model is consistent with other trends at a more disaggregate level such as the reduction in the racial gap in schooling and the decrease in the cross-sectional dispersion in hours.
2012	O43	Restuccia, Diego, and Richard Rogerson. 2012. <i>Misallocation and Productivity</i>. University of Toronto, Department of Economics, Working Papers. A large portion of differences in output per capita across countries is explained by differences in total factor productivity (TFP). In this article, we summarize a recent literature--and the articles in this special issue on misallocation and productivity--that focus on the reallocation of factors across heterogeneous production units as an important source of measured TFP differences across countries.

2013	F47	Foure, Jean, Agnes Benassy-Quere, and Lionel Fontagne. 2013. "Modelling the World Economy at the 2050 Horizon." <i>Economics of Transition</i>, 21(4): 617-54. Economic analysis is increasingly addressing long-term issues (such as global warming) that require a dynamic baseline for the world economy. In this article, we develop a three-factor (capital, energy, labour) macroeconomic (MaGE--Macroeconometrics of the Global Economy) model, and project growth for 147 countries to 2050. We improve on the literature by the following: (i) accounting for the energy constraint through dynamic modelling of energy productivity, (ii) modelling female participation rates consistent with education catch-up, (iii) departing from the assumptions of either a closed economy or full capital mobility (by applying a Feldstein-Horioka type relationship between saving and investment rates), and (iv) offering a fully consistent treatment of the Balassa-Samuels effect. These innovative features have a sizeable impact on projected GDP.
2013	Q50	Barro, Robert J. 2013. <i>Environmental Protection, Rare Disasters, and Discount Rates</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 19258. Extremely low discount rates play a central role in the Stern Review's evaluation of environmental protection, and this assumption has been criticized by many economists. The Review also stresses that great uncertainty is a critical element for optimal environmental policies. An appropriate model for this policy analysis requires sufficient risk aversion and fat-tailed uncertainty to get into the ballpark of explaining the observed equity premium. A satisfactory framework, based on Epstein-Zin/Weil preferences, also separates the coefficient of relative risk aversion (important for results on environmental investment) from the intertemporal elasticity of substitution for consumption (which matters little). Calibrations based on existing models of rare macroeconomic disasters suggest that optimal environmental investment can be a significant share of GDP even with reasonable values for the rate of time preference and the expected rate of return on private capital. The key parameters, yet to be pinned down, are the proportionate effect of environmental investment on the probability of environmental disaster and the baseline probability of environmental disaster.
2013	Q50 Y10	World Bank. 2013. <i>The Little Green Data Book 2013</i>, Washington, D.C.: World Bank. Pocket-sized booklet of key environment and development indicators, with a special focus on Adjusted Net Savings. Based on World Development Indicators 2013. Includes a world table; regional tables; income-group tables; and country tables of indicators relating to agriculture, forests and biodiversity, oceans, energy and emissions, water and sanitation, environment and health, and national accounting aggregates--savings, depletion, and degradation.

2007	D01	Yoshii, Satoshi. 2007. "A Study on Changes in the Composition of Output—An Alternative Consumption Theory in Terms of Multiple-Self." <i>Evolutionary and Institutional Economics Review</i> , 4(1): 171-80. In a Reproduction System, consumer behavior that is so complicated and depends on individual habits, social conventions, institutions, and neighbors' behavior is put into the Black Box. This paper presents an alternative consumption theory in terms of Multiple-self that describes a conflict between the roles which individuals bear in a society, and attempts to explain economic effects such as Veblen effects and some elasticity of demand for households, without using marginal utility theory.
2007	D74	Purificato, Francesco. 2007. "Il conflitto politico tra capitalisti e lavoratori in un modello neokaleckiano di crescita e distribuzione del reddito. (The Political Conflict between Capitalists and Workers in a Neokaleckian Model of Growth and Income Distribution. With English summary)." <i>Studi Economici</i> , 62(93): 95-111. The paper aims to analyse the impact on the economy of the fiscal policy affected by the political conflict between capitalists and workers. In the short run this conflict rises because the social classes compete for not bearing the costs connected with the public expenditure and for appropriate of its benefit. The paper shows the necessary conditions such that a fiscal policy aimed to promote the capitalists' interest or the workers' interest determines positive or negative effect on the demand level and the capital accumulation.
2007	N93	Petith, Howard. 2007. <i>Neoliberalismo Europeo y la Transición Española Vista desde el Enfoque de Clase y Explotación</i> . Unitat de Fonaments de l'Anàlisi Econòmica (UAB) and Institut d'Anàlisi Econòmica (CSIC), UFAE and IAE Working Papers. Recientemente, ha aparecido en la corriente principal de la economía, un nuevo enfoque que se expresa en términos de clase y explotación y que se basa en un modelo analítico complejo y sofisticado. El objetivo de este artículo es exponer dos ejemplos de este enfoque de forma simplificada y demostrar como explican la tendencia neoliberal reciente de la Unión Europea y la transición Española desde la dictadura hacia la democracia.
2008		

Year	DE	Title and Abstract
2008	D10	Geanakoplos, John. 2008. <i>Overlapping Generations Models of General Equilibrium</i>. Cowles Foundation, Yale University, Cowles Foundation Discussion Papers: 1663. The OLG model of Allais and Samuelson retains the methodological assumptions of agent optimization and market clearing from the Arrow-Debreu model, yet its equilibrium set has different properties: Pareto inefficiency, indeterminacy, positive valuation of money, and a golden rule equilibrium in which the rate of interest is equal to population growth (independent of impatience). These properties are shown to derive not from market incompleteness, but from lack of market clearing "at infinity;" they can be eliminated with land or uniform impatience. The OLG model is used to analyze bubbles, social security, demographic effects on stock returns, the foundations of monetary theory, Keynesian vs. real business cycle macromodels, and classical vs. neoclassical disputes.
2008	D84	Crocco, Marco A. 2008. "Technical Change and Formation of Expectations." <i>Metroeconomica</i>, 59(2): 276-304. The aim of this paper is to discuss the implications for the process of expectation formation as developed by Keynes and the Post-Keynesians when technical change (as understood by the Evolutionary and Institutional school of thought) is taken into account. The claim made here is that the traditional division of expectations in short and long period is insufficient to deal with all features of technical change, and thus, a new type of expectations (medium-period) is proposed. Moreover, it is claimed that the independence among different types of expectations cannot stand when medium-period expectations are taken into account.
2008	G30 J01	Peralta, Nacho Alvarez, and Bibiana Medialdea Garcia. 2008. <i>Financial Globalization and Labor: Employee Shareholding or Labor Regression?</i>. Political Economy Research Institute, University of Massachusetts at Amherst, Working Papers. The authors review from a critical perspective the 'patrimonial capitalism' approach, as well as its analysis of wage-labor transformations in developed economies during the last thirty years. For this purpose, they take the economies of France and the United States as study cases. According to this approach, patrimonial financialization of working households has involved a radical transformation of the wage-labor nexus, paradigmatically exemplified by the concept of employee shareholding. The authors point out weaknesses of this approach, theoretical as well as empirical. Furthermore, they focus on an alternative interpretation that characterizes the nature of wage-labor nexus transformation in the French and U.S. economies as a wage adjustment. This wage adjustment is the result of the neoliberal policies developed to restore capital profitability after the crisis of the 1970s, and has caused an erosion of salary and social conquests attained by labor after the Second World War. Finances have acted as a lever of social reorganization among classes to achieve the objective of profitability recovery.
2008	G31 L25	Skott, Peter, and Soon Ryoo. 2008. "Macroeconomic Implications of Financialisation." <i>Cambridge Journal of Economics</i>, 32(6): 827-62. A growing literature suggests that 'financialisation' may weaken the performance of non-financial corporations and constrain the growth of aggregate demand. This paper uses two alternative approaches--one derived from Skott and one from Lavoie and Godley--and two different settings--a labour-constrained setting and a dual-economy setting--to evaluate some of the claims that have been made. Our analysis, which pays explicit attention to financial stock-flow relations, suggests that the qualitative effects of 'financialisation' are insensitive to the precise specification of household saving behaviour but depend critically on the labour market assumptions (labour-constrained versus dual) and the specification of the investment function (Harrodian versus Kaleckian).
2008	G32 G35	Charles, Sebastien. 2008. "Corporate Debt, Variable Retention Rate and the Appearance of Financial Fragility." <i>Cambridge Journal of Economics</i>, 32(5): 781-95. This paper develops a formal neo-Kaleckian model of growth and distribution with excess capacity. First, we deal with the stability and uniqueness of equilibrium in the short run and make some comparative static exercises. Then we show the long run behaviour of the model by endogenising the retention rate and the level of debt. Within that framework, we investigate the conditions for multiple equilibria and show the possibility of instability following a series of increases in the rate of interest or as a result of less prudent dividend policies on the part of firms.
2008	J01	THE SAME AS G30 Peralta, Nacho Alvarez, and Bibiana Medialdea Garcia. 2008. <i>Financial Globalization and Labor: Employee Shareholding or Labor Regression?</i>. Political Economy Research Institute, University of Massachusetts at Amherst, Working Papers.
2008	J51	Heise, Arne. 2008. "The Political Economy of Meritocracy: A Post-Kaleckian, Post-Olsonian Approach to Unemployment and Income Inequality in Modern Varieties of Capitalism." <i>Review of Radical Political Economics</i>, 40(1): 67-88. The "big trade-off," described by Arthur Okun some thirty years ago, is back again: equality or efficiency, or to put it differently, modern highly developed economies and societies have to choose between the Scylla of income inequality and the Charybdis of unemployment. Furthermore, it looks like the continental European economies--foremost Germany and France--sided with more egalitarian ends accepting higher unemployment while the liberal economies such as the United States and the United Kingdom chose higher inequality for lower unemployment. In this paper it is argued that the trade-off is not a supply-side necessity to maintain work effort in a situation of incomplete contracts, but is a politico-economic issue of particular interest groups seeking rents. However, unlike in Mancur Olson's seminal approach, it is not the trade unions that are forming distributional coalitions on the labor market, but rather the meritocracy which is happy to use Keynesian-type demand management to advance their material interests by pursuing a "meritocratically optimal rate of unemployment" (MORU).

2009		
2009	C63	CV: Dosi, Giovanni, Giorgio Fagiolo, and Andrea Roventini. 2009. "The Microfoundations of Business Cycles: An Evolutionary, Multi-agent Model." In <i>Schumpeterian Perspectives on Innovation, Competition and Growth</i>, ed. Uwe Cantner, Jean-Luc Gaffard and Lionel Nesta, 161-80. Dordrecht and New York: Springer.
2009	F32 F33	Palley, Thomas I. 2009. "Rethinking the Economics of Capital Mobility and Capital Controls." <i>Revista de Economia Politica/Brazilian Journal of Political Economy</i>, 29(3): 15-34. This paper reexamines the issue of international financial capital mobility, which is today's economic orthodoxy. Discussion is often framed in terms of the impossible trinity. That framing distorts discussion by representing capital mobility as having equal significance with sovereign monetary policy and control over exchange rates. It also distorts discussion by ignoring possibilities for coordinated monetary policy and exchange rates, and for managed capital flows. The case for capital mobility rests on neo-classical economic efficiency arguments and neo-liberal political arguments. The case against capital mobility is based on Keynesian macroeconomic inefficiency arguments, neo-Walrasian market failure arguments, and neo-Marxian arguments regarding distortion of the social structure of accumulation. Close examination shows the case for capital mobility to be extremely flimsy, pointing to the ideological dimension behind today's policy orthodoxy.

2009	G01	CV; Goldstein, Jonathan P. 2009. "Heterodox Macroeconomics and the Current Global Financial Crisis." In <i>Heterodox Macroeconomics: Keynes, Marx and Globalization</i> , ed. Jonathan P. Goldstein and Michael G. Hillard, 263-67. Routledge Advances in Heterodox Economics. London and New York: Taylor and Francis, Routledge.
2010		
2010	B50	Wray, L. Randall. 2010. "Money". Levy Economics Institute, The, Economics Working Paper Archive This paper advances three fundamental propositions regarding money: (1) As R. W. Clower (1965) famously put it, money buys goods and goods buy money, but goods do not buy goods. (2) Money is always debt; it cannot be a commodity from the first proposition because, if it were, that would mean that a particular good is buying goods. (3) Default on debt is possible. These three propositions are used to build a theory of money that is linked to common themes in the heterodox literature on money. The approach taken here is integrated with Hyman Minsky's (1986) work (which relies heavily on the work of his dissertation adviser, Joseph Schumpeter [1934]); the endogenous money approach of Basil Moore; the French-Italian circuit approach; Paul Davidson's (1978) interpretation of John Maynard Keynes, which relies on uncertainty; Wynne Godley's approach, which relies on accounting identities; the "K" distribution theory of Keynes, Michal Kalecki, Nicholas Kaldor, and Kenneth Boulding; the sociological approach of Ingham; and the chartalist, or state money, approach (A. M. Innes, G. F. Knapp, and Charles Goodhart). Hence, this paper takes a somewhat different route to develop the more typical heterodox conclusions about money.
2010	C22	Basu, Deepankar, and Panayiotis T. Manolacos. 2010. Is there a tendency for the rate of profit to fall? Econometric evidence for the U.S. economy, 1948-2007. University of Massachusetts Amherst, Department of Economics, Working Papers. The law of the tendential fall in the rate of profit has been at the center of theoretical and empirical debates within Marxian political economy ever since the publication of Volume III of Capital. An important limitation of this literature is the absence of a comprehensive econometric analysis of the behaviour of the rate of profit. In this paper, we attempt to fill this lacuna in two ways. First, we investigate the time series properties of the profit rate series. The evidence suggests that the rate of profit behaves like a random walk and exhibits "long waves" interestingly correlated with major epochs of U.S. economic history. In the second part, we test Marx's law of the tendential fall in the rate of profit with a novel econometric model that explicitly accounts for the counter-tendencies. We find evidence of a long-run downward trend in the general profit rate for the US economy for the period 1948-2007.
2010	F54 G28 L32	CV; Lapavitsas, Costas. 2010. "Systemic Failure of Private Banking: A Case for Public Banks." In <i>21st Century Keynesian Economics</i> , ed. Philip Arestis and Malcolm Sawyer, 162-201. International Papers in Political Economy Series. New York: St. Martin's Press, Palgrave Macmillan.
2010	N13 N15	Greif, Avner, and Guido Tabellini. 2010. Cultural and Institutional Bifurcation: China and Europe Compared. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 7648. How to sustain cooperation is a key challenge for any society. Different social organizations have evolved in the course of history to cope with this challenge by relying on different combinations of external (formal and informal) enforcement institutions and intrinsic motivation. Some societies rely more on informal enforcement and moral obligations within their constituting groups. Others rely more on formal enforcement and general moral obligations towards society at large. How do culture and institutions interact in generating different evolutionary trajectories of societal organizations? Do contemporary attitudes, institutions and behavior reflect distinct pre-modern trajectories?
2011		
2011	C61 Q54 Q57	Barkley Rosser, J., Jr. 2011. "Post Keynesian Perspectives and Complex Ecologic-Economic Dynamics." <i>Metroeconomica</i>, 62(1): 96-121. This paper considers the implications of complex ecologic-economic dynamics for three broad, Post Keynesian perspectives: the uncertainty perspective, the macrodynamics perspective and the Sraffian perspective. Catastrophic, chaotic, and other complex dynamics will be seen as reinforcing the conceptual foundations of Keynesian uncertainty. Predator-prey models will be seen as deeply linked to Post Keynesian macrodynamic models. Finally, certain cases in ecologic-economic systems will be seen as generating such Sraffian, capital theoretic conundra as reswitching. Ecologic-economic models considered besides predator-prey will include fisheries, forestry, lake dynamics, and global climatic-economic dynamics.
2011	E02 G18 G20	Wray, L. Randall. 2011. <i>Financial Keynesianism and Market Instability</i>. Levy Economics Institute, The, Economics Working Paper Archive. In this paper I will follow Hyman Minsky in arguing that the postwar period has seen a slow transformation of the economy from a structure that could be characterized as "robust" to one that is "fragile." While many economists and policymakers have argued that "no one saw it coming," Minsky and his followers certainly did! While some of the details might have surprised Minsky, certainly the general contours of this crisis were foreseen by him a half century ago. I will focus on two main points: first, the past four decades have seen the return of "finance capitalism"; and second, the collapse that began two years ago is a classic "Fisher-Minsky" debt deflation. The appropriate way to analyze this transformation and collapse is from the perspective of what Minsky called "financial Keynesianism"--a label he preferred over Post Keynesian because it emphasized the financial nature of the capitalist economy he analyzed.
2011	E02 G18 G20	Wray, L. Randall. 2011. <i>A Minskyan Road to Financial Reform</i>. Levy Economics Institute, The, Economics Working Paper Archive. In the aftermath of the global financial collapse that began in 2007, governments around the world have responded with reform. The outlines of Basel III have been announced, although some have already dismissed its reform agenda as being too little (and too late!). Like the proposed reforms in the United States, it is argued, Basel III would not have prevented the financial crisis even if it had been in place. The problem is that the architects of reform are working around the edges, taking current bank activities as somehow appropriate and trying to eliminate only the worst excesses of the 2000s. Hyman Minsky would not be impressed. Before we can reform the financial system, we need to understand what the financial system does--or, better, what it should do. To put it as simply as possible, Minsky always insisted that the proper role of the financial system is to promote the "capital development" of the economy. By this he did not simply mean that banks should finance investment in physical capital. Rather, he was concerned with creating a financial structure that would be conducive to economic development to improve living standards, broadly defined. In this paper, we first examine Minsky's general proposals for reform of the economy--how to restore stable growth that promotes job creation and rising living standards. We then turn to his proposals for financial reform. We will focus on his writing in the early 1990s, when he was engaged in a project at the Levy Economics Institute on reconstituting the financial system (Minsky 1992a, 1992b, 1993, 1996). As part of that project, he offered his insights on the fundamental functions of a financial system. These thoughts lead quite naturally to a critique of the financial practices that precipitated the global financial crisis, and offer a path toward thorough-going reform.

Year	DE	Title and Abstract
2011	F34	Porcile, Gabriel, Alexandre Souza, and Ricardo Viana. 2011. "Metas de inflacao, taxa de cambio real e crise externa num modelo kaleckiano. (Inflation Target, Real Exchange and External Crisis in a Kaleckian Model. With English summary.)." <i>Revista de Economia Politica/Brazilian Journal of Political Economy</i> , 31(4): 579-93. Which role should the real exchange rate play in an inflation target regime? In this paper this point is discussed from the point of view of the conditions required for avoiding an external crisis. With this objective, a dynamic Kaleckian model is presented focusing on the stability of the external debt to capital ratio. The main conclusion is that policy makers should monitor closely the evolution of the real exchange rate in order to make the inflation target regime compatible with external stability.
2011	G18	THE SAME AS E02 Wray, L. Randall. 2011. <i>Financial Keynesianism and Market Instability</i> . Levy Economics Institute, The, Economics Working Paper Archive.
2011	G18	THE SAME AS E02 Wray, L. Randall. 2011. <i>A Minskyan Road to Financial Reform</i> . Levy Economics Institute, The, Economics Working Paper Archive.
2011	G18 G20	Wray, L. Randall. 2011. "Minsky's Money Manager Capitalism and the Global Financial Crisis". Levy Economics Institute, The, Economics Working Paper Archive. The world's worst economic crisis since the 1930s is now well into its third year. All sorts of explanations have been proffered for the causes of the crisis, from lax regulation and oversight to excessive global liquidity. Unfortunately, these narratives do not take into account the systemic nature of the global crisis. This is why so many observers are misled into pronouncing that recovery is on the way-or even under way already. I believe they are incorrect. We are, perhaps, in round three of a nine-round bout. It is still conceivable that Minsky's "it"-a full-fledged debt deflation with failure of most of the largest financial institutions-could happen again. Indeed, Minsky's work has enjoyed unprecedented interest, with many calling this a "Minsky moment" or "Minsky crisis." However, most of those who channel Minsky locate the beginnings of the crisis in the 2000s. I argue that we should not view this as a "moment" that can be traced to recent developments. Rather, as Minsky argued for nearly 50 years, we have seen a slow realignment of the global financial system toward "money manager capitalism." Minsky's analysis correctly links postwar developments with the prewar "finance capitalism" analyzed by Rudolf Hilferding, Thorstein Veblen, and John Maynard Keynes-and later by John Kenneth Galbraith. In an important sense, over the past quarter century we created conditions similar to those that existed in the run-up to the Great Depression, with a similar outcome. Getting out of this mess will require radical policy changes no less significant than those adopted in the New Deal.
2011	G20	THE SAME AS E02 Wray, L. Randall. 2011. <i>Financial Keynesianism and Market Instability</i> . Levy Economics Institute, The, Economics Working Paper Archive.

2011	G38	Wray, L. Randall. 2011. "Lessons We Should Have Learned from the Global Financial Crisis but Didn't". Levy Economics Institute, The, Economics Working Paper Archive. In this paper, I first quickly recount the causes and consequences of the global financial crisis (GFC). Of course, the triggering event was the unfolding of the subprime crisis; however, I argue that the financial system was already so fragile that just about anything could have caused the collapse. I then move on to an assessment of the lessons we should have learned. Briefly, these include: (a) the GFC was not a liquidity crisis, (b) underwriting matters, (c) unregulated and unsupervised financial institutions naturally evolve into control frauds, and (d) the worst part is the cover-up of the crimes. I argue that we cannot resolve the crisis until we begin going after the fraud. Finally, I outline an agenda for reform, along the lines suggested by the work of Hyman P. Minsky.
2011	J68 R23	Chakrabarti, Saumya. 2011. "A Macroeconomic Structure of Employment: Rural-Urban Conflict in a Kaleckian Framework." <i>Review of Radical Political Economics</i> , 43(2): 172-97. Faced with the phenomenon of "jobless growth" and to contain the vast "surplus population" the governments of the developing world have taken up measures to manage poverty and social security outside the sphere of accumulation-led growth in the "urban-modern" sector especially through "rural" employment generation. Many researchers criticize such policies, as government expenditure supporting accumulation and growth of the urban sector is thought to be competitive with government financed rural employment creation. However, my assertion is that there is no demand-driven trade-off between these urban and rural employment generations. In fact, I propose a supply-side trade-off. The generic "food-supply-constraint" creates this rural-urban conflict. To investigate this phenomenon, first a Kaleckian macroeconomic framework is constructed, with which I examine the role of the government and that of the "food sector" in supporting accumulation in the modern sector and thereby generating urban employment. Subsequently, the issue of rural employment creation with the help of food surplus and through direct government intervention is considered. Finally, we arrive at the issue of the rural-urban conflict: the conflict between the effects of government involvement in accumulation-led urban employment generation and of direct government intervention through "development management" administering rural employment. However, I also propose a policy that could minimize such a contradiction.

2012		
2012	D14	Hein, Eckhard. 2012. "Finance-Dominated Capitalism, Re-distribution, Household Debt and Financial Fragility in a Kaleckian Distribution and Growth Model." <i>PSL Quarterly Review</i> , 65(260-263): 11-51. In a Kaleckian distribution and growth model with workers' debt we examine the short and long run effects of three stylized facts of "finance-dominated capitalism": a fall in animal spirits of the firm sector with respect to real investment in capital stock, re-distribution of income at the expense of the wage share, and increasing lending of rentiers to workers for consumption purposes. In particular, we specify the conditions for long-run stability of the workers' debt-capital ratio. We thus identify the threshold for this ratio to turn unstable causing increasing financial fragility and finally financial crisis due to systemic stock-flow or stock-stock dynamics.
2012	E64 O23	Panigo, Demian Tupac, and Pablo Ignacio Chena. 2012. "Regulationist Macro-models for Developing Countries: An Application to the Argentine New Development Pattern." <i>Revue de la Regulation</i> , 0(11). In this paper we present a regulationist structural macroeconomic model (RSMM) to develop economic forecasts and examine different policy outcomes in Argentina. RSMM main characteristics involve cumulative causation dynamics where income distribution, macroeconomic volatility, credit rationing

Year	DE	Title and Abstract
		and productive heterogeneity conjugates to obtain a new instrument to precisely examine key macroeconomic and social variables. Available empirical results indicate: 1) the existence of dynamic increasing returns to scale; 2) the relevance of income distribution for investment, tax collection and public expenditures; 3) the significant influence of macroeconomic volatility on employment generation; 4) the strong effect of investment (positive) on imports and domestic consumption (negative) on exports; and 5) that price dynamics depend on wages and demand factors but also (and predominantly) on external variables and income policies.
2012	E64	Cassetti, Mario. 2012. "Macroeconomic Outcomes of Changing Social Bargains: The Feasibility of a Wage-Led Open Economy Reconsidered." <i>Metroeconomica</i>, 63(1): 64-91. It has been argued, in neo-Kaleckian growth theory, that profit-led growth regimes are more likely in an open economy, at least in the short run. This paper reconsiders this question by developing a macroeconomic model for the medium run where distribution and inflation, caused by conflicting nominal income claims, influence growth. We show that the strict alternative between wage-led and profit-led growth is misguided, and that an expansion of real wages and employment is feasible when enduring incomes policies are established. Hindrance to these policies is reminiscent of the political opposition to permanent full employment envisaged by Kalecki.
2012	J33	Lima, Gilberto Tadeu. 2012. "A Neo-Kaleckian Model of Profit Sharing, Capacity Utilization and Economic Growth." <i>Metroeconomica</i>, 63(1): 92-108. This paper sets forth a Neo-Kaleckian model of capacity utilization and growth with distribution featuring a profit-sharing arrangement. While a given proportion of firms compensate workers with only a base wage, the remaining proportion do so with a base wage and a share of profits. Consistent with the empirical evidence, workers hired by profit-sharing firms have a higher productivity than their counterparts in base-wage firms. While a higher profit-sharing coefficient raises capacity utilization and growth irrespective of the distribution of compensation strategies across firms, a higher frequency of profit-sharing firms does likewise only if the profit-sharing coefficient is sufficiently high.
2012	N20	Wray, L. Randall. 2012. <i>Introduction to an Alternative History of Money</i>. Levy Economics Institute, The, Economics Working Paper Archive. This paper integrates the various strands of an alternative, heterodox view on the origins of money and the development of the modern financial system in a manner that is consistent with the findings of historians and anthropologists. As is well known, the orthodox story of money's origins and evolution begins with the creation of a medium of exchange to reduce the costs of barter. To be sure, the history of money is "lost in the mists of time," as money's invention probably predates writing. Further, the history of money is contentious. And, finally, even orthodox economists would reject the Robinson Crusoe story and the evolution from a commodity money through to modern fiat money as historically accurate. Rather, the story told about the origins and evolution of money is designed to shed light on the "nature" of money. The orthodox story draws attention to money as a transactions-cost-minimizing medium of exchange. Heterodox economists reject the formalist methodology adopted by orthodox economists in favor of a substantivist methodology. In the formalist methodology, the economist begins with the "rational" economic agent facing scarce resources and unlimited wants. Since the formalist methodology abstracts from historical and institutional detail, it must be applicable to all human societies. Heterodoxy argues that economics has to do with a study of the institutionalized interactions among humans and between humans and nature. The economy is a component of culture; or, more specifically, of the material life process of society. As such, substantivist economics cannot abstract from the institutions that help to shape economic processes; and the substantivist problem is not the formal one of choice, but a problem concerning production and distribution. A powerful critique of the orthodox story regarding money can be developed using the findings of comparative anthropology, comparative history, and comparative economics. Given the embedded nature of economic phenomenon in prior societies, an understanding of what money is and what it does in capitalist societies is essential to this approach. This can then be contrasted with the functioning of precapitalist societies in order to allow identification of which types of precapitalist societies would use money and what money would be used for in these societies. This understanding is essential for informed speculation on the origins of money. The comparative approach used by heterodox economists begins with an understanding of the role money plays in capitalist economies, which shares essential features with analyses developed by a wide range of Institutional, Keynesian, Post Keynesian, and Marxist macroeconomists. This paper uses the understanding developed by comparative anthropology and comparative history of precapitalist societies in order to logically reconstruct the origins of money.
2012	O23	THE SAME AS E64 Panigo, Demian Tupac, and Pablo Ignacio Chena. 2012. "Regulationist Macro-models for Developing Countries: An Application to the Argentine New Development Pattern." <i>Revue de la Regulation</i>, 0(11).
2012	O23 O24	Lopez G., Julio. 2012. "L'essor et le declin de la strategie economique keynesienne-structuraliste au Mexique. (Rise and Demise of the Structuralist-Keynesian Economic Strategy in Mexico. With English summary.)." <i>Revue de la Regulation</i>, 0(11). The aim of this paper is to study the proximate causes as well as the historical origins of the downfall of the Mexican "economic miracle", which took place approximately between 1950 and the mid-1970s. The author shares a view that holds that in the mid-1970s, Mexico's previous growth strategy faded, and sees the economic troubles as an expression of the exhaustion of that strategy. He shows how this economic exhaustion came about by considering the supply and demand limits to fast growth in an international context that deteriorated, especially when the import substitution strategy reached a relatively advanced stage. He then considers the relationship between economics and politics during the "miracle" period as well as in the following years, arguing that fast and stable growth also served as material support for an alliance between the upper classes and the political bureaucracy. Thus, the demise of the previous economic model also eroded the material and ideological framework that made possible or eased the class alliance built during the "miracle" years.
2013		
2013	B30	Bini, Piero. 2013. "The Italian Economists and the Crisis of the Nineteen-Seventies: The Rise and Fall of the "Conflict Paradigm"." <i>History of Economic Thought and Policy</i>, 2(1): 73-101. Between 1969 and the early nineteen-eighties a unique parabola took place in Italy that was both historical and theoretical. We are referring here to the birth, development and decline of a research project that had assumed Sraffa's book <i>Production of Commodities by Means of Commodities</i> as its basic reference. At the beginning of this debate, the characteristics of Sraffa's theory as an "open" scheme enabled it to produce a theoretical core having multiple derivations (both Keynesian and Marxian). In this system of scientific synergies a special role was played by the discussion concerning wages as "independent variable". The result was a meta-theoretical concept of wage as a price governed prevalently by social forces and power relations. We have called this complex research programme the "conflict paradigm". Successively the paper considers the reasons which, since the mid-seventies, started to corrode this compound doctrinaire alliance, first of all the intellectual disorientation caused by both the acute expressions of crisis in the second half of nineteen-seventies, and the criticism against the Sraffa's theory as an "open" scheme, as a factor that deprived the study of economics of the solid anchor of equilibrium analysis.
2013	H62	Fontana, Giuseppe, and Malcolm Sawyer. 2013. "Post-Keynesian and Kaleckian Thoughts on Ecological Macroeconomics." <i>European Journal of Economics and Economic Policies: Intervention</i>, 10(2): 256-67. This paper outlines an

Year	DE	Title and Abstract
		approach to ecological macroeconomics based on post-Keynesian and Kaleckian ideas. It views growth as demand-driven through investment, and focuses on the conflicts between that demand-driven growth rate, the growth of the effective labour force and the 'nature constrained' rate of growth. The paper argues that there will not be 'market forces' which will address those conflicts, and specifically to bring growth to an environmentally sustainable growth rate. The policy agenda which is suggested is wide ranging and it calls for appropriate fiscal policy and budget deficits.
2013	Q56 Q58	Chester, Lynne, and Joy Paton. 2013. "The Economic-Environment Relation: Can Post-Keynesians, Regulationists and Polanyians Offer Insights?" <i>European Journal of Economics and Economic Policies: Intervention</i> , 10(1): 106-21. As the environmental debate has intensified, post-Keynesians, Regulationists and Polanyians remain relatively silent. All treat time as historical, consider economic issues subordinate to politics and have plenty to say about growth, institutions, uncertainty, and path-dependent events. These concepts seem pertinent to understanding the economic-environment problematic. This article explores the 'environmental potential' of these three heterodox economic traditions. We examine the conception of nature underpinning each methodological approach and the ability of their key conceptual tools to explain the economic-environment relation. Methodological pluralism and a project driven by the neoclassical agenda, we posit, seriously weakens the possibility of a post-Keynesian-grounded coherent environmental perspective. On the other hand, the Regulationists and Polanyians provide cogent analytical frameworks to advance explanations of the economic-environment relation and the contemporary environmental challenge.

2006	B54	Austen, Siobhan, and Therese Jefferson. 2006. "Comparing Responses to Critical Realism." <i>Journal of Economic Methodology</i>, 13(2): 257-82. This article is a study of the response of two heterodox schools of economic thought to "new" philosophical ideas. Specifically, it considers the response within Post Keynesian and feminist economics to Tony Lawson's recent call for economists to pay greater attention to ontology and for economists to adopt research methods consistent with critical realism. Lawson's arguments were formally introduced to these schools over the space of a few years and continue to generate considerable discussion within their ranks. The focus of analysis in this article is on the debate about Lawson's ideas published in the leading journals associated with two schools of thought: The Journal of Post Keynesian Economics and Feminist Economics. The article contrasts the reception Lawson's ideas received in each of the two journals and suggests some reasons for these differences. It argues that some barriers to the adoption of new ideas exist in each school of thought and that this has implications for the direction and content of economic thought in heterodox schools.
2006	D52	Miller, Marcus, and Lei Zhang. 2006. <i>Fear and Market Failure: Global Imbalances and 'Self-insurance'</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 6000. Two key issues are examined in an integrated framework: the emergence of global imbalances and the precautionary motive for accumulating reserves. Standard models of general equilibrium would predict modest current account surpluses in the emerging markets if they face higher risk than the US itself. But, with pronounced Loss Aversion in Emerging Markets, their precautionary savings can generate substantial 'global imbalances', especially if there is an inefficient supply of global 'insurance'. A combination of fear and market failure generates imbalances as a general equilibrium outcome. In

Year	DE	Title and Abstract
		principle, lower real interest rates will ensure aggregate demand equals supply at a global level: but disequilibrium may result if the required real interest rate is negative. A precautionary savings glut appears to us to be a temporary phenomenon, however, destined for correction as and when adequate reserve levels are achieved. If the process of correction is triggered by 'Sudden Stop' on capital flows to the US, might this not lead to 'hard landing' that is forecast by several leading macroeconomists? When precautionary saving is combined with financial panic, history offers no guarantee of full employment.
2006	D52 D60	Dubey, Pradeep, and John Geanakoplos. 2006. <i>Money and Production, and Liquidity Trap</i> . Cowles Foundation, Yale University, Cowles Foundation Discussion Papers: 1574. We prove the existence of monetary equilibrium in a finite horizon economy with production. We also show that if agents expect the monetary authority to significantly decrease the supply of bank money available for short term loans in the future, then the economy will fall into a liquidity trap today.
2006	I21	Ouattara, Mama. 2006. "Croissance optimale et choc a apparition aleatoire. (Optimal Growth and Random Timing Shock. With English summary.)." <i>Economie Appliquee</i> , 59(2): 65-87. We present an optimal growth model in which, one of the production factors undergoes a shock which occurs randomly. To illustrate the interest of the problem under study, we make use of HIV/AIDS. We furthermore show that uncertainty impacts negatively the levels of the stock of capital and consumption as well as that of their rates. Furthermore, the paper examines the uncertainty effects on these variables in a state of competitive equilibrium with external effects.
2006	P30 Z13	Marangos, John. 2006. "Developing a Civilised Society in Transition Economies: The Post Keynesian Paradigm." <i>Journal of Socio-Economics</i> , 35(4): 660-81. A Post Keynesian paradigm of transition requires the exposition of what I define as primary elements: economic analysis; definition of a good society; speed; political structure; ideological structure and the role of initial conditions. The next step is to identify secondary elements, the desired changes with respect to: price liberalisation-stabilisation; privatisation; institutional structure; monetary policy and the financial system; fiscal policy; international trade and social policy. It is argued that Post Keynesianism clarifies the reasons why the orthodox model of transition implemented in transition economies was inappropriate and unsuccessful. The Post Keynesian recommendations would have resulted in a more sensible and successful transition.
2006	Q58	Sim, Nicholas C. S. 2006. "Environmental Keynesian Macroeconomics: Some Further Discussion." <i>Ecological Economics</i> , 59(4): 401-05. This paper extends the IS-LM-EE framework first formulated by Heyes (Heyes, A., 2000. A proposal for the greening of textbook macro: 'IS-LM-EE'. <i>Ecol. Econ.</i> 32, 1-7). In his model, exogenous fiscal or monetary shocks are needed so that the intersection of all three schedules is reached. Such independent adjustments are circumvented in this paper, which argues that a naturally adjusting process exists and formalizes this mechanism for the IS-LM-EE framework.
2006	Z13	THE SAME AS P30 Marangos, John. 2006. "Developing a Civilised Society in Transition Economies: The Post Keynesian Paradigm." <i>Journal of Socio-Economics</i> , 35(4): 660-81.
2007		
2007	D12	CV; Miles, David. 2007. "Modelling the Impact of Demographic Change upon the Economy." In <i>New Developments in the Economics of Population Ageing</i> , ed. John Creedy and Ross Guest, 360-95. Elgar Reference Collection. International Library of Critical Writings in Economics, vol. 202. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2007	E02	CV; Ferreira, Jesus, and Felipe Serrano. 2007. "New Institutions for a New Economic Policy." In <i>Money, Distribution and Economic Policy: Alternatives to Orthodox Macroeconomics</i> , ed. Eckhard Hein and Achim Truger, 141-57. New Directions in Modern Economics. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2007	N20	CV; Bellofiore, Riccardo, and Joseph Halevi. 2007. "You Can't Always Get What You Want: Why Europe Is Not Keynesian-Able While the US New Economy Is Driven by Financial Keynesianism." In <i>Euroland and the World Economy: Global Player or Global Drag?</i> , ed. Jorg Bibow and Andrea Terzi, 215-32. New York: St. Martin's Press, Palgrave Macmillan.
2007	O52	Lobejon Herrero, Luis Fernando. 2007. "Demanda, crecimiento economico e integracion monetaria: La experiencia italiana. (Demand, Economic Growth and Monetary Integration: The Italian Case. With English summary.)." <i>Revista de Economia Mundial</i> , 0(17): 175-94. Italy was among the most dynamic European countries during the first decades after the Second World War. Nowadays, however, its GDP growth is really low. This paper examines this experience, using a methodology connected with the Keynesian tradition, especially with some studies focused on the impact of exports on growth. A new econometric model based on this Keynesian framework shows that not only exports, but all exogenous components of demand have had an important effect on Italian economic evolution. It also shows that the controversial participation of Italy on the process of building up the European monetary integration might have had a negative impact on that evolution.
2007	Q41	Snowden, Brian. 2007. "The New Classical Counter-Revolution: False Path or Illuminating Complement?" <i>Eastern Economic Journal</i> , 33(4): 541-62. In this paper the author responds to Laurence Seidman's recent article, 'The New Classical Counter-Revolution: A False Path for Macroeconomics'. The author challenges the view that new classical macroeconomics has been a false path and provides a critique of Seidman's arguments with respect to his interpretation of the 1970s 'stagflation', the relevance of new classical macroeconomics for practical policymaking, the contribution of real business cycle theory, and the new classical content of contemporary macroeconomic textbooks. The author concludes that the new classical counter-revolution has had an extremely productive influence on the current mainstream new neoclassical synthesis framework.
2007	Q41	Seidman, Laurence S. 2007. "The New Classical Counter-Revolution: False Path or Illuminating Complement? Reply." <i>Eastern Economic Journal</i> , 33(4): 563-65. The picture of economic well-being depends crucially on how it is measured. We introduce a new measure of economic well-being that includes public consumption, income from wealth, and household production. The differences in scope and method between our measure and standard income lead to substantially different findings regarding economic well-being. The average U.S. household appears to be much better off in 2001 relative to 1989 according to our measure in comparison to money income. In contrast to official measures, our measure shows that racial disparity increased. The increase in measured inequality was higher than indicated by the official measures.
2007	Y30	Arnone, M. 2007. "Macroeconomia e Autorganizzazione: Un nuovo contributo [Review Article]. (With English summary.)." <i>Rivista Internazionale di Scienze Sociali</i> , 115(4). This discussion paper critically reviews a new book by Aoki and Yokishawa and presents some of the techniques adopted by the authors as a new approach to the foundations of macroeconomics. The paper discusses some of the main techniques of statistical mechanics relevant in this context, namely the Master Equation and the Polya Urn. The former is a key instrument for deriving some Keynesian results throughout the book, in particular the role of effective demand in stimulating the economy; additionally, it is used to assess the role and significance of uncertainty and to re-

Year	DE	Title and Abstract
		examine so-called "policy ineffectiveness", showing instead the positive contribution of an active economic policy. The Polya Urn is used to show demand saturation as a growth limiting factor and demand for new products as a growth-enhancing one, with the clear objective of linking the Keynesian principle of effective demand (short term) with a long-term growth theory.
2008		
2008	G01	Prascevic, Aleksandra. 2008. "The Return to Keynesianism in Overcoming Cyclical Fluctuations?" <i>Economic Annals</i>, 0(177): 30-58. The problems faced by the American economy in the second half of 2007, which intensified in 2008, have once again asked economic science, and even more so economic policy, questions relating to business cycles--the reasons for cyclical fluctuations, the character of business cycles and, naturally, economic policy measures that can be implemented to alleviate and overcome an economic recession. Since the 1970s, business cycle theories have been intensively developed--ranging from monetary theories, developed within monetarism and the first phase of New Classical Macroeconomics, to the real business cycle theory of New Classical Macroeconomics. Consequently, the triggers for the beginning of a cycle can be monetary (monetary theories) or real in the form of technological shocks (real business cycles). In essence economic policy conducted since the 1970s, has rejected the Keynesian explanations of the functioning of the economic system, and thus the policy of aggregate demand management. However, the measures that are now being implemented in the USA point to a return to Keynesianism. This refers, above all, to attempts to compensate for the inefficiency of monetary policy with fiscal expansion. All three psychological propensities (propensity to consume, propensity to invest and liquidity preference) in Keynes's theory and applied in Keynesian economic policy, are still the significant determinants of monetary and fiscal policies. The return to Keynesianism points to the depth of the crisis faced by the USA, but also confirms the vitality of Keynesian economics and affirms the view that--although Keynes wished to present his theory as being "general"--it is actually the theory of economic depression.
2008	G30	Orhangazi, Ozgur. 2008. "Keynesgil finansal duzenlemelerden finansallasmaya: Iktisat literaturu ve ABD ekonomisinin finansallasmasina tarihsel bir bakis. (From Keynesian Financial Regulations to Financialization: A Historical View to Literature and the Financialization of the US Economy. With English summary.)." <i>Middle East Technical University Studies in Development</i>, 35(1): 133-59. In the last twenty-twenty five years, the size and significance of financial markets, relations, institutions, and operations have enormously increased in all economies, especially in the US economy. Consequently, the current stage of capitalism is now defined by the concept of 'financialization,' which found its place next to the commonly used concepts of globalization and neoliberalism. This article analyzes the causes and consequences of the transition from the regulated financial system of the Keynesian accumulation era to the financialization process of today in the context of the US economy. It presents a historical perspective on the evolution of financialization and its proximate causes and implications for the nonfinancial corporations, while analyzing the empirical trends in the US economy.
2008	H21 H25	Fuster, Luisa, Ayse Imrohorglu, and Selahattin Imrohorglu. 2008. "Altruism, Incomplete Markets, and Tax Reform." <i>Journal of Monetary Economics</i>, 55(1): 65-90. We compute the welfare effects of different revenue-neutral tax reforms that eliminate capital income taxation in two general equilibrium models calibrated to the U.S. economy. In our dynamic model, the reform with the largest welfare gain is the one that eliminates all income taxation and increases the consumption tax to 35%; 75% of the population alive at the time of the reform benefit from it. Individuals use inter vivos transfers and bequests to redistribute the long-run benefits. In a pure life-cycle economy that lacks this redistribution technology, we find that the same reform would benefit only 9% of the population.
2008	H21 H25	Abraham, Arpad. 2008. "Comment On: "Altruism, Incomplete Markets, and Tax Reform" by Fuster, Imrohorglu and Imrohorglu." <i>Journal of Monetary Economics</i>, 55(1): 91-97.
2008	H77	Backhaus, Ursula. 2008. "Wilhelm Roepke's Focus on the Municipality." <i>Journal of Public Finance and Public Choice/Economia delle Scelte Pubbliche</i>, 26(2-3): 143-54. To Wilhelm Roepke 1899-1966], small circles are important for a humane economy and society. At the local level, the economic, social, and cultural interaction of people prevents the loss of traditions and civic values, and is an antidote to alienation from work, boredom, loneliness, crime, neglect of children, and other dangers of a modern mass society. Roepke's call for decentralization applies to the state aggregate level as well. While he is an advocate of decentralized architectural design of municipalities in order to fight pitfalls of modern mass society, he is also an advocate of decentralization in the design of economic policies in order to prevent political dictatorship. An example of his decentralized proposals are the German deficit-based recovery policies, which were designed under his guidance in the Brauns Commission [1930-1931]. In contrast to what Keynes had suggested, these policies have been designed as municipal policies, and not as centralized (aggregate) state policies.
2008	H87	Colciago, Andrea, Tiziano Ropele, V. Anton Muscatelli, and Patrizio Tirelli. 2008. "Global Economic Imbalances: Prospects and Remedies: The Role of Fiscal Policy in a Monetary Union: Are National Automatic Stabilizers Effective?" <i>Review of International Economics</i>, 16(3): 591-610. We assess the role of national fiscal policies, as automatic stabilizers, within a monetary union. We use a two-country New Keynesian DSGE model, incorporating non-Ricardian consumers and a home bias in national consumption. Fiscal policy directly stabilizes non-Ricardian agents' consumption. By doing so it contributes to the reduction in the volatility of variables such as output, wage inflation, and real interest rates. Our analysis of country-specific shocks does not suggest potential inter-country conflicts (as long as policies are constrained within the automatic stabilizers framework). However, we detect a potential conflict between the two consumer groups, because fiscal policy may raise optimizing agents' consumption volatility.
2008	J61	Bentolila, Samuel, Juan J. Dolado, and Juan F. Jimeno. 2008. "Does Immigration Affect the Phillips Curve? Some Evidence for Spain." <i>European Economic Review</i>, 52(8): 1398-1423. The Phillips curve has flattened in Spain over 1995-2006: unemployment has fallen by 15 percentage points, with roughly constant inflation. This change has been much more pronounced than elsewhere. We argue that this stems from the immigration boom in Spain over this period. We show that the New Keynesian Phillips curve is shifted by immigration if natives' and immigrants' labor supply elasticities and bargaining power differ. Estimation of this curve for Spain indicates that the fall in unemployment since 1995 would have led to an annual increase in inflation of 2.5 percentage points if it had not been largely offset by immigration.
2008	L26	CV; Richardson, Colin, and Jerry Courvisanos. 2008. "Modeling Keynes with Kalecki." In <i>Keynes and Macroeconomics after 70 Years: Critical Assessments of The General Theory</i>, ed. L. Randall Wray and Mathew Forstater, 99-122. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2008	L71 Q43	Dib, Ali. 2008. "Oil Prices, U.S. Dollar Fluctuations, and Monetary Policy in a Small Open Oil Exporting Economy." <i>Les Cahiers du CREAD</i>, 0(85-86): 5-44. We develop a New-Keynesian model of a small, open oil-exporting economy to quantify the dynamic effects of oil price and U.S. dollar fluctuations. Two alternative monetary policies are considered: Taylor-type and money supply rules. Oil, priced in the U.S. dollar, is the only commodity to export and the country borrows and mainly imports in terms of the

Year	DE	Title and Abstract
		euro. The country is, therefore, facing two exchange rates: The euro/U.S. dollar and U.S. dollar/Algerian dinar. Simulation results suggest that depreciations of the U.S. dollar have implied large country's terms of trade and current account deteriorations, because of external debt valuation, interest payments, and import prices. However, parallel increases in oil prices have offset these negative effects and led to large improvement of the country's net debt position and current account. Moreover, monetary authority may successfully manage the value of its currency and/or adjust the short-run nominal interest rate to isolate the Algerian economy from these external shocks.
2008	O21	CV ; Gala, Paulo. 2008. "Real Exchange Rate Levels, Investment and Growth: A Keynesian Perspective." In <i>Keynes and Macroeconomics after 70 Years: Critical Assessments of The General Theory</i> , ed. L. Randall Wray and Mathew Forstater, 234-44. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2008	Q43	THE SAME AS L71 Dib, Ali. 2008. "Oil Prices, U.S. Dollar Fluctuations, and Monetary Policy in a Small Open Oil Exporting Economy." <i>Les Cahiers du CREAD</i> , 0(85-86): 5-44.
2009		
2009	A23	Heer, Burkhard, and Alfred Maussner. 2009. <i>Dynamic General Equilibrium Modeling: Computational Methods and Applications</i> , Second edition. Berlin and Heidelberg: Springer. Revised and expanded second edition of a graduate or advanced undergraduate textbook examines how to compute dynamic general equilibrium models. Discusses basic models; perturbation methods; the deterministic extended path; discrete state space methods; parameterized expectations; projection methods; computation of stationary distributions; dynamics of the distribution function; deterministic overlapping generations models; stochastic overlapping generations models; numerical methods; and various other tools. Includes end-of-chapter exercises.
2009	B30	Ponsot, Jean-Francois, and Sergio Rossi, eds. 2009. <i>The Political Economy of Monetary Circuits: Tradition and Change in Post-Keynesian Economics</i> , New York: St. Martin's Press, Palgrave Macmillan. Ten papers offer a modern approach to monetary macroeconomics that is deeply rooted in the post-Keynesian tradition outside mainstream economics. Papers discuss circuit theory supplementing John Maynard Keynes's genuine analysis of the monetary economy of production (Claude Gnos); bridging the gap between monetary circuit theory and post-Keynesian monetary theory (Jesper Jespersen); monetary circuit theory and money emissions (Sergio Rossi); the existence of profits within the monetary circuit--some unanswered questions revisited (Louis-Philippe Rochon); saving, firms' self-financing, and fixed capital formation in the monetary circuit (Jean-Luc Bailly); finance and the realization problem in Rosa Luxemburg--a "circuitist" reappraisal (Riccardo Bellofiore and Marco Passarella); money, capital turnover, and the leisure class--Thorstein Veblen's tips for a monetary theory of production (Guglielmo Forges Davanzati and Riccardo Realfonzo); from Wicksell to Keynes--some thoughts on the role of a central bank in the tradition of monetary circuit theory (Stefano Figuera); the dynamics of the monetary circuit (Steve Keen); and the financialization of modern economies in monetary circuit theory (Marc Pilkington).
2009	C13 C20 C30	Moon, Hyungsik Roger, and Frank Schorfheide. 2009. "Estimation with Overidentifying Inequality Moment Conditions." <i>Journal of Econometrics</i> , 153(2): 136-54. This paper derives limit distributions of empirical likelihood estimators for models in which inequality moment conditions provide overidentifying information. We show that the use of this information leads to a reduction of the asymptotic mean-squared estimation error and propose asymptotically uniformly valid tests and confidence sets for the parameters of interest. While inequality moment conditions arise in many important economic models, we use a dynamic macroeconomic model as a data generating process and illustrate our methods with instrumental variable estimators of monetary policy rules. The results obtained in this paper extend to conventional GMM estimators.
2009	C44	Dennis, Richard, Kai Leitemo, and Ulf Soderstrom. 2009. "Methods for Robust Control." <i>Journal of Economic Dynamics and Control</i> , 33(8): 1604-16. Robust control allows policymakers to formulate policies that guard against model misspecification. The principal tools used to solve robust control problems are state-space methods [see Hansen, L. P., Sargent T. J., 2008. Robustness. Princeton University Press; Giordani, P., Soderlind, P., 2004. Solution of macromodels with Hansen-Sargent robust policies: some extensions. <i>Journal of Economic Dynamics and Control</i> 28 (12), 2367-2397]. In this paper, we show that the structural-form methods developed by Dennis [2007. Optimal policy rules in rational-expectations models: new solution algorithms. <i>Macroeconomic Dynamics</i> 11 (1), 31-55] to solve control problems with rational expectations can also be applied to robust control problems, with the advantage that they bypass the task, often onerous, of having to express the reference model in state-space form. In addition, we show how to implement two different timing assumptions with distinct implications for the robust policy and the economy. We apply our methods to a New Keynesian Dynamic Stochastic General Equilibrium model and find that robustness has important effects on policy and the economy.
2009	D14	Charpe, Matthieu, Peter Flaschel, Christian Proano, and Willi Semmler. 2009. "Overconsumption, Credit Rationing and Bailout Monetary Policy: A Minskyan Perspective." <i>Intervention: European Journal of Economics and Economic Policies</i> , 6(2): 247-70. We consider a Keynes-Goodwin model of effective demand and the distributive cycle where workers purchase goods and houses with a marginal propensity significantly larger than one. They therefore need credit, supplied from asset holders, and have to pay interest on their outstanding debt. In this initial situation, the steady state is attracting, while a marginal propensity closer to one makes it repelling. The stable excessive overconsumption case can easily turn from a stable boom to explosiveness and from there through induced processes of credit rationing into a devastating bust. In such a situation the central bank may prevent the worst by acting as creditor of last resort, purchasing loans where otherwise debt default (and bankruptcy regarding house ownership) would occur. This bail-out policy can stabilize the economy and also reduces the loss of homes of worker families.
2009	G24	Raines, J. Patrick, Heather R. Richardson, and Charles G. Leathers. 2009. "Where Bernanke Is Taking the Federal Reserve: A Post Keynesian and Institutional Perspective." <i>Journal of Post Keynesian Economics</i> , 31(3): 367-82. We develop a perspective on where Bernanke is taking the Federal Reserve by drawing from Paul Davidson's Post Keynesian analyses of the current financial crisis and the Federal Reserve as an effective market maker and Thorstein Veblen's perception that the Federal Reserve was supporting credit-inflation by large investment banks in the 1920s. New Deal legislation restricted the ability of investment banks to create credit-inflation and left the Federal Reserve with only an indirect relationship with investment banks. Financial deregulation and financial derivatives resulted in a new and larger form of credit-inflation by underwriter-bank conglomerates. Bernanke's responses to the inevitable financial crisis are bringing the Federal Reserve into an even closer relationship with underwriter-bank conglomerates than Veblen envisioned.
2009	J16	Todorova, Zdravka. 2009. <i>Money and Households in a Capitalist Economy: A Gendered Post Keynesian-Institutional Analysis</i> , Cheltenham, U.K. and Northampton, Mass.: Elgar. Examines households in capitalist society, utilizing a combination of post-Keynesian, institutional, and gender analysis. Discusses the place of households in the post-Keynesian theory of monetary production; introducing gender in post-Keynesian economics; the move toward a gendered post-Keynesian-institutional analysis;

Year	DE	Title and Abstract
		institutional change, households, and the state; and social intelligence and households under capitalism--conclusions and further explanations.
2009	J20	Zanetti, Francesco. 2009. "Effects of Product and Labor Market Regulation on Macroeconomic Outcomes." <i>Journal of Macroeconomics</i> , 31(2): 320-32. This paper develops a New Keynesian model with labor search to investigate the effects of product and labor market regulation on macroeconomic outcomes. Product market regulation is proxied by the firm's price markup, and labor market regulation by the worker's bargaining power over the real wage. The results indicate that an increase in both types of regulation leads to a decline in macroeconomic fluctuations, and increases the importance of technology shocks in explaining movements in labor market tightness and employment.
2009	J65	Thomas, Carlos, and Francesco Zanetti. 2009. "Labor Market Reform and Price Stability: An Application to the Euro Area." <i>Journal of Monetary Economics</i> , 56(6): 885-99. Central bankers frequently suggest that labor market reform may be beneficial for inflation management. This paper investigates this topic by simulating the effects of reductions in firing costs and unemployment benefits on inflation volatility in the Euro Area, using an estimated New Keynesian model with search and matching frictions. Qualitatively, changes in labor market policies alter the volatility of inflation in response to shocks, by affecting the volatility of the three components of real marginal costs (hiring costs, firing costs, and wage costs). Quantitatively, we find, however, that neither policy is likely to have an important effect on inflation volatility, due to the small contribution of hiring and firing costs to inflation dynamics.
2009	M11 M31	Heim, John J. 2009. <i>Determinants Of Demand For Different Types Of Investment Goods</i> . Rensselaer Polytechnic Institute, Department of Economics, Rensselaer Working Papers in Economics. This paper compares the demand for the three individual components of aggregate investment demand: (1) demand by businesses for plant and equipment, (2) business inventory investment and (3) residential housing construction. The models tested are largely based on Keynesian theories of business investment demand, with some allowance for residential housing demand being more driven by Keynes' consumer demand variables. Other possible determinants of investment are also tested, including "crowd out" effects of government deficits on business investment and demographic effects on the residential construction market. Annual data for the U.S., 1960-2000, are tested using two stage least squares regression techniques modified to eliminate heteroskedasticity in the data. The models are estimated in "first differences", rather than levels of the data to reduce the effects of multicollinearity, non stationarity and autocorrelation. The models explain about 90% of the variance in plant and equipment demand, 85% of the variance in residential housing demand for and 67% of inventory demand. The results indicate that demand for each of these three types of investment goods is driven by different combinations of variables Business investment in plant and equipment appears determined by how much the overall economy is growing (the accelerator effect), the availability of credit (crowd out), the availability of depreciation reserves, the prime interest rate lagged three years, business profits and stock values lagged one year, and the effects of an exchange rate change over the four year period following the change. Inventory investment seems mainly determined by availability of depreciation reserves, crowd out, interest rates, unexpected changes in consumer demand and the accelerator. Residential construction demand seems mainly driven by disposable income, the effect of general growth in the economy on consumer spending (the accelerator), credit availability (crowd out), current year mortgage rates, and prior year consumer wealth levels.
2009	O13 Q48	Alarco Tosoni, German. 2009. "Impactos macroeconomicos de los precios de los energeticos en Mexico con un modelo de equilibrio general poskeynesiano. (Macroeconomic Impacts of Energy Prices in Mexico Using a Post-Keynesian General Equilibrium Model. With English summary.)" <i>Analisis Economico</i> , 24(56): 7-35. The study shows the elements of justification for current energy policy prices, which likely originated from the traditional adjustment programs aimed at improving the results of public and current account balances. An ad-hoc input-output matrix is developed for the oil, electricity, maquila export industries, and the other production activities, taking year 2003 as baseline. An impact assessment is also made for different price scenarios considering a post-Keynesian general equilibrium model. The article concludes that the relevance of macroeconomic impacts in price changes should promote the elimination of some of the current practices for others that could allow maximizing the contribution of the different productive sectors to economic growth.
2009	O18 R50	Menezes, Melissa Silva, and Marco Aurelio Crocco. 2009. "Sistemas de moeda local: Uma investigacao sobre seus potenciais a partir do caso do Banco Bem em Vitoria/ES. (Local Money Systems: An Investigation towards Its Potentialities Based on the Study of the Banco Bem in Vitoria, Brazil. With English summary.)" <i>Economia e Sociedade</i> , 18(2): 371-98. The aim of this paper is to investigate towards a relatively unexplored area: the local money systems (LMS), that are, in short, an agreement amongst the population of a community to use a mean of payment which is valid only in that particular space where they live. To achieve such objectives, it was made a survey of the existent national and international bibliography on this topic, an exercise of theorization based on the post-Keynesian theory and an exploratory study of a Brazilian case, the Banco Bem located in the city of Vitoria/ES. The goal was not to infer concluding results--which would be precipitate because of its early character--but to expand its understanding and to indicate its potentialities and limits.
2009	Q12	Elbers, Chris, Jan Willem Gunning, and Melinda Vigh. 2009. <i>Investment under Risk with Discrete and Continuous Assets</i> . Tinbergen Institute, Tinbergen Institute Discussion Papers: 09-054/2. This paper considers a general class of stochastic dynamic choice models with discrete and continuous decision variables. This class contains a variety of models that are useful for modeling intertemporal household decisions under risk. Our examples are drawn from the field of development economics. We formalize this class as a dynamic programming problem, then propose a solution method that relies on value function iteration. Finally, in an example we show how our algorithm can be applied to solve and estimate a dynamic model with discrete and continuous controls.

Year	DE	Title and Abstract
		origins in Kalecki offers a promising line of enquiry which is developed here. The paper identifies the principal differences between the Keynesian and Kaleckian approaches. The possibilities are explored of finding accommodation between the mainstream and Kaleckian approaches to the taxation of greenhouse gases. The macroeconomic implications of taxing greenhouse gases are identified. However, these may be thwarted by the emergence of "political aspects of innovation", akin to Kalecki's "political aspects of full employment". A Kaleckian balanced budget approach allied to fiscal incentives to innovate offers some prospect of common ground with the mainstream.

(Sustainable Development in a Post-Keynesian Perspective: Return to Basis of Eco-development. With English summary)." <i>Economie Appliquee</i> , 62(3): 221-44. While sustainable development is a unanimously accepted watchword today, we wish to show that the post-Keynesian school, even if it did not emphasize on environmental issues and, generally speaking, on sustainable development as such, has tools that make it relevant on this topic. Indeed, post-Keynesian sustainable development can be close to Sachs' eco-development, which is inspired by Kalecki. Thus, post-Keynesianism and eco-development share the same position related to economic growth. They meet, via the concept of radical uncertainty, on the importance of the precautionary principle. If the implications of the principle of effective demand seem to oppose them, these divergences can be easily overcome.

2009	R23	Pappa, Evi. 2009. "The Effects of Fiscal Shocks on Employment and the Real Wage." <i>International Economic Review</i> , 50(1): 217-44. We study the transmission of fiscal shocks in the labor market. We employ a structural VAR and base identification on the restrictions that shocks to government consumption, investment, and employment must raise output and deficits. These restrictions hold in both prototype Real Business Cycle (RBC) and New Keynesian models. Shocks to government consumption and investment increase real wages and employment contemporaneously, both at state level and in the aggregate. The dynamics in response to employment shocks are mixed: increases in government employment raise the real wage and total employment in the aggregate. However, in one third of the states they reduce total employment.
2009	R31	Stojanov, Dragoljub. 2009. "Keynes and Economic Crisis: Some Reconsiderations." <i>Zbornik Radova Ekonomskog Fakulteta u Rijeci: Casopis za Ekonomsku Teoriju i Praksu/Proceedings of Rijeka School of Economics: Journal of Economics and Business</i> , 27(2): 293-310. In this paper, we read Keynes's "General Theory of Employment, Interest and Money" from the point of view of the main causes of the economic crisis in general and particularly the present world economic crisis. We compare Keynes's approach to the crisis with the work of contemporary distinguished economists. We conclude that a drop of marginal efficiency of capital is the main cause of the economic crisis and depression, and that such a drop is an unavoidable consequence of functioning of a market capitalist economy. Such a view differs significantly from the deliberations of many economists who hold insufficient demand as the main cause of the crisis. We think that insufficient demand appears on the surface as a cause of the crisis. However, insufficient demand is just a consequence of a previously overheated economy faced with the drop of MEC. Consequently, a crisis cannot be prevented by expansive financial policy. Therefore it should come as a surprise that Keynes in the last year of his life retreated from his ideas expressed in "General Theory" and declared himself as not Keynesian any more (Hutchison, 1981). We

Year	DE	Title and Abstract
		think that major systemic--institutional as well as structural changes--need to be taken in the majority of developed economies in order to cope efficiently with present and future crisis.

2010	A14 L14 L66 M30 N80	Young, Andrew T., and Daniel Levy. 2010. <i>Explicit Evidence on an Implicit Contract</i> . Department of Economics, West Virginia University, Working Papers: 10-07] We offer the first direct evidence of an implicit contract in a goods market. The evidence we offer comes from the market for Coca-Cola. We demonstrate that the Coca-Cola Company left a substantial amount of written evidence of its implicit contract with its consumers--a very explicit form of an implicit contract. The contract represented the promise of a five cent (nominal) price and adherence to the "Secret Formula". In general, the implicit nature of such contracts makes observation difficult. To overcome this difficulty, we adopt a narrative approach. Based on the analysis of a large number of historical documents obtained from the Coca-Cola Archives and other sources, we offer evidence of the Coca-Cola Company both acknowledging and acting on this implicit contract. We also make another unique contribution by exploring quality as a margin of adjustment available to Coca-Cola. The implicit contract included a promise not only of a constant nominal price but also a constant quality (i.e., 6.5 oz. of the Secret Formula). During a period of over 70 years, we find evidence of only a single case of true quality change. By studying the margin of adjustment the Coca-Cola Company chose in response to changes in market conditions, we demonstrate that the perceived costs of breaking the implicit contract were large. We argue that one piece of direct evidence on the magnitude of these costs is the aftermath "New Coke's" introduction in 1985.
2010	C50	Heim, John J. 2010. <i>Do Government Deficits Crowd Out Consumer And Investment Spending?</i> . Rensselaer Polytechnic Institute, Department of Economics, Rensselaer Working Papers in Economics. This paper econometrically tests whether deficits financed by government borrowing "crowd out" business and consumer spending reductions by reducing credit availability. To test the hypothesis, the government deficit variables are added to consumption and investment models to see if they increase explained variance, negatively impact consumption and investment spending, and are statistically significant. U.S. data for 1960-2000 is tested. A demand-driven econometric model, patterned after the work of Klein and Fair and containing eight behavioral equations is used to estimate crowd out effects. Demand models seemed appropriate because they, "provide the foundation of much of our current understanding of economic fluctuations "(Mankiw (2007), because demand fluctuations appear to have caused the recent economic crisis (Romer 2010), and because the fiscal policy prescriptions of demand models clearly lose some or all of their effectiveness if crowd out simultaneously reduces consumption and investment spending by reducing private credit. The findings indicate government deficits financed by borrowing systematically crowd out private consumption and investment spending. The findings also indicate that increases the savings components of M2 can offset part of this crowd out effect. Finally, consumption and investment functions with crowd out explanatory variables predict generally Keynesian "IS" curve coefficients model more accurately than models without them. The sign of the tax variable in actual econometric tests of IS curve was positive, contrary to predictions from no-crowd out Keynesian models The sign of the tax variable in the IS curve could only be accurately predicted from econometric estimates of consumption and investment equations containing crowd out. Findings for the government spending variable also showed crowd out markedly reduced its stimulus effect, in some model completely offsetting it.
2010	D03	Jefferson, Therese, and J. E. King. 2010. "Can Post Keynesians Make Better Use of Behavioral Economics?" <i>Journal of Post Keynesian Economics</i> , 33(2): 211-34. In recent decades, there has been a growth in economic research programs loosely described as behavioral economics. Despite calls for closer engagement between behavioral and Post Keynesian economics, the impact of behavioral economics on the Post Keynesian literature remains relatively limited. In this paper, we examine the nature of behavioral economics and the case made by those who claim or demonstrate that it can make a contribution to Post Keynesianism. We also consider why to date behavioral economics has had such a restricted effect. We conclude that there is scope for further successful engagement between behavioral economics and Post Keynesian economics if it is based on explicitly stated common ground, defined in terms of methodology.
2010	D03	Fung, Matthew V. 2010. "Comments on "Can Post Keynesians Make Better Use of Behavioral Economics?"." <i>Journal of Post Keynesian Economics</i> , 33(2): 235-49. The paper "Can Post Keynesians Make Better Use of Behavioral Economics?" argues that "there is scope for a successful engagement between behavioral economics and Post Keynesian economics if it is based on explicitly stated common ground defined in terms of methodology." That argument limits the ways Post Keynesians can engage with behavioral economics. I suggest that Post Keynesians should also engage with behavioral economics on a theoretical level and discuss some ways Post Keynesians have already done so.
2010	D03	Davidson, Paul. 2010. "Behavioral Economists Should Make a Turn and Learn from Keynes and Post Keynesian Economics." <i>Journal of Post Keynesian Economics</i> , 33(2): 251-54. This paper indicates that Keynes's General Theory provided many examples of actual behavior that differed from that predicted by classical theory--the mainstream economics of Keynes's time. This behavior included herd behavior in financial markets, the use of conventions, decisions made under uncertainty that differ from decisions made under probabilistic risk, and so forth. Recent MRI evidence by neural scientists indicates that different parts of the brain are involved when decisions are made under risk conditions (with probabilities of outcomes known) and uncertainty conditions (where no probabilities of outcomes are known). Keynes was the first behavioral scientist!
2010	D03	D'Orlando, Fabio, and Eleonora Sanfilippo. 2010. "Behavioral Foundations for the Keynesian Consumption Function." <i>Journal of Economic Psychology</i> , 31(6): 1035-46. This paper has two main goals. The first is to investigate the role that behavioral principles play in the micro-foundation of Keynes's consumption theory, the second to discuss the possibility of grounding a Keynesian-type aggregate consumption function on the basis of (some of) the principles underlying contemporary behavioral models.
2010	D22	Alexiou, Constantinos. 2010. "A Keynesian-Kaleckian Model of Investment Determination: A Panel Data Investigation." <i>Journal of Post Keynesian Economics</i> , 32(3): 427-43. The undertaken study purports to assess the empirical merits of the Post Keynesian doctrine as this is reflected by both the Keynesian as well as the Kaleckian theoretical approaches to investment determination. In doing so, a generalized method of moments panel data methodology provides the econometric platform upon which the respective models have been vigorously tested. Annual time-series data were used, spanning from 1970 to 2005, for the G7 economies. The generated evidence confirms previous analyses insofar as capacity utilization and profits assume a key role in the determination of investment.

2010	F37	Gupta, Rangan, and Alain Kabundi. 2010. "Forecasting Macroeconomic Variables in a Small Open Economy: A Comparison between Small- and Large-Scale Models." <i>Journal of Forecasting</i> , 29(1-2): 168-85. This paper compares the forecasting ability of five alternative types of models in predicting four key macroeconomic variables, namely, per capita growth rate, the CPI inflation, the money market rate, and the growth rate of the nominal effective exchange rate for the South African economy. Unlike the theoretical small open economy new Keynesian dynamic stochastic general equilibrium, the unrestricted VAR, and the small-scale Bayesian vector autoregressive models, which are estimated based on four variables, dynamic factor models and the large-scale BVAR models use information from a data-rich environment containing 266 macroeconomic time series observed over the period 1983:01 to 2002:04. The results, based on root mean square errors, for one- to eight-quarter-ahead out-of-sample forecasts over the horizon of 2003:01 to 2006:04, show that, except for the growth rate of the nominal effective exchange rate, large-scale BVARs outperform the other four types of models consistently and, generally, significantly.

2010	G35	Wei, Chao. 2010. "Inflation and Stock Prices: No Illusion." <i>Journal of Money, Credit, and Banking</i> , 42(2-3): 325-45. Campbell and Vuolteenaho (2004) use VAR results to advocate inflation illusion as the explanation for the positive association between inflation and dividend yields. Using a structural approach, we find that a fully rational dynamic general equilibrium model can generate a positive correlation between dividend yields and inflation as observed in the data. The paper describes a channel by which the technology shock moves both inflation and dividend yields in the same direction, resulting in a positive correlation between the two.
2010	H51 H75 I11	Narayan, Paresh Kumar. 2010. "Modelling Health and Output at Business Cycle Horizons for the USA." <i>Health Economics</i> , 19(7): 872-80. In this paper, we employ a theoretical framework--a simple macro model augmented with health--that draws guidance from the Keynesian view of business cycles to examine the relative importance of permanent and transitory shocks in explaining variations in health expenditure and output at business cycle horizons for the USA. The variance decomposition analysis of shocks reveals that at business cycle horizons permanent shocks explain the bulk of the variations in output, while transitory shocks explain the bulk of the variations in health expenditures. We undertake a shock decomposition analysis for private health expenditures versus public health expenditures and interestingly find that while transitory shocks are more important for private sector expenditures, permanent shocks dominate public health expenditures.

2011	B26	Sheng, Andrew. 2011. "Central Banking in an Era of Quantitative Easing". Levy Economics Institute, The Economics Working Paper Archive. This paper reviews the key insights of Hyman P. Minsky in arguing why finance cannot be left to free markets, drawing on the East Asian development experience. The paper suggests that Minsky's more complete stock-flow consistent analytical framework, by putting finance at the center of analysis of economic and financial system stability, is much more pragmatic and realistic compared to the prevailing neoclassical analysis. Drawing upon the East Asian experience, the paper finds that Minsky's analysis has a system-wide slant and correctly identifies Big Government and investment as driving employment and profits, respectively. Specifically, his two-price system can aid policymakers in correcting the systemic vulnerability posed by asset bubbles. By concentrating on cash-flow analysis and funding behaviors, Minsky's analysis provides the link between cash flows and changes in balance sheets, and therefore can help identify unsustainable Ponzi processes. Overall, his multidimensional analytical framework is found to be more relevant than ever in understanding the Asian crisis, the 2008 global financial crisis, and policymaking in the postcrisis world.
2011	B26	Labye, Agnes. 2011. "La crise financière actuelle: Une application du modèle de Minsky? (The Current Financial Crisis: An Application of Minsky Model? With English summary)." <i>Revue d'Economie Financière</i>, 0(102): 263-84. The currently observed turmoil in financial markets, which is believed to have been ignited by the collapse of the American subprime mortgage market, has recently brought to prominence the ideas of Hyman Minsky, member of the post-Keynesian school of economics. Many commentators are of the view that Minsky's framework of thinking accurately anticipated the current financial crisis. The key mechanism that pushes the economy towards a crisis is the accumulation of debt during the period of prosperity. So, the economy becomes more and more fragile. Financial innovations and deregulation in a context of globalisation are responsible of this situation. It's an important point of his analysis. It's an aspect of the "financial instability hypothesis" (FIH). Another aspect of FIH is that during good times, banks and other intermediaries try to lure investors to buy debt by means of sophisticated innovations. So the major role of financial intermediaries in a process of crisis is showed. Definitely, it's possible to show that the current crisis is an application of Minsky's model.
2011	B59	Kesting, Stefan. 2011. "What Is 'Green' in the Green New Deal—Criteria from Ecofeminist and Post-Keynesian Economics." <i>International Journal of Green Economics</i>, 5(1): 49-64. This article aims in general at further fulfilling the ambition of green economics to be a holistic paradigm synthesising and integrating a diverse set of heterodox economic approaches and philosophies. In particular, it addresses the current lack of macroeconomic and more specifically post-Keynesian short run theories in green economics. This new paradigm is in its essence a radical ecofeminist approach to economics. From this vantage point, the ecofeminist framework of (re)productivity developed by Biesecker and Hofmeister is indeed very congruent with green economics. Moreover, the goal of the article is to develop normative (ecofeminist) criteria for green stimulus packages. This could improve green economic policy formulation and real-world implementation [Turk, (2008), p.267].
2011	C14	Eusepi, Stefano, Bart Hobijn, and Andrea Tambalotti. 2011. "CONDI: A Cost-of-Nominal-Distortions Index." <i>American Economic Journal: Macroeconomics</i>, 3(3): 53-91. We construct a PCE-based price index whose weights minimize the welfare costs of nominal distortions: a cost-of-nominal-distortions index. We compute these weights in a multi-sector New Keynesian model, calibrated to match US data on price stickiness, labor shares, and inflation across sectors. The CONDI weights mostly depend on price stickiness. Moreover, CONDI stabilization leads to negligible welfare losses compared to the optimal policy and is better approximated by core rather than headline inflation targeting. An even better approximation can be obtained with an adjusted core index.
2011	C54	Aruoba, S. Boragan, and Frank Schorfheide. 2011. "Sticky Prices versus Monetary Frictions: An Estimation of Policy Trade-Offs." <i>American Economic Journal: Macroeconomics</i>, 3(1): 60-90. We develop a two-sector monetary model with a centralized and decentralized market. Activities in the centralized market resemble those in a standard New Keynesian economy with price rigidities. In the decentralized market, agents engage in bilateral exchanges for which money is essential. This paper is the first to formally estimate such a model, evaluate its fit based on postwar US data, and assess its money demand properties. Steady-state welfare calculations reveal that the distortions created by the monetary friction may be of similar magnitude as the distortions created by the New Keynesian friction.
2011	C68	Jaaskela, Jarkko P., and Kristoffer Nimark. 2011. "A Medium-Scale New Keynesian Open Economy Model of Australia." <i>Economic Record</i>, 87(276): 11-36. We estimate a new Keynesian open economy dynamic stochastic general equilibrium model of Australia with a large number of shocks, frictions and rigidities, matching a large number of observable time series. We find that both foreign and domestic shocks are important drivers of the Australian business cycle. We also find that the initial impact on inflation of an increase in demand for Australian commodities is negative, because of an improvement in the real exchange rate, although there is a persistent positive effect on inflation that dominates at longer horizons.
2011	C73	Soromenho, Jorge Eduardo de Castro, and Jaylson Jair da Silveira. 2011. "Desemprego e Flexibilidade de Salários em um Contexto Evolucionário. (Unemployment and Wage Flexibility in an Evolutionary Setting. With English summary)." <i>Estudos Economicos</i>, 41(2): 269-96. We make use of an evolutionary game approach to study the relation between wage flexibility and unemployment in an economy with decentralized wage bargains. In our model, labor unions pick a nominal wage out of a finite set with cardinality in each period, while firms choose employment levels that maximize their profits. We are able to show that: 1) the economy presents multiple equilibria, some are characterized by homogeneity of nominal wages (pure strategy equilibrium) and others by heterogeneity of nominal wages (mixed strategy equilibrium); 2) the medium-run equilibrium is selected by a social learning process, given by a replicator dynamics; and 3) the selected medium-run equilibrium may not be the full employment equilibrium.
2011	D02 J08	CV: Howell, David R. 2011. "Institutions, Aggregate Demand and Cross-Country Employment Performance: Alternative Theoretical Perspectives and the Evidence." 2011	E26	Figuera, Stefano. 2011. "Alcune considerazioni sullo Shadow Banking System. (Some Thoughts on the Shadow Banking System. With English summary)." <i>Studi Economici</i>, 66(104): 69-87. The financial intermediation system has been characterized by the emergence of new subjects and instruments modifying its organization. The development of the shadow banking system parallel to the traditional one has led to the demand, during the recent period of financial crisis, for a more efficient control to weather the growing systemic risk. This changing context leads the author to consider some essential profiles of the monetary nature of the capitalist economy. Specifically, a need is perceived to reinterpret recent events in the light of the credit nature of money and the endogenous character of its supply, aspects on which scholars of the Keynesian school have long focused their attention. The author considers particularly useful the indications deriving from the monetary production theory, especially with reference to the distinction among the various forms of financing, to understand such changes and adopt suitable strategies to handle them.

2011	E26	Forges Davanzati, Guglielmo. 2011. "Sussidi di disoccupazione ed economia sommersa: Un'analisi keynesiano-istituzionalista. (With English summary.)." <i>Studi e Note di Economia</i> , 16(3): 321-38. The aim of this paper is to analyse the role of social and moral norms in the underground economy, within a Keynesian-Institutionalist theoretical framework. In particular, it is shown that the existence of illegal behaviours can be explained in the light of the persistence of social and moral norms which constrain individual choices. Moreover, the effect of increased unemployment benefits in reducing the size of the underground economy is explored, and, on theoretical grounds, it is suggested that this increases aggregate demand and thus employment in the 'regular' sector, while also reducing the labour supply in the underground sector.
2011	F47	Herve, Karine, Nigel Pain, Pete Richardson, Franck Sedillot, and Pierre-Olivier Beffy. 2011. "The OECD's New Global Model." <i>Economic Modelling</i> , 28(1-2): 589-601. This paper provides a summary of the OECD's new global macroeconomic model, including an overview of model structure and a selection of simulations illustrating its main properties. Compared with its predecessors, the new model is more compact and regionally aggregated, but gives more weight to the focus of policy interests in global trade and financial linkages. The country model structures typically combine short-term Keynesian-type dynamics with a consistent long-run neo-classical supply-side. While retaining a conventional treatment of international trade and payments linkages, the model has a greater degree of stock-flow consistency, with explicit modelling of domestic and international assets, liabilities, and associated income streams. Account is also taken of the influence of financial and housing market developments on asset valuation and domestic expenditures via house and equity prices, interest rates, and exchange rates. As a result, the model gives more prominence to wealth and wealth effects in determining longer-term outcomes and the role of asset prices in the transmission of international shocks both to goods and financial markets.

2011	G38	Wray, L. Randall. 2011. " <i>Lessons We Should Have Learned from the Global Financial Crisis but Didn't</i> ". Levy Economics Institute, The, Economics Working Paper Archive. In this paper, I first quickly recount the causes and consequences of the global financial crisis (GFC). Of course, the triggering event was the unfolding of the subprime crisis; however, I argue that the financial system was already so fragile that just about anything could have caused the collapse. I then move on to an assessment of the lessons we should have learned. Briefly, these include: (a) the GFC was not a liquidity crisis, (b) underwriting matters, (c) unregulated and unsupervised financial institutions naturally evolve into control frauds, and (d) the worst part is the cover-up of the crimes. I argue that we cannot resolve the crisis until we begin going after the fraud. Finally, I outline an agenda for reform, along the lines suggested by the work of Hyman P. Minsky.
2011	H10 H40 H44	Wray, L. Randall. 2011. " <i>Keynes after 75 Years: Rethinking Money as a Public Monopoly</i> ". Levy Economics Institute, The, Economics Working Paper Archive. In this paper I first provide an overview of alternative approaches to money, contrasting the orthodox approach, in which money is neutral, at least in the long run; and the Marx-Veblen-Keynes approach, or the monetary theory of production. I then focus in more detail on two main categories: the orthodox approach that views money as an efficiency-enhancing innovation of markets, and the Chartalist approach that defines money as a creature of the state. As the state's "creature," money should be seen as a public monopoly. I then move on to the implications of viewing money as a public monopoly and link that view back to Keynes, arguing that extending Keynes along these lines would bring his theory up to date.
2011	H32	Edge, Rochelle M., and Jeremy B. Rudd. 2011. "General-Equilibrium Effects of Investment Tax Incentives." <i>Journal of Monetary Economics</i> , 58(6-8): 564-77. A new Keynesian model with a nominal tax system is developed and used to study the macroeconomic effects of temporary tax-based investment incentives. Two claims regarding the effects of these incentives are examined: first that they are overstated in partial-equilibrium frameworks; and second that repeated use of such incentives by policymakers can ultimately be destabilizing. The results contradict the first claim and imply that the second claim is not general. The model is also used to compute the predicted effects of an investment tax incentive that has figured prominently in recent fiscal stimulus packages.

2011	J26	Helppie McFall, Brooke. 2011. "Crash and Wait? The Impact of the Great Recession on the Retirement Plans of Older Americans." <i>American Economic Review</i> , 101(3): 40-44. This study uses data from pre- and post-crash surveys from the Cognitive Economics study to examine the impact of recent stock and labor market wealth losses on the planned retirement ages of older Americans. Regression estimates imply that the average wealth loss between July 2008 and May/June 2009 is associated with an increase in planned retirement age of approximately 2.5 months. Furthermore, pessimism about future stock market returns is found to amplify the impact of wealth losses on retirement timing.

2011	J40	Jarmolowicz, Wacław, and Magdalena Knapinska. 2011. "Labour Market Theories in Contemporary Economics." <i>Transformations in Business and Economics</i>, 10(2): 268-80. The subject of this article is a synthetic presentation, analysis, and evaluation of contemporary labour market theories, especially based on the achievements of the authors of the neo-classical and Keynesian schools. First, there is presented the genesis and main concepts of the traditional views and then the newest theories of the main stream of economy referring to the functioning of the labour market in developed countries are presented. Special attention is paid to the issue of work force mobility and flows. The review of chosen contemporary labour market theories has been conducted in three areas. The first one emphasizes mainly the structural and institutional factors as the ones causing unbalance on the labour market, which is exemplified by the segmentation theory. In the second one it is stressed that unbalance may be caused by interferences in long-term adjustment processes on the labour market, and which is presented in the human capital theory, natural rate of unemployment theory or the job search theory. The third area of discussion concerns the idea that unbalance on the labour market may result from the inflexibility of wage, which has been assumed in the efficient wage theory and in the insider-outsider theory.
2011	J60	Schmitt, John, and Kris Warner. 2011. <i>Deconstructing Structural Unemployment</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. Some economic observers argue "structural unemployment" has increased in the wake of the Great Recession, but in this paper we find little support for either of two arguments that suggest that structural unemployment has been on the rise. The first argument focuses on the large increase in unemployment among construction workers. The second argument is that falling house prices have reduced the mobility of unemployed workers--creating a "housing lock" in which unemployed workers, who would otherwise relocate to regions with jobs, are stuck in high unemployment areas.
2011	L84	Braunstein, Elissa, Irene van Staveren, and Daniele Tavani. 2011. "Embedding Care and Unpaid Work in Macroeconomic Modeling: A Structuralist Approach." <i>Feminist Economics</i>, 17(4): 5-31. This study embeds paid and unpaid care work in a structuralist macroeconomic model. Care work is formally modeled as a gendered input into the market production process via its impact on the current and future labor force, with altruistic motivations determining both how much support people give one another and the economic effectiveness of that support. This study uses the model to distinguish between two types of economies--a "selfish" versus an "altruistic" economy--and seeks to understand how different macroeconomic conditions and events play out in the two cases. Whether and how women and men share the financial and time costs of care condition the results of the comparison with more equal sharing of care responsibilities making the "altruistic" case more likely.

It is formed by a Structuralist Development Macroeconomics that offers scientific explanation to New Developmentalism--a national development strategy. In this intervention the author delineates its main theoretical claims and policies.
2011	O44	Ganelli, Giovanni, and Juha Tervala. 2011. "International Transmission of Environmental Policy: A New Keynesian Perspective." <i>Ecological Economics</i>, 70(11): 2070-82. In this paper, we examine the international transmission of environmental policy using a New Keynesian model of the global economy. We first consider the case in which the quality of the environment affects utility, but not productivity. This allows us to look at the trade-off between environmental quality and output. We then consider the case in which the quality of the environment increases productivity but does not affect utility. Our main results show that in both cases a unilateral implementation of a more stringent environmental policy by the domestic country raises foreign welfare under a benchmark parameterization. Our modeling strategy allows an analysis of how nominal rigidities interact with the implementation of environmental reforms, by allowing the domestic country to shift, through exchange rate depreciation, parts of the costs of more stringent environmental policies to the foreign one.
2011	Q11	Maruyama, Yoshihiro, and Tadashi Sonoda. 2011. <i>A Theory of the Producer-Consumer Household: The New Keynesian Perspective on Self-Employment</i>. New York: St. Martin's Press, Palgrave Macmillan. Explores the effect of positive aggregate-demand externalities on the self-employment sectors of Asian economies, focusing on their ability to stabilize aggregate economic fluctuations and on family firms of self-employing producer households. Discusses a prototype model of the producer-consumer household; the behavioral transformation of producer-consumer households through the development of competitive markets; effects of the internal wage rate on output supply--a structural estimation for Japanese rice farmers; the economic differentiation of producer-consumer households; the structure of labor supply; demand for capital service--consumption good in the production of household goods; a dual economy of the New Keynesian type with self-employment included; the sectoral productivity and the behavior of the economy in which the home production of household goods is inevitable; and the positive aggregate-demand externalities of producer-consumer households to stabilize aggregate economic fluctuations--a comparison between Japan and the United States.
2011	Q11	Goyal, Ashima, and Shruti Tripathi. 2011. "New Keynesian Aggregate Supply in the Tropics: Food Prices, Wages and Inflation." <i>International Journal of Monetary Economics and Finance</i>, 4(4): 330-54. Since consumer prices are a weighted average of domestic and imported goods prices, domestic price inflation (WPII) should cause consumer price inflation (CPII). But at low per capita incomes average wages respond to food prices, raising costs, and hence domestic prices. Then CPII, for which food is the dominant component, should Granger cause WPII. This reverse causality is derived and finds support in an estimated new Keynesian aggregate supply (AS) framework with the wage-price link. The AS and the identity both hold as long-run cointegrating relationships. The AS is elastic but food prices and the exchange rate are important for inflation.

2012	C12	Liu, Chungping, and Patrick Minford. 2012. <i>How important is the credit channel? An empirical study of the US banking crisis. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 9142.</i> We examine whether by adding a credit channel to the standard New Keynesian model we can account better for the behaviour of US macroeconomic data up to and including the banking crisis. We use the method of indirect inference which evaluates statistically how far a model's simulated behaviour mimics the behaviour of the data. We find that the model with credit dominates the standard model by a substantial margin. The credit channel is the main contributor to the variation in the output gap during the crisis.
2012	C36	Hall, Alastair R., Sanggohn Han, and Otilia Boldea. 2012. "Inference Regarding Multiple Structural Changes in Linear Models with Endogenous Regressors." <i>Journal of Econometrics</i>, 170(2): 281-302. This paper considers the linear model with endogenous regressors and multiple changes in the parameters at unknown times. It is shown that minimization of a Generalized Method of Moments criterion yields inconsistent estimators of the break fractions, but minimization of the Two Stage Least Squares (2SLS) criterion yields consistent estimators of these parameters. We develop a methodology for estimation and inference of the parameters of the model based on 2SLS. The analysis covers the cases where the reduced form is either stable or unstable. The methodology is illustrated via an application to the New Keynesian Phillips Curve for the US.
2012	D86	Carlsson, Mikael, and Oskar Nordstrom Skans. 2012. "Evaluating Microfoundations for Aggregate Price Rigidities: Evidence from Matched Firm-Level Data on Product Prices and Unit Labor Cost." <i>American Economic Review</i>, 102(4): 1571-95. Using matched data on product-level prices and the producing firm's unit labor cost, we find a moderate pass-through of current idiosyncratic marginal-cost changes. Also, the response does not vary across firms facing very different idiosyncratic shock variances, but identical aggregate conditions. These results do not fit the predictions of Mackowiak and Wiederholt (2009). Neither do firms react strongly to predictable marginal-cost changes, as expected from Mankiw and Reis (2002). We find that firms consider both current and expected future marginal cost when setting prices. This points toward impediments to continuous price adjustments as a key driver of monetary non-neutrality.

2013	C69	Caverzasi, Eugenio, and Antoine Godin. 2013. "Stock-flow Consistent Modeling through the Ages". <i>Levy Economics Institute, The Economics Working Paper Archive</i>. The aim of the paper is to provide an overview of the current stock-flow consistent (SFC) literature. Indeed, we feel the SFC approach has recently led to a blossoming literature, requiring a new summary after the work of Dos Santos (2006) and, above all, after the publication of the main reference work on the methodology, Godley and Lavoie's Stock-flow Consistent Approach (2007). The paper is developed along the following lines. First, a brief historical analysis investigates the roots of this class of models that can be traced as far back as 1949 and the work of Copeland. Second, the competing points of view regarding some of its main controversial aspects are underlined and used to classify the different methodological approaches followed in using these models. Namely, we discuss (1) how the models are solved, (2) the treatment of time and its implication, and (3) the need-or not-of microfoundations. These results are then used in the third section of the paper to develop a bifocal perspective, which allows us to divide the literature reviewed according to both its subject and the methodology. We explore various topics such as financialization, exchange rate modeling, policy implication, the need for a common framework within the post-Keynesian literature, and the empirical use of SFC models. Finally, the conclusions present some hypotheses (and wishes) over the possible lines of development of the stock-flow consistent models.

2013	F52	Schmeder, Genevieve. 2013. "Le casse-tete economique des depenses militaires. Le cas des Etats-Unis. (The Economic Puzzle in Military Spending: The Case of the United States. With English summary.)." <i>Innovations</i>, 0(42): 17-38. The first part of the paper presents the two main approaches, liberal and Keynesian, of the question of whether, in peacetime, military spending is good or bad for the economy, an issue on which the multiplicity and complexity of the relationship between defense and growth forbids providing a unique answer. The second part examines the case of the United States where, for decades, the two parties sharing power have made military Keynesianism a cornerstone of public policy as well as the national economy. This policy, however, cannot be considered as a sustainable one.
2013	F62	Diss; Zaniboni, Nicola. 2013. Essays in International Economics. PhD diss. Princeton University. The first chapter of this dissertation investigates the impact of globalization on inflation in the context of a two-country New Keynesian model. Three

Year	DE	Title and Abstract
		questions have been raised in the recent literature: Has globalization lowered long-run inflation? Has globalization affected short-run dynamics of inflation? Has globalization been a source of shocks for the inflation process? Here, these questions are framed in terms of the effects of increased openness on different aspects of open-economy Phillips curves, considering different scenarios for the measure of inflation, and for the assumed export-pricing behavior of firms. The main qualitative prediction of the model is that globalization makes Phillips curves flatter. Quantitatively, the effects of globalization on inflation are modest: increased openness only slightly decreases the slope of Phillips curves, domestic factors are still the main determinants of inflation, and globalization does not lead to a substantial increase in the volatility of shocks to the inflation process. The second chapter explores another angle for the impact of openness. Many studies have estimated the so-called New Keynesian Phillips curve (NKPC), with mixed results. This chapter thus investigates whether several dimensions of openness to international trade, in particular the distinction between traded and nontraded goods, affect the specification of the NKPC that can be brought to the data. More specifically, which additional control variables should be included in estimating the NKPC, relative to its closed-economy counterpart? We ask this question for both domestically produced goods' and consumption expenditure's inflation, considering different scenarios for nontradability, in final goods and intermediate inputs, and for the assumed export-pricing behavior of firms, namely Producer Currency Pricing and Local Currency Pricing. We find that nontradability matters: estimation of the NKPC not accounting for these aspects is likely to produce biased results. The third and last chapter, co-authored with Alexis Antoniadis, studies exchange rate pass-through and its determinants using scanner data on about 85% of the fast moving consumer goods (FMCGs) sold by 1,041 outlets in the United Arab Emirates between January of 2005 and December of 2010. The data, reported at the barcode level at each outlet, are augmented with Country-of-Origin (COO) information that was collected from the products' labels. At the aggregate level, we find exchange rate pass-through on imported consumer goods to be 3% in the short-run and 20% in the long-run. We then show that exchange rate pass-through is correlated positively with retailer market share, negatively with product quality, and negatively with the elasticity of substitution of the products within specific FMCGs categories.

2013	I13	Yasar, Yavuz. 2013. "The Crisis in the Turkish Pension System: A Post Keynesian Perspective." <i>Journal of Post Keynesian Economics</i>, 36(1): 131-52. The Turkish pension system began experiencing some structural and fiscal difficulties in the mid-1990s: increasing dependency ratio (e.g., number of beneficiaries per active contributors) and budget transfers to close the deficit in the system. These trends resulted in a crisis in the system, and it thus underwent a major transformation as reforms moved the traditional pay-as-you-go (PAYG) scheme significantly toward privatization and personal responsibility for assuming risk. These changes reflect the interests of business (e.g., ITO, 1999; TISK, 1995; TOSIAD, 1997, 1999, 2004) and international financial institutions (e.g., Government of Turkey, 2004; ILO, 1995; World Bank, 1994). This article establishes the overlooked underlying causes of the crisis by analyzing the Turkish pension data from a post Keynesian macroeconomic perspective. It argues that the problems of the Turkish pension system do not lie in the design of the traditional system (i.e., PAYG) but in the changes that have taken place in industrial relations (i.e., increasing unemployment, informal employment, and low wages) and social policy (i.e., narrowing the base and extent of social protection and financing health care and education via market mechanisms) in line with neoliberal policies pursued since the 1980s.
2013	K34	Kalbasi Anaraki, Nahid. 2013. "The U.S. Corporate Tax Reform and Its Macroeconomic Outcomes." <i>Research in World Economy</i>, 4(1): 14-21. The corporate tax reform has been among the most controversial issues during the past U.S. presidential debates. Though much has been said about the adverse macroeconomic effects of the corporate tax hike, less attention has been paid to the magnitude of such effects. This study attempts to measure the adverse effects of the corporate tax hike on macroeconomic variables such as investment, real GDP, productivity growth, hourly wages, unemployment rate, natural rate of unemployment, and consumer price index (CPI). The estimated regression results with quarterly data from 1960 to 2010 suggest that a 10% increase in the effective corporate tax rate reduces private investment by 3.1%, real GDP by 1.5%, productivity by 2.6%, and hourly wages by 4%. The results also indicate that this increase in the effective corporate tax rate raises short-term unemployment rate by 0.5%, the natural rate of unemployment by 1%, and the consumer price index (CPI) by 0.9%.
2013	L74 L85	Miranda de Melo, Marcelo. 2013. "Is There Bubble Price in the Real Estate of Ceara? A Post-Keynesian Approach." <i>Transnational Corporations Review</i>, 5(4): 96-103. This research is to investigate the evidence of a bubble price formation in the real estate sector of Ceara between the period of 2007 and 2010. The research applied for the post-Keynesian theory based on the asset bubble speculative definition. By using the time series co-integration, the augmented Dickey-Fuller test (ADF) identifies the unit root in all variables. However all variables are stationary when integrated in first order. The Johansen test identified one co-integrating vector between the average selling price per square meter and the average construction cost per square meter. This result, according to the post-Keynesian theory, was rejected evidence of real estate price bubble formation in the regions studied. The Johansen test also detected co-integration between home credit and the average selling price per square meter, indicating that home credit has kept stable for real estate price increase.
2013	L94	Dejuan, Oscar, Luis Antonio Lopez, Maria Angeles Tobarra, and Jorge Zafrilla. 2013. "A Post-Keynesian Age Model to Forecast Energy Demand in Spain." <i>Economic Systems Research</i>, 25(3): 321-40. This paper develops an extended input-output model for the estimation of energy demand and related issues. It is built on the last Spanish Symmetric Input-Output Table (IOT, 2005). It has been tested for the period 2005-2008 and used for forecasting energy demand for the years 2009-2012 under different economic scenarios. The model shares some traits of the computable and applied general equilibrium models where quantity and price systems are interwoven. The differences lie in the theories explaining output and prices. Our quantity system is based on Keynes'

Year	DE	Title and Abstract
		principle of effective demand (broad energy multipliers are derived). The price system is based on the classical (Sraffian) theory of prices of production, akin to post-Keynesian full-cost prices. The general price system can be manipulated to account for the specificities of energy prices. Historical trends of energy coefficients are computed by extrapolation of past IOTs and calibration.
2013	M14	Verde, Melania. 2013. "Il dibattito sulla "responsabilita sociale di impresa": Una classificazione dicotomica. (With English summary.)." <i>Rivista di Politica Economica</i> , 102(7-9): 227-59. The paper tries to assess an exhaustive literature review about social responsibility, through examining two different analytical perspectives. Starting from the question: "What does characterize business/entrepreneurship?" we identify two schools of thought, the neoclassic one which sees in profit maximization what strongly characterizes a firm, and the institutionalist school which addresses the equilibrium of a set of values and interests that a firm is able to represent as its social purpose. The task is made more actual when considering the emerging debate about the evolution of the concept of the nature of firm towards less classical ideas.
2013	O25	Torres, Daniela Almeida Raposo, and Marco Flavio da Cunha Resende. 2013. "Causacao circular do crescimento das economias em desenvolvimento: Uma ponte entre as abordagens evolucionaria e pos keynesiana. (The Circular Causation of Growth in Developing Economies. With English summary.)." <i>Revista de Economia Politica/Brazilian Journal of Political Economy</i> , 33(2): 240-59. Based on the Post Keynesian approach and on the Evolutionary literature, this study seeks to demonstrate the causal relationships between the National Innovation System and the national and international financial systems. This study shows that there is a circular causation in the less developed economies that contributes to the immaturity of its National Innovation System and to its structural external vulnerability. Conclusions highlight that the cycles in the less developed economies mirror the cycles of international liquidity.
2013	O43	Rozmainsky, Ivan V. 2013. "A Simple Post Keynesian Model of Investor Myopia and Economic Growth." <i>Montenegrin Journal of Economics</i> , 9(3): 45-56. The paper contains an attempt to develop investor myopia theory of economic growth. Investor myopia takes place when agents do not take long-term outcomes of their activity into account. This phenomenon, can, of course, lead to underinvestment. The outcome is negative rates of economic growth. Such negative growth, as it known, had hit Russia, Ukraine and some other transitional economies in the 1990s. Investor myopia can be treated as the long-run phenomenon which is concerned with serious defects of institutional environment. The main practical conclusion is that the State is responsible for overcoming of investor myopia. This phenomenon can be considered as the key to many fundamental economic problems of developing and transitional economies.
2013	P43 Z12	Suzuki, Yasushi. 2013. "A Post-Keynesian Perspective on Islamic Prohibition of Gharar." <i>International Journal of Islamic and Middle Eastern Finance and Management</i> , 6(3): 200-210. Purpose--This paper aims to draw the wisdom of the prohibition of Gharar through the lens of institutional and Post-Keynesian economics. Design/methodology/approach--This research applies the theoretical contributions of the Post-Keynesian economics and the new institutional economics to clarify the dimensions of Islamic Gharar. This research attempts to see the divergence between theory and practice, looking at empirical data including the information from an interview with one of Indonesian Islamic banks. Findings--The lens of institutional and Post-Keynesian economics is useful to clarify two dimensions of Gharar; incompleteness of contracting and fundamental uncertainty associated with business. As for the latter dimension of Gharar, the tradition of Post-Keynesian economics can distinguish "animal spirit in speculation" and "animal spirit in enterprise", the latter of which should be carefully considered. However, the interview reveals a kind of difficulty for Islamic financial institutions to tackle "Murabaha syndrome".
2013	Q24 R14	While, Aidan, David Gibbs, and Andrew E. G. Jonas. 2013. "The Competition State, City-Regions, and the Territorial Politics of Growth Facilitation." <i>Environment and Planning A</i> , 45(10): 2379-98. As urban centres of agglomeration expand and compete for investment, new demands may arise for additional housing, infrastructure, and services. Failure to meet these demands imposes costs on firms and workers, stifles expansion, and potentially compromises the long-run economic competitiveness of the growth area. Drawing on evidence from Germany (Munich), Sweden (Stockholm), and the UK (Cambridge) this paper examines the organisational and political challenges of growth facilitation in the context of post-Keynesian political and economic restructuring. Particular emphasis is placed on tensions arising from changes in the form and function of European state social regulation. These tensions are not simply a matter of neoliberal regulatory deficit but reflect broader societal cleavages in relation to the uneven spatial impact of local economic growth. Deploying the concept of territorial structures of growth facilitation provides a conceptual framework for taking forward research on the relationship between state spatial regulation, state restructuring, and the competitiveness of city-regions.
2013	R30	Ashiya, Noriko. 2013. "Perfect' Real Estate Liquidity and Adjustment Paths to Long-Run Equilibrium." <i>Journal of International Economic Studies</i> , 0(27): 61-76. The purpose of this paper is to formulate an example of the international macroeconomic climate with 'perfect' real estate liquidity and identify the crucial implications brought about by such extreme degrees of real estate liquidity, or 'financial' real estate. For this, we will extend the traditional Keynesian international macroeconomic model, revisited and modified in the study of Branson and Buiter (1983), and construct a simple analytical framework with reference to the recent economic climate with extreme degrees of real estate liquidity. It will be shown that, after the increase in the foreign interest rate, real estate liquidity may help reduce the fluctuations of home output along an adjustment path between one equilibrium position and another. This finding suggests that real estate liquidity may serve as a buffer against influences from foreign countries, although within the setting of a theoretical perfect market.
2013	Z12	THE SAME AS P43 Suzuki, Yasushi. 2013. "A Post-Keynesian Perspective on Islamic Prohibition of Gharar." <i>International Journal of Islamic and Middle Eastern Finance and Management</i> , 6(3): 200-210.

The date of final verification: November 12, 2016.

E12 — Contributors — Авторы

Baranov, Alexander O. — Баранов Александр Олегович — 0.45 AS²;
Lychagin, Anton M. — Лычагин Антон Михайлович — 0.8 AS;
Lychagin, Dmitry M. — Лычагин Дмитрий Михайлович — 0.36 AS;
Lychagin, Mikhail V. — Лычагин Михаил Васильевич — 0.9 AS;
Mkrtchyan, Gagik M. — Мкртчян Гагик Мкртичевич — 0.45 AS;
Muhina, Irina K. — Мухина Ирина Константиновна — 0.4 AS;
Popov, Ilya Y. — Попов Илья Юрьевич — 0.36 AS;
Slepenkova, Juliya M. — Слепенкова Юлия Михайловна — 0.37 AS;
Suslov, Victor I. — Суслов Виктор Иванович — 0.45 AS.

The total volume of derivative works for E12 is equal to 4.54 AS.
Общий объем раздела E12 — 4,54 авторских (уч.-изд.) л.

² AS — Author's Sheet — unit of measuring the volume of a literary work; equal to 40,000 characters (including the spaces between words), or 3,000 sq cm of illustrations (maps) like the table E12.E.

E13 General Aggregative Models: Neoclassical ¹

NL(J) — number of new links in the year J (J = 2006, ..., 2013).

Table E13.F Examples of Publications according to New Links in 2006—2013

Year	DE	Title and Abstract
2006		
2006	B52	CV ; Niggle, Chris. 2006. "Institutionalist-Post Keynesian Economics and the Post Monetarist New Consensus." In <i>Complexity, Endogenous Money and Macroeconomic Theory: Essays in Honour of Basil J. Moore</i> , ed. Mark Setterfield, 368-88. Cheltenham, U.K. and Northampton, Mass: Elgar.
2006	D44	Reny, Philip J., and Motty Perry. 2006. "Toward a Strategic Foundation for Rational Expectations Equilibrium." <i>Econometrica</i> , 74(5): 1231-69. A step toward a strategic foundation for rational expectations equilibrium is taken by considering a double auction with n buyers and m sellers with interdependent values and affiliated private information. If there are sufficiently many buyers and sellers, and their bids are restricted to a sufficiently fine discrete set of prices, then, generically, there is an equilibrium in nondecreasing bidding functions that is arbitrarily close to the unique fully revealing rational expectations equilibrium of the limit market with unrestricted bids and a continuum of agents. In particular, the large double-auction equilibrium is almost efficient and almost fully aggregates the agents' information.
2006	D53	Constantinides, George M. 2006. "Market Organization and the Prices of Financial Assets." <i>Manchester School</i> , 74(0): 1-23. Several empirical regularities in the prices of financial assets are at odds with the predictions of standard economic theory. I address these regularities and explore the extent to which they are resolved in the context of two markets organized in very different ways. The first setting is a neoclassical economy with incomplete markets and heterogeneous agents. Market incompleteness naturally arises because of the non-existence of markets in which consumers or households can co-insure idiosyncratic income shocks for obvious moral hazard reasons. The second setting is an overlapping generations economy with three generations in which the young generation is constrained from borrowing and investing in equities. The borrowing constraints naturally arise because human capital alone does not collateralize major loans in modern economies for reasons of moral hazard and adverse selection.
2006	E37	Kehoe, Patrick J. 2006. <i>How to Advance Theory with Structural VARs: Use the Sims-Cogley-Nason Approach</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 12575. The common approach to evaluating a model in the structural VAR literature is to compare the impulse responses from structural VARs run on the data to the theoretical impulse responses from the model. The Sims-Cogley-Nason approach instead compares the structural VARs run on the data to identical structural VARs run on data from the model of the same length as the actual data. Chari, Kehoe, and McGrattan (2006) argue that the inappropriate comparison made by the common approach is the root of the problems in the SVAR literature. In practice, the problems can be solved simply. Switching from the common approach to the Sims-Cogley-Nason approach basically involves changing a few lines of computer code and a few lines of text. This switch will vastly increase the value of the structural VAR literature for economic theory.
2006	G13	Pavlov, Vlad. 2006. "The Equity Premium in an Overlapping-Generations Economy." <i>North American Journal of Economics and Finance</i> , 17(2): 155-72. In a recent paper, Constantinides, Donaldson and Mehra (CDM) present a convincing economic story that could simultaneously explain a high equity premium and a low risk-free rate. The argument is based on the effect of a borrowing restriction in an overlapping-generations model (OLG) with three generations. This paper investigates the effect of borrowing restrictions on the size of the equity premium in a model similar to CDM, but with a complete structure of contingent claims. The main conclusion of the analysis is that the results obtained by CDM follow from the particular market structure adopted in the model rather than the effects of the life cycle. Once the markets are completed, the equity premium and the risk-free rate in the OLG economy are identical to those obtained in a representative-agent (RA) economy.
2006	H51	Ponthiere, Gregory. 2006. <i>Growth, Longevity and Public Policy</i> . CESifo GmbH, CESifo Working Paper Series: CESifo Working Paper No. 1780. This paper studies the optimal long-run public intervention in a two-period OLG model where the probability of surviving the first period and the length of the second period can be influenced by distinct policies. While the optimal size of public intervention depends on the extra-productivity of public spendings in longevity, its optimal structure is determined by (1) differences in the productivity of each policy; (2) how growth would influence each longevity aspect under laissez-faire; (3) the dependence of each longevity aspect on past achievements. Given competing effects, the optimal intervention can hardly, under additive expected lifetime utility, be strongly unbalanced.
2006	H52	Allgood, Sam, and Arthur Snow. 2006. "Marginal Welfare Costs of Taxation with Human and Physical Capital." <i>Economic Inquiry</i> , 44(3): 451-64. We develop a perfect foresight, overlapping generations model with intragenerational inequality and endogenous human and physical capital investment, and we calculate welfare costs for marginal reforms of taxation and public spending. Welfare costs are uniformly lower than in the equivalent static model where human and physical capital are fixed. Most of the upward bias in static estimates arises from fixed human capital because welfare cost is predominantly tax leakage from lower effective labor supply, but reallocating time between education and labor can leave effective labor supply unchanged. Hence, adjustments in human capital have an important mitigating influence on marginal welfare costs.
2006	J10 N33	DE LA CROIX, David, and Alessandro SOMMACAL. 2006. <i>A theory of medicine effectiveness, differential mortality, income inequality and growth for pre-industrial England</i> . Universite catholique de Louvain, Center for Operations Research and Econometrics (CORE). CORE Discussion Papers: 2006045. We study how mortality, health care, and income growth interact, looking at their relationship prior to the Industrial Revolution, when income per capita was stagnant. We first present a model of individual medical spending giving a rationale for individual health expenditures even when medicine was not effective in postponing death. We then explain the rise of effective medicine by a learning process function of expenditures in health. The rise in effective medicine can then be linked to the take-off of the eighteenth century through life expectancy increases, and fostered capital accumulation. The rise of effective medicine has also an impact on the relation between growth and inequality and on the intergenerational persistence of differences in income. These channels are operative through differential mortality induced by medicine effectiveness that turns out to determine a differential in the propensity to save among income groups.
2006	N14	Tsakalotos, Euclid. 2006. "Social Conflict and the Effectiveness of Aggregate Demand Management Policies." <i>Review of Radical Political Economics</i> , 38(2): 214-42. This article examines the role of social conflict in explaining macroeconomic phenomena and, especially, the effectiveness of aggregate demand policies as a means of raising real output. The social conflict approach is compared with a traditional Keynesian view along with Ball, Mankiw, and Romer's and Lucas's models of the determinants of the effectiveness of aggregate demand policies. Empirical analysis during the period from the 1950s to the 1990s for fifteen OECD countries provides significant evidence that the social conflict view of inflation has much to offer in explaining differences in the effectiveness of aggregate demand policies both across countries and through time.

2007	B23	De Vroey, Michel, and Pierre Malgrange. 2007. "Theorie et modelisation macro-economiques, d'hier a aujourd'hui. (The Evolution of Macroeconomic Theory and Modelling along the Last Fifty Years. With English summary)." <i>Revue Francaise d'Economie</i> , 21(3): 3-38. An outline of the evolution from the birth up to present days of the macroeconomics is laid out, its emergence during the thirties, then the period of the domination of the Keynesian macroeconomics of the years 1950 to 1970. The following stage of the evolution has been the attack from Milton Friedman and Robert Lucas against Keynesian macroeconomics. We consider the works of these authors deserve the label of a "scientific revolution a la Kuhn", with the emergence of the dynamic and stochastic macroeconomics. Associated with this, the focus of macroeconomics has shifted. Themes linked to market failures, and especially to unemployment disappear, in favour of cycle and growth analysis, these last being studied from the postulate of efficient working of the system. These last years have seen the emergence of a "New Neoclassical Synthesis" mimicking the old synthesis in combining Keynesian and classical elements, while adopting the new methodology of equilibrium discipline and of agents rational behaviour.
2007	C82	Gomme, Paul, and Peter Rupert. 2007. "Theory, Measurement and Calibration of Macroeconomic Models." <i>Journal of Monetary Economics</i> , 54(2): 460-97. Calibration has become a standard tool of macroeconomics. This paper extends and refines the calibration methodology along several important dimensions. First, accounting for home production is important both in measuring calibration targets and in organizing the data in a model-consistent fashion. For this reason, thinking about home production is important even if the model under consideration does not include home production. Second, investment-specific technological change is included because of its strong balanced growth parameter restrictions. Third, the measurement strategy is laid out as transparently as possible so that others can easily replicate the underlying calculations. The data and calculations used in this paper are available at http://clevelandfed.org/research/Models/rbc/Index.cfm .
2007	D14	Silos, Pedro. 2007. "Housing, Portfolio Choice and the Macroeconomy." <i>Journal of Economic Dynamics and Control</i> , 31(8): 2774-2801. This paper investigates the properties of the wealth distribution and the portfolio composition regarding housing and equity holdings, and their relationship to macroeconomic shocks. To this end, I construct a business cycle model in which agents differ in age, income and wealth. Housing provides shelter services and serves as collateral for loans. The model is consistent with several facts such as the life-cycle pattern of housing-to-wealth ratios, the larger degree of concentration for non-housing wealth, the smaller weight of housing in richer households' portfolios as well as the larger housing-to-wealth ratios in recessions. In addition, the model shows that while relaxing the collateral constraint does not impact the business cycle dynamics for the entire economy, it significantly alters the behavior of residential and business investment for the younger and poorer fraction of the population.

2007	F59	Conesa, Juan Carlos, Timothy J. Kehoe, and Kim J. Ruhl. 2007. <i>Modeling Great Depressions: The Depression in Finland in the 1990s</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 13591. This paper is a primer on the great depressions methodology developed by Cole and Ohanian (1999, 2007) and Kehoe and Prescott (2002, 2007). We use growth accounting and simple dynamic general equilibrium models to study the depression that occurred in Finland in the early 1990s. We find that the sharp drop in real GDP over the period 1990-93 was driven by a combination of a drop in total factor productivity (TFP) during 1990-92 and of increases in taxes on labor and consumption and increases in government consumption during 1989-94, which drove down hours worked in Finland. We attempt to endogenize the drop in TFP in variants of the model with an investment sector and with terms-of-trade shocks but are unsuccessful.

2007	Q41	Snowden, Brian. 2007. "The New Classical Counter-Revolution: False Path or Illuminating Complement?" <i>Eastern Economic Journal</i> , 33(4): 541-62. In this paper the author responds to Laurence Seidman's recent article, 'The New Classical Counter-Revolution: A False Path for Macroeconomics'. The author challenges the view that new classical macroeconomics has been a false path and provides a critique of Seidman's arguments with respect to his interpretation of the 1970s 'stagflation', the relevance of new classical macroeconomics for practical policymaking, the contribution of real business cycle theory, and the new classical content of contemporary macroeconomic textbooks. The author concludes that the new classical counter-revolution has had an extremely productive influence on the current mainstream new neoclassical synthesis framework.
2007	Q41	Seidman, Laurence S. 2007. "The New Classical Counter-Revolution: False Path or Illuminating Complement? Reply." <i>Eastern Economic Journal</i> , 33(4): 563-65. The picture of economic well-being depends crucially on how it is measured. We introduce a new measure of economic well-being that includes public consumption, income from wealth, and household production. The differences in scope and method between our measure and standard income lead to substantially different findings regarding economic well-being. The average U.S. household appears to be much better off in 2001 relative to 1989 according to our measure in comparison to money income. In contrast to official measures, our measure shows that racial disparity increased. The increase in measured inequality was higher than indicated by the official measures.

Discusses basic ideas and methods; a stochastic formulation; linear control theory; the Kalman filter; a static multiplier and constraint games; time domain games for attaining robustness; frequency domain games and criteria for robustness; calibrating misspecification fears with detection error probabilities; a permanent income model; competitive equilibria without robustness; competitive equilibria with robustness; asset pricing; risk sensitivity, model uncertainty, and asset pricing; Markov perfect equilibria with robustness; robustness in forward-looking models; robust filtering with commitment; robust filtering without commitment; and alternative approaches.
2008	C78	Gertler, Mark, Luca Sala, and Antonella Trigari. 2008. "An Estimated Monetary DSGE Model with Unemployment and Staggered Nominal Wage Bargaining." <i>Journal of Money, Credit, and Banking</i>, 40(8): 1713-64. We develop and estimate a medium scale macroeconomic model that allows for unemployment and staggered nominal wage contracting. In contrast to most existing quantitative models, employment adjustment is on the extensive margin and the employment of existing workers is efficient. Wage rigidity, however, affects the hiring of new workers. The former is introduced via the staggered Nash bargaining setup of Gertler and Trigari (2006). A robust finding is that the model with wage rigidity provides a better description of the data than does a flexible wage version. Overall, the model fits the data roughly as well as existing quantitative macroeconomic models, such as Smets and Wouters (2007) or Christiano, Eichenbaum, and Evans (2005). More work is necessary, however, to ensure a robust identification of the key labor market parameters.
2008	D61	Hara, Chiaki. 2008. "Complete Monotonicity of the Representative Consumer's Discount Factor." <i>Journal of Mathematical Economics</i>, 44(12): 1321-31. A univariate real-valued function is said to be completely monotone if it takes positive values and alternate the signs of its higher order derivatives, starting from everywhere negative first derivatives. We prove that the representative consumer's discount factor of a continuous-time economy under uncertainty is a power function of some completely monotone function of time satisfying certain boundary conditions if and only if it may be derived from a group of consumers having constant and equal relative risk aversion, and constant and yet possibly unequal discount rates.

2008	E01	Gomme, Paul, B. Ravikumar, and Peter Rupert. 2008. <i>The Return to Capital and the Business Cycle</i>. Concordia University, Department of Economics, Working Papers: 08002. We measure the return to capital directly from the NIPA and BEA data and examine the return implications of the real business cycle model. Specifically, we construct a quarterly time series of the after-tax return to business capital. The business cycle properties of this return differs considerably from those of the S&P 500 returns. First, its volatility is considerably smaller than that of S&P 500 returns. Second, our measured return is procyclical and leads output by one quarter; S&P 500 returns are countercyclical and lead the cycle by four quarters. The standard business cycle model captures almost 50% of the volatility in the return to capital (relative to the volatility of output), and does well in capturing the lead-lag pattern. We consider several departures from the benchmark model; the model with stochastic taxes captures nearly 85% of the relative volatility in the return to capital and the model with high risk aversion captures 80% of the relative volatility. We then include capital gains in our measurement and use a model with investment specific technological change to address the higher volatility in the return to capital. This model accounts for more than 80% of the return volatility, and essentially all of the relative volatility.
2008	F10	Jones, Ronald W. 2008. "The Aggregate Elasticity of Factor Substitution with Middle Products." <i>Journal of Macroeconomics</i>, 30(2): 633-40. The elasticity of substitution between factors in production relates the change in the ratio of factors used in a production process to a given change in the factor price ratio. An aggregate concept of such an elasticity relates a change in overall factor endowments to the resulting change in factor prices. For a closed economy the behavior of consumers is an important part of such an aggregate elasticity, since endowment changes can bring about changes in commodity prices and resulting adjustments to factor prices. For a small open economy, commodity prices in typical models are exogenous. In the model with middle products, all final consumer goods are non-traded, so that local consumer behavior can affect factor prices. The aggregate elasticity of substitution is shown to be an average of production elasticities and demand elasticity even for a small open economy.
2008	F10	Miyagiwa, Kaz. 2008. "The Endogenous Aggregate Elasticity of Substitution for a Small Open Economy: Comment." <i>Journal of Macroeconomics</i>, 30(2): 641-44. This note applies the approach of Miyagiwa and Papageorgiou [Miyagiwa, K. and Papageorgiou, C., 2007. Endogenous aggregate elasticity of substitution. <i>Journal of Economic Dynamics and Control</i> 31, 2899-2919] to provide simple frameworks for endogenizing the aggregate elasticity of substitution between capital and labor for a growing small open economy.
2008	F34	Kehoe, Timothy J., and Kim J. Ruhl. 2008. <i>Sudden Stops, Sectoral Reallocations, and the Real Exchange Rate</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 14395. A sudden stop of capital flows into a developing country tends to be followed by a rapid switch from trade deficits to surpluses, a depreciation of the real exchange rate, and decreases in output and total factor productivity. Substantial reallocation takes place from the nontraded sector to the traded sector. We construct a multisector growth model, calibrate it to the Mexican economy, and use it to analyze Mexico's 1994-95 crisis. When subjected to a sudden stop, the model accounts for the trade balance reversal and the real exchange rate depreciation, but it cannot account for the decreases in GDP and TFP. Extending the model to include labor frictions and variable capital utilization, we still find that it cannot quantitatively account for the dynamics of output and productivity without losing the ability to account for the movements of other variables.
2008	F34	Chen, David Y. 2008. "Foreign International Reserves Reversal on U.S. Debt and Exchange Rate." <i>Global Journal of Finance and Economics</i>, 5(2): 127-44. This paper uses a simple dynamic stochastic model of five equations to examine relationships among central banking fundamentals: large quantities of foreign international reserves held by major US trade partners in Asia, dollar exchange rate, current account balance, federal government budget deficits and public debt. In this model, issuance of US debt instrument incorporates past and future exchange rate which is represented by a one-step ahead rational expectations component. This model, built on DSGE framework, is solved by means of Sims' QZ decomposition method. Results suggest that reversals in foreign international reserves exert minor negative impact on exchange rate. Twin deficits have even smaller impact on exchange rate. Foreign international reserves indeed exert positive impact on national debt.

2008	G10 G32 N22	De Graeve, Ferre. 2008. "The External Finance Premium and the Macroeconomy: US Post-WWII Evidence." <i>Journal of Economic Dynamics and Control</i> , 32(11): 3415-40. The central variable of theories of financial frictions--the external finance premium--is unobservable. This paper distils the external finance premium from a Dynamic Stochastic General Equilibrium (DSGE) model estimated on US macroeconomic data covering the period 1954 to 2004. Within the DSGE framework, movements in the premium can be given an interpretation in terms of shocks driving business cycles. A key result is that the estimate--based solely on non-financial macroeconomic data--picks up over 70% of the dynamics of lower grade corporate bond spreads. The paper also identifies a gain in fitting key macroeconomic aggregates by including financial frictions in the model and documents how shock transmission is affected.

2008	G31	Gaggero, Alberto A. 2008. "Optimal Investment in the Presence of Investment Shock and Congestion." <i>Journal of Institutional and Theoretical Economics</i> , 164(2): 327-42. This paper develops a dynamic overlapping-generations model in the presence of investment shocks and aims to understand how social welfare is affected by the investment decision of the firm and by the time of demand of the consumers. By simulating the model, I find that to maximize social welfare a considerable proportion of consumers should postpone their demand. Rational consumers, in fact, react to congestion by shifting their demand to the next period, whenever there is a positive shock affecting the investment function. However, policy-makers should consider policies favouring investment very carefully, since investment affects social welfare via a bell-shaped function.

2008	H31 J32	Creedy, John, and Ross Guest. 2008. "Changes in the Taxation of Private Pensions: Macroeconomic and Welfare Effects." <i>Journal of Policy Modeling</i> , 30(5): 693-712. This paper provides an applied general equilibrium analysis of several alternative taxation regimes applying to private pensions. The analysis focuses on the implications of this and other pension tax regimes for intergenerational equity, national living standards, labour supply, saving and social welfare. The method of analysis is simulation of an open economy overlapping generations CGE model. The model is calibrated to Australia and is used to examine the decision, announced by the Australian Government in its 2006 Budget, to exempt from tax all superannuation (the Australian term for superannuation) benefits received by recipients over 60 years of age.
2008	I28	Futagami, Koichi, and Mitsuyoshi Yanagihara. 2008. "Private and Public Education: Human Capital Accumulation under Parental Teaching." <i>Japanese Economic Review</i> , 59(3): 275-91. This paper examines a simple overlapping generations model of human capital accumulation under both the public and private education regimes. Both young individuals and their parents allocate time to human capital accumulation. Under the public education regime, the government collects tax to finance expenditure for education resources. We show that there exists a level of tax which maximizes the speed of human capital accumulation because of parental teaching; and, if the government chooses tax rates adequately, human capital grows faster and welfare levels become higher under the public education regime than under the private.
2008	I31	Wirl, Franz, Andreas J. Novak, and Franz X. Hof. 2008. "Happiness Due to Consumption and Its Increases, Wealth and Status." <i>Studies in Nonlinear Dynamics and Econometrics</i> , 12(4). This paper departs from the standard open-economy Ramsey model and introduces additional concerns for wealth, status and Easterlin's (2001) hypothesis that consumption changes, in particular increases, are important and not only the level. These extensions induce first of all interior steady states, which are lacking in the standard model, multiple steady states (separated by thresholds leading to history dependence) and limit cycles. The existence of cyclical consumption patterns could provide a so far ignored source for real business cycles. Surprisingly, introducing status conferred by private wealth or conspicuous consumption has no effect despite the involved externalities (the outcomes are observationally equivalent) as long as the social influence associated with the status externalities remains moderate.
2008	J21	Santos Monteiro, Paulo. 2008. <i>Family Labor Supply and Aggregate Saving</i> . University of Warwick, Department of Economics, The Warwick Economics Research Paper Series (TWERPS). I study the impact of idiosyncratic risk on savings and employment in a small open economy populated by two-member families. Families incur a fixed cost of participation when both members are employed. Because of market incompleteness and information asymmetries, this cost coupled with labor market frictions can generate multiple equilibria. In particular, there might be one equilibrium with high employment and low saving and another one with low employment and high saving. The model predicts that aggregate saving and employment rates are negatively correlated across countries. I present empirical evidence that supports the general equilibrium prediction of the model
2008	J32	Verbic, Miroslav. 2008. "Modelling the Pension System in an Overlapping-Generations General Equilibrium Modelling Framework." <i>Economic and Business Review</i> , 10(2): 117-52. This article presents a theoretical contribution to the field of overlapping-generations general equilibrium modelling, i.e., an upgrade of this branch of models with a pension system. Within the pension block we model both the first pension pillar, financed on a pay-as-you-go basis, and the fully-funded second pillar of the Slovenian pension system. The modelling of the first pension pillar is based on cash flows of the mandatory pension insurance institution, the relationship between the pension base and the pension, and the process of harmonising pension growth to wage growth. The modelling of the second pillar centres on implementation of the liquidity constraint. Use was made of supplementary pension profiles, and the ratio between premia paid and pensions paid out from supplementary pension insurance. The category of total pension was also introduced, and the model ensured that at every point households adjusted the scope of labour supply and their current consumption towards the target total pension.
2008	J32	THE SAME AS H31 Creedy, John, and Ross Guest. 2008. "Changes in the Taxation of Private Pensions: Macroeconomic and Welfare Effects." <i>Journal of Policy Modeling</i> , 30(5): 693-712.
2008	L11	Samaniego, Roberto M. 2008. "Entry, Exit and Business Cycles in a General Equilibrium Model." <i>Review of Economic Dynamics</i> , 11(3): 529-41. This paper studies the role of entry and exit in the short run behavior of a general equilibrium model with industry dynamics. For tractability, and to preserve potential asymmetries in the impulse responses, I focus on the transition dynamics of the economy after shocks. Entry and exit are found to be insensitive to productivity shocks of reasonable magnitude. Moreover, the dynamics of GDP are insensitive to fluctuations in entry and exit rates, and any asymmetries are negligible. As an application

Year	DE	Title and Abstract
		of the model, the paper also asks whether firing costs may interact with entry and exit to affect transition dynamics after shocks, finding that they do not.
2008	L65	CV: Ventelou, Bruno, Yann Videau, and Jean-Paul Moatti. 2008. "Fragility: A Macro-dynamic Motive to Offer Quick and General Access to ART in LDC." 2008	N10	Chen, Ping. 2008. "Equilibrium Illusion, Economic Complexity and Evolutionary Foundation in Economic Analysis." <i>Evolutionary and Institutional Economics Review</i> , 5(1): 81-127. It is widely believed that an equilibrium framework based on simple models, such as the representative agent and bilateral bargaining, in a frictionless economy provides a consistent framework in micro, macro, finance, and institutional economics. However, equilibrium believes in self-stabilizing market and institutional convergence broken down when inherent instability and non-predictable uncertainty emerge under nonlinear and social interactions. Equilibrium illusions in economics and econometrics are pretty in math modeling but dangerous in policy decision. Known examples are the Frisch model of noise-driven cycles, the Lucas model of microfoundations, and the Coasian world of zero transactions. These models not only violate basic laws in science but also lack evidence in economic history. Their common problem is associated with linear Hamiltonian economics with symmetric information without history. Economics are dissipative systems in nature, characterized by symmetry breaking, information flow, a time arrow, and history. The many-body problem is fundamentally different from the one-body and two-body problem in mathematics. Both computational and natural experiments, such as a stock market crash and a transitional depression, reveal the severe limitations of equilibrium thinking and structural changes from evolutionary dynamics. The new science of complexity offers new tools of nonlinear dynamics and non-stationary time series analysis. Existing puzzles in equilibrium economics, such as persistent cycles, interruptive crises, market resilience, social movements, and organizational diversity, can be better understood by nonlinear dynamic models. Like the paradigm shift after Einstein in physics, the evolutionary perspective provides a general framework, while equilibrium models serve as its special cases, since the equilibrium picture is an approximation of economic complexity in a short-time window taken from a long-term historical current.
2008	N10	Temin, Peter. 2008. "Real Business Cycle Views of the Great Depression and Recent Events: A Review of Timothy J. Kehoe and Edward C. Prescott's <i>Great Depressions of the Twentieth Century</i> ." <i>Journal of Economic Literature</i> , 46(3): 669-84. This book collects essays, most of which were published earlier, into an advertisement for real business cycle (RBC) analysis. Half of the essays discuss the Great Depression; half discuss events of the 1980s and 1990s. They all use the general equilibrium model of economic growth to analyze short-run fluctuations in the rate of economic growth of various countries. I find that the use of closed economy models without frictions is not useful for the analysis of short-run variations in the rate of economic growth. Almost all of these essays end by claiming that variations in the rate of GDP growth were due to changes in the rate of total factor productivity (TFP) growth. They do not provide any explanation for fluctuations in the rate of TFP growth, leaving the reader no closer to understanding these periods of depression and slow growth. I discuss in turn the essays on the Great Depression, the essays on more recent fluctuations, and the definition of "great depressions" used in this volume.

2008	N30 O43	Doepke, Matthias, and Michele Tertilt. 2008. <i>Women's Liberation: What's in It for Men?</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 13919. The nineteenth century witnessed dramatic improvements in the legal rights of married women. Given that these changes took place long before women gained the right to vote, they amounted to a voluntary renouncement of power by men. In this paper, we investigate men's incentives for sharing power with women. In our model, women's legal rights set the marital bargaining power of husbands and wives. We show that men face a tradeoff between the rights they want for their own wives (namely none) and the rights of other women in the economy. Men prefer other men's wives to have rights because men care about their own daughters and because an expansion of women's rights increases educational investments in children. We show that men may agree to relinquish some of their power once technological change increases the importance of human capital. We corroborate our argument with historical evidence on the expansion of women's rights in England and the United States.

2009	D02	CV: Ferreira, Jesus, and Felipe Serrano. 2009. "Institutions, Expectations and Aggregate Demand." In <i>Macroeconomic Theory and Macroeconomic Pedagogy</i> , ed. Giuseppe Fontana and Mark Setterfield, 309-22. New York: St. Martin's Press, Palgrave Macmillan.
2009	D78	Dennis, Richard, Kai Leitemo, and Ulf Soderstrom. 2009. "Methods for Robust Control." <i>Journal of Economic Dynamics and Control</i> , 33(8): 1604-16. Robust control allows policymakers to formulate policies that guard against model misspecification. The principal tools used to solve robust control problems are state-space methods [see Hansen, L. P., Sargent T. J., 2008. Robustness. Princeton University Press; Giordani, P., Soderlind, P., 2004. Solution of macromodels with Hansen-Sargent robust policies: some extensions. <i>Journal of Economic Dynamics and Control</i> 28 (12), 2367-2397]. In this paper, we show that the structural-form methods developed by Dennis [2007. Optimal policy rules in rational-expectations models: new solution algorithms. <i>Macroeconomic Dynamics</i> 11 (1), 31-55] to solve control problems with rational expectations can also be applied to robust control problems, with the advantage that they bypass the task, often onerous, of having to express the reference model in state-space form. In addition, we show how to implement two different timing assumptions with distinct implications for the robust policy and the economy. We apply our methods to a New Keynesian Dynamic Stochastic General Equilibrium model and find that robustness has important effects on policy and the economy.
2009	E64	Setterfield, Mark. 2009. "Macroeconomics without the LM Curve: An Alternative View." <i>Cambridge Journal of Economics</i> , 33(2): 273-93. This paper develops a 'fully articulated' post-Keynesian alternative to the 'New Consensus' macroeconomic model, based on explicitly post-Keynesian hypotheses about the inflation process, the income-generating process and the appropriate conduct of monetary policy. The paper demonstrates how the equilibrium configuration of this model can be manipulated by non-monetary policy interventions, including fiscal policy and incomes policy. One (perhaps surprising) result that emerges from the analysis is that in the context of the proper policy environment, inflation targeting can have a positive impact on real economic performance.
2009	F44	Diss: Davis, (Jonathan) Scott. 2009. Globalization and the Business Cycle. PhD diss. Vanderbilt University. This dissertation studies the effect of globalization, specifically increased international trade and financial integration, on various aspects of the

Year	DE	Title and Abstract
		international business cycle. The second chapter, "Globalization and International Business Cycle Co-movement", investigates the links between bilateral trade integration, financial integration, industrial specialization, and business cycle correlation. Using a reduced form empirical approach, and an international real business cycle model with endogenous trade integration, financial integration, industrial specialization, and cyclical co-movement, I show that a model based on classical assumptions can replicate some of the causal channels that we see in the data, but it fails to match others. I then speculate as to what features are missing from the real business cycle model that could explain these empirical irregularities. The third chapter, "Globalization and the Phillips Curve", attempts to find the effect of increasing trade integration on the short run tradeoff between output and inflation. Specifically, we try to answer two closely related questions. Will increased international trade integration make inflation less sensitive to movements in the domestic output gap, and will inflation become more sensitive to movements in the foreign output gap? This paper answers these questions using a sticky price DSGE model. We find that trade integration leads to a slight reduction in the sensitivity of inflation to the domestic output gap. Also, inflation is somewhat sensitive to the foreign output gap, and this sensitivity increases with the level of trade integration. The fourth chapter, "Variable Markups and International Business Cycle Co-movement", incorporates endogenous markup variability into a real business cycle model to evaluate the impact of markup variability on international business cycle co-movement. We show both the qualitative and quantitative significance of markup variability on cyclical co-movement, and we show that introducing markup variability can help reconcile the positive effect of trade on co-movement found in the data with the negative effect predicted by the real business cycle model (the trade-comovement puzzle). Thus this paper shows how strategic production decisions by individual firms can have a significant effect on the co-movement of aggregate production across countries.
2009	G01	Ng, Yew-Kwang. 2009. "Why Is a Financial Crisis Important? The Significance of the Relaxation of the Assumption of Perfect Competition." <i>International Journal of Business and Economics</i> , 8(2): 91-114. Under the usual assumption of perfect competition, we have money being neutral and changes in nominal aggregate demand cannot affect the real economic variables. If so, a financial crisis cannot be very important. However, the real world is characterized more by non-perfect competition when changes in nominal demand can affect real variables. This paper shows the important differences and explains the crux of these differences from both the demand and cost sides. It also provides a simplified general-equilibrium analysis of the economy and shows that, by concentrating on a representative firm and on how this firm is affected by macro variables and simplified interaction with other firms, macro analysis of the economy without assuming perfect competition is manageable with more realistic and richer results.
2009	G01	McKibbin, Warwick J., and Andrew Stoeckel. 2009. "Modelling the Global Financial Crisis." <i>Oxford Review of Economic Policy</i> , 25(4): 581-607. This paper models the global financial crisis as a combination of shocks to global housing markets and sharp increases in risk premia of firms, households, and international investors in an intertemporal (dynamic stochastic general equilibrium or DSGE) global model. The model has six sectors of production and trade in 15 major economies and regions. The paper shows that a 'switching' of expectations about risk premia shocks in financial markets can easily generate the severe economic contraction in global trade and production currently being experienced in 2009 and subsequent events. The results show that the future of the global economy depends critically on whether the shocks to risk are expected to be permanent or temporary. The best representation of the crisis may be one where initial long-lasting pessimism about risk is unexpectedly revised to a more moderate scenario. This suggests a rapid recovery in countries not experiencing a balance sheet adjustment problem.

We extend the classic capital tax competition model to an overlapping generations economy and study the effects of a coordinated reform where capital tax rates across all locations are increased to alleviate the policy externality. Welfare across generations is examined and several new effects are derived. Simulations calibrated to US data indicate these effects may be as large as the spending effect of the classic model. The initial old generation, however, may not be better off, and an additional transfer from the initial young to the initial old may be required for the reform to be a Pareto improvement.
2009	H72 P25	Yang, Guang. 2009. "Local Government Expenditure, RBC Model and Regional Business Cycle in China--Take Tianjin for Example." <i>Frontiers of Economics in China</i> , 4(4): 588-600. In this paper, the actual economy in Tianjin Municipal city are simulated with RBC model through introducing local government expenditure. From the works review and stylized facts, it is easy to find that government expenditure will have important influence on economy. Then this paper provides new evidence to support this judgment by DCC theory. After concluding the stylized facts of Tianjin city, a regional RBC model with local government expenditure is developed. Next, this paper starts to solve this RBC model, get log-linearization of the solution and estimate all parameters. A program on Matlab is made to simulate actual economy in Tianjin city with this RBC model. The result is the RBC model with local government expenditure has better performance than that without local government expenditure. Therefore, it will be necessary to consider local government expenditure, if regional economy is researched.

2009	J45	Linnemann, Ludger. 2009. "Macroeconomic Effects of Shocks to Public Employment." <i>Journal of Macroeconomics</i> , 31(2): 252-67. The paper discusses the short-run relation between public and private employment. Empirical evidence is presented suggesting that in aggregate US time series, increases in government employment appear to generate temporarily positive responses of private employment and real output. Unlike in the case of shocks to government spending on goods, this contradicts the predictions of business cycle models based on the neoclassical growth model. It is explored in how far a model which includes the production of useful public services can potentially explain the qualitative properties of the evidence.

Year	DE	Title and Abstract
2009	J61	Palivos, Theodore. 2009. "Welfare Effects of Illegal Immigration." <i>Journal of Population Economics</i> , 22(1): 131-44. This paper analyzes the welfare effect of illegal immigration on the host country within a dynamic general equilibrium framework and shows that it is positive for two reasons. First, immigrants are paid less than their marginal product, and second, after an increase in immigration, domestic households find it optimal to increase their holdings of capital. It is also shown that dynamic inefficiency may arise, despite the fact that the model is of the Ramsey type. Nevertheless, the introduction of a minimum wage, which leads to job competition between domestic unskilled workers and immigrants reverses all of the above results.
2009	L25	Green, Edward J. 2009. "Heterogeneous Producers Facing Common Shocks: An Overlapping-Generations Example." <i>Journal of Economic Theory</i> , 144(6): 2266-76. An analytically tractable model of a competitive, full-information economy is provided in which, for some parameter values, entry and exit over the course of the business cycle is concentrated among small firms. This model is intended to make the logical point that the relatively high sensitivity of small firms to business-cycle fluctuations does not necessarily indicate the presence of informational or incentive constraints in financial markets.
2009	L25	Correa, Romar. 2009. "Stability through Financial Embeddedness." <i>International Journal of Social Economics</i> , 36(9-10): 1021-33. The purpose of this paper is to appraise the transition from bank-based systems to universal banking. The Wynne Godley and Francis Cripps macroeconomic framework is used to structure the argument. It is shown that the activity of oligopolistic firms leads, through their build-up of inventories, to an unstable system. However, the industrial structure of an economy might be embedded in a network of inter-bank linkages. The coupling of real and credit activities delivers a weak stability.

2009	N01	PENSIEROSO, Luca. 2009. <i>Real Business Cycle Models of the Great Depression</i> . Universite catholique de Louvain, Institut de Recherches Economiques et Sociales (IRES), Discussion Papers (IRES - Institut de Recherches Economiques et Sociales); 2009034. This paper presents and assesses the recent application of models in the Real Business Cycle (RBC) tradition to the analysis of the Great Depression of the 1930s. The main conclusion is that the breaking of the depression taboo has been a desirable completion of the cliometric revolution: no historic event should be exempt from a dispassionate quantitative analysis. On the other hand, the substantive contribution of RBC models is not yet sufficient to establish a new historiography of the Great Depression.

2009	R23	Pappa, Evi. 2009. "The Effects of Fiscal Shocks on Employment and the Real Wage." <i>International Economic Review</i> , 50(1): 217-44. We study the transmission of fiscal shocks in the labor market. We employ a structural VAR and base identification on the restrictions that shocks to government consumption, investment, and employment must raise output and deficits. These restrictions hold in both prototype Real Business Cycle (RBC) and New Keynesian models. Shocks to government consumption and investment increase real wages and employment contemporaneously, both at state level and in the aggregate. The dynamics in response to employment shocks are mixed: increases in government employment raise the real wage and total employment in the aggregate. However, in one third of the states they reduce total employment.

2010	B26	Wickens, M. R. 2010. "What's Wrong with Modern Macroeconomics? Why Its Critics Have Missed the Point." <i>CESifo Economic Studies</i> , 56(4): 536-53. The blame for the recent financial crisis has been attributed to modern macroeconomic theory rather than banking and finance. This article defends modern macroeconomics against its critics arguing that the critics have missed the point of why macroeconomics is carried out in the way it is. It also defends finance from some criticisms, especially of the efficient markets hypothesis. It is claimed that, far from being in a state of crisis as a result of recent events, modern macroeconomics has received a huge stimulus, and that the financial crisis was brought about more by a failure to employ modern macroeconomics than by the failings of macroeconomics.
2010	C54	Edge, Rochelle M., Thomas Laubach, and John C. Williams. 2010. "Welfare-Maximizing Monetary Policy under Parameter Uncertainty." <i>Journal of Applied Econometrics</i> , 25(1): 129-43. This paper examines welfare-maximizing monetary policy in an estimated micro-founded general equilibrium model of the US economy where the policymaker faces uncertainty about model parameters. Uncertainty about parameters describing preferences and technology implies uncertainty about the model's dynamics, utility-based welfare criterion and the natural rates of output and interest that would prevail absent nominal rigidities. We estimate the degree of uncertainty regarding natural rates due to parameter uncertainty. We find that optimal Taylor rules under parameter uncertainty respond less to the output gap and more to price inflation than would be optimal absent parameter uncertainty. We also show that policy rules that focus solely on stabilizing wages and prices yield welfare outcomes very close to the first-best.
2010	C54	Onatski, Alexei, and Noah Williams. 2010. "Empirical and Policy Performance of a Forward-Looking Monetary Model." <i>Journal of Applied Econometrics</i> , 25(1): 145-76. In this paper we consider the implications of a fully specified dynamic general equilibrium model, developed by Smets and Wouters (2003). This is a relatively large-scale forward-looking model, which was shown to provide a good fit to the data. We show that systematically accounting for prior uncertainty may lead to substantially different parameter estimates. However many of the qualitative features of the model remain similar under the alternative estimates that we find. We then formulate and analyze optimal policy rules in the model, focusing on a simple loss function which is commonly used and is independent of the estimates. We determine the optimal equilibrium dynamics for our estimates as well as those of Smets and Wouters, and find that they imply largely similar behavior. We then analyze simple policy rules, finding that these rules perform

Year	DE	Title and Abstract
		relatively well and are robust to our different sets of parameter estimates. Overall, our results suggest that the model may be relatively robust in its ability to capture certain aspects of the data. However some caution should be exercised in basing inference on the structural estimates, as these seem to be only weakly identified.
2010	C54	Lubik, Thomas A., and Paolo Surico. 2010. "The Lucas Critique and the Stability of Empirical Models." <i>Journal of Applied Econometrics</i>, 25(1): 177-94. This paper reconsiders the empirical relevance of the Lucas critique using a DSGE sticky price model in which a weak central bank response to inflation generates equilibrium indeterminacy. The model is calibrated to capture the magnitude of the historical shift in the Federal Reserve's policy rule. Using Monte Carlo simulations and a backward-looking model of aggregate supply and demand, we find that shifts in the policy rule induce breaks in both the reduced-form coefficients and the reduced-form error variances. When the instability of the reduced-form error variances is accounted for, the Lucas critique is found to be empirically relevant.
2010	D12	Wendner, Ronald. 2010. "Conspicuous Consumption and Generation Replacement in a Model of Perpetual Youth." <i>Journal of Public Economics</i>, 94(11-12): 1093-1107. This paper investigates household decisions in an overlapping generations model in which individual utility depends on a weighted average of consumption of one's peers. In contrast to representative agent economies, the consumption externality generally affects savings and growth rates. The effects critically depend on the rate at which labor productivity changes with age. For a high (low) rate, the externality lowers (raises) the steady state propensity to consume out of total wealth. The optimal allocation can be decentralized by a (reverse) unfunded social security system if the rate of labor productivity decline is high (low). In contrast to discrete time OLG models, the optimal steady state capital income tax is zero, in spite of the externality.
2010	D85	Kirman, Alan. 2010. "The Economic Crisis Is a Crisis for Economic Theory." <i>CESifo Economic Studies</i>, 56(4): 498-535. This article examines, in the light of recent events, the origins of the difficulties that current macroeconomic models have in encompassing the sort of sudden crisis which we are currently observing. The reasons for this are partly due to fundamental problems with the underlying General Equilibrium theory and partly to the unrealistic assumptions on which most financial models are based. What is common to the two is that systematic warnings over more than a century in the case of finance and over 30 years in the case of equilibrium theory have been ignored and we have persisted with models which are both unsound theoretically and incompatible with the data. It is suggested that we drop the unrealistic individual basis for aggregate behaviour and the even more unreasonable assumption that the aggregate behaves like such a 'rational' individual. We should rather analyse the economy as a complex adaptive system, and take the network structure that governs interaction into account. Models that do this, of which two examples are given, unlike standard macroeconomic models, may at least enable us to envisage major 'phase transitions' in the economy even if we are unlikely to be able to forecast the timing of their onset.
2010	E66	Graves, Philip E. 2010. <i>Appropriate Fiscal Policy over the Business Cycle: Proper Stimulus Policies Can Work</i>. CESifo Group Munich, CESifo Working Paper Series: 3160. Fiscal policy has become quite controversial in the post-Keynesian era, the debate over the Obama stimulus package being a contentious recent example. Some pundits go so far as to take the position that macroeconomic theory has failed to meaningfully progress in terms of providing useful recommendations for policy-makers, particularly in times of recession. Others take the laissez-faire view that policy reactions to the business cycle do not help in a rational expectations world and indeed do harm by increasing uncertainty. Still others, while not necessarily viewing themselves as in any sense "Keynesian," have a nagging feeling that sometimes doing nothing must be worse than doing something--but what to do? Sensible guidance is provided here on how governments should spend taxpayer dollars and on how that spending should change under varying economic conditions. The nature of public goods, namely whether they are complements, substitutes, or neutral to private goods, is seen to be critical to such decisions.

2010	F40	Bowen, Harry P., Haris Munandar, and Jean-Marie Viaene. 2010. <i>On the Extent of Economic Integration: A Comparison of EU Countries and US States</i>. Tinbergen Institute, Tinbergen Institute Discussion Papers: 10-009/2. This discussion paper led to a forthcoming publication in <i>Journal of Regional Science</i> entitled 'Are EU Countries less Integrated than US States? Theory and Evidence'. European economic integration is commonly believed to be incomplete, and that further reforms are needed. In this context, the union of U.S. states is considered the benchmark of complete economic integration and is often the basis for comparison regarding the extent of E.U. economic integration. Yet, with low trade barriers and with productive factors at least notionally mobile across E.U. countries, is the belief that U.S. states are more integrated than E.U. member states correct? To address this question, this paper first develops three theoretical predictions about the distribution of output and factors that would arise among members of a fully integrated economic area in which goods, capital and labor are freely mobile and policies are harmonized. These theoretical predictions are then empirically tested using data on the output and factor stocks of 14 E.U. member states and the 51 U.S. states (includes District of Columbia) for the period 1965 to 2000. The empirical results convincingly support each theoretical prediction. Hence, contrary to popular belief, the extent of E.U. economic integration is not statistically different from that among U.S. states.

2010	G35	Leung, Charles Ka Yui, and Nan-Kuang Chen. 2010. "Stock Price Volatility, Negative Autocorrelation and the Consumption-Wealth Ratio: The Case of Constant Fundamentals." <i>Pacific Economic Review</i>, 15(2): 224-45. Based on infinite horizon models, previous theoretical works show that the empirical stock price movement is not justified by the changes in dividends. The present paper provides a simple overlapping generations model with constant fundamentals in which the stock price displays volatility and negative autocorrelation even without changes in dividend. The horizon of the agents matters. In addition, as in recent empirical works, the aggregate consumption-wealth ratio 'predicts' the asset return. Thus, this framework may be useful in understanding different stylized facts in asset pricing. Directions for future research are also discussed.
2010	I11	Jouvet, Pierre-Andre, Pierre Pestieau, and Gregory Ponthiere. 2010. "Longevity and Environmental Quality in an OLG Model." <i>Journal of Economics (Zeitschrift für Nationalökonomie)</i>, 100(3): 191-216. Whereas existing OLG models with endogenous longevity neglect the impact of environmental quality on mortality, this paper studies the design of the optimal public policy in a two-period OLG model where longevity is influenced positively by health expenditures, but negatively by pollution due to production. It is shown that if agents, when choosing how much to spend on health, do not internalize the impact of their decision on environmental quality (i.e. the space available for each person), the decentralization of the social optimum requires a tax not

Year	DE	Title and Abstract
		only on capital income (to internalize the pollution externality), but, also, on health spending (to internalize the congestion externality). We also examine the second-best policy under a limited set of taxation instruments, and explore its sensitivity to the pollution process and to individual preferences.
2010	I11	Gupta, Rangan, and Cobus Vermeulen. 2010. "Private and Public Health Expenditures in an Endogenous Growth Model with Inflation Targeting." <i>Annals of Economics and Finance</i>, 11(1): 139-53. This paper develops a monetary endogenous growth overlapping generations model characterized by endogenous longevity and an inflation targeting monetary authority, and analyzes the growth dynamics that emerges from this framework. Besides the endogenous longevity which depends on the complementarity of private and public health expenditures, the growth process is endogenized by allowing for a productive role of government expenditure on infrastructure. Following the huge existing literature, money is introduced by assuming that banks are obligated to hold a fraction of the deposits as cash reserve requirements. Given this framework, we show that multiple equilibria emerges, with the low-growth (high-growth) equilibrium being unstable (stable) and locally determinate (locally indeterminate). In addition, we show that, under certain conditions, endogenous fluctuations and even chaos could emerge around the high-growth equilibrium.
2010	I25	Palivos, Theodore, and Dimitrios Varvarigos. 2010. "Education and Growth: A Simple Model with Complicated Dynamics." <i>International Journal of Economic Theory</i>, 6(4): 367-84. We construct a simple model of education and growth in which children spend a fraction of their time and parents spend a fraction of their income on education. Both a strategic complementarity and an intergenerational externality are present. The interactions between each pair of consecutive generations lead to rich dynamics. We show that multiple growth equilibria arise, some of them periodic and some aperiodic. We also find a negative correlation between volatility and growth, without a one-way causal relationship between the two being, necessarily, present. Rather, this negative correlation is driven by the structural characteristics of the economy.
2010	J88	Soares, Jorge. 2010. "Welfare Impact of a Ban on Child Labor." <i>Economic Inquiry</i>, 48(4): 1048-64. This article presents a new rationale for imposing restrictions on child labor. In a standard overlapping generation model where parental altruism results in transfers that children allocate to consumption and education, the Nash-Cournot equilibrium results in suboptimal levels of parental transfers and does not maximize the average level of utility of currently living agents. A ban on child labor decreases children's income and generates an increase in parental transfers bringing their levels closer to the optimum, raising children's welfare as well as average welfare in the short run and in the long run. Moreover, the inability to work allows children to allocate more time to education, and it leads to an increase in human capital. Besides, to increase transfers, parents decrease savings and hence physical capital accumulation. When prices are flexible, these effects diminish the positive welfare impact of the ban on child labor.
2010	K41	Fabbri, Daniela. 2010. "Law Enforcement and Firm Financing: Theory and Evidence." <i>Journal of the European Economic Association</i>, 8(4): 776-816. This paper investigates the economic effects on firms' policies of differences in law enforcement. We find that in judicial districts where trials are longer, bank financing is more costly and firms are smaller. However, we do not find any significant relation between law enforcement and firms' leverage ratio. We rationalize our results within a two-region dynamic general equilibrium model with asymmetric information and collateralized credit contracts. We find that a stronger enforcement of creditors' rights not only improves credit conditions (partial equilibrium effect), but also fosters individual capital accumulation (general equilibrium effect). In line with this theoretical prediction, we find a positive relation between individual savings and quality of legal enforcement.
2010	L26	Jiang, Neville, Ping Wang, and Haibin Wu. 2010. "Ability-Heterogeneity, Entrepreneurship, and Economic Growth." <i>Journal of Economic Dynamics and Control</i>, 34(3): 522-41. This paper develops an endogenous growth model of occupational choice with overlapping generations heterogeneous in entrepreneurial ability. While an increase in the number of entrepreneurs creates a growth-enhancing variety effect, the reduced overall quality of entrepreneurial ability retards growth. As a result, the number of entrepreneurs and output growth need not be positively related, in response to changes in the ability distribution. While cheaper financial operation and higher manufacturing productivity are both growth-enhancing, they have different effects on equilibrium factor prices and equilibrium financial markups. Additionally, the long-run growth consequences of subsidies to entrepreneurship and credit-market imperfections are studied.
2010	L26	Clemens, Christiane, and Maik Heinemann. 2010. "On Entrepreneurial Risk-Taking and the Macroeconomic Effects of Financial Constraints." <i>Journal of Economic Dynamics and Control</i>, 34(9): 1610-26. This paper deals with credit market imperfections and idiosyncratic risks in a two-sector heterogeneous agent dynamic general equilibrium model of occupational choice. We focus especially on the effects of tightening financial constraints on macroeconomic performance, entrepreneurial risk-taking, and social mobility. Contrary to many models in the literature, our comparative static results cover a broad range for financial constraints, from an unrestrained to a perfectly constrained economy. We find substantial gains in output, welfare, and wealth equality associated with credit market improvements. The marginal gains from relaxing constraints are largest for empirically relevant debt-equity ratios. Interestingly, the entrepreneurship rate and social mobility respond non-monotonically to a change in the tightness of financial constraints. The results crucially depend on feedback effects in general equilibrium, where optimal firm sizes and the demand for credit are endogenously determined.
2010	L26	Kim, Kunhong, and Young Sik Kim. 2010. "Business Cycle and Asset Prices: A Computable General Equilibrium Analysis with Agency Costs and Habit Formation." <i>Journal of Economic Theory and Econometrics</i>, 21(2): 1-29. For the purpose of explaining both business cycles and asset returns, we examine a real business cycle (RBC) model with habit-augmented preferences and endogenous costs of adjusting the capital stock. Following the agency-cost model of Carlstrom and Fuerst (1997), capital adjustment costs are affected by the level of the entrepreneur's net worth such that an increase in net worth (following a positive productivity shock) lowers agency costs associated with external financing, and hence makes it easier to expand the capital stock. Along with the restricted labor supply, the model resolves the asset pricing puzzles of the consumption-based model in the sense that the implied stochastic discount factor (or pricing kernel) reaches the Hansen-Jagannathan(1991) volatility bound. Further, this improvement in the asset pricing dimension is achieved without reducing such business cycle performance as output and consumption volatility. This is in a sharp contrast to the standard RBC model with the reduced-form adjustment cost technology where sufficiently low supply elasticity of capital (or persistently high capital adjustment costs) is required to generate the equity premium at the expense of low output volatility. Here, the capital supply is highly elastic with respect to Tobin's q under the plausible calibrations of the structural parameters affecting endogenous capital adjustment costs. The sluggish behavior of net worth, as a shifter of the capital supply curve, is the key mechanism by which capital adjustment is delayed, hampering consumption smoothing desired by households with habit persistence preferences. The agency-costs model reveals that a small curvature in the capital adjustment cost function, viewed as crucial for understanding the fluctuations in Tobin's q , can be also consistent with both the historical equity premium and the key business cycle facts.

2010	N00	Fernandez-Villaverde, Jesus, Jeremy Greenwood, and Nezih Guner. 2010. <i>From Shame to Game in One Hundred Years: An Economic Model of the Rise in Premarital Sex and its De-Stigmatization</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 15677. Societies socialize children about many things, including sex. Socialization is costly. It uses scarce resources, such as time and effort. Parents weigh the marginal gains from socialization against its costs. Those at the lower end of the socioeconomic scale indoctrinate their daughters less than others about the perils of premarital sex, because the latter will lose less from an out-of-wedlock birth. Modern contraceptives have profoundly affected the calculus for instilling sexual mores, leading to a de-stigmatization of sex. As contraception has become more effective there is less need for parents, churches and states to inculcate sexual mores. Technology affects culture.

2010	Q42	van der Ploeg, Frederick, and Cees Withagen. 2010. <i>Is there really a Green Paradox?</i>. Tinbergen Institute, Tinbergen Institute Discussion Papers: 10-020/3. Optimal climate policy is studied in a Ramsey growth model with exhaustible oil reserves, an infinitely elastic supply of renewables, stock-dependent oil extraction costs and convex climate damages. We concentrate on economies with an initial capital stock below that of the steady state of the carbon-free economy and the initial cost of oil (extraction cost plus scarcity rent and social cost of carbon) below that of renewables. There are then two regimes. If the oil stock is small, the social optimum path consists of an initial oil-only phase followed by a renewables-only phase. With a lower cost of renewables or a lower discount rate, more oil is left in situ and renewables are phased in more quickly. The optimal carbon tax rises along its development path during the oil-only phase, but the rise flattens off as less accessible reserves are explored and the social cost of carbon increases. Subsidizing renewables without an optimal carbon tax induces more oil to be left in situ and a quicker phasing in of renewables, but oil is depleted more rapidly initially. The net effect on global warming is ambiguous. The second regime occurs if the initial oil stock is large. The social optimum then consists of an initial oil-only phase followed with a final oil-renewables phase. This regime converges to the steady state of the carbon-free economy as well. The paper also gives a full characterization of two other regimes that occur if the initial capital stock is above its steady state or renewables have an initial cost advantage.
2010	Q51	Jouvet, Pierre-Andre, Pierre Pestieau, and Gregory Ponthiere. 2010. "Longevity and Environmental Quality in an OLG Model." <i>Journal of Economics (Zeitschrift fur Nationalokonomie)</i>, 100(3): 191-216. Whereas existing OLG models with endogenous longevity neglect the impact of environmental quality on mortality, this paper studies the design of the optimal public policy in a two-period OLG model where longevity is influenced positively by health expenditures, but negatively by pollution due to production. It is shown that if agents, when choosing how much to spend on health, do not internalize the impact of their decision on environmental quality (i.e. the space available for each person), the decentralization of the social optimum requires a tax not only on capital income (to internalize the pollution externality), but, also, on health spending (to internalize the congestion externality). We also examine the second-best policy under a limited set of taxation instruments, and explore its sensitivity to the pollution process and to individual preferences.
2010	Z12	Ali, D. H. Norulazidah P. H. Omar, and Gareth D. Myles. 2010. "The Consequences of Zakat for Capital Accumulation." <i>Journal of Public Economic Theory</i>, 12(4): 837-56. The payment of zakat by the owners of wealth is one of the five pillars of Islam. Many countries operate with no enforcement of the obligation to pay, making zakat a form of voluntary redistribution. We analyze how zakat affects capital accumulation in a model that explicitly recognizes the voluntary nature of zakat. The voluntary payment is modeled using both warm glow and social custom frameworks. These are embedded within an overlapping generations model with heterogenous consumers and endogenous population growth. The results show that zakat can raise the capital-labor ratio when it is motivated by the warm glow but welfare can be nonmonotonic in the strength of the warm glow. In the social custom model, reduced participation can lead to a reduced capital-labor ratio as the rate of zakat is increased.

Levy Economics Institute, The, Economics Working Paper Archive. Orthodox and heterodox theories of financial crises are hereby compared from a theoretical viewpoint, with emphasis on their genesis. The former view (represented by the fourth-generation models of Paul Krugman) reflects the neoclassical vision whereby turbulence is an exception; the latter

Year	DE	Title and Abstract
		insight (represented by the theories of Hyman P. Minsky) validates and extends John Maynard Keynes's vision, since it is related to a modern financial world. The result of this theoretical exercise is that Minsky's vision represents a superior explanation of financial crises and current events in financial systems because it considers the causes of financial crises as endogenous to the system. Crucial facts in relevant financial crises are mentioned in section 1, as an introduction; the orthodox models of financial crises are described in section 2; the heterodox models of financial crises are outlined in section 3; the main similarities and differences between orthodox and heterodox models of financial crises are identified in section 4; and conclusions based on the information provided by the previous section are outlined in section 5. References are listed at the end of the paper.
2011	C33	Malik, Sheheryar, and Michael K. Pitt. 2011. "Particle Filters for Continuous Likelihood Evaluation and Maximisation." <i>Journal of Econometrics</i>, 165(2): 190-209. In this paper, a method is introduced for approximating the likelihood for the unknown parameters of a state space model. The approximation converges to the true likelihood as the simulation size goes to infinity. In addition, the approximating likelihood is continuous as a function of the unknown parameters under rather general conditions. The approach advocated is fast and robust, and it avoids many of the pitfalls associated with current techniques based upon importance sampling. We assess the performance of the method by considering a linear state space model, comparing the results with the Kalman filter, which delivers the true likelihood. We also apply the method to a non-Gaussian state space model, the stochastic volatility model, finding that the approach is efficient and effective. Applications to continuous time finance models and latent panel data models are considered. Two different multivariate approaches are proposed. The neoclassical growth model is considered as an application.
2011	C46	Barro, Robert J., and Tao Jin. 2011. "On the Size Distribution of Macroeconomic Disasters." <i>Econometrica</i>, 79(5): 1567-89. The coefficient of relative risk aversion is a key parameter for analyses of behavior toward risk, but good estimates of this parameter do not exist. A promising place for reliable estimation is rare macroeconomic disasters, which have a major influence on the equity premium. The premium depends on the probability and size distribution of disasters, gauged by proportionate declines in per capita consumption or gross domestic product. Long-term national-accounts data for 36 countries provide a large sample of disasters of magnitude 10% or more. A power-law density provides a good fit to the size distribution, and the upper-tail exponent, alpha, is estimated to be around 4. A higher alpha signifies a thinner tail and, therefore, a lower equity premium, whereas a higher coefficient of relative risk aversion, gamma, implies a higher premium. The premium is finite if alpha > gamma. The observed premium of 5% generates an estimated gamma close to 3, with a 95% confidence interval of 2 to 4. The results are robust to uncertainty about the values of the disaster probability and the equity premium, and can accommodate seemingly paradoxical situations in which the equity premium may appear to be infinite.

2011	D74	Fofack, Hippolyte. 2011. "Conflicts and Peace Dividends in Developing Countries: A Comparative Analysis." <i>Journal of African Development</i>, 13(2): 237-72. Sub-Saharan Africa's dismal development outcomes--growth collapse and declining real income--are often used to highlight its sharp development contrast with other regions of the developing world. Drawing on a large cross-section analysis, this paper shows that Africa's underlying dismal growth performance can be largely accounted for by high political risk and uncertainty which undermined investments and growth prospects in the region over most of the post-independence era. This hypothesis is further supported by empirical evidence. In particular, counterfactual simulations based on a variation of neoclassical growth models and under the hypothetical equalization of political risk profile alternative result in large economic returns, reflected in the significantly higher level of aggregate output and income in the subset of conflict-affected countries. Income levels get even higher when the hypothetical reduction of political risks alternative is accompanied by sustained increases in capital accumulation.
2011	F00	THE SAME AS B00 Munoz, Jesus. 2011. "Orthodox versus Heterodox (Minskyan) Perspectives of Financial Crises: Explosion in the 1990s versus Implosion in the 2000s". Levy Economics Institute, The, Economics Working Paper Archive.
2011	G33	Aysun, Uluc, and Adam Honig. 2011. "Bankruptcy Costs, Liability Dollarization, and Vulnerability to Sudden Stops." <i>Journal of Development Economics</i>, 95(2): 201-11. Countries with intermediate levels of institutional quality suffer larger output contractions following sudden stops of capital inflows than less developed nations. However, countries with strong institutions seldom experience significant falls in output after capital flow reversals. We reconcile these two observations using a calibrated DSGE model that extends the financial accelerator framework developed in Bernanke, Gertler and Gilchrist (1999). The model captures financial market institutional quality with creditors' ability to recover assets from bankrupt firms. Bankruptcy costs affect vulnerability to sudden stops directly but also indirectly by affecting the degree of liability dollarization. Simulations reveal an inverted U-shaped relationship between bankruptcy costs and the output loss following sudden stops.
2011	H12	Sato, Motohiro, and Kazumasa Oguro. 2011. "Simulation Analysis of Macroeconomic Impact of Large Scale Earthquake in Tokyo. (In Japanese. With English summary.)" <i>Keizai Bunseki</i>, 0(184): 120-40. The present paper considers a simple (Keynesian) macroeconomic model to quantify impacts of the large scale earthquake in Tokyo on national economy variables such as economic growth, price level, interest rate, and fiscal balance by Monte Carlo simulations. In doing so, we account for the current situation of Japan public finance and society such as increasing public debt ratio to GDP and aging of the population. The simulations reveal that while GDP falls immediately after the disaster, there will be quick recovery restructuring projects boosting the economy. Overall, the impact of the earthquake on the economy seems to be limited. The reason behind this result is that our staged economy with society aging damps supply decline and increasing macro demand after the disaster with keeping GDP gap modest. It is noted however that the large scale earthquake increases probability that interest rate surges and government goes bankrupt with public debt being accumulated. The probability of the fiscal crisis in the year of 2020 is estimated to jump up from 12% without the earthquake to 43% in the scenario that it occurs in 2015. We also discuss ex ante preventive policies to mitigate detrimental effects of the disaster. They include captive, or fund for disaster relief and fiscal consolidation. These policies serve to mitigate the perverse effect of the earthquake on the economy.
2011	H41	Diss: Yu, Chia-Ming. 2011. Essays on Information and Urban Economics. PhD diss. Washington University in St. Louis. Standard models of rational expectations repeatedly advocate that, in addition to reconciling demand and supply, prices generically reveal

Year	DE	Title and Abstract
		private information. We ask: Does location help or hinder information transmission in markets? The first essay shows that when space is introduced in standard models, the simple beauty of price mechanisms efficiently revealing information may be destroyed. The second essay shows that though location can help signal a worker's productivity, its role in information revelation is limited. In the third essay, in contrast to Tiebout's hypothesis that individuals would reveal their true preferences for public goods by the choice of community in which to live, fiscal competition for talent does not yield complete sorting, but rather partially segregated equilibria. "Rational Expectations in Urban Economics" (Job Market Paper): Canonical analysis of the classical general equilibrium model demonstrates the existence of an open and dense subset of standard economies that possess fully-revealing rational expectations equilibria. This paper shows that the analogous result is not true in urban economies under reasonable modifications for this field. An open subset of economies where none of the modified rational expectations equilibria fully reveals private information is found. There are two important pieces. First, there can be information about a location known by a consumer who does not live in that location in equilibrium, and thus the equilibrium rent does not reflect this information. Second, if a consumer's utility depends only on information about their (endogenous) location of residence, perturbations of utility naturally do not incorporate information about other locations conditional on their location of residence. Existence of equilibrium is proved. Space can prevent housing prices from transmitting information from informed to uninformed households, resulting in an inefficient outcome. "Locational Signaling and Agglomeration": Agglomeration can be caused by asymmetric information and a locational signaling effect: The location choice of workers signals their productivity to potential employers. The cost of a signal is the cost of housing at that location. When workers' marginal utility of housing is negatively correlated with their productivity, skill-biased technological change causes a core-periphery bifurcation where the agglomeration of high-skill workers eventually constitutes a unique stable equilibrium. When workers' marginal utility of housing and their productivity are positively correlated, skill-biased technological improvements will never result in a core-periphery equilibrium. Location can at best be an approximate rather than a precise sieve for high-skill workers. "Jurisdictional Competition for Talent by Bohemian Cultural Amenities": It is well known that the problem in offering public goods hinges on the true revelation of households' preference for goods. In contrast to the reliance on a large number of communities in Tiebout (1956), this paper shows that when few jurisdictions compete for multi-type mobile talent through cultural amenities and when high-skill workers have a stronger preference for cultural amenities than low-skill workers, with housing markets the equilibrium is almost-complete-sorting. That is, except for the workers in one jurisdiction, all types of workers are revealed by their residential choices. Therefore, with housing markets, jurisdictional competition for multi-type mobile talent can be a solution to Samuelson's free-rider problem in offering public goods.
2011	H41	Creedy, John, and Solmaz Moslehi. 2011. <i>Modelling the Composition of Government Expenditure</i> , Cheltenham, U.K. and Northampton, Mass.: Elgar. Explores the factors that determine the composition of government expenditure using a range of modeling approaches. 2011	H56	Auray, Stephane, Aurelien Eyquem, and Frederic Jouneau-Sion. 2011. <i>Wars as Large Depreciation Shocks</i> . Centre de Recherche en Economie et Statistique, Working Papers: 2012-30. In this paper, we propose a theoretical framework to investigate the impact of conflicts and wars on key macroeconomic aggregates and welfare. Using a panel data with 12 countries from 1875 onwards we first show that consumption drops more than output during conflicts, while the opposite is true during "peaceful" recessions. To handle both cases, we build a variation of a Real Business Cycle model first proposed by Hercowitz and Sampson [1991]. We extend the initial model to account for specific shocks that destroy capital stocks--as conflicts do--by assuming an (exogenously) time-varying depreciation rate of the stock of capital. In addition to these shocks, the model also imbeds generalized TFP shocks capturing standard technological factors as well as the potential effects of human losses on production. The model is able to reproduce the different responses of macroeconomic aggregate to productivity shocks during peaceful periods as well as their responses during conflicts. We describe how these two sources of randomness in the model may be extracted from the available data, and analyze how they interact. We conclude that conflicts have significant and persistent influence on generalized TFP shocks, while the "reverse" effect is not statistically significant. Finally, we show that the welfare costs of conflicts such as World War II are substantially larger than the welfare costs of business cycles usually reported in the literature

2011	I20	Cremer, Helmuth, Firouz Gahvari, and Pierre Pestieau. 2011. "Fertility, Human Capital Accumulation, and the Pension System." <i>Journal of Public Economics</i> , 95(11-12): 1272-79. This paper provides a unified treatment of externalities associated with fertility and human capital accumulation within pay-as-you-go pension systems. It considers an overlapping generations model in which every generation consists of high earners and low earners with the proportion of types being determined endogenously. The number of children is deterministically chosen but the children's future ability is in part stochastic, in part determined by the family background, and in part through education. In addition to the customary externality source associated with a change in average fertility rate, this setup highlights another externality source. This is due to the effect of a parent's choice of number and educational attainment of his children on the proportion of high-ability individuals in the steady state. Our other results include: (i) investments in education of high- and low-ability parents must be subsidized; (ii) direct child subsidies to one or both parent types can be negative; i.e., they can be taxes; (iii) net subsidies to children (direct child subsidies plus education subsidies) to at least one type of parents must be positive; and (iv) parents who have a higher number of children should invest less in their education.
2011	I20	Angelopoulos, Konstantinos, Jim Malley, and Apostolis Philippopoulos. 2011. "The Welfare Implications of Resource Allocation Policies under Uncertainty: The Case of Public Education Spending." <i>Journal of Macroeconomics</i> , 33(2): 176-92. In this paper, we examine whether policy interventions, aimed at improving resource allocation, also have important stabilization effects over the business cycle. To this end, we employ a dynamic stochastic general equilibrium model in which public education expenditures, financed by distorting taxes, enhance the productivity of private education choices. We then calculate the welfare implications of competing operating targets using a state-contingent instrument rule for public education spending. Our main findings are: (i) there can be important cyclical effects of different resource allocation policies depending on the operating target used and the degree of macroeconomic uncertainty; (ii) it is important to use an operating target which is as close as possible to the heart of the market imperfection that justifies policy action; (iii) policy action should not be monotonic in the degree of macroeconomic uncertainty.
2011	J40	Jarmolowicz, Wacław, and Magdalena Knapinska. 2011. "Labour Market Theories in Contemporary Economics." <i>Transformations in Business and Economics</i> , 10(2): 268-80. The subject of this article is a synthetic presentation, analysis, and evaluation of contemporary labour market theories, especially based on the achievements of the authors of the neo-classical and Keynesian schools. First, there is presented the genesis and main concepts of the traditional views and then the newest theories of the main stream of economy referring to the functioning of the labour market in developed countries are presented. Special attention is paid to the issue of work force mobility and flows. The review of chosen contemporary labour market theories has been conducted in

Year	DE	Title and Abstract
		three areas. The first one emphasizes mainly the structural and institutional factors as the ones causing unbalance on the labour market, which is exemplified by the segmentation theory. In the second one it is stressed that unbalance may be caused by interferences in long-term adjustment processes on the labour market, and which is presented in the human capital theory, natural rate of unemployment theory or the job search theory. The third area of discussion concerns the idea that unbalance on the labour market may result from the inflexibility of wage, which has been assumed in the efficient wage theory and in the insider-outsider theory.
2011	K11 P14	Tchouto, Jules Eric. 2011. "Air Pollution, Allocation of Property Rights, Environmental Issues and Theoretical Overlapping Generations General Equilibrium Modelling." <i>South East European Journal of Economics and Business</i> , 6(1): 23-36. This paper presents how the environment--considered as a production factor--and other related assumptions can be introduced step by step in a theoretical overlapping generations general equilibrium model (OLG-GE). The first part shows the behaviors of agents with pollution in the absence of an environmental policy. The second part emphasizes a greenhouse gas abatement policy through the allocation of pollution permit ownership, which allows property rights on the environment; here we assume a three-factor model: capital-labor-environment. The last part of the paper highlights one theoretical property about the allocation of pollution permits within a OLG-GE steady state with the environment. To our knowledge, it is the first time that the aforementioned property has been characterized.
2011	L81	Matha, Thomas Y., and Olivier Pierrard. 2011. "Search in the Product Market and the Real Business Cycle." <i>Journal of Economic Dynamics and Control</i> , 35(8): 1172-91. Empirical evidence suggests that most firms operate in imperfectly competitive markets. We develop a search-matching model between wholesalers and retailers. Firms face search costs and form long-term relationships. Price bargain results in both wholesaler and retailer mark ups, which depend on firms' relative bargaining power. We simulate the general equilibrium model and explore the role of product market search frictions for business cycles. We conclude from the simulation exercise that incorporating product market search structure and shocks improve the standard real business cycle model to reproduce US business cycle fluctuations.
2011	L81 M31	Guimaraes, Bernardo, and Kevin D. Sheedy. 2011. "Sales and Monetary Policy." <i>American Economic Review</i> , 101(2): 844-76. A striking fact about pricing is the prevalence of "sales": large temporary price cuts followed by prices returning to exactly their former levels. This paper builds a macroeconomic model with a rationale for sales based on firms facing customers with different price sensitivities. Even if firms can adjust sales without cost, monetary policy has large real effects owing to sales being strategic substitutes: a firm's incentive to have a sale is decreasing in the number of other firms having sales. Thus the flexibility seen in individual prices due to sales does not translate into flexibility of the aggregate price level.
2011	L83	Chang, Juin-Jen, Lee-Jung Lu, and Shih-Wen Hu. 2011. "Congestion Externalities of Tourism, Dutch Disease and Optimal Taxation: Macroeconomic Implications." <i>Economic Record</i> , 87(276): 90-108. This article develops a dynamic optimising macro model that sheds light on two tourism stylised facts, namely, (i) the congestion externalities caused by tourism expansion and (ii) the wealth effect generated by the revenues from overseas tourism taxation. Based on the two salient characteristics, our positive analysis indicates that if tourism tax revenues are used to provide rebates to local residents, because of the wealth effect, Dutch disease cannot be cured by the consumption tax on tourists. In contrast, if tourism tax revenues are used to provide productive government services for the manufacturing sector, Dutch disease can be treated effectively by taxation tailored for tourism. In a normative analysis, we show that to simultaneously correct the distortion caused by the congestion externality of tourism and generate the revenues from overseas tourism taxation, a government should not only levy a general tax on tourism consumption, but it should also discriminate between domestic and overseas tourism consumption, so that a positive tax surcharge is imposed on foreign tourists. In addition, the key factors that govern the optimal rates of a general tax and tax surcharge are also examined in this article.

2011	N32	Diss: Orrego Peche, Fabrizio. 2011. Essays in Overlapping Generations Economies. PhD diss. Carnegie Mellon University. In Chapter 1, Habit formation and sunspots in overlapping generations models, I introduce habit formation into an otherwise standard overlapping generations economy with pure exchange populated by three-period-lived agents. Habits are modeled in such a way that current consumption increases the marginal utility of future consumption. With logarithmic utility functions, I demonstrate that habit formation may give rise to stable monetary steady states in economies with hump-shaped endowment profiles and reasonably high discount factors. Intuitively, habits imply adjacent complementarity in consumption, which in turn helps explain why income effects are sufficiently strong in spite of logarithmic utility. The longer horizon further strengthens the income effect. Finally, I use the bootstrap method to construct stationary sunspot equilibria for those economies in which the steady state is locally stable. Chapter 2, Demography and the long-run trend of interest rates and the price-earnings ratio, states that during the twentieth century, the U.S. witnessed a cyclical birth rate: 52 million people were born between 1925 to 1944, 79 million from 1945 to 1964, and 69 million in the baby bust from 1965 to 1984. These birth waves in turn shaped the evolution of the ratio of middle-age to young adults, or MY ratio, which captures the stance of the population pyramid at any given time. In this paper, I study the effects of demographic change, as measured by the MY ratio, on interest rates and the price-earnings ratio. In order to accomplish this, I construct a deterministic overlapping generations model with pure exchange in the spirit of Geanakoplos, Magill and Quinzii [2004]. The behavior of the MY ratio gives rise to exogenous cycles that last forty years. The first prediction of the model is that the price-earnings ratio should be in phase with the MY ratio. Since interest rates adjust to prevent any arbitrage opportunities, the second prediction is that real interest rates should move inversely with the MY ratio, except after the peak in the MY ratio. The model matches qualitatively the long-run trends in real interest rates and the price-earnings ratio in the U.S. postwar era. With production, the results do not change significantly, provided that capital adjustment costs are allowed for. In chapter 3, Sequential incompleteness and dynamic suboptimality in stochastic overlapping generations economies with production, I study a stochastic overlapping generations model with production and three-period-lived agents. Agents trade bonds and risky capital. Unlike the two-period model, I show that a stationary equilibrium in which prices and allocations depend solely on the aggregate capital stock and the current shock does not exist. The recursive equilibrium becomes the relevant equilibrium concept. For the recursive formulation of the model, markets are sequentially incomplete and hence I show that there is room for Pareto improvements in terms of intergenerational risk sharing. Finally, I examine whether the introduction of capital income taxation improves the allocation of risk.

Year	DE	Title and Abstract
2011	N34	Pensiero, Luca. 2011. "The Great Depression in Belgium from a Neoclassical Perspective." <i>Review of Economic Dynamics</i>, 14(2): 389-402. This article casts the Belgian Great Depression of the 1930s within a dynamic stochastic general equilibrium (DSGE) framework. The results show that a DSGE model with total factor productivity and monetary shocks, coupled with sticky nominal wages a la Taylor is able to account reasonably well for most of the data on the Depression, but it overestimates real wages.
2011	N93 N94	Felice, Emanuele. 2011. <i>The determinants of Italy's regional imbalances over the long run: exploring the contributions of human and social capital</i>. University of Oxford, Department of Economics, Economics Series Working Papers: Number 88. The article aims to present and discuss estimates of levels of human and social capital in Italy's regions over the long term, i.e. roughly from the second half of the nineteenth century up to the present day. The results are linked to newly available evidence for regional value added in order to begin to form an explanatory hypothesis of long-term regional inequality in Italy. More particularly, convergence in value added per capita across Italy's regions is tested (through both cross-section and dynamic panel regressions) in light of the neoclassical exogenous growth approach, which incorporates human capital and social capital as conditioning variables into a long-term production function. On the whole, the results confirm the importance of conditioning variables, i.e. of regional differences in human capital and social capital, but also suggest that their impact significantly changed over the twentieth century, thus supporting the view that, in different periods, conditioning variables are determined by technological regimes.
2011	P10	Flaschel, Peter, and Alfred Greiner. 2011. <i>A Future for Capitalism: Classical, Neoclassical and Keynesian Perspectives</i>, Cheltenham, U.K. and Northampton, Mass.: Elgar. Explores current approaches to the study of macrodynamical systems in the tradition of the classical, neoclassical, and Keynesian interpretations of the workings of modern capitalist economies and the societies that are built on them. Discusses real-financial market interactions and the choice of policy measures; income security within the bounds of the reserve army mechanism; segmented labor markets and low income work; atypical employment and smooth factor substitution; economic growth with an employer of last resort--a simple model of flexicurity capitalism; economic policy in a growth model with human capital, heterogeneous agents, and unemployment; public debt, public expenditures, and endogenous growth with real wage rigidities; flexicurity--a baseline supply side model; factor substitution, Okun's Law, and gradual wage adjustments; skill formation, heterogeneous labor, and investment-driven business fluctuations; and leasing capitalism--monetary-fiscal policy measures and labor market reforms.

2011	P44	Delangizan, Sohrab, Ali Falahati, and M. Rajabi. 2011. "Asymmetry of the Impact of Monetary Shocks on Economic Growth in Iran at the New Keynesians. (In Farsi. With English summary)." <i>Quarterly Journal of Economic Growth and Development Research</i>, 1(3): 135-63. One of the most important macroeconomic discussions is the effects of monetary policies on the real section of economy. With this respect, the present article investigates the asymmetric or symmetric effects of monetary shocks on the economic growth of Iran. In this article, the relevant model extracted from macroeconomic literature of money in Iran's economy is being examined. The results demonstrate that money isn't neutral in Iran's economy and the effects of monetary policies on growth of Iran's economy are asymmetric. The negative monetary shocks influence the economic growth more than the positive monetary shocks, so that the negative monetary shocks in boom cycles and the positive monetary shocks in recession cycles have more significant effect on the economic growth. According to the result, it can be demonstrated that the effects of monetary shocks on economic growth is larger and more asymmetric if the shocks are bigger, and the lower the monetary shocks, the less the effects, consequently the asymmetry of negative and positive shocks will be slight. Also there are information gaps between economic makers so that the expectations are not formed rationally in Iran. So according to the results, it can be concluded that Iran's economy is in agreement with the Keynesian economics.
2011	Q11	O'Connell, Stephen A. 2011. "Towards a Rule-Based Approach to Monetary Policy Evaluation in Sub-Saharan Africa." <i>Journal of African Economies</i>, 20(0): ii36-66. I review the three-equation AS/IS/MP model that is at the core of the dynamic stochastic general equilibrium (DSGE) models in use within central banks in the industrial countries. Monetary policy (MP) rules play a central role in these models, and alternative rules can be compared in terms of their implications for the economy's dynamic adjustment to shocks. I discuss the advantages of DSGE modelling in low-income countries and show how interest-rate rules can be adapted to reflect the balance-sheet instruments widely used among African countries. I also identify features of the African economic environment that are poorly captured by existing models, including a large and volatile food sector, imperfect capital mobility and a credit channel for monetary policy. To illustrate the DSGE approach, I develop a model in which food supply shocks play a key role in inflation dynamics. I show that private storage can generate serial correlation of food price inflation when food price shocks are serially uncorrelated.
2011	Q40 Q50	Golosov, Mikhail, John Hassler, Per Krusell, and Aleh Tsyvinski. 2011. <i>Optimal Taxes on Fossil Fuel in General Equilibrium</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 17348. We analyze a dynamic stochastic general-equilibrium (DSGE) model with an externality through climate change from using fossil energy. A central result of our paper is an analytical derivation of a simple formula for the marginal externality damage of emissions. This formula, which holds under quite plausible assumptions, reveals that the damage is proportional to current GDP, with the proportion depending only on three factors: (i) discounting, (ii) the expected damage elasticity (how many percent of the output flow is lost from an extra unit of carbon in the atmosphere), and (iii) the structure of carbon depreciation in the atmosphere. Very importantly, future values of output, consumption, and the atmospheric CO2 concentration, as well as the paths of technology and population, and so on, all disappear from the formula. The optimal tax, using a standard Pigou argument, is then equal to this marginal externality. The simplicity of the formula allows the optimal tax to be easily parameterized and computed. Based on parameter estimates that rely on updated natural-science studies, we find that the optimal tax should be a bit higher than the median, or most well-known, estimates in the literature. We also show how the optimal taxes depend on the expectations and the possible resolution of the uncertainty regarding future damages. Finally, we compute the optimal and market paths for the use of energy and the corresponding climate change.
2011	R21 R28	Ortega, Eva, Margarita Rubio, and Carlos Thomas. 2011. "House Purchase versus Rental in Spain." <i>Moneda y Credito</i>, 0(232): 109-44. One of the most salient features of the Spanish housing market, compared to other European economies, is its relatively low rental share. This may be partly attributed to the existence of fiscal distortions in Spain favoring ownership. In this paper, we simulate the potential effects of different policy measures aimed at homogenizing the fiscal treatment of ownership and renting and improving the efficiency of the rental market. We do so in the context of a DSGE model featuring a market for owner-occupied and rented housing, as well as collateral constraints in loan markets. We find that eliminating the existing subsidy to house purchases, introducing a comparable subsidy to rental payments or increasing the efficiency in the production of housing rental services raise the rental share by a similar amount. However, their implications in terms of the construction sector differ.

2012	C02	Faggini, Marisa, and Anna Parziale. 2012. "The Failure of Economic Theory: Lessons from Chaos Theory." <i>Modern Economy</i> , 3(1): 1-10. The crisis that was shaking the world economy should push economists to wonder about the approach used to analyse economic phenomena. The motivations that have generated it, describing a whole of interdependencies, interactions, are clear and convincing. But a question remains: if the situation is so clear a posteriori why have economists not been able to foresee it? What is happening to economic science if it is not able to recognize an economic crisis before it "steps in it"? How is it possible that economic science was caught off guard yet again? Besides, what is the implication for the status of economics as a science if it is not able to successfully deal with real economic problems? The aim of the paper is to show the weakness of traditional economic theory and what improvements in terms of description and foresight could be obtained applying chaos theory to the study of economic phenomena.
2012	D22	Gibbons, Robert, Richard Holden, and Michael Powell. 2012. "Organization and Information: Firms' Governance Choices in Rational-Expectations Equilibrium." <i>Quarterly Journal of Economics</i> , 127(4): 1813-41. We analyze a rational-expectations model of price formation in an intermediate-good market under uncertainty. There is a continuum of firms, each consisting of a party who can reduce production cost and a party who can discover information about demand. Both parties can make specific investments at private cost, and there is a machine that either party can control. As in incomplete-contracting models, different governance structures (i.e., different allocations of control of the machine) create different incentives for the parties' investments. As in rational-expectations models, some parties may invest in acquiring information, which is then incorporated into the market-clearing price of the intermediate good by these parties' production decisions. The informativeness of the price mechanism affects the returns to specific investments and hence the optimal governance structure for individual firms; meanwhile, the governance choices by individual firms affect the informativeness of the price mechanism. In equilibrium, the informativeness of the price mechanism can induce ex ante homogeneous firms to choose heterogeneous governance structures.
2012	D42	Leoni, Patrick L. 2012. "Rational Expectations and Monopolistic Trades." <i>Journal of Economics (Zeitschrift für Nationalökonomie)</i> , 107(2): 129-40. We argue that the use of rational expectations in monopolistic markets, as typically done, is overly restrictive because the rationale of this approach is not met in those markets. In a model that encompasses a general equilibrium framework, we consider a monopolist (a producer) with subjective beliefs that endogenously hedges against fluctuations in input prices in a complete market. We introduce a notion of entropy of beliefs, and we characterize long-run optimal rational investments with this entropy. For irrational beliefs, we show that long-run profits are a decreasing function of this entropy. However, long-run profits always remain positive as long as the entropy remains finite despite the market selection hypothesis that would predict long-run 0-profit.
2012	D57	Duan, Wen-Qi. 2012. "Modelling the Evolution of National Economies Based on Input-Output Networks." <i>Computational Economics</i> , 39(2): 145-55. Uncovering the evolutionary dynamics of economies is helpful for us to design economic policy. This paper develops an economic evolution model by examining the coupled dynamics of industry growth and interindustry structure. For each industry, its economic properties (mainly characterized by price and quantity) are incorporated into the model. The input-output relationships among different industries are described as input-output networks, in which nodes represent industries, and weights represent technological and economic constraints between pairing industries. By measuring the dynamic importance of each node, we find that all the nodes in the input-output networks have the same dynamic importance. On the basis of this empirical regularity and the rational expectation assumption, we show that the coupled dynamics of the economic properties of nodes and input-output networks can explain the evolutionary dynamics of national economies.
2012	E16	Lombardo, Giovanni, and Federico Ravenna. 2012. "The Size of the Tradable and Non-tradable Sectors: Evidence from Input-Output Tables for 25 Countries." <i>Economics Letters</i> , 116(3): 558-61. We compute the tradable and non-tradable input shares for consumption and investment from the latest release of OECD input-output tables. We document that input shares (the content of tradable and non-tradable goods per unit of final demand) differ substantially from final demand shares (the amount of tradable and non-tradable goods directly demanded for consumption or investment purposes). The deviation is especially large for investment expenditures. Non-tradable share estimates are essential to correctly parameterize multi-sector DSGE open economy models.
2012	H00	Trabandt, Mathias, and Harald Uhlig. 2012. <i>How Do Laffer Curves Differ Across Countries?</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 17862. We seek to understand how Laffer curves differ across countries in the US and the EU-14, thereby providing insights into fiscal limits for government spending and the service of sovereign debt. As an application, we analyze the consequences for the permanent sustainability of current debt levels, when interest rates are permanently increased e.g. due to default fears. We build on the analysis in Trabandt-Uhlig (2011) and extend it in several ways. To obtain a better fit to the data, we allow for monopolistic competition as well as partial taxation of pure profit income. We update the sample to 2010, thereby including recent increases in government spending and their fiscal consequences. We provide new tax rate data. We conduct an analysis for the pessimistic case that the recent fiscal shifts are permanent. We include a cross-country analysis on consumption taxes as well as a more detailed investigation of the inclusion of human capital considerations for labor taxation.
2012	H53	Fanti, Luciano, and Luca Gori. 2012. "Public Expenditure on Health and Private Old-Age Insurance in an OLG Growth Model with Endogenous Fertility: Chaotic Dynamics under Perfect Foresight." <i>Computational Economics</i> , 40(4): 333-53. his study analyses the dynamics of an economy with overlapping generations, endogenous population (fertility and adult mortality), logarithmic preferences and Cobb-Douglas technology. We show that the public provision of health investments and the existence of a private system of old-age insurance (i.e., transfers from children to parents) may cause the birth and death of multiple (three) steady states, deterministic chaos and bubbling phenomena when individuals have perfect foresight. Interestingly, however, we show that periodic dynamics (cycles) or complex dynamics (chaos) and global stability of the economy can endogenously be reconciled in the model, because the rise either in public health investments or transfers from young to old people can have the potential to smooth and ultimately suppress endogenous fluctuations in the cases of existence of both a single steady state or multiple steady states.

		utility maximization hypothesis and the existence of a representative agent. Our result is stated on terms of a direct utility representation, and it does not depend on parametric assumptions.
2012	M12	Diss: Zambrano Riveros, Jorge Andres. 2012. Essays on Macroeconomics and Information Economics. PhD diss. University of California, Los Angeles. My research interests are in the intersection of macroeconomics and information economics. I am particularly interested in the optimal design of incentives for individuals who interact over time in uncertain environments with imperfect information, and its consequences for aggregates. The dissertation is composed by three chapters that address three particular environments within this area. The first chapter studies the optimal contract in a principal-agent model where a risk-neutral principal delegates to a risk-neutral agent the decision of whether to pursue a risky project or a safe one. The return from the risky project is unknown and the agent can acquire costly unobservable information about it before taking the decision. The optimal contract suggests that the principal should only reward the agent for outcomes that are significantly better than the safe return. It is also optimal to distort the project choice in favor of the risky one as a mechanism to induce the direct revelation of the uncertain state. In a managerial context, the findings explain why options and profit sharing compensation induce better decision making from CEOs, as well as why excessive risk taking might be optimal. The second chapter explores the role of effort and human capital as mechanisms to alleviate the idiosyncratic risk faced by individuals in the presence of incomplete markets. I construct a DSGE model where effort and human capital determine the probability of being employed the next period. I show how in the stationary equilibrium individuals diversify between these mechanisms. As a result, I obtain a wealth distribution that better approximates the real one. The results shed light on the potential implication of combining policies of unemployment insurance and subsidies to education to improve the wealth distribution. The third chapter studies dynamic stochastic models where current actions are constrained by a current state and determine the distribution over future states. The purpose of this paper is to provide a general learning process that allows agents to take the optimal decision when these endogenous transitions are unknown. Our paper generalizes previous results by not imposing parametric restrictions on the unknown transition functions.
2012	P35	Lukyanenko, I. G., and R. B. Semko. 2012. "Forecasting the Consequences of Economic Policy by Means of General Equilibrium Model. (In Ukrainian. With English summary)." <i>Actual Problems of Economics</i>, 127(1): 303-19. The article studies the peculiarities of constructing the dynamic stochastic model of general equilibrium taking into account the "financial accelerator". This model is constructed for the first time for the economy of Ukraine and is based on the Bayesian econometrics. The results of the estimation allow forecasting the consequences of the basic monetary instruments' actions as well as studying the influence of fiscal shocks upon the economic system of Ukraine and to develop the strategic decisions directed at its stabilization and development.
2012	P40	Borzani, Mohammad Vaez, Mohammad Hasan Moshref Javadi, and Azam Koohi Esfahani. 2012. "The Analysis of the Level of Consistency between Neoclassic and Islamic Paradigms in Economic Development. (In Farsi. With English summary)." <i>Quarterly Journal of Economic Growth and Development Research</i>, 2(6): 95-148. Each country would follow an economic paradigm which is constructed on ethical values and epistemological foundations. Taking lessons from the existing vast amount of theoretical and empirical research in neoclassic paradigm and taking views on consistency of it with Islamic doctrine can appear as a road map to catch Iran an economic development. In this paper, the consistency between Neoclassic and Islamic Paradigms in three fields--implicit assumptions, explicit assumptions, and development mechanisms--have been compared by the use of content analysis method. The results show that, against specific aspects, there is no basic consistency between Neoclassic and Islamic paradigms.

2013	C20	Mueller, Ulrich K. 2013. "Risk of Bayesian Inference in Misspecified Models, and the Sandwich Covariance Matrix." <i>Econometrica</i>, 81(5): 1805-49. It is well known that, in misspecified parametric models, the maximum likelihood estimator (MLE) is consistent for the pseudo-true value and has an asymptotically normal sampling distribution with "sandwich" covariance matrix. Also, posteriors are asymptotically centered at the MLE, normal, and of asymptotic variance that is, in general, different than the sandwich matrix. It is shown that due to this discrepancy, Bayesian inference about the pseudo-true parameter value is, in general, of lower asymptotic frequentist risk when the original posterior is substituted by an artificial normal posterior centered at the MLE with sandwich covariance matrix. An algorithm is suggested that allows the implementation of this artificial posterior also in models with high dimensional nuisance parameters which cannot reasonably be estimated by maximizing the likelihood.
	D03	CV: Branch, William, George W. Evans, and Bruce McGough. 2013. "Finite-Horizon Learning." In <i>Macroeconomics at the Service of Public Policy</i> , ed. Thomas J. Sargent and Jouko Vilmunen, 141-63. Oxford and New York: Oxford University Press.
2013	F17	Annabi, Nabil, Maxime Fougere, and Min Li. 2013. "Foreign Competition and Income Distribution in Canada: A Dynamic Microsimulation CGE Model Analysis." <i>International Economic Journal</i>, 27(4): 525-47. In this study we assess the impact of increased foreign competition on labour markets and income distribution in Canada, using a newly developed dynamic microsimulation computable general equilibrium (CGE) model. The main findings of the simulations conducted are that the decline in world prices of imports and exports of the manufacturing products during the 2000s induces small increases in low-income rates and inequality in the short run as well as contractions in the export-oriented manufacturing sectors. In the long run, however, it enhances capital accumulation, particularly in the primary and service sectors, increases real GDP and reduces low-income rates, especially among families with two persons or more.
2013	F60	Atanasov, Atanas P. 2013. "Toward Global Neoclassical Economics: A Critical Point of View." <i>Economic Alternatives</i>, 0(2): 21-31. It is argued that in Lakatosian sense the expected utility model--which is the core operating block of the Neoclassical Research Programme and its globalization faces serious challenges. It could be accused of relative degeneration. The following notes focus on the evolution of the model and on the failure to describe its generalization, though its axiomatic foundation is relaxed. The

Year	DE	Title and Abstract
		following remarks aim to present a relatively critical view on the prospects of the globalization of the Neoclassical Research Programme, focusing on the expected utility model (EUM). This model represents the methodology of the programme after World War Two (WW2). As a result, its evolution in the decades after WW2 and especially in the last two decades have come to serve as a benchmark for the evaluation of the dynamics and prospects in the development of the dominating Neoclassical economics, including its globalization. Globalization, or the establishment of the so-called Global economics, are terms that imply internationalization, global positioning, and the application of leading contemporary economics, that is Anglo-Saxon economics, which is officially operating in the developed economies and throughout the world, no matter whether it is referred to as Mainstream economics or Neoclassical economics. The so-called global economics has the distinguishing features of the neoclassical theoretical economics, namely axiomatization, formalism, and modeling. As these features are typical of the construction of expected utility (EU), developed by John von Neumann and Oscar Morgenstern (1947 [1944]) ¹ , which has considerably influenced the development of the post WW2 economic theory--the evolution and the state of EUM since 1940s exposes the trends in the development of neoclassical economics and its globalization. Three main starting points that are used, without going into detail, to present the relatively critical view of the theoretical and descriptive efficacy of the globalizing neoclassical economics. 1. The axiomatization of EUM in mid and late 1940s, the clarification of its axiomatic foundations and the interpretation of its meaning and importance in 1950s. This point is crucial for the organization and the explicit statement of this critical point of view because, in principle, the rationalizing of individual choice and decision making in recent decades is treated in specialized literature in the context and in the light of this axiomatization. 2. The evolution of the general form of EUM. The paper presents this point in a brief and schematic manner, paying attention to the specific multiplicative form of the model, which undergoes many changes primarily along the line of the development of the two subjective transformation functions--the subjective transformation function of the outcome and the subjective transformation function of the probability for the occurrence of the outcome. Such a schematic presentation offered below does not go into detail with regard to the complexity of the presentation of the individual choice using EU (this requires more concrete and in depth analysis), but provides for outlining the overall evolution, while presenting in a specific form the evolution of EUM, focusing on its general trends of development. 3. The evaluation of the role of axiomatization to support or reject a model or a theory. This is done from the perspective of the weakening EUM axioms, in order to accommodate the so called anomalies (descriptive contradictions, descriptive failures) which EUM encounters, and specifically from the point of view of the descriptive failure of the weakened generalizations of EUM. As is well known, such failures are registered. And this is the decisive argument. The observed descriptive failures of the weakened EUM are interpreted in Lakatosian sense as a relative degeneration of the methodology of this programme. This paper formulates the arguments and structures the defense of the view in two parts.
2013	G20	Roberts, Mark A. 2013. "The Conflating Effects of Education and Financial Competition in an Overlapping Generations-Growth Model with Nelson-Phelps Human Capital." <i>Manchester School</i>, 81(0): 93-113. The Nelson-Phelps concept of human capital, determining the speed at which a new technology may be implemented, is considered within an AK, overlapping-generations model, where finance firms act as local monopolies in the loan market but as monopsonistic price-takers in the deposit market. Households also vote for taxes earmarked for public investment in education and, thence, the subsequent level of human capital. A concentrated financial market structure, despite directly lowering economic growth, may indirectly raise it through provoking a political economy response of voting for higher taxes for greater levels of Nelson-Phelps human capital.
2013	H22	Chen, Shu-Hua, and Jang-Ting Guo. 2013. "On Indeterminacy and Growth under Progressive Taxation and Productive Government Spending." <i>Canadian Journal of Economics</i>, 46(3): 865-80. We examine the theoretical interrelations between equilibrium (in)determinacy and economic growth in a one-sector representative-agent model of endogenous growth with progressive taxation of income and productive flow of public spending. We analytically show that, if the demand-side effect of government purchases is weaker, the economy exhibits an indeterminate balanced-growth equilibrium and belief-driven growth fluctuations when the tax schedule is sufficiently progressive or regressive. If the supply-side effect of public expenditures is weaker, indeterminacy and sunspots arise under progressive income taxation. In sharp contrast to traditional Keynesian-type stabilization policies, our analysis finds that raising the tax progressivity may destabilize an endogenously growing economy with fluctuations driven by agents' self-fulfilling expectations.
2013	H27	Kavand, Hossein, and Arghavan Novin Vajari. 2013. "The Role of Public Investment on Long Run Economic Growth: A Neoclassical Endogenous Growth Mode. (In Farsi. With English summary)." <i>Tahghighat-e-Eghtesadi</i>, 48(3): 87-106. This paper extends endogenous growth models through augmenting them with government budget and oil revenues as well as the effect of public investment efficiency on long-run growth of private and government consumption and import for an oil producing economy. Based on the extracted model, the optimal growth rate of government's current expenditure (or consumption) has a positive relation with the efficiency use of public investment in the oil production sector. With the increase of the share of oil revenues in the government budget, the optimal growth rate of the government's current expenditure increases. In addition, the effect of oil revenue injection to the government budget on the long-run growth of public consumption depends on the efficient use of public capital in the oil production sector. In other words, if investment in the oil sector is not sufficient and its capital return is very low, the economy can experience a low, long-run growth for the government's current expenditure.
2013	H32	Lendvai, Julia, Rafal Raciborski, and Lukas Vogel. 2013. "Macroeconomic Effects of an Equity Transaction Tax in a General-Equilibrium Model." <i>Journal of Economic Dynamics and Control</i>, 37(2): 466-82. The paper studies the impact of an equity transaction tax (ETT) on financial and real variables in a DSGE model with two types of financial frictions: (1) financial intermediaries facing a leverage constraint; (2) noise shocks that lead to the emergence of non-fundamental equity trade. The ETT depresses the demand for equity and hence increases the cost of capital; this then affects firms' investment decisions. In the long run, the tax is found to be as distortive as a corporate income tax. The transaction tax also reduces volatility in financial markets, but the impact on real volatility is limited.
2013	H77	Ozguzer, Gul Ertan, and Luca Penserioso. 2013. "An Analysis of Turkey's Accession to the European Union." <i>Canadian Journal of Economics</i>, 46(4): 1380-1405. We build a two-country dynamic general equilibrium model to study whether European citizens would benefit from the eventual accession of Turkey to the European Union (EU). The results of the simulations show that Turkey's accession is welfare enhancing for Europeans, provided that Turkish total factor productivity (TFP) increases sufficiently after enlargement. In the benchmark model with no capital mobility, the Europeans are better off if the Turkish TFP increases bridges more than 21% of the initial TFP gap between Turkey and the EU. This figure increases to 33% when capital mobility is introduced.
2013	I15	Bloom, David E., Elizabeth T. Cafiero, Mark E. McGovern, Klaus Prettnner, Anderson Stanciole, Jonathan Weiss, Samuel Bakkila, and Larry Rosenberg. 2013. <i>The Economic Impact of Non-Communicable Disease in China and India: Estimates, Projections, and Comparisons</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 19335. This paper provides estimates of the economic impact of non-communicable diseases (NCDs) in China and India for the period 2012-2030. Our estimates are derived using WHO's EPIC model of economic growth, which focuses on the negative effects of NCDs on labor supply and capital accumulation. We present results for the five main NCDs (cardiovascular disease, cancer, chronic respiratory disease, diabetes, and

Year	DE	Title and Abstract
		mental health). Our undiscounted estimates indicate that the cost of the five main NCDs will total USD 27.8 trillion for China and USD 6.2 trillion for India (in 2010 USD). For both countries, the most costly domains are cardiovascular disease and mental health, followed by respiratory disease. Our analyses also reveal that the costs are much larger in China than in India mainly because of China's higher income and older population. Rough calculations also indicate that WHO's Best Buys for addressing the challenge of NCDs are highly cost-beneficial.
2013	I30	de La Grandville, Olivier. 2013. "On Poverty Traps and Equilibria in Growth Models." <i>Journal of Reviews on Global Economics</i> , 2(2): 25-30. We show that, contrary to a widely spread error, when the savings and the population growth rates are constant, an unstable equilibrium cannot exist in a neoclassical model, because it would imply an increasing average productivity of capital and therefore a negative marginal productivity of labor. As a consequence, a poverty trap, a dire reality, cannot be explained by such an unstable equilibrium, nor cannot it be eliminated by a capital "big-push". We finally give necessary conditions for an economy to escape a poverty trap.

2013	J60	Magnani, Riccardo. 2013. <i>The Solow Growth Model with Keynesian Involuntary Unemployment</i> . CEPII research center, Working Papers. The aim of this paper is to extend the Solow model in a way that permits to endogenize unemployment. Starting from a Neoclassical growth model, as the Solow model, we introduce a mechanism that allows us to determine the Keynesian unemployment, i.e. unemployment that is caused by the weakness of the aggregate demand. Using our base model, that works as a Keynesian demand-driven model, we find that an increase in the aggregate demand (due to a reduction in the saving rate or to an increase in public expenditures) reduces unemployment and stimulates the GDP. Then, we modify the investment function in order to take into account for the crowding-in/crowding-out effect on investments. This allows us to build a model which is between Neoclassical supply-driven models and Keynesian demand-driven models.
2013	L71	Kavand, Hossein, and Arghavan Novin Vajari. 2013. "The Role of Public Investment on Long Run Economic Growth: A Neoclassical Endogenous Growth Mode. (In Farsi. With English summary)." <i>Tahghighat-e-Eghtesadi</i> , 48(3): 87-106. This paper extends endogenous growth models through augmenting them with government budget and oil revenues as well as the effect of public investment efficiency on long-run growth of private and government consumption and import for an oil producing economy. Based on the extracted model, the optimal growth rate of government's current expenditure (or consumption) has a positive relation with the efficiency use of public investment in the oil production sector. With the increase of the share of oil revenues in the government budget, the optimal growth rate of the government's current expenditure increases. In addition, the effect of oil revenue injection to the government budget on the long-run growth of public consumption depends on the efficient use of public capital in the oil production sector. In other words, if investment in the oil sector is not sufficient and its capital return is very low, the economy can experience a low, long-run growth for the government's current expenditure.

2013	P34	Liao, Ying, and Ridong Hu. 2013. "Inflation Persistence in China: A Comparative Analysis on Standard CIA Model and CIA Model with Endogenous Money." <i>Actual Problems of Economics</i> , 144(6): 341-53. In this paper we study the inflation persistence in Chinese economy using the DSGE approach. Two monetary DSGE models are estimated--a standard CIA model and CIA model with a Taylor rule. The results show that the augmented model outperforms the standard CIA model in terms of capturing inflation persistence. At the same time, inflation must "inherit" the persistence from external shocks; backward-looking imparts some "intrinsic" persistence to inflation and autoregressive parameter of inflation constitutes the dominant source of persistence. This article uses the Bayesian method to estimate the model, and the estimated and inferred are credible due to Markov chain reaching convergence.
2013	P34	Ivashchenko, S. M. 2013. "Dynamic Stochastic General Equilibrium Model with Banks and Endogenous Defaults of Firms. (In Russian. With English summary)." <i>Zhurnal Novoi Ekonomicheskoi Associacii/Journal of the New Economic Association</i> , 0(19): 27-50. A dynamic stochastic general equilibrium (DSGE) model with endogenous defaults of firms has been developed. Proposed mechanism of defaults is very flexible. It takes into account an amount of assets owned by firms. It suggests that banks receive some payment from firm after default. The model is estimated for the USA and Russia.
2013	Q21 Q31	Arseneau, David M., and Sylvain Leduc. 2013. "Commodity Price Movements in a General Equilibrium Model of Storage." <i>IMF Economic Review</i> , 61(1): 199-224. The paper embeds the canonical rational expectations competitive storage model into a general equilibrium framework thereby allowing the nonlinear commodity price dynamics implied by the competitive storage model to interact with the broader macroeconomy. The paper's main result is that the endogenous movement in interest rates implied under general equilibrium enhances the effects of competitive storage on commodity prices. Compared with a model in which the real interest rate is fixed, the paper finds that storage in general equilibrium leads to more persistence in commodity prices and to a lower frequency of stockouts. A key mechanism driving this result is a link between the ability of the household to smooth consumption over time and the level of storage in the stochastic equilibrium. Finally, the model is used to examine the macroeconomic effects of biofuel subsidies for ethanol producers.
2013	Q23	Vatin, Francois. 2013. "Landry lecteur de Cournot: Un parcours forestier ou les chemins de traverse de la pensee economique. (Landry Reader of Cournot: A Forest Promenade or a Cross Path through Economic Thought. With English summary)." <i>Economies et Societes</i> , 47(10): 1705-30. In his thesis dated 1901, Landry bases himself on Cournot to demonstrate the suboptimal character of individual property. At the same time, he adopts a subjective theory of value, inspired by the Austrian marginalists. But the arguments, which he draws from Cournot, are inscribed in an objectivist ecological conception of the value, inspired by the engineers and foresters. This ecological questioning is also present in the works of Otto Effertz, another inspiration of young

Year	DE	Title and Abstract
		Landry. Landry abandoned quickly this inspiration contrary to the neoclassical frame. However, Effertz knew, through Landry, Cournot, and the French forestry theory, which he exploited for his theory of "economic antagonisms." Studying these cross-references between these different authors illustrates a forgotten dimension of the economic controversies in the early twentieth century, which is not without an echo today.
2013	Q31	THE SAME AS Q21 Arseneau, David M., and Sylvain Leduc. 2013. "Commodity Price Movements in a General Equilibrium Model of Storage." <i>IMF Economic Review</i> , 61(1): 199-224.
2013	Q37	Rabee Hamedani, Hasti, and Mehdi Pedram. 2013. "Oil Price Shock and Optimal Monetary Policy in a Model of Small Open Oil Exporting Economy--Case of Iran." <i>Journal of Money and Economy</i> , 8(3): 21-61. Oil price shocks are the main source of macroeconomic fluctuations in oil exporting countries. It is believed that appropriate monetary policy can help to stabilize these unwanted variations toward optimal allocations. A stochastic dynamic general equilibrium model featuring the properties of both cost push and wealth effect transmission channels is developed for the Iranian economy. In this context, it is possible to evaluate the role of monetary policy measures to accommodate supply side cost push effects and demand side wealth effect of oil price shock. This paper is intended to investigate the optimal monetary policy strategy for the economy of Iran and calibrated for its structural characteristics and patterns of external shocks. The comparative analysis of alternative monetary policies in terms of Ramsey, and optimal simple rules is performed based on key nominal and real variables variance reductions and the linear quadratic loss (LQ) function. Our findings show that domestic inflation targeting rule is the optimal monetary policy both in terms of stabilization performance and welfare costs. It must be mentioned that the addition of exchange rate to domestic inflation targeting rule has failed to improve the welfare measure and stabilization in comparison to domestic inflation targeting rule.
2013	Q38	Li, Chuan-Zhong, and Karl-Gustaf Lofgren. 2013. "Genuine Savings Measurement under Uncertainty and Its Implications for Depletable Resource Management." <i>Environmental Economics</i> , 4(3): 20-25. The concept of genuine savings has in recent years become widely accepted as a dynamic welfare indicator, which first appeared in Weitzman (1976) and then "formalized" by Pearce and Atkinson (1993). This paper attempts to generalize this concept in a stochastic setting using the Dasgupta-Heal-Solow growth model under the Merton (1975) type of population growth uncertainty. It is shown that the formula for genuine savings under uncertainty also involves a variance component reflecting the welfare loss from risk aversion (cf. Li and Lofgren, 2012). Moreover, the welfare implications of the risk-adjusted genuine savings on depletable resource management are explored.
2013	Q52	Vermeulen, Koen. 2013. <i>The Methodology of Modern Macroeconomics and the Descriptive Approach to Discounting</i> . Tinbergen Institute, Tinbergen Institute Discussion Papers: 13-200/V1. Critics of modern macroeconomics often raise concerns about unwarranted welfare conclusions and data mining. This paper illustrates these concerns with a thought experiment, based on the debate in environmental economics about the appropriate discount rate in climate change analyses: I set up an economy where a social evaluator wants to determine the optimal time path of emission levels, and seeks advice for this from an old-style neo-classical macroeconomist and a new neo-classical (modern) macroeconomist; I then describe how both economists analyze the economy, their policy advice, and their mistakes. I then use the insights from this thought experiment to point out some pitfalls of the modern macroeconomic methodology.

* Пересечения с микрокатегориями, помеченными желтым, появились в 2014—2015 гг.

E13: Balance of Links

244	Links in 2005
157	New links in 2006-2013
421	Potential links at the end of 2013
822	Total

The date of final verification: November 12, 2016.

E13 — Contributors — Авторы

Baranov, Alexander O. — Баранов Александр Олегович — 0.58 AS²;
 Lychagin, Anton M. — Лычагин Антон Михайлович — 1.05 AS;
 Lychagin, Dmitry M. — Лычагин Дмитрий Михайлович — 0.44 AS;
 Lychagin, Mikhail V. — Лычагин Михаил Васильевич — 1.16 AS;
 Mkrtchyan, Gagik M. — Мкртчян Гагик Мкртчичевич — 0.58 AS;
 Muhina, Irina K. — Мухина Ирина Константиновна — 0.5 AS;
 Popov, Ilya Y. — Попов Илья Юрьевич — 0.44 AS;
 Slepikova, Yuliya M. — Слепенкова Юлия Михайловна — 0.5 AS;
 Suslov, Victor I. — Суслов Виктор Иванович — 0.58 AS.

The total volume of derivative works for E13 is equal to 5.83 AS.

Общий объем раздела E13 — 5,83 авторских (уч.-изд.) л.

² AS — Author's Sheet — unit of measuring the volume of a literary work; equal to 40,000 characters (including the spaces between words), or 3,000 sq cm of illustrations (maps) like the table E13.E.

E16 General Aggregative Models: Social Accounting Matrix¹

Table E16.F Examples of Publications according to New Links in 2006—2013

Year	DE	Title and Abstract
2009		
2009	D31 E16 E23 H51 H52 O15 O23	Nunez, Gaspar, and Clemente Polo. 2009. "Una Matriz de Contabilidad Social de Mexico y un analisis estructural de la economia mexicana. (With English summary)." <i>Estudios Sociales</i> , 17(0): 9-52. The central goal of this paper is to present a Social Accounting Matrix of the Mexican economy for the year 1996, detailing the methodology we follow in building it. And, as a second goal, to illustrate its usefulness we carry out a basic structural analysis to study the impact of some exogenous shocks, applying an extension of Leontief's model. Specifically, we compute the Matrix of Generalized Multipliers to analyze the impact on income distribution of an increase in aggregated demand uniformly distributed, of an increase in investment, of an increase in exports, and of an increase of public expenditure in public health or education. On the other hand, besides constituting a useful tool by itself, and of being the object of study of a wide array of analytical tools of the structural analysis, a SAM also constitutes the base data on which models of applied general equilibrium are designed and implemented.
2010		
2010	J15 R11 R15 R23	Economidis, Charalambos, and Paulos Gasparis. 2010. "The Participation of Migrants in the Greek Economy at a Regional Level: An Input-Output Analysis." <i>Asian-African Journal of Economics and Econometrics</i> , 10(2): 471-98. In the context of the Social Accounting Matrix the column of households is divided into two sub-columns, for migrant and Greek households respectively. There is a further break down of the two sub-columns by the 5 major regions of the country, for which the corresponding input-output tables are available for 2005. In addition, an effort has been made to construct a comprehensive Social Accounting Matrix that includes sub-columns for migrant and Greek households by the 5 major regions of the country. Subsequently, the participation

Year	DE	Title and Abstract
		of migrant households in the Greek economy was ascertained and correlated with that of the corresponding Greek households in order to draw general conclusions about the participation of migrants in each region. The general conclusion of the paper is that overall, although a multifaceted issue, migrants make a positive contribution to the Greek economy also at a regional level, mainly through their contribution to production.
2011		
2011	C67 D57	Sergento, Ana, Pedro Nogueira Ramos, and Geoffrey Hewings. 2011. "Input-Output Modelling Based on Total-Use Rectangular Tables: Is This a Better Way?" <i>Notas Economicas</i> , 0(34): 8-34. Input-output tables can be presented in different formats, according to three main criteria: 1) symmetric or rectangular format; 2) total or domestic-use flows and 3) valuation prices (basic prices--bp or purchasers' prices--pp). Official National Accounts (at least in EU) produce in a regular base a total use rectangular table at pp--also known as the Make and Use (M&U) format--that is different from the lay-out upon which traditional input-output models were developed (domestic use, symmetric, bp). The problem with this latter one is of course that it is only available at times in many countries. The objective of this paper is to prove (under common hypotheses) the equivalence between two alternative procedures, from the point of view of the results of an input-output model: 1) to convert the M&U input-output table into the traditional format--a domestic-use symmetric table at bp--and then implement the model; 2) to perform the direct modelling of the original table (the total-use rectangular table at pp). That equivalence is illustrated with Portuguese data for the year 2002.
2011	D58 E20 E32 I12 O11	Sukati, Mphumuzi Angelbert. 2011. "The Analysis of the Possible Economic Effects of HIV/AIDS Using the SAM and CGE Models." <i>Asian-African Journal of Economics and Econometrics</i> , 11(1): 1-13. Swaziland does not have a social accounting matrix (SAM) in place and as such there are many shocks that affect that country's economy but which cannot be analyzed effectively. Most notable of this is the economic effects of the HIV/AIDS scourge that is affecting that country of which it has been difficult to determine the effects it has had on the economy in an objective manner. This paper will highlight the usefulness of the SAM and computable general equilibrium (CGE) models in analyzing the possible economic effects of HIV/AIDS in Swaziland. The absence of a SAM for Swaziland means that empirical analysis of the effect of the disease in the economy could not be undertaken but it is hoped that the arguments presented here will contribute to the use of these methods as tools for analyzing various shocks in an economy. The main aim of the paper is to lay the basic framework to help small developing countries develop practical SAMs that will become an important tool in analyzing the performances of their economies.
2011	E44 G21 O11 O16	Touati, Karima, and Hamid Kherbachi. 2011. "Impact du secteur financier sur l'activite economique en Algerie par une MCSRF. (Impact of the Financial Sector on Economic Activity in Algeria by a Real Financial Social Accounting Matrix. With English summary.)" <i>Les Cahiers du CREAD</i> , 0(95): 5-26. This article tries to construct a real financial social accounting matrix for the Algerian economy for 2003 and we describe a number of multipliers in order to evaluate the impact of the financial sector on the real economy. We have simulated the effect of an increase in credits to the economy as well as a decrease in banking activities. The results show the weakness of the multiplier effect in Algeria and are basically identical to those of research works on developing countries.
2011	I12	THE SAME AS D58 Sukati, Mphumuzi Angelbert. 2011. "The Analysis of the Possible Economic Effects of HIV/AIDS Using the SAM and CGE Models." <i>Asian-African Journal of Economics and Econometrics</i> , 11(1): 1-13.
2011	L16 O52 P24	Cardenete Flores, Manuel Alejandro, and Maria del Carmen Delgado Lopez. 2011. "Análisis de la estructura de la economía georgiana. (Analysis of the Structure of the Georgian Economy. With English summary.)" <i>Papeles de Europa</i> , 23(0): 21-42. This paper analyzes the economic structure of the Georgian economy by 2007. Using the Social Accounting Matrix of this country for that particular year, authors analyze the key sectors of the economy. There can be found an accounting decomposition of multipliers in their three effects (direct, indirect, and induced), and finally, the analysis of the reaction of different productive sectors in the region to the transfer of funds received by the USAID and the distribution of income and expenditure of Georgians consumers is run. The results show the most important sectors of the country, among them are to be included: agriculture, manufacturing, and trade, as well as the sectors of minor impact and importance which are in the case mining, education, and government institutions.
2011	O11	Sharma, A. C., and Ramesh Kolli. 2011. "Supply and Use Tables for Indian Economy, 2006-07." <i>Journal of Income and Wealth</i> , 33(1): 66-78. In this paper, the supply and use tables for the Indian Economy based on the latest available input-output tables for 2006-07 have been constructed.
2011	O11	THE SAME AS D58 Sukati, Mphumuzi Angelbert. 2011. "The Analysis of the Possible Economic Effects of HIV/AIDS Using the SAM and CGE Models." <i>Asian-African Journal of Economics and Econometrics</i> , 11(1): 1-13.

2011	O52	THE SAME AS L16 Cardenete Flores, Manuel Alejandro, and Maria del Carmen Delgado Lopez. 2011. "Análisis de la estructura de la economía georgiana. (Analysis of the Structure of the Georgian Economy. With English summary.)" <i>Papeles de Europa</i> , 23(0): 21-42.
2011	P24	THE SAME AS L16 Cardenete Flores, Manuel Alejandro, and Maria del Carmen Delgado Lopez.
2012		
2012	C53	Boisvert, Richard N., David Kay, and Calum G. Turvey. 2012. "Macroeconomic Costs to Large Scale Disruptions of Food Production: The Case of Foot-and-Mouth Disease in the United States." <i>Economic Modelling</i> , 29(5): 1921-30. We forecast the economic consequences of a widespread contamination of the food system based on a hypothetical outbreak of foot-and-mouth disease (FMD). Since the immediate effect on the livestock sector could affect the entire supply chain and US livestock, meat, and dairy exports, we measure these impacts using GTAP, a multi-region, multi-sector computable general equilibrium (CGE) model of the global economy. The immediate "shocks" to the US livestock, raw milk, and other animal products sectors indirectly affect all sectors of the economy, as well as international markets and trade. We decompose these effects due to each component of the initial shocks, and estimate the importance of these shocks to the national food system for the Mid-Atlantic Region using IMPLAN. Our GTAP results indicate that losses to the USA economy would be about \$11.7 billion, and with the ripple effect throughout the rest of the world including beneficiary nations (Argentina, Brazil, Latin America, Australia, and New Zealand) and losers (Canada,

Year	DE	Title and Abstract
		Mexico, European Union) would be 14.1 billion. We estimate the proportion of the domestic impact affecting the Mid-Atlantic Region. Based on a regional input-output model of that region, we estimate that total losses in value added are nearly \$800 million; losses in labor income total about \$565 million; and there are job losses of just over 12 thousand.
2012	C61	Duchin, Faye, and Stephen H Levine. 2012. "The Rectangular Sector-by-Technology Model: Not Every Economy Produces Every Product and Some Products May Rely on Several Technologies Simultaneously." <i>Journal of Economic Structures</i>, 1(1): 1-11. This paper identifies a fundamental challenge in the development of input-output databases of the world economy intended for analysis of alternative scenarios with a model of the world economy. Primary data sources for individual economies generally do not use the same sectoral classification schemes, in part for lack of coordination and also because not all economies produce all goods. In addition, some economies produce a given good simultaneously using several technologies, sometimes quite distinct in terms of factor requirements and cost structures, information that can and should be retained for scenario analysis. To accommodate the relevant information in a way that is both precise and parsimonious, we introduce rectangular input-output matrices and a modeling framework for analyzing them. This framework extends an existing input-output/linear programming model, the rectangular choice-of-technology (RCOT) model, and integrates it into an existing input-output/linear programming model of the world economy, the World Trade Model (WTM). The desirable properties of the resulting WTM/RCOT model are illustrated through a numerical example. This formulation requires that a criterion be specified to choose among available options, and we discuss some alternative criteria. Square input-output matrices and their inverses are only a special case of this more general formulation, and we show how moving to the rectangular formulation expands the types of questions that input-output analysts are able to address.
2012	D24 O47	Jorgenson, Dale W. 2012. "The World KLEMS Initiative." <i>International Productivity Monitor</i>, 0(24): 5-19. The objective of this article is to provide an overview of the World KLEMS Initiative, which brings together EU KLEMS, Latin America KLEMS, and Asia-KLEMS. This project generates KLEMS data sets, consisting of inputs of capital (K) and labour (L) at the industry level, together with inputs of energy (E), materials (M) and services (S), for countries around the world. Growth of output, inputs, and productivity at the industry level is critical to understanding changes in the structure of an economy, especially the relative importance of different industries and different inputs. The article illustrates the insight into the growth process provided by the KLEMS framework by analyzing the sources of economic growth in the United States over the 1947-2010 period, including contributions to growth from IT-producing and IT-using and non-IT-using industries as well as college and non-college labour.
2012	D24	Sancho, Ferran. 2012. "Straightening Out the Concept of Direct and Indirect Input Requirements." <i>Economics Bulletin</i>, 32(1): 502-09. Gim and Kim (1998) proposed a generalization of Jeong (1982, 1984) reinterpretation of the Hawkins-Simon condition for macroeconomic stability to off-diagonal matrix elements. This generalization is conceptually relevant for it offers a complementary view of interindustry linkages beyond final or net output influence. The extension is completely similar to the 'total flow' idea introduced by Szymer (1992) or the 'output-to-output' multiplier of Miller & Blair (2009). However the practical implementation of Gim and Kim is actually faulty since it confuses the appropriate order of output normalization. We provide a new and elementary solution for the correct formalization using standard interindustry concepts. The advantage of our approach is that it unravels and clarifies the step by step actual mechanisms behind the accounting rules.
2012	E01	Hernandez, Gustavo. 2012. "Matrices insumo-producto y análisis de multiplicadores: Una aplicación para Colombia. (Input-Output Matrices and Multiplier Analysis: An Application for Colombia. With English summary)." <i>Revista de Economía Institucional</i>, 14(26): 203-21. Input-output analysis is widely used in different scenarios, because it is easy to implement and interpret. Nevertheless, it is important to note that input-output coefficients should be built with caution, especially in the case of secondary production, as this may imply negative coefficients. To overcome this problem the coefficients were constructed indirectly, applying this methodology using data from the 2007 national accounts, base 2000. Using these new coefficients, we performed a traditional multiplier analysis to obtain the key sectors of the economy. This analysis is sensitive to the level of disaggregation used.
2012	E01	Pyatt, Graham, and Jeffery I. Round. 2012. "Distributional Invariance and the Design of SAMs." <i>Economic Systems Research</i>, 24(3): 251-73. The decomposition of a matrix multiplier derived from a social accounting matrix (SAM) by Pyatt and Round [(1979). Accounting and Fixed Price Multipliers in a Social Accounting Matrix Framework. <i>Economic Journal</i> , 89, 850-873] has prompted a number of subsequent applications. In one of the earliest examples Stone [(1985). The Disaggregation of the Household Sector in the National Accounts, Chapter 8. In: G. Pyatt and J.I. Round (eds.) <i>Social Accounting Matrices: A Basis for Planning</i> . Washington, DC, The World Bank, 145-185] made the intriguing observation that the higher order (circular) effects of an exogenous change in final demand on the distribution of income and the structure of production were more or less independent of the sectoral composition of the initial injection. Our initial objective in this article is to explore this phenomenon of distributional invariance and to derive sufficient conditions for it. We then argue that these conditions have important implications for the design of SAMs, for the taxonomies they adopt and for levels of disaggregation, all of which strongly condition the quality of results that can be generated via subsequent modelling.
2012	E13 E21 E22	Lombardo, Giovanni, and Federico Ravenna. 2012. "The Size of the Tradable and Non-tradable Sectors: Evidence from Input-Output Tables for 25 Countries." <i>Economics Letters</i>, 116(3): 558-61. We compute the tradable and non-tradable input shares for consumption and investment from the latest release of OECD input-output tables. We document that input shares (the content of tradable and non-tradable goods per unit of final demand) differ substantially from final demand shares (the amount of tradable and non-tradable goods directly demanded for consumption or investment purposes). The deviation is especially large for investment expenditures. Non-tradable share estimates are essential to correctly parameterize multi-sector DSGE open economy models.
2012	E22 O33	Liard-Muriente, Carlos F. 2012. "Integración vertical y productividad: La intensificación de capital en Puerto Rico durante las décadas del 1960-1970. (Vertical Integration and Productivity: The Intensification of Capital in Puerto Rico during the Decades of 1960-1970. With English summary)." <i>Revista de Economía del Caribe</i>, 9(0): 79-106. This article aims to use the technique of vertical integration as an alternative to traditional productivity measures based on input-output methodology. Leontief scheme suffers certain limitations, which are based on the hypothesis that the technical coefficients are constant. Technical parameters may vary because of technological change, which acts independently of the technical coefficients. That is why the factor "time" plays an important role while in the case of vertical integration, without confronting this problem, any change, either by economies of scale or technological progress, only causes a change in the coefficient vertically integrated, without altering the structure of the system. The article uses the economy of Puerto Rico as applied study. We derive direct and indirect requirements of capital and labor respectively, and the maximum characteristic values (eigenvalues), using the technical coefficient matrices and vectors for use in the economy of Puerto Rico.
2012	E24 E31	Andre, Francisco J., M. Alejandro Cardenete, and M. Carmen Lima. 2012. "Using a CGE Model to Identify the Policy Trade-Off between Unemployment and Inflation: The Efficient Phillips Curve." <i>Economic Systems Research</i>, 24(4): 349-69. This paper

Year	DE	Title and Abstract
	E52 E62	provides a new reading of a classical economic relation: the short-run Phillips curve. Our point is that, when dealing with inflation and unemployment, policy-making can be understood as a multicriteria decision-making problem. Hence, we use so-called multiobjective programming in connection with a computable general equilibrium (CGE) model to determine the combinations of policy instruments that provide efficient combinations of inflation and unemployment. This approach results in an alternative version of the Phillips curve labelled as efficient Phillips curve. Our aim is to present an application of CGE models to a new area of research that can be especially useful when addressing policy exercises with real data. We apply our methodological proposal within a particular regional economy, Andalusia, in the south of Spain. This tool can give some keys for policy advice and policy implementation in the fight against unemployment and inflation.
2012	E24	Dietzenbacher, Erik, and Umed Temurshoev. 2012. "Input-Output Impact Analysis in Current or Constant Prices: Does It Matter?" <i>Journal of Economic Structures</i> , 1(1): 1-18. This paper addresses the question whether the results of input-output (IO) impact analyses differ (and to what extent) when a framework in current prices or in constant prices is used. We consider the effect of an exogenous stimulus of final demand in current prices on (a) gross output in constant prices, and (b) employment. In an empirical application to Denmark, we found that all predicted effects were very similar. This holds in particular for the results at the aggregate, economy-wide level and, to a lesser extent, at the sectoral level.

2012	E52	Sudo, Nao. 2012. "Sectoral Comovement, Monetary Policy Shocks, and Input-Output Structure." <i>Journal of Money, Credit, and Banking</i> , 44(6): 1225-44. The comovement of output across the sector producing nondurables (i.e., nondurable goods and services) and the sector producing durables is well established in the monetary business cycle literature. However, standard sticky-price models that incorporate sectoral heterogeneity in price stickiness (i.e., sticky nondurables prices and flexible durables prices) cannot generate this feature. We argue that an input-output (I-O) structure provides a solution to this problem. Here, we develop a two-sector model with an I-O structure, which is calibrated to the U.S. economy. In the model, each sector's output affects those of the others by acting as an intermediate input. This connection between the sectors provides a channel through which sectoral comovement is induced.

2012	F14 F43	Pei, Jiansuo, Jan Oosterhaven, and Erik Dietzenbacher. 2012. "How Much Do Exports Contribute to China's Income Growth?" <i>Economic Systems Research</i> , 24(3): 275-97. It is a widespread belief that exports, in particular of "high-tech" products, contribute much to China's income growth. This study addresses this issue by applying a structural decomposition analysis to input-output (I-O) data. We employ two extended I-O tables that distinguish processing trade from ordinary exports. The contribution of exports to the value-added growth from 2002 to 2007 is found to be overestimated by 32% when standard I-O tables are used rather than the extended I-O tables. Even more strikingly, the value-added growth that may be attributed to the exports of "high-tech" telecommunication products is overestimated by no less than 63%. A serious overestimation of the contribution to income growth of certain products (such as high-tech products) sends out misleading signals to policymakers. When measured correctly, the true contribution appears to be substantially smaller than is generally believed to be.
2012	H23	Diss: Morrone, Henrique. 2012. Three Essays on Distribution and Economic Expansion of a Dual Economy. PhD diss. University of Utah. This dissertation aims to investigate the evolutionary process of a dual economy, using the Structuralist approach. In this sense, the work is divided in three parts. Firstly, we make a brief introduction of the literature on the dynamic between distribution and economic expansion. Specifically, it discusses the Structuralist approach to a dual, open-economy. The review of this model suggests that further research that incorporates distributive issues might be a fertile avenue (area) to accomplish a better understanding of a developing economy. The second part presents a methodology to estimate a Social Accounting Matrix for Brazil in 2006 that separates between formal and informal sectors. The goal of this study is to estimate and to analyze the Social Accounting Matrix for Brazil in 2006. The shares of output by informal and formal sectors are applied as weights to estimate the size of the two sectors. The results reveal important structural linkages between the two sectors and may serve as data input for future Structuralist calibrated models. Thirdly, the last part presents a dual, open-economy model that describes the schematic behavior of the Brazilian economy. We compare the short-run effects of two major experiments: an income transfer toward workers in the modern sector and an income transfer to workers from the subsistence sector, and discuss them in the context of Brazil. The results suggest that redistribution under certain conditions may lead to economic expansion.
2012	L24 L60	Breda, Emanuele, and Rita Cappariello. 2012. "A Tale of Two Bazaar Economies: An Input-Output Analysis of Germany and Italy." <i>Economia e Politica Industriale</i> , 39(2): 111-37. The paper evaluates the extent of production internationalisation in Italy and Germany from 1995 to 2007. The analysis is based on a broad set of international outsourcing indicators to which we have added a new indicator to take account also of the import content of domestic inputs: the direct and indirect import content of production. In 2007, both countries showed a similar intensity of international offshoring, although Italian manufacturing firms showed a slightly higher rate. From a dynamic viewpoint, both economies spurred substantial growth in off-shoring in 1995-2000, although the growth was stronger in Germany, where at least manufacturing started from a lower level. In 2001-2003, off-shoring levels stagnated in both economies, although growth quickly resumed in 2004-2007, suggesting a shift in the strategic direction and the reorganisation of production by Italian firms. The new challenges posed by globalisation, the widespread take-up of information and communication technologies, and the adoption of the euro have induced the most dynamic Italian firms to retool their organisational set-up, including the degree of vertical specialisation.
2012	L66 Q11 Q17	Boisvert, Richard N., David Kay, and Calum G. Turvey. 2012. "Macroeconomic Costs to Large Scale Disruptions of Food Production: The Case of Foot-and-Mouth Disease in the United States." <i>Economic Modelling</i> , 29(5): 1921-30. We forecast the economic consequences of a widespread contamination of the food system based on a hypothetical outbreak of foot-and-mouth disease (FMD). Since the immediate effect on the livestock sector could affect the entire supply chain and US livestock, meat, and dairy exports, we measure these impacts using GTAP, a multi-region, multi-sector computable general equilibrium (CGE) model of the global economy. The immediate "shocks" to the US livestock, raw milk, and other animal products sectors indirectly affect all sectors of the economy, as well as international markets and trade. We decompose these effects due to each component of the initial shocks, and estimate the importance of these shocks to the national food system for the Mid-Atlantic Region using IMPLAN. Our GTAP results indicate that losses to the USA economy would be about \$11.7 billion, and with the ripple effect throughout the rest of the world including beneficiary nations (Argentina, Brazil, Latin America, Australia, and New Zealand) and losers (Canada,

Year	DE	Title and Abstract
		Mexico, European Union) would be 14.1 billion. We estimate the proportion of the domestic impact affecting the Mid-Atlantic Region. Based on a regional input-output model of that region, we estimate that total losses in value added are nearly \$800 million; losses in labor income total about \$565 million; and there are job losses of just over 12 thousand.
2012	O14	Jahangard, Esfandiari, and Vida Keshavarz. 2012. "Identification of Key Sectors for Iran, South Korea and Turkey Economies: A Network Theory Approach." <i>Iranian Economic Review</i> , 16(32): 41-62. Considering the scarcity of resources especially in developing countries, it is critical to identify the key sectors of these economies. Recognition of key sectors is one important subject for policy makers and economic planners. In determining key sectors both in theory and in practice, several different methods are proposed in the literature. One of the most novel and recent approaches is based on network theory, under which different weights, known as influence indices, are assigned to both intermediate and final demand of sectors. In order to pinpoint those sectors with strong linkages in a contributing to the economy, network theory proposes a definition of centrality measures including total effects, meditative effects, and immediate effects which considered as multilevel indicators. The purpose of this study is to determine the key sectors of Iran, South Korea, and Turkey and compare the results using Iran's 1999 input-output table, South Korea's 2005 input-output table, and Turkey's 2002 input-output table. The results show that considering the role of final demand for some economic activities are really important in identifying key sectors of Iran, Turkey, and Korea although it is less important in some sectors of Turkey and South Korea.
2012	O14 O18 P23 P25	Sarula. 2012. "Comparative Study on the Industrial Structure in Inner-Mongolia, China: Based on an Input-Output Analysis. (In Japanese. With English summary)." <i>Studies in Regional Science</i> , 42(2): 337-50. This paper clarifies the characteristics of the current industrial structure in Inner-Mongolia, based on comparisons with the nation-wide industrial structure in China. The method introduced for this purpose is an input-output analysis. First, the paper overviews the structural characteristics and changes in Inner Mongolian industries, based on the 2007 input-output table. Second, it focuses on diffusion impacts between industries based on analysis of production inducement coefficient and power of dispersion. Finally, the paper deals with the trade structure between Inner Mongolia and other areas to clarify the economic mutual dependency with a skyline analysis.

"Testing Bohm-Bawerk's Theory of Capital: Some Evidence from the Finnish Economy." <i>Review of Austrian Economics</i> , 26(2): 207-20. This paper considers the pure labour theory of value and Bohm-Bawerk's theory of capital as approximations of Sraffa's model of single production, and tests them with data from the Symmetric Input-output Tables of the Finnish economy. The results show that (i) in comparison with the labour values, the actual Bohm-Bawerkian production prices are 'equally' good or even better approximations of the actual Sraffian production prices and market prices; and (ii) the Sraffian production price-profit rate relationship is, by and large, governed by the differences in the Bohm-Bawerkian average periods of production.
2013	B31 N13	Dodgson, John. 2013. "Gregory King and the Economic Structure of Early Modern England: An Input-Output Table for 1688." <i>Economic History Review</i> , 66(4): 993-1016. This article presents an input-output table for England and Wales for the year 1688 which is based on the extensive dataset compiled by Gregory King in the 1690s, together with other contemporary and modern material relating to the end of the seventeenth century. As well as showing the inter-relationships between the different parts of the economy, the data in the table can be used to compute national income and the shares of different sectors such as agriculture, manufacturing, and services in total value added. Further, the approach used to compile the table provides a way to subject King's data to as much independent assessment as is possible given alternative sources of information. Sensitivity analysis is used to assess the impact on national income and sector shares of alternative estimates of the grain harvest, metal manufacture, and service sector output.
2013	B51 E25	Froehlich, Nils. 2013. "Labour Values, Prices of Production and the Missing Equalisation Tendency of Profit Rates: Evidence from the German Economy." <i>Cambridge Journal of Economics</i> , 37(5): 1107-26. During recent years, several empirical studies have found that deviations from labour values to market prices are quite small. However, most of these articles do not offer a

Year	DE	Title and Abstract
		detailed reason for this result. In this paper, two theoretical justifications of the labour theory of value are brought together with some data concerning labour values, prices of production, and market prices, on the basis of German input-output tables from 2000 and 2004. In addition, the statistical characteristics of profit rates are analysed. Both of the theoretical arguments are much in line with the empirical observations, because there is only a slight transformation tendency and at the same time profit rates and capital intensity are negatively correlated. Moreover, during the period under observation the German economy seems to be in a state of statistical equilibrium.
2013	D12	Canning, Patrick. 2013. "Maximum-Likelihood Estimates of a US Multiregional Household Expenditure System." <i>Economic Systems Research</i> , 25(2): 245-64. This paper applies the maximum-likelihood equation to a model that produces US regional household expenditure estimates using national-level data on average expenditures by type of household and regional data on the number of households by type. Empirical results follow the analytical properties of the model and demonstrate an impressive capacity to recover regional statistics. These findings are useful in applied regional studies since they demonstrate a general framework to assess the input data and the overall estimation model.
2013	D85 L14	Garcia-Muniz, Ana Salome. 2013. "Modelling Linkages versus Leakages Networks: The Case of Spain." <i>Regional and Sectoral Economic Studies</i> , 13(1): 43-54. Network analysis in the input-output field is an ongoing and interesting area of research which has seen a rise in contributions in recent years. In the input-output field, studies based on graph and network theory have been developed only about topological measures used descriptively. Modelling input-output structure by statistical network models is the aim. The proposed network models for the Spanish productive relationships assess the evolution of the productive structure and offers insights into the explanation of the domestically and imported productive structure in the periods 1995 and 2009 in Spain.
2013	E25	THE SAME AS B51 Froehlich, Nils. 2013. "Labour Values, Prices of Production and the Missing Equalisation Tendency of Profit Rates: Evidence from the German Economy." <i>Cambridge Journal of Economics</i> , 37(5): 1107-26.
2013	E25 I32 I38	Acharya, Sanjaya, Marcello Signorelli, Borut Vojinovic, and Zan Jan Oplotnik. 2013. "Alternative Approach to Economic Restructuring to Benefit the Poor--SAM Multipliers Analysis as Alternative Approach." <i>Scientific Annals of the "Alexandru Ioan Cuza" University of Iasi</i> , 60(1): 1-20. Many economic reforms in developing economies are, in fact, price deregulation in the product markets and trade liberalisation, concerning whether the growth of exports accelerates. This paper, however, attempts to offer a new flavour in the policy reforms using fixed price model to study the growth impact of different sectoral investments and transfers to households. We used Social Accounting Matrix (SAM) multipliers to analyse the flow structure and distributional effects of sectoral investments and transfers in a typical developing economy. Using the case of Nepal, we simulate the effects of additional demand creations to sectors and transfer earning growth to households and measure their effects and conclude that in the given flow structure, the additional sector demand and transfer growth in the economy benefit the middle income groups more; whereas the benefit to the poorest is only modest. We examine the effects of potential pro-poor economic restructuring measures especially with regard to the improvements of efficiency parameters and redirection of factor endowments. Consequently, poor households transfer towards those activities which have higher multiplier effects of additional demand and transfer earning. Furthermore, redirection of factor endowments requires undergoing with the skill upgrade of poor labour to be conducive with higher economic growth.
2013	E25 F33	Morrone, Henrique, and Adalmir Antonio Marquetti. 2013. "Distribuicao e expansao em um modelo neoestructuralista: Uma aplicacao para o Brasil. (Distribution and Expansion in a Neostructuralist Model: An Application to Brazil. With English summary.)" <i>Revista de Economia Contemporanea</i> , 17(3): 468-93. This paper presents a neo-structuralist model that attempts to evaluate the impact of simulation exercises on the economic performance of the Brazilian economy. The data from the National Accounting System is employed to build a Social Accounting Matrix that serves as base for our model. Three experiments are applied: a rise in the investment level, an income transfer to workers, and a policy mix that combines both the preceding simulations (devaluation with redistribution). The results suggest that every experiment impacts positively the Brazilian economy; it validates the neo-structuralist claims about the positive effects of exchange devaluation and redistribution on the level of economic activity.
2013	E58	Hayden, F. Gregory. 2013. "Network Analysis for Modern Monetary Theory." <i>Journal of Economic Issues</i> , 47(2): 575-84. This article integrates Scott Fullwiller's two social fabric matrices for Federal Reserve and Treasury operations to help establish a number of results. First, the resulting network demonstrates that the components are involved in an intense, extensive, and complex network of interconnections. Second, given the numerous pathways in the network, it becomes clear that one needs to identify specific pathways when undertaking a discussion. Third, the article identifies variant criteria that guide the rules, regulations, and requirements of real-world monetary operations, and clarifies that the conflict between normative belief criteria and variant criteria is crucial for understanding the formulation of alternative monetary policies. Fourth, the article establishes that, beyond social criteria, technological criteria also deliver rules, regulations, and requirements to the institutions. Fifth, it further refines the social fabric matrix itself. Finally, the integrated matrix provides a base to which components may be added with a view to pursuing future research interests.
2013	E58 P34	Wang, Li. 2013. "Impact of Change in the Deposit Reserve Ratio on Chinese Macro-economy. (In Chinese. With English summary.)" <i>Journal of Quantitative and Technical Economics</i> , 30(5): 152-60. This paper extends a conventional CGE model to a financial CGE model by joining the two agents of commercial banks and central banks, as well as detailed description of a savings-investment mechanism. Based on this framework, we establish a Financial Social Accounting Matrix and simulate the impact of changes in the deposit reserve ratio on Chinese macro-economy and sectoral economy. The simulation results show that change in deposit reserve ratio is an effective tool to control and adjust Chinese macro-economy in some degree. Impact of decreasing the deposit reserve ratio has stronger effect on the economy than that of increasing the ratio. In terms of the impact on the sectoral economy, construction sector is the most sensitive sector to the change in deposit reserve ratio followed by service sector and manufacturing sector, the response of the agricultural sector is relatively weaker than other sectors.
2013	E66 O57	Suslov, N. I. 2013. "UN Project Future of the World Economy: What Did Not Come True? [2011]." <i>Problems of Economic Transition</i> , 56(1): 53-68. The article is devoted to an analysis of long-term forecasting based on input-output models. The base scenarios for world economic development constructed within the framework of the well-known United Nations forecasting project of the 1970s, Future of the World Economy, are discussed. Substantiation is given to the idea that the main reason why the forecast deviated from the actual development parameters for regions of the world is that institutional threats in countries of Africa and Latin America and in the Soviet Union and Eastern Europe were underestimated. Another reason is the failure to adequately take into account the effect of the energy crisis. The main conclusion is that experts involved in forecasting are able to foresee development possibilities better than threats.
2013	F13	Bond, Eric W., Mario J. Crucini, Tristan Potter, and Joel Rodrigue. 2013. "Misallocation and Productivity Effects of the Smoot-Hawley Tariff." <i>Review of Economic Dynamics</i> , 16(1): 120-34. Using a newly created microeconomic archive of US imports at

Year	DE	Title and Abstract
	N12 N72	the tariff line level for 1930-1933, we construct industry-level tariff wedges incorporating the input-output structure of US economy and the heterogeneous role of imports across sectors of the economy. We use these wedges to show that the average tariff rate of 46% in 1933 substantially understated the true impact of the Smoot-Hawley (SH) tariff structure, which we estimate to be equivalent to a uniform tariff rate of 70%. We use these wedges to calculate the impact of the Smoot-Hawley tariffs on total factor productivity and welfare. In our benchmark parameterization, we find that tariff protection reduced TFP by 1.2% relative to free trade prior to the Smoot-Hawley legislation. TFP fell by an additional 0.5% between 1930 and 1933 due to Smoot-Hawley. We also conduct counterfactual policy exercises and examine the sensitivity of our results to changes in the elasticity of substitution and the import share. A doubling of the substitution elasticities yields a TFP decline of almost 5% relative to free trade, with an additional reduction due to SH of 0.4%.
2013	F21	Trinh, Bui, Nguyen Viet Phong, and Binh Phan. 2013. "The Economic Growth and Policy Implications in Vietnam." <i>Journal of Applied Finance and Banking</i> , 3(5): 239-52. After a long period of high and stable economic growth, Vietnam's economy is experiencing a difficult time that inflation is considered the main reason for. To solve the situation, Vietnam's government has continuously introduced a series of aggregate demand management policies relating to restraining inflation or boosting economic growth. This paper uses quantitative methodology to analyze the relationship between growth and inflation in Vietnam and the input-output system by W. Leontief to analyze the periodical structure of the economy. Hence it would be possible to identify the cause for economic growth and raise some implications to policymakers.
2013	F33	THE SAME AS E25 Morrone, Henrique, and Adalmir Antonio Marquetti. 2013. "Distribuicao e expansao em um modelo neoestruturalista: Uma aplicacao para o Brasil. 2013	H54 R58	Cardenete Flores, Manuel Alejandro, Maria del Carmen Delgado Lopez, and Patricia D. Fuentes Saguar. 2013. "Analisis del impacto de los Fondos Europeos en Andalucia: 2000-2006. (Impact Assessment of the European Funds in Andalusia: 2000-2006. With English summary.)." <i>Estudios de Economia Aplicada</i> , 31(1). After two decades in which Andalusia has been receiving financing from the European Structural Funds with the objective to develop through these investments the key sectors that boost economic growth in the region, this paper proposes an analysis that will reveal the economic impact of the European Funds received by the Autonomous Community of Andalusia during the period 2000-2006. For this it will use the Social Accounting Matrix of year 2005 and a model of linear multipliers. The results will underscore a significant contribution of the European Funds to the growth of the region for the period analyzed (2000-2006).
2013	H54	Fabbrini, Luigi. 2013. "The Matrix of the Italian Economy and Developments in Structural Interdependence Analysis." <i>Rivista Internazionale di Scienze Sociali</i> , 121(3-4): 405-24. The article focuses on Leontief's structural interdependence theory and its recent developments and applications. Fabbrini traces out the origin of this new field of research and provides a rich review of the literature available at that time. In particular the author discusses the relative merits and limitations of the models based on open and closed matrixes respectively, and thoroughly discusses the assumptions and the methodological issues involved in the two. The second part of the article is entirely devoted to a detailed comment on the first application of input-output analysis to the Italian post-1951 economic system offered by Chenery, Clark and Cao-Pinna. The author assesses the importance of the methodology undertaken by the abovementioned authors and highlights how their main findings support the possibility of a steady growth rate in the Italian economy driven by a bold program of public investments without imperiling the balance of payments equilibrium and monetary stability.
2013	H62 O17	Gul, Zafer Baris. 2013. "Turkiye'de 2000 sonrası donemde kamu maliyesi uygulamalarının bolusum etkilerinin sosyal hesaplar matrisi (SHM) ile analizi. (The Analysis of Distributional Effects of Public Finance Implementations with Social Accounting Matrix [SAM] in Turkey after 2000s. With English summary.)." <i>Akdeniz IIBF Dergisi</i> , 13(26): 77-102. This study aims to reveal the effects of public finance applications determined by the IMF's letters of intent and expressed by the "primary surplus" policy on the fundamental institutions of the economy characterised by households, firms, and the state in Turkey's post 2000 era. In this paper, the main analytical tools are the 2002 and 2006 Social Accounting Matrices (SAM), which are comprised of households, firms, and the state, and the decomposition of institutions. The public finance structure forms an efficient state framework and is applied through primary surplus policy, which causes the state to shift from a deficit to a surplus position by a fiscal austerity programme. In this sense, household and firm deficits are deepened via a decreasing savings rate in the private sector. The most affected layers from these processes are the urban worker classes and pensioners.
2013	H62	Nasrollahi, Khadijeh, Nematollah Akbari, and Safoora Ramzani. 2013. "Currency Revenues from Tourists and the Impact on Different Economic Sectors of Isfahan. (In Farsi. With English summary.)." <i>Quarterly Journal of the Economic Research</i> , 0(1): 1-23. Tourism plays a growing role in developing countries and is considered as a way of government deficit reduction, gaining foreign exchange and creating jobs. In addition, it is viewed as a channel of getting away from single product economies. In fact, tourism is an industry with multi-dimensional impacts on different sectors of economy. Therefore, it can also be viewed as an important development factor in Isfahan province. In this study, the impacts of international tourist expenditures on income generation, allocation, distribution, consumption and savings in different economic sectors of Isfahan province has been analyzed using Social Account Matrix (SAM) technique, supported by input-output matrix. The results show that financial sector has a very poor performance in this regard in terms of generating revenues coming from international tourists. Although the government sector has the highest share regarding the initial allocation of income, but due to the transactions happening among structural sectors, households have been the main gainers of this income generation. In fact, almost 84% of the generated revenues in this way have been consumed.
2013	H76 O22 R53	Wijerathna, Deeptha, Jayatileke S. Bandara, and Kamal Karunagoda. 2013. "How Useful Is a Regional SAM in Evaluating Regional Projects in Sri Lanka? An Illustration for Post-war Regional Development Policy Analysis." <i>Australasian Journal of Regional Studies</i> , 19(2): 239-73. Over the last several decades, Social Accounting Matrices (SAMs) have emerged as a widely accepted method for the presentation of macroeconomic data and an analytical technique for impact analyses at national, regional and village levels. Although there is a large body of literature concerning the construction and application of SAMs, there are only a few impact evaluations with regional and village SAMs. This is particularly evident when focusing on the impact of regional investment projects in developing countries. In this paper, we have attempted to demonstrate how a regional SAM can successfully be applied to evaluate the impact of an irrigation project in the Southern Province of Sri Lanka. This example clearly demonstrates the possibility of using regional and village level SAMs in evaluating post-war development projects, such as infrastructure and irrigation projects, in Sri Lanka.

Year	DE	Title and Abstract
	Q10	presenting theoretical principles with respect to the place of economic sectors in decreasing poverty and analyzing direct and indirect effects of FGT (Foster-Greer-Thorbecke) poverty index separately for different economic activities against increase in production. In this study, using fixed price multiplier coefficients approach in the scope of social accounting matrix pattern, the impact of economic growth on poverty reduction is investigated. The results indicate that the reduction of poverty in fourteen economic sectors has been affected by two factors: change in average income of the socio-economic groups and the elasticity of poverty index to change in the average income of the same groups. Also, the growth in agriculture, building, wholesale, and retail sectors have the highest share in decreasing poverty.

The main objective of this paper is to highlight the determinants of informal sector activity with a special focus on informal self-employment opposed to informal wage employment. For this purpose, we build a theoretical framework to show the important role of education in occupational choice. To empirically test our hypothesis, we estimate a two-stage degenerated nested logit model after rejecting the independence of irrelevant alternatives hypothesis. Our results show that the probability of formal sector employment increases with the level of education. In the informal sector, education attainment tends to reduce the probability of self-employment as opposed to wage employment. Other relevant determinants are related to gender, age, and place of residence.

"Impacto economico de la inversion en infraestructuras de transporte de electricidad: Estimacion a partir de la matriz de contabilidad social de Aragon. (With English summary.)." <i>Economia Industrial</i> , 0(390): 135-44. The aim of this paper is to analyse the regional macroeconomic impact of the investment performed and foreseen by Red Electrica de Espana (Spanish Electrical Network) on the expansion and improvement of the electricity transmission infrastructures during the period 2007-2014 model of lineal multipliers, based on the Aragon's social accounting matrix concerning the regional economic situation in 2005 has been applied. Moreover the impact of these investments in electricity transmission infrastructures on the creation of jobs has been estimated.
2013	J23 Q42 Q48 Q54	da Silva, P. Pereira, C. Oliveira, and D. Coelho. 2013. "Employment Effects and Renewable Energy Policies: Applying Input-Output Methodology to Portugal." <i>International Journal of Public Policy</i> , 9(3): 147-66. Renewable energy is playing an increasing role in energy mixes around the world, including Europe, which is aiming for a target of 20% renewable energy by 2020. Portugal is at the forefront of the European intention, with a 31% target. The advantages of the application of renewable energy policies are widely accepted to include a decrease in greenhouse gas emissions and an improvement in energy security. In many cases job creation is also touted as a benefit but this claim stands on an uncertain footing. Amongst the variety of methodologies, analytical studies using extensive surveys seem to be more appropriate for regional studies while linear simulations, either in the form of input-output (I-O) analysis or, in recent years, social accounting matrix (SAM) multiplier analysis appear to better suit national and international studies. This paper offers an assessment of the impact of Portuguese 'green' energy policies on the employment level departing from a system of symmetric input-output tables recently built for Portugal by the Department of Foresight and Planning.

2013	L14 Q54 Q56	Andrew, Robbie M., and Glen P. Peters. 2013. "A Multi-region Input-Output Table Based on the Global Trade Analysis Project Database (GTAP-MRIO)." <i>Economic Systems Research</i> , 25(1): 99-121. Understanding the drivers of many environmental problems requires enumerating the global supply chain. Multi-region input-output analysis (MRIOA) is a well-established technique for this purpose, but constructing a multi-region input-output table (MRIOT) can be a formidable challenge. We constructed a large MRIOT using the Global Trade Analysis Project (GTAP) database of harmonised economic, IO, and trade data. We discuss the historical development of the GTAP-MRIO and describe its efficient construction. We provide updated carbon footprint estimates and analyse several issues relevant for MRIO construction and applications. We demonstrate that differences in environmental satellite accounts may be more important than differences in MRIOTs when calculating national carbon footprints. The GTAP-MRIO is a robust global MRIOT and, given its easy availability and implementation, it should allow the widespread application of global MRIOA by a variety of users.
2013	L14	Meng, Bo, Yaxiong Zhang, and Satoshi Inomata. 2013. "Compilation and Applications of IDE-JETRO's International Input-Output Tables." <i>Economic Systems Research</i> , 25(1): 122-42. International input-output (IO) tables are among the most useful tools for economic analysis. Since these tables provide detailed information about international production networks, they have recently attracted considerable attention in research on spatial economics, global value chains, and issues relating to trade in value added. The Institute of Developing Economies at the Japan External Trade Organization (IDE-JETRO) has more than 40 years of experience in the construction and analysis of international IO tables. This paper explains the development of IDE-JETRO's multi-regional IO projects including the construction of the Asian International Input-Output table and the Transnational Interregional Input-Output table between China and Japan. To help users understand the features of the tables, this paper also gives examples of their application.

(Sectoral Developments in Production and Employment in Turkish Economy: An Input-Output Analysis. With English summary.)." <i>Middle East Technical University Studies in Development</i> , 40(2): 373-93. In an economy, developments in sectoral production and employment are as important as developments in gross output and total employment in terms of policy proposals. In this study in an input-output framework, developments in sectoral production and employment for the Turkish economy for 1985-2002 period are analyzed. The main data source is the latest input-output tables published by TURKSTAT. For twenty-five sectors defined in this study, backward and forward linkages for output and employment are calculated. In this way the analysis reveals the reflection of changes in the structure of the economy on sectoral output and employment, the role played by sectors in generation of employment and in this context the "key sectors" in the economy.

2013	O25	Sharify, Nooraddin. 2013. "Input-Output Modelling of the Effect of Implicit Subsidies on General Prices." <i>Economic Modelling</i> , 33(0): 913-17. Implicit subsidies are implemented for different reasons in many countries. These subsidies generally emerge through selling public resources such as gas, oil, and water at a lower price to one or more sectors. They are not considered in government payments and national accounts. Hence, it is expected that any change in the size of these subsidies influences the price of the relative sectors through the intermediate expenditures. This paper aims at developing the table adjusting price (TAP) and standard Leontief price (SLP) models to measure the effect of an exogenous change in the size of implicit subsidy on the price indices of all sectors. The proposed models allowed the researcher to analyse a change in the level of implicit subsidy in different cases. In addition, an empirical example illustrates the result of the implementation of these models.
2013	O53	Bekhet, Hussain Ali. 2013. "Assessing Structural Changes in the Malaysian Economy: I-O Approach." <i>Economic Modelling</i> , 30(0): 126-35. This study attempts to re-investigate the production structure change for the Malaysian economy through changes in the A and (I - A) - 1 matrices over the period 1980-2005, when the planners formulated and implemented nine plans so far. Five input-output tables were published by the Department of Statistics in Malaysia for the period under study. A structural change method was carried out to analyze and assess the changes in economic efficiency. This comparative study focuses on changes in the economic structure with different levels of development over time (1980-2005). The change in the economic structure is decomposed into two initial components (technology and total output). In accordance with the results, there appear to be similarities over time in the national structure of production patterns of intermediate use of commodities. Also, the results clearly indicate a rather remarkable degree of commonality in the patterns of growth processes, with more significant differences among sectors than between tables. However, the changes within sectors, and the Malaysian table as a whole, seem to result from changes in the level of the efficiency. Technical relationship seems to have remained relatively unchanged. It is clear that the economy has not moved fast enough forward, and does not seem to be geared by, the type of exports that may sustain a dynamic industrial development, based on external markets. New evidence is revealed in this study: the efficiency degree between demand and supply side for the Malaysian economy still remain weak and changeable over the period of study.

The hypothesis of ecologically unequal exchange posits that low and middle income developing nations maintain an ecological deficit with wealthy developed nations, exporting natural resources and high impact commodities thereby allowing wealthy economies to avoid operating ecologically impactful industries at home. In this survey we assess the footprint of consumption of 187 countries using eight indicators of environmental pressure in order to determine whether or not this phenomenon occurs. We use input-output analysis with a new high resolution global Multi-Region Input-Output table to calculate each trading pair's balance of trade in biophysical terms of: GHG emissions, embodied water, and scarcity-weighted water content, air pollution, threatened species, Human Appropriated Net Primary Productivity, total material flow, and ecological footprint. We test three hypotheses that should be true if ecologically unequal exchange occurs. One: The inter-regional balance of trade in biophysical terms is disproportional to the balance of trade in financial terms. We find this is true, though not strongly so. Two: Exports from developing nations are more ecologically intensive than those from developed nations. We find this is true. Three: High-income nations disproportionately exert ecological impacts in lower income nations. We find this is false: high income nations are mostly exporters, not importers, of biophysical resources.

Year	DE	Title and Abstract
2013	Q53 Q54 Q58	Mazhar, Ummad, and Ceyhun Elgin. 2013. "Environmental Regulation, Pollution and the Informal Economy." <i>State Bank of Pakistan Research Bulletin</i> , 9(1): 62-81. The regulation of environmental pollution is challenging. Particularly, the presence of institutional weaknesses like informal economy may not allow effective regulation. In this context, this paper addresses three related questions: (a) how does stringent environmental regulation affects pollution, (b) what is the link between stringency of environmental regulation and the size of the informal economy, and (c) how informal economy affects formal sector pollution? We use a data set of more than 100 countries from 2007 to 2010, a multivariate framework that controls for the influence of important factors and an index of perceived stringency of environmental regulation. The main findings of the paper, in line with theoretical reasoning, are that (i) stringent environmental regulation reduces pollution and (ii) stringent environmental regulation increases the size of the informal economy. This evidence suggests that informal economy helps avoid environmental regulation by being outside the regulatory sphere. An additional support to this finding is provided by the robust negative correlation between the size of the informal economy and the formal sector pollution. Our findings are based on interactive and non-linear effects that are tested and verified. In this regard, the paper raises new issues about possible mechanisms to reduce pollution in the presence of the informal economy.

2013	Q54 Q56	Tukker, Arnold. 2013. "EXIOPOL--Development and Illustrative Analyses of a Detailed Global MR EE SUT/IOT." <i>Economic Systems Research</i> , 25(1): 50-70. EXIOPOL (A New Environmental Accounting Framework Using Externality Data and Input-Output Tools for Policy Analysis) was a European Union (EU)-funded project creating a detailed, global, multi-regional environmentally extended Supply and Use table (MR EE SUT) of 43 countries, 129 sectors, 80 resources, and 40 emissions. We sourced primary SUT and input-output tables from Eurostat and non-EU statistical offices. We harmonized and detailed them using auxiliary national accounts data and co-efficient matrices. Imports were allocated to countries of exports using United Nations Commodity Trade Statistics Database trade shares. Optimization procedures removed imbalances in these detailing and trade linking steps. Environmental extensions were added from various sources. We calculated the EU footprint of final consumption with resulting MR EE SUT. EU policies focus mainly on energy and carbon footprints. We show that the EU land, water, and material footprint abroad is much more relevant, and should be prioritized in the EU's environmental product and trade policies.
2013	Q54 Q56	Wiedmann, Thomas, and John Barrett. 2013. "Policy-Relevant Applications of Environmentally Extended MRIO Databases--Experiences from the UK." <i>Economic Systems Research</i> , 25(1): 143-56. The impressive development in global multi-region input-output (IO) databases is accompanied by an increase in applications published in the scientific literature. However, it is not obvious whether the insights gained from these studies have indeed been used in political decision-making. We ask whether and to what extent there is policy uptake of results from environmentally extended multi-region IO (EE-MRIO) models and how it may be improved. We identify unique characteristics of such models not inherent to other approaches. We then present evidence from the UK showing that a policy process around consumption-based accounting for greenhouse gas emissions and resource use has evolved that is based on results from EE-MRIO modelling. This suggests that specific, policy-relevant information that would be impossible to obtain otherwise can be generated with the help of EE-MRIO models. Our analysis is limited to environmental applications of global MRIO models and to government policies in the UK.

"Analysis of the Impact of the European Funds in Andalusia in 2007-2013 Using a General Equilibrium Model." <i>Modern Economy</i> , 4(6): 448-52. Ever since the accession of Spain to the European Economic Community, Andalusia has been recipient of European Funds. This paper proposes an analysis that will reveal the economic impact of the European Funds received by the autonomous region of Andalusia during the period 2007-2013. With this purpose, a computable general equilibrium (CGE) model will be implemented to assess, in different simulation scenarios, the effects of those funds on the main macroeconomic indicators. The results will highlight the significant contribution of the European Funds to the regional growth during the period analysed.
2013	R58	Mainar, Alfredo J., and Monica Flores. 2013. "Análisis de una economía regional a partir de modelos multisectoriales La Matriz de Contabilidad Social de Aragón 2005. (Analysis of a Regional Economy Using Multisectorial Models: The Social Accounting Matrix of Aragón 2005. With English summary.)" <i>Regional and Sectoral Economic Studies</i> , 13(1): 143-56. This paper presents the social accounting matrix of the Aragonese economy by 2005, making further application of it to analyze the economic structure of Aragón. Therefore, the aim of this paper is twofold: first, to describe the use of construction techniques of a regional social accounting matrix, in this case for Aragonese economy in 2005; on the other hand, from that built matrix to carry out a structural analysis of the Aragonese economy and its sectoral and institutional relationships. This is carried out applying the main linear models in the literature, especially the use of multipliers and their decomposition, and the detection of key sectors.

* Пересечения с микрокатегориями, помеченными желтым, появились в 2014—2015 гг.

E16: Balance of Links

15	Links in 2010
96	New links in 2011-2013
711	Potential links at the end of 2013
822	Total

The date of final verification: November 12, 2016.

E16 — Contributors — Авторы

Baranov, Alexander O. — Баранов Александр Олегович — 0.35 AS²;
Lychagin, Anton M. — Лычагин Антон Михайлович — 0.64 AS;
Lychagin, Dmitry M. — Лычагин Дмитрий Михайлович — 0.28 AS;
Lychagin, Mikhail V. — Лычагин Михаил Васильевич — 0.7 AS;
Mkrtychyan, Gagik M. — Мкртчян Гагик Мкртичевич — 0.35 AS;
Muhina, Irina K. — Мухина Ирина Константиновна — 0.32 AS;
Porov, Ilya Y. — Попов Илья Юрьевич — 0.28 AS;
Slepenkova, Juiya M. — Слепенкова Юлия Михайловна — 0.3 AS;
Suslov, Victor I. — Суслов Виктор Иванович — 0.35 AS.

The total volume of derivative works for E16 is equal to 3.57 AS.

Общий объем раздела E16 — 3,57 авторских (уч.-изд.) л.

² AS — Author's Sheet — unit of measuring the volume of a literary work; equal to 40,000 characters (including the spaces between words), or 3,000 sq cm of illustrations (maps) like the table E16.E.

E17 General Aggregative Models: Forecasting and Simulation: Models and Applications¹

2006	D33	Krueger, Dirk, and Alexander Ludwig. 2006. "On the Consequences of Demographic Change for Rates of Returns to Capital, and the Distribution of Wealth and Welfare." National Bureau of Economic Research, Inc. NBER Working Papers: 12453. This paper employs a multi-country large scale Overlapping Generations model with uninsurable labor productivity and mortality risk to quantify the impact of the demographic transition towards an older population in industrialized countries on world-wide rates of return, international capital flows and the distribution of wealth and welfare in the OECD. We find that for the U.S. as an open economy, rates of return are predicted to decline by 86 basis points between 2005 and 2080 and wages increase by about 4.1%. If the U.S. were a closed economy, rates of return would decline and wages increase by less. This is due to the fact that other regions in the OECD will age even more rapidly; therefore the U.S. is "importing" the more severe demographic transition from the rest of the OECD in the form of larger factor price changes. In terms of welfare, our model suggests that young agents with little assets and currently low labor productivity gain, up to 1% in consumption, from higher wages associated with population aging. Older, asset-rich households tend to lose, because of the predicted decline in real returns to capital.
2006	D33	Jensen, Henning Tarp, and Finn Tarp. 2006. "A Bank-Fund Projection Framework with CGE Features." <i>Journal of Policy Modeling</i>, 28(2): 103-32. In this paper, we present a SAM-based methodology for integrating standard CGE features with a macroeconomic World Bank-International Monetary Fund (IMF) modelling framework. The resulting macro-micro framework is based on optimising agents, but it retains key features from the macroeconomic model. We highlight that the integrated model is amenable to analyses of issues regarding poverty and income distribution, and present an application where the model is used to study a stylized macroeconomic model growth scenario for Mozambique. The integrated model projections demonstrate that the macroeconomic growth scenario overlooks an undesirable distributional impact. The integrated macroeconomic and CGE model framework is in conclusion identified as a superior modelling tool for analysing growth scenarios.
2006	L84	Campbell, Bryan, and Steve Murphy. 2006. "The Recent Performance of the Canadian Forecasting Industry." <i>Canadian Public Policy</i>, 32(1): 23-40. This paper evaluates the forecast performance of Canadian financial institutions and forecasting firms between 1984 and 2003. The sample period is roughly double that of an earlier study. We divide the sample in two and investigate whether a particular institution has improved its relative standing over the last ten years. Results for two Quebec institutions--the Banque Nationale (National Bank) and the Mouvement Desjardins--are now included in the second part of the sample, whereas a complete dataset was not available for these two institutions during the 1980s. We look as well at the relative performance of individual forecasters compared to the consensus forecast (defined as the mean of the forecasts available during the period in question). The paper then compares the accuracy of the Canadian consensus forecast with the forecast offered by the OECD each December for a limited number of key macroeconomic variables.
2006	R23	Banerji, Anirvan, Pami Dua, and Stephen M. Miller. 2006. "Performance Evaluation of the New Connecticut Leading Employment Index Using Lead Profiles and BVAR Models." <i>Journal of Forecasting</i>, 25(6): 415-37. The leading and coincident employment indexes for the state of Connecticut developed following the recession of the early 1990s fell short of expectations. This paper performs two tasks. First, it describes the process of revising the Connecticut Coincident and Leading Employment Indexes. Second, it analyzes the statistical properties and performance of the new indexes by comparing the lead profiles of the new and old indexes as well as their out-of-sample forecasting performance, using the Bayesian Vector Autoregressive (BVAR) method. The new coincident index shows improved performance in dating employment cycle chronologies. The lead profile test demonstrates that superiority in a rigorous, non-parametric statistic fashion. The mixed evidence on the BVAR forecasting experiments illustrates that leading indexes properly predict cycle turning points and do not necessarily provide accurate forecasts except at turning points, a view that our results support.
2007		
2007	D60	Chen, Yanbin, and Lili Ma. 2007. "Study of the Welfare Cost of Inflation in China." <i>Frontiers of Economics in China</i>, 2(4): 490-519. Inflation is always an important indicator to measure whether economy is stable and healthy. This paper provides a substantive survey of the research on the welfare cost of inflation, and uses the methods of consumer's surplus and neo-classical general equilibrium models respectively to estimate the welfare cost of inflation in China. The results show that high inflation will cause huge welfare cost in China, so keeping low inflation is beneficial to the entire economic welfare of China.
2007	J08	CV: Horn, Gustav A. 2007. "Structural Reforms and Macroeconomic Policy--The Example of Germany." In <i>Money, Distribution and Economic Policy: Alternatives to Orthodox Macroeconomics</i>, ed. Eckhard Hein and Achim Truger, 158-68. New Directions in Modern Economics. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2007	N12	Fernald, John G. 2007. "Trend Breaks, Long-Run Restrictions, and Contractionary Technology Improvements." <i>Journal of Monetary Economics</i>, 54(8): 2467-85. Structural vector autoregressions with long-run restrictions are extraordinarily sensitive to low-frequency correlations. Recent literature finds that the estimated effects of technology shocks are sensitive to how one treats hours per capita. However, after allowing for (statistically and economically significant) trend breaks in productivity, results are much less sensitive: hours fall when technology improves. The issue is that the common high-low-high pattern of productivity growth and hours (i.e., the low-frequency correlation) inevitably leads to a positive estimated response. The trend breaks control for this correlation. This example suggests a practical need for care in using long-run restrictions.
2007	O30	CV: Jorgenson, Dale W., and Kazuyuki Motohashi. 2007. "Information Technology and the Japanese Economy." In <i>Divergences in Productivity Between Europe and the United States: Measuring and Explaining Productivity Gaps Between Developed Countries</i>, ed. Gilbert Cette, Michel Fouquin and Hans-Werner Sinn, 150-74. Ifo Economic Policy series. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2008		
2008	G00	Diss: Kim, Yunmi. 2008. Essays on Time Series Models with Dynamic Coefficients in Macroeconomics and Finance. PhD diss. University of Washington.
2008	G01	Karakitsos, Elias. 2008. "The "New Consensus Macroeconomics" in the Light of the Current Crisis." <i>Ekonomia</i>, 11(2): 89-111. The paper analyses the current credit crisis and finds that NCM or Neo-Wicksellian models are inadequate to detect the roots of the crisis, let alone to deal from a policy perspective with the problems and the cures. It attempts to rectify some of these drawbacks

Year	DE	Title and Abstract
		of the NCM models and in the way monetary policy should be designed. First, it suggests that the policymakers' objective function should be augmented to include a target on asset price inflation in a way that does not impede the free functioning of financial markets. The variable that suggests itself as target is the household net wealth as percent of disposable income. Second, it introduces a wealth effect in consumption, which is necessary if the effect of bubbles is to be detected and ultimately prevented. Third, it endogenises the wealth effect in consumption by explaining separately financial and housing wealth in a rudimentary way. Fourth, it endogenises potential output and the natural interest rate so that erroneous policy implications are bypassed.
2008	G11	Blaskowitz, Oliver, and Helmut Herwartz. 2008. <i>Testing directional forecast value in the presence of serial correlation</i>. Sonderforschungsbereich 649, Humboldt University, Berlin, Germany, SFB 649 Discussion Papers: SFB649DP2008-073. Common approaches to test for the economic value of directional forecasts are based on the classical Chi-square test for independence, Fisher's exact test or the Pesaran and Timmerman (1992) test for market timing. These tests are asymptotically valid for serially independent observations. Yet, in the presence of serial correlation they are markedly oversized as confirmed in a simulation study. We summarize serial correlation robust test procedures and propose a bootstrap approach. By means of a Monte Carlo study we illustrate the relative merits of the latter. Two empirical applications demonstrate the relevance to account for serial correlation in economic time series when testing for the value of directional forecasts.
2008	H20	Adjemian, Stephane, Christophe Cahn, Antoine Devulder, and Nicolas Maggiar. 2008. "Variantes en univers incertain. (Simulations under Uncertainty. With English summary.)." <i>Economie et Prevision</i>, 0(183-184): 223-38. The authors illustrate the usefulness of the Bayesian approach in economic-policy assessment, which typically relies on simulations. We describe a dynamic stochastic general equilibrium (DGSE) model for the euro zone. The Bayesian estimation of the model measures parameter-related uncertainty, which translates into simulation-related uncertainty. We offer a practical application by simulating the impact of a tax policy: an announced VAT shock.
2008	H24 H68	Nagar, A. L., Sanjay Kumar, and Sayan Samanta. 2008. "Projection of Corporate and Personal Income Tax Receipts for FY 2007-08 and 2008-09." <i>Finance India</i>, 22(3): 851-62. The tax receipts forecasting model captures seasonal patterns of tax collections and with simple celebration techniques and provide relatively accurate results. The actual CT receipts in the Q1 and 2 of 2007-08 are Rs. 260.58 (100 crores) and Rs. 441.82 (100 crores), respectively showing increases of 55.84% and 30.32% respectively. The actual IT receipts in Q1 and 2 of 2007-08 are Rs. 351.68 (100 crores) showing an increase of 34.24% over previous year. The projected CT, projected GDP (at 16% rate of growth), and the projected CT (obtained from our model) are found to be Rs. 394.61 (100 crores), Rs 563.12 (100 crores), Rs. 656.77 (100 crores), and Rs. 757.17 (100 crores) and the total projected CT receipts in FY 2008-09 are Rs. 2,371.67 (100 crores) and projected IT receipts in Q1 and 2 to Q4 of 2008-09 would be Rs. 472.09 (100 crores), Rs. 339.19 (100 crores), and Rs. 496.59 (100 crores), respectively. Therefore, the projected tax revenue at the end of FY 2008-09 would be Rs. 3,636.76 (100 crores).
2008	N15	CV: Perkins, Dwight H., and Thomas G. Rawski. 2008. "Forecasting China's Economic Growth to 2025." In <i>China's Great Economic Transformation</i>, ed. Loren Brandt and Thomas G. Rawski, 829-86. Cambridge and New York: Cambridge University Press.
2008	Q54	von Below, David, and Torsten Persson. 2008. <i>Uncertainty, Climate Change and the Global Economy</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 14426. The paper illustrates how one may assess our comprehensive uncertainty about the various relations in the entire chain from human activity to climate change. Using a modified version of the RICE model of the global economy and climate, we perform Monte Carlo simulations, where full sets of parameters in the model's most important equations are drawn randomly from pre-specified distributions, and present results in the forms of fan charts and histograms. Our results suggest that under a Business-As-Usual scenario, the median increase of global mean temperature in 2105 relative to 1900 will be around 4.5 C. The 99 percent confidence interval ranges from 3.0 C to 6.9 C. Uncertainty about socio-economic drivers of climate change lie behind a non-trivial part of this uncertainty about global warming.
2009		
2009	G17	Makridakis, Spyros, Robin M. Hogarth, and Anil Gaba. 2009. "Forecasting and Uncertainty in the Economic and Business World." <i>International Journal of Forecasting</i>, 25(4): 794-812. Forecasts are crucial for practically all economic and business decisions. However, there is a mounting body of empirical evidence showing that accurate forecasting in the economic and business world is usually not possible. In addition, there is huge uncertainty, as practically all economic and business activities are subject to events we are unable to predict. The fact that forecasts can be inaccurate creates a serious dilemma for decision and policy makers. On the one hand, accepting the limits of forecasting accuracy implies being unable to assess the correctness of decisions and the surrounding uncertainty. On the other hand, believing that accurate forecasts are possible means succumbing to the illusion of control and experiencing surprises, often with negative consequences. We believe that the time has come for a new attitude towards dealing with the future. In this article, we discuss the limited predictability in the economic and business environment. We also provide a framework that allows decision and policy makers to face the future- despite the inherent limitations of forecasting and the uncertainty, sometimes huge, surrounding most future-oriented decisions.
2009	G17	Blaskowitz, Oliver, and Helmut Herwartz. 2009. <i>On economic evaluation of directional forecasts</i>. Sonderforschungsbereich 649, Humboldt University, Berlin, Germany, SFB 649 Discussion Papers: SFB649DP2009-052. It is commonly accepted that information is helpful if it can be exploited to improve a decision making process. In economics, decisions are often based on forecasts of up or downward movements of the variable of interest. We point out that directional forecasts can provide a useful framework to assess the economic forecast value when loss functions (or success measures) are properly formulated to account for realized signs and realized magnitudes of directional movements. We discuss a general approach to evaluate (directional) forecasts which is simple to implement, robust to outlying or unreasonable forecasts and which provides an economically interpretable loss/success functional framework. As such, the measure of directional forecast value is a readily available alternative to the commonly used squared error loss criterion.
2009	G18 R28	Khandani, Amir E., Andrew W. Lo, and Robert C. Merton. 2009. <i>Systemic Risk and the Refinancing Ratchet Effect</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 15362. The confluence of three trends in the U.S. residential housing market--rising home prices, declining interest rates, and near-frictionless refinancing opportunities--led to vastly increased systemic risk in the financial system. Individually, each of these trends is benign, but when they occur simultaneously, as they did over the past decade, they impose an unintentional synchronization of homeowner leverage. This synchronization, coupled with the indivisibility of residential real estate that prevents homeowners from deleveraging when property values decline and homeowner equity deteriorates, conspire to create a "ratchet" effect in which homeowner leverage is maintained or increased during good times without the ability to decrease leverage during bad times. If refinancing-facilitated homeowner-equity extraction is sufficiently widespread--as it was during the years leading up to the peak of the U.S. residential real-estate market--the

Year	DE	Title and Abstract
		inadvertent coordination of leverage during a market rise implies higher correlation of defaults during a market drop. To measure the systemic impact of this ratchet effect, we simulate the U.S. housing market with and without equity extractions, and estimate the losses absorbed by mortgage lenders by valuing the embedded put-option in non-recourse mortgages. Our simulations generate loss estimates of \$1.5 trillion from June 2006 to December 2008 under historical market conditions, compared to simulated losses of \$280 billion in the absence of equity extractions.
2009	I18	Keogh-Brown, Marcus, Simon Wren-Lewis, W. John Edmunds, Philippe Beutels, and Richard D. Smith. 2009. <i>The possible macroeconomic impact on the UK of an influenza pandemic</i>. University of Oxford, Department of Economics, Economics Series Working Papers: 431. Little is known about the possible impact of an influenza pandemic on a nation's economy. We applied the UK macroeconomic model 'COMPACT' to epidemiological data on previous UK influenza pandemics, and extrapolated a sensitivity analysis to cover more extreme disease scenarios. Analysis suggests that the economic impact of a repeat of the 1957 or 1968 pandemics, allowing for school closures, would be short lived, constituting a loss of 3.35% and 0.58% of GDP in the first pandemic quarter and year respectively. A more severe scenario (with more than 1% of the population dying) could yield impacts of 21% and 4.5% respectively. The economic shockwave would be gravest when absenteeism (through school closures) increases beyond a few weeks, creating policy repercussions for influenza pandemic planning as the most severe economic impact is due to policies to contain the pandemic rather than the pandemic itself. Accounting for changes in consumption patterns made in an attempt to avoid infection worsens the potential impact. Our mild disease scenario then shows first quarter/first year reductions in GDP of 9.5%/2.5%, compared to our severe scenario reductions of 29.5%. These results clearly indicate the significance of behavioural change over disease parameters.
2009	I18 J61	CV: Rose, Adam Z., Garrett R. Beeler Asay, Dan Wei, and Billy Leung. 2009. "Macroeconomic Impacts of Shutting Down the U.S. Borders in Response to a Security or Health Threat." In <i>Global Business and the Terrorist Threat</i> , ed. Harry W. Richardson, Peter Gordon and James E. Moore II, 228-70. Cheltenham, U.K. and Northampton, Mass.: Elgar.
2009	L83	Kasimati, Evangelia, and Peter Dawson. 2009. "Assessing the Impact of the 2004 Olympic Games on the Greek Economy: A Small Macroeconometric Model." <i>Economic Modelling</i>, 26(1): 139-46. This paper examines the impact of the Athens 2004 Olympic Games on the Greek economy. Using a small aggregate macroeconometric model we find evidence to support the view that the Olympics is an event that could successfully boost the economy of the host city by generating benefits that outweigh the preparation cost. Consistent with recent literature in this area, whilst the impact effects are quite strong during the preparation phase and the year the Games took place, the long-term economic legacy effects appear to be quite modest.
2009	Q32	Esfahani, Hadi Salehi, Kamiar Mohaddes, and M. Hashem Pesaran. 2009. <i>Oil Exports and the Iranian Economy</i>. CESifo Group Munich, CESifo Working Paper Series: CESifo Working Paper No. 2843. This paper develops a long run growth model for a major oil exporting economy and derives conditions under which oil revenues are likely to have a lasting impact. This approach contrasts with the standard literature on the "Dutch disease" and the "resource curse", which primarily focus on short run implications of a temporary resource discovery. Under certain regularity conditions and assuming a Cobb Douglas production function, it is shown that (log) oil exports enter the long run output equation with a coefficient equal to the share of capital. The long run theory is tested using a new quarterly data set on the Iranian economy over the period 1979Q1-2006Q4. Building an error correction specification in real output, real money balances, inflation, real exchange rate, oil exports, and foreign real output, the paper finds clear evidence for two long run relations: an output equation as predicted by the theory and a standard real money demand equation with inflation acting as a proxy for the (missing) market interest rate. Real output in the long run is shaped by oil exports through their impact on capital accumulation, and the foreign output as the main channel of technological transfer. The results also show a significant negative long run association between inflation and real GDP, which is suggestive of economic inefficiencies. Once the effects of oil exports are taken into account, the estimates support output growth convergence between Iran and the rest of the world. We also find that the Iranian economy adjusts quite quickly to the shocks in foreign output and oil exports, which could be partly due to the relatively underdeveloped nature of Iran's financial markets.
2010		
2010	C71	Boldea, O., J. C. Engwerda, T. Michalak, J. E. J. Plasmans, and Y. Salmah. 2010. <i>A Simulation Study of an ASEAN Monetary Union</i>. Tilburg University, Center for Economic Research, Discussion Paper: 2010-100. This paper studies the pros and cons of a monetary union for the ASEAN1 countries, excluding Myanmar. We estimate a stylized open-economy dynamic general equilibrium model for the ASEAN countries. Using the framework of linear quadratic differential games, we contrast the potential gains or losses for these countries due to economic shocks, in case they maintain their status-quo, they coordinate their monetary and/or fiscal policies, or form a monetary union. Assuming for all players open-loop information, we conclude that there are substantial gains from cooperation of monetary authorities. We also find that whether a monetary union improves upon monetary cooperation depends on the type of shocks and the extent of fiscal policy cooperation. Results are based both on a theoretical study of the structure of the estimated model and a simulation study.
2010	O10	Gupta, Rangan, and Alain Kabundi. 2010. "Forecasting Macroeconomic Variables in a Small Open Economy: A Comparison between Small- and Large-Scale Models." <i>Journal of Forecasting</i>, 29(1-2): 168-85. This paper compares the forecasting ability of five alternative types of models in predicting four key macroeconomic variables, namely, per capita growth rate, the CPI inflation, the money market rate, and the growth rate of the nominal effective exchange rate for the South African economy. Unlike the theoretical small open economy new Keynesian dynamic stochastic general equilibrium, the unrestricted VAR, and the small-scale Bayesian vector autoregressive models, which are estimated based on four variables, dynamic factor models and the large-scale BVAR models use information from a data-rich environment containing 266 macroeconomic time series observed over the period 1983:01 to 2002:04. The results, based on root mean square errors, for one- to eight-quarter-ahead out-of-sample forecasts over the horizon of 2003:01 to 2006:04, show that, except for the growth rate of the nominal effective exchange rate, large-scale BVARs outperform the other four types of models consistently and, generally, significantly.
2010	P39	DUFRENOT, Gilles, Adelya OSPANOVA, and Alain SAND-ZANTMAN. 2010. <i>Modeling transition in Central Asia: the Case of Kazakhstan</i>. William Davidson Institute at the University of Michigan, William Davidson Institute Working Papers Series: wp1001. This paper presents a small macro-econometric model of Kazakhstan to study the impact of various economic policies. It uses a new approach to test the existence of a level relationship between a dependent variable and a set of regressors, when the characteristics of the regressors' non-stationarity are not known with certainty. The simulations provide insights into the role of a tight monetary policy, higher foreign direct investment, and rises in nominal wages and in crude oil prices. The results obtained are in line with economic observations and give some support to the policies chosen as priority targets by the Kazakh authorities for the forthcoming years.

Year	DE	Title and Abstract
2011		
2011	C38	Carriero, Andrea, George Kapetanios, and Massimiliano Marcellino. 2011. "Forecasting Large Datasets with Bayesian Reduced Rank Multivariate Models." <i>Journal of Applied Econometrics</i>, 26(5): 735-61. The paper addresses the issue of forecasting a large set of variables using multivariate models. In particular, we propose three alternative reduced rank forecasting models and compare their predictive performance for US time series with the most promising existing alternatives, namely, factor models, large-scale Bayesian VARs, and multivariate boosting. Specifically, we focus on classical reduced rank regression, a two-step procedure that applies, in turn, shrinkage and reduced rank restrictions, and the reduced rank Bayesian VAR of Geweke (1996). We find that using shrinkage and rank reduction in combination rather than separately improves substantially the accuracy of forecasts, both when the whole set of variables is to be forecast and for key variables such as industrial production growth, inflation, and the federal funds rate. The robustness of this finding is confirmed by a Monte Carlo experiment based on bootstrapped data. We also provide a consistency result for the reduced rank regression valid when the dimension of the system tends to infinity, which opens the way to using large-scale reduced rank models for empirical analysis.
2011	C38	Bermingham, Colin, and Antonello D'Agostino. 2011. <i>Understanding and forecasting aggregate and disaggregate price dynamics</i>. European Central Bank, Working Paper Series: 1365. The issue of forecast aggregation is to determine whether it is better to forecast a series directly or instead construct forecasts of its components and then sum these component forecasts. Notwithstanding some underlying theoretical results, it is generally accepted that forecast aggregation is an empirical issue. Empirical results in the literature often go unexplained. This leaves forecasters in the dark when confronted with the option of forecast aggregation. We take our empirical exercise a step further by considering the underlying issues in more detail. We analyse two price datasets, one for the United States and one for the Euro Area, which have distinctive dynamics and provide a guide to model choice. We also consider multiple levels of aggregation for each dataset. The models include an autoregressive model, a factor augmented autoregressive model, a large Bayesian VAR and a time-varying model with stochastic volatility. We find that once the appropriate model has been found, forecast aggregation can significantly improve forecast performance. These results are robust to the choice of data transformation.
2011	F44	CV: Aruoba, S. Boragan, Francis X. Diebold, M. Ayhan Kose, and Marco E. Terrones. 2011. "Globalization, the Business Cycle, and Macroeconomic Monitoring." 2011	H12	Sato, Motohiro, and Kazumasa Oguro. 2011. "Simulation Analysis of Macroeconomic Impact of Large Scale Earthquake in Tokyo. (In Japanese. With English summary.)." <i>Keizai Bunseki</i>, 0(184): 120-40. The present paper considers a simple (Keynesian) macroeconomic model to quantify impacts of the large scale earthquake in Tokyo on national economy variables such as economic growth, price level, interest rate, and fiscal balance by Monte Carlo simulations. In doing so, we account for the current situation of Japan public finance and society such as increasing public debt ratio to GDP and aging of the population. The simulations reveal that while GDP falls immediately after the disaster, there will be quick recovery restructuring projects boosting the economy. Overall, the impact of the earthquake on the economy seems to be limited. The reason behind this result is that our staged economy with society aging damps supply decline and increasing macro demand after the disaster with keeping GDP gap modest. It is noted however that the large scale earthquake increases probability that interest rate surges and government goes bankrupt with public debt being accumulated. The probability of the fiscal crisis in the year of 2020 is estimated to jump up from 12% without the earthquake to 43% in the scenario that it occurs in 2015. We also discuss ex ante preventive policies to mitigate detrimental effects of the disaster. They include captive, or fund for disaster relief and fiscal consolidation. These policies serve to mitigate the perverse effect of the earthquake on the economy.
2011	H23 Q40 Q50	Golosov, Mikhail, John Hassler, Per Krusell, and Aleh Tsyvinski. 2011. <i>Optimal Taxes on Fossil Fuel in General Equilibrium</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 17348. We analyze a dynamic stochastic general-equilibrium (DSGE) model with an externality through climate change from using fossil energy. A central result of our paper is an analytical derivation of a simple formula for the marginal externality damage of emissions. This formula, which holds under quite plausible assumptions, reveals that the damage is proportional to current GDP, with the proportion depending only on three factors: (i) discounting, (ii) the expected damage elasticity (how many percent of the output flow is lost from an extra unit of carbon in the atmosphere), and (iii) the structure of carbon depreciation in the atmosphere. Very importantly, future values of output, consumption, and the atmospheric CO2 concentration, as well as the paths of technology and population, and so on, all disappear from the formula. The optimal tax, using a standard Pigou argument, is then equal to this marginal externality. The simplicity of the formula allows the optimal tax to be easily parameterized and computed. Based on parameter estimates that rely on updated natural-science studies, we find that the optimal tax should be a bit higher than the median, or most well-known, estimates in the literature. We also show how the optimal taxes depend on the expectations and the possible resolution of the uncertainty regarding future damages. Finally, we compute the optimal and market paths for the use of energy and the corresponding climate change.
2011	H72	Fernandez-Caballero, Laura, Diego J. Pedregal, and Javier J. Perez. 2011. <i>Monitoring sub-central government spending in Spain</i>. Banco de Espana, Banco de Espana Working Papers: 1127. The evolution of Regional and Local governments' spending in Spain is currently under close scrutiny by national and international investors and analysts, international organizations and rating agencies. Indeed, some 50% of general government spending and some 70% of public employment are managed by Regions and Municipalities, which consequently have to bear a great portion of the overall fiscal consolidation plan currently under way. Despite recent efforts of the Spanish government at increasing transparency, the significant shortages of the existing data render the task of monitoring regional and local governments' public spending in real-time a complicated endeavor. Within this framework, we exploit all available short-term information on sub-national governments' spending from scattered sources, and find a subset of indicators usable for real-time policy analysis. In particular: (i) we compile a dataset on quarterly and monthly regional government's spending variables, by reviewing all available, scattered sources, and put together a database usable for economic and policy analysis; (ii) we exploit the compiled information, and other additional sources, by fitting time-series mixed-frequencies models to the data, and show the forecasting and monitoring capabilities of the selected short-term fiscal indicators; (iii) we show that official annual budgetary targets do present a reasonable forecasting performance when used as indicators of regional and local spending targets in national accounts terms, in particular when used in combination with time series indicators.

2011	I32	Akanbi, Olusegun A., and Charlotte B. Du Toit. 2011. "Macro-econometric Modelling for the Nigerian Economy: A Growth-Poverty Gap Analysis." <i>Economic Modelling</i> , 28(1-2): 335-50. This study develops comprehensive full-sector macro-econometric models for the Nigerian economy with the aim of explaining and providing a long-term solution for the persistent growth-poverty divergence experienced by the country. The models are applied to test the hypothesis of existing structural supply-side constraints versus demand-side constraints impeding the economic growth and development of the country. A review of the historical performance of the Nigerian economy reveals significant socio-economic constraints as the predominant impediments to high and sticky levels of poverty in the economy. Thus, a model which is suitable for policy analyses of the Nigerian economy needs to capture the long-run supply-side characteristics of the economy. A price block is incorporated to specify the price adjustment between the production or supply-side sector and real aggregate demand sector. The institutional characteristics with associated policy behaviour are incorporated through a public and monetary sector, whereas the interaction with the rest of the world is represented by a foreign sector, with specific attention being given to the oil sector. The models are estimated with time-series data from 1970 to 2006 using the Engle-Granger two-step co-integration technique, capturing both the long-run and short-run dynamic properties of the economy. The full-sector models are subjected to a series of policy scenarios to evaluate various options for government to improve the productive capacity of the economy, thereby achieving sustained accelerated growth and a reduction in poverty in the Nigerian economy.
2011	J13	Ashraf, Quamrul H., David N. Weil, and Joshua Wilde. 2011. <i>The Effect of Interventions to Reduce Fertility on Economic Growth</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 17377. We assess quantitatively the effect of exogenous reductions in fertility on output per capita. Our simulation model allows for effects that run through schooling, the size and age structure of the population, capital accumulation, parental time input into child-rearing, and crowding of fixed natural resources. The model is parameterized using a combination of microeconomic estimates, data on demographics and natural resource income in developing countries, and standard components of quantitative macroeconomic theory. We apply the model to examine the effect of an intervention that immediately reduces TFR by 1.0, using current Nigerian vital rates as a baseline. For a base case set of parameters, we find that an immediate decline in the TFR of 1.0 will raise output per capita by approximately 13.2 percent at a horizon of 20 years, and by 25.4 percent at a horizon of 50 years.
2011	J42 J51	Deak, Szabolcs, Lionel Fontagne, Marco Maffezzoli, and Massimiliano Marcellino. 2011. "LSM: A DSGE Model for Luxembourg." <i>Economic Modelling</i> , 28(6): 2862-72. Luxembourg is a small open economy with a set of particular features, including rather limited competition in the domestic goods market, strong union power, and a segmented labor market for resident and non-resident workers. In this paper, we develop a medium scale DSGE model that captures these features, calibrate it to mimic the actual behavior of the key macroeconomic aggregates, and use it to conduct policy experiments aimed at relaxing some of the existing rigidities in the goods and labor market.

2012	C14	Ghosh, Anisha, and Christian Julliard. 2012. <i>Can Rare Events Explain the Equity Premium Puzzle?</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 8899. Probably not. First, allowing the probabilities of the states of the economy to differ from their sample frequencies, the Consumption-CAPM is still rejected in both U.S. and international data. Second, the recorded world disasters are too small to rationalize the puzzle unless one assumes that disasters occur every 6-10 years. Third, if the data were generated by the rare events distribution needed to rationalize the equity premium puzzle, the puzzle itself would be unlikely to arise. Fourth, the rare events hypothesis, by reducing the cross-sectional dispersion of consumption risk, worsens the ability of the Consumption-CAPM to explain the cross-section of returns.

2013		
2013	B40	Hannsgen, Greg. 2013. Heterodox Shocks. Levy Economics Institute, The, Economics Working Paper Archive. Should shocks be part of our macro-modeling tool kit--for example, as a way of modeling discontinuities in fiscal policy or big moves in the financial markets? What are shocks, and how can we best put them to use? In heterodox macroeconomics, shocks tend to come in two broad types, with some exceptions for hybrid cases. What I call Type 1 shocks are one-time exogenous changes in parameters or variables. They are used, for example, to set computer simulations in motion or to pose an analytical question about dynamic behavior outside of equilibrium. On the other hand, Type 2 shocks, by construction, occur at regular time intervals, and are usually drawn at random from a probability distribution of some kind. This paper is an appreciation and a survey of shocks and their admittedly scattered uses in the heterodox macro literature, along with some proposals and thoughts about using shocks to improve models. Since shocks of both types might appear at times to be ad hoc when used in macro models, this paper examines possible justifications for using them.
2013	C26 C36	Giesen, Sebastian, and Rolf Scheufele. 2013. Effects of Incorrect Specification on the Finite Sample Properties of Full and Limited Information Estimators in DSGE Models. Halle Institute for Economic Research, IWH Discussion Papers: 8. In this paper we analyze the small sample properties of full information and limited information estimators in a potentially misspecified DSGE model. Therefore, we conduct a simulation study based on a standard New Keynesian model including price and wage rigidities. We then study the effects of omitted variable problems on the structural parameters estimates of the model. We find that FIML performs superior when the model is correctly specified. In cases where some of the model characteristics are omitted, the performance of FIML is highly unreliable, whereas GMM estimates remain approximately unbiased and significance tests are mostly reliable.

Table E19.F Examples of Publications according to New Links in 2006—2013

Year	DE	Title and Abstract
2006		
2006	O23	CV: Friedman, Milton. 2006. "From Galbraith to Economic Freedom: Part I: The Conventional Wisdom of J. K. Galbraith." In <i>The Road to Economic Freedom. Volume 2.</i> , ed. Philip Booth and John Meadowcroft, 345-81. An Elgar Reference Collection. Cheltenham, U.K. and Northampton, Mass.: Elgar in association with the Institute of Economic Affairs.
2008		
2008	A13 O43	Aharonovitz, Gilad, Nathan Skuza, and Faysal Fahs. 2008. <i>Can Integrity Replace Institutions? Theory and Evidence</i>. School of Economic Sciences, Washington State University, Working Papers: 2009-06. Institutions are important for proper economic performance, but can be somewhat replaced by trust or other social norms. This study shows that institutions and trust can be replaced by integrity of the individual agents in the economy, regardless of any social arrangement. We construct a model of a transactions-based economy in which transactions are preceded by contracts, and show that any one of (1) institutions, (2) trust, or (3) integrity, can foster economic growth, while the absence of all three will lead to economic decay. The model also predicts that in the absence of institution and trust, dishonest agents may gain higher payoffs than honest agents. We construct data of economic performance of different social groups in Lebanon, measure integrity and other values of these groups, and support the latter conclusion with this data.
2009		
2009	Z10	Aharonovitz, Gilad D., Nathan Skuza, and Faysal Fahs. 2009. <i>Can Integrity Replace Institutions? Theory and Evidence</i>. CESifo Group Munich, CESifo Working Paper Series: CESifo Working Paper No. 2730. Institutions are important for proper economic performance, but are replaceable by trust or other social norms. We show that when proper institutions and trust are missing, integrity of the individuals can replace them. We construct a model of a transactions-based economy with contracts preceding the transactions, and show that any one of (1) institutions, (2) trust, or (3) integrity, foster economic growth. We construct data of economic performance of social groups in Lebanon, measure integrity and other values of these groups, and use this data and data from Kenya to support one of the model's predictions. Policy implications are discussed.
2012		
2012	F31 H62 O11 Q33	Bresser-Pereira, Luiz Carlos. 2012. "Structuralist Macroeconomics and the New Developmentalism." <i>Revista de Economia Politica/Brazilian Journal of Political Economy</i>, 32(3): 347-66. This paper first presents some basic ideas and models of a structuralist development macroeconomics that complements and actualizes the ideas of the structuralist development economics that was dominant between the 1940s and the 1960s. A system of three models focusing on the exchange rate (the tendency to the cyclical overvaluation of the exchange rate, a critique of growth with foreign savings, and new a model of the Dutch disease) shows that it is not just volatile but chronically overvalued, and for that reason it is not just a macroeconomic problem; as a long term disequilibrium, it is in the core of development economics. Second, it summarizes "new developmentalism"--a sum of growth policies based on these models and on the experience of fast-growing Asian countries.

Table E20.F Examples of Publications according to New Links in 2006—2013

Year	DE	Title and Abstract
2006		
2006	B52 D01 D85	CV: Foster, John, and Jason Potts. 2006. "Complexity, Evolution, and the Structure of Demand." In <i>Flexibility and Stability in the Innovating Economy</i> , ed. Maureen McKelvey and Magnus Holmen, 99-120. Oxford and New York: Oxford University Press.
2006	D64	Cagetti, Marco, and Mariacristina De Nardi. 2006. <i>Wealth Inequality: Data and Models</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 12550. In the United States wealth is highly concentrated and very unequally distributed: the richest 1% hold one third of the total wealth in the economy. Understanding the determinants of wealth inequality is a challenge for many economic models. We summarize some key facts about the wealth distribution and what economic models have been able to explain so far.
2006	H51	Nardi, Mariacristina De, Eric French, and John Bailey Jones. 2006. <i>Differential Mortality, Uncertain Medical Expenses, and the Saving of Elderly Singles</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 12554. People have heterogeneous life expectancies: women live longer than men, rich people live longer than poor people, and healthy people live longer than sick people. People are also subject to heterogeneous out-of-pocket medical expense risk. We construct a rich structural model of saving behavior for retired single households that accounts for this heterogeneity, and we estimate the model using AHEAD data and the method of simulated moments. We find that the risk of living long and facing high medical expenses goes a long way toward explaining the elderly's savings decisions. Specifically, medical expenses that rise quickly with both age and permanent income can explain why the elderly singles, and especially the richest ones, run down their assets so slowly. We also find that social insurance has a big impact on the elderly's savings.
2006	H70	Miguel, Edward, and Gerard Roland. 2006. <i>The Long Run Impact of Bombing Vietnam</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 11954. We investigate the impact of U.S. bombing on later economic development in Vietnam. The Vietnam War featured the most intense bombing campaign in military history and had massive humanitarian costs. We use a unique U.S. military dataset containing bombing intensity at the district level (N=584). We compare the heavily bombed districts to other districts controlling for baseline demographic characteristics and district geographic factors, and use an instrumental variable approach exploiting distance to the 17th parallel demilitarized zone. U.S. bombing does not have a robust negative impact on poverty rates, consumption levels, infrastructure, literacy or population density through 2002. This finding suggests that local recovery from war damage can be rapid under certain conditions, although further work is needed to establish the generality of the finding in other settings.
2006	J17 K42	Naor, Ziv. 2006. "Untimely Death, the Value of Certain Lifetime and Macroeconomic Dynamics." <i>Defence and Peace Economics</i> , 17(4): 343-59. In the past few years, several studies have documented the fact that terrorism has a negative impact on economic activity. The present study attempts to provide an explanation that rests on two pillars. The first pillar expands on Eckstein and Tsiddon (2004) to account explicitly for a subjective assessment of the probability of death due to an act of terror; the second explicitly accounts for the dissatisfaction that derives from untimely death. In the first pillar, individuals estimate the risk of death by invoking the cumulative-prospect theory (Kahneman and Tversky, 1992). Since the probability of death in a terrorist attack is low, decision weights are higher than the actual probabilities. Needless to say, while cumulative-prospect theory governs individuals' behavior, the economy is governed by actual probabilities. The second pillar on which our explanation rests is the

Year	DE	Title and Abstract
		disutility that emerges from an individual's untimely and unnatural death. When calibrated, the integration of both explanations seems to show that terror has a rather strong impact on economic activity, one that may be observed in terror-affected regions.
2006	L40	Arestis, Philip, John McCombie, and Roger Vickerman, eds. 2006. <i>Growth and Economic Development: Essays in Honour of A. P. Thirlwall</i> . Cheltenham, U.K. and Northampton, Mass.: Elgar. Fourteen papers explore A. P. Thirlwall's contribution to economics over the last forty years. Papers discuss the implications of Thirlwall's Law for Africa's development challenges; Thirlwall's Law and Palley's pitfalls--a reconsideration; specifying the demand for imports in macroeconomic models; Keynes, post-Keynesian analysis, and the open economies of the twenty-first century; cycles, aggregate demand, and growth; modeling historical growth--a contribution to the debate; endogenous growth theory--a partial critique; the nature of economic growth and the neoclassical approach; the core of macroeconomic theory; the crisis of the stability pact and a proposal; narrowing the options--the macroeconomic and financial framework for EU enlargement; competition and competition policy in emerging markets--international and developmental dimensions; models of saving, income, and the macroeconomics of developing countries in the post-Keynesian tradition; and the influence of Keynes on development economics.
2006	O17	Marjit, Sugata, and Dibyendu S. Maiti. 2006. "Politics and Contemporary Macroeconomy of India." <i>India Macroeconomics Annual</i> , 0(0): 9-56. This section addresses the locus standi of research on political economy issues in India. It argues that the tradition of research on political economy in India is over-burdened with discursive practices and that the quantitative analyses, albeit part of the mainstream discourse elsewhere, have not flourished in India. This article provides a survey of the contemporary, mainly quantitative, writings on political-economic issues in India. The second section offers a simple verification of the basic hypothesis that along with continued commitment towards liberalization, fiscal discipline in India is achieved mainly by keeping up a relatively 'populist' public expenditure. The last part uses an analytical model of re-distributive politics to show that the poor, although aware of what public investments can do for them in the long run and without having any preference for the present in terms of a subjective rate of discount, still favour pure income transfers and may not vote in favour of larger public investments.
2006	O24	Pahlavani, Mosayeb, Ed Wilson, and Abbas Valadkhani. 2006. "Structural Changes in the Iranian Economy: An Empirical Analysis with Endogenously Determined Breaks." <i>International Journal of Applied Business and Economic Research</i> , 4(1): 1-8. This paper employs annual time series data (1960-2003) and the ZA (Zivot and Andrews, 1992) and the LP (Lumsdaine and Papell, 1997) approaches to determine endogenously the more likely time of major structural breaks in various macroeconomic variables of the Iranian economy. We have considered the presence of one and two unknown structural breaks in the data. The results obtained from these two approaches are consistent in that the time of one structural break in eight out of the ten variables examined in the paper is the same. The resulting structural breaks coincide with important phenomena in the economy such as the 1974 oil shock, the 1979 Islamic revolution, the Iraqi war, or the implementation of the exchange rate unification policy in 1993 in the case of the official exchange rate.
2006	O42	CV; Dekle, Robert, and Kenneth Kletzer. 2006. "Deposit Insurance, Regulatory Forbearance, and Economic Growth: Implications for the Japanese Banking Crisis." In <i>Japan's Great Stagnation: Financial and Monetary Policy Lessons for Advanced Economies</i> , ed. Michael M. Hutchison and Frank Westermann, 61-101. CESifo Seminar Series. Cambridge and London: MIT Press.
2006	R21 R31	Rae, David, and Paul van den Noord. 2006. <i>Ireland's Housing Boom: What has Driven it and Have Prices Overshot?</i> . OECD Economics Department, OECD Economics Department Working Papers: 492. The Irish housing market is very buoyant. The housing boom is driven by strong economic growth, dynamic demographics and low interest rates. However, large tax advantages and relatively lenient credit policies by banks have also played their part, and prices may have become overvalued. To the extent that high house prices reflect favourable tax treatment, they may lead to economic inefficiencies by drawing excessive resources into residential construction. While a soft landing appears the most likely prospect, a disorderly correction of house prices would pose risks for macroeconomic and possibly financial stability. In this context, one policy lever available to the government would be a phased removal of the tax advantages associated with housing. In addition, banks should remain cautious in their lending and provisioning policies.
2006	R31	Vartia, Laura. 2006. <i>Finland's housing market: reducing risks and improving policies</i> . OECD Economics Department, OECD Economics Department Working Papers: 514. While pronounced cycles in house prices have been a major cause of macroeconomic instability in the past, current house price developments do not yet suggest an overheating of the housing market. However, several important concerns are related to both direct effects of housing markets on overall activity and to more structural and regional issues. A factor making housing markets and the macro economy vulnerable to interest rate shocks is the high share of mortgage loans linked to variable interest rates. Tax subsidies to housing may largely be capitalised in higher land prices rather than increasing housing availability to the extent that slow planning procedures and municipalities' unwillingness to provide building land have limited the growth of the housing stock in growth regions. This would argue for improving municipalities' incentives to provide building land, speeding up planning procedures and a phased removal of the tax advantage associated with housing. Furthermore, the provision of social housing and the housing allowance system should be better targeted on those most in need of affordable housing.
2006	Z13	Salvadori, Neri, ed. 2006. <i>Economic Growth and Distribution: On the Nature and Causes of the Wealth of Nations</i> , Cheltenham, U.K. and Northampton, Mass.: Elgar. Sixteen papers, resulting from a conference held in Lucca in the summer of 2004, explore different approaches to the issues of economic growth and distribution and their theoretical, empirical, historical, and methodological implications. Papers discuss inequality and the process of development; the role of income distribution in long-run endogenous growth; the competition-of-capitals doctrine and the wage-profit relationship; a heterodox growth and distribution model; distribution and growth in a post-Keynesian stock-flow consistent model; technological progress, income distribution, and capacity utilization; demand-led growth and the classical approach to value and distribution--whether they are compatible; macroeconomic volatility and income inequality in a stochastically growing economy; the saving-investment nexus in the debate on pension reforms; income distribution and output change--a macro multiplier approach; a dynamic applied general equilibrium model from a classical-Keynesian-Schumpeterian approach; heterodox business cycles; technological innovation, financial fragility, and complex dynamics; growth, history, and institutions; religious culture, institutions, and growth; and trade, poverty, and growth--two perspectives, one message.

2007	B50	Stockhammer, Engelbert. 2007. <i>Some Stylized Facts on the Finance-Dominated Accumulation Regime</i> . Political Economy Research Institute, University of Massachusetts at Amherst, Working Papers. While there is an agreement that the Fordist accumulation regime has come to an end in the course of the 1970s, there is no agreement on how to characterize the post-Fordist regime (or if a such is already in place). The paper seeks put together various arguments related to financialization (in the broad sense) from a macroeconomic point of view and investigate the relevance of these arguments by means of an analysis stylized

Year	DE	Title and Abstract
		facts for EU countries. The paper discusses changes in investment behaviour, consumption behaviour and government expenditures, investigating to what extent changes are related to financialization. Households experience higher debt levels. Rising profits of businesses come with only moderate investment. The notion of a "finance-dominated" accumulation regime is proposed to highlight that financial developments crucially shape the pattern and the pace of accumulation. The finance dominated accumulation regime is characterized by a mediocre growth performance and by higher volatility. However, so far deregulated financial markets have not lead to major financial crises in advanced capitalist economies. A possible reason for this is that the size of the state sector has not been substantially reduced despite neoliberal attempts to do so.
2007	E39 P25	Egert, Balazs, and Dubravko Mihaljek. 2007. <i>Determinants of House Prices in Central and Eastern Europe</i> . CESifo GmbH, CESifo Working Paper Series: CESifo Working Paper No. 2152. This paper studies the determinants of house prices in eight transition economies of central and eastern Europe (CEE) and 19 OECD countries. The main question addressed is whether the conventional fundamental determinants of house prices, such as GDP per capita, real interest rates, housing credit and demographic factors, have driven observed house prices in CEE. We show that house prices in CEE are determined to a large extent by the underlying conventional fundamentals and some transition-specific factors, in particular institutional development of housing markets and housing finance and quality effects.
2007	F00	Caballero, Ricardo J., and Guido Lorenzoni. 2007. <i>Persistent Appreciations and Overshooting: A Normative Analysis</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 13077. Most economies experience episodes of persistent real exchange rate appreciations, when the question arises whether there is a need for intervention to protect the export sector. In this paper we present a model of irreversible destruction where exchange rate intervention may be justified if the export sector is financially constrained. However the criterion for intervention is not whether there are bankruptcies or not, but whether these can cause a large exchange rate overshooting once the factors behind the appreciation subside. The optimal policy includes ex-ante and ex-post interventions. Ex-ante (i.e., during the appreciation phase) interventions have limited effects if the financial resources in the export sector are relatively abundant. In this case the bulk of the intervention takes place ex-post, and is concentrated in the first period of the depreciation phase. In contrast, if the financial constraint in the export sector is tight, the policy is shifted toward ex-ante intervention and it is optimal to lean against the appreciation. On the methodological front, we develop a framework to study optimal dynamic interventions in economies with financially constrained agents.
2007	F22 F35	van Dalen, Hendrik P. 2007. <i>Global Aging and Economic Convergence: A Real Option or Still a Case of Science Fiction?</i> . Tinbergen Institute, Tinbergen Institute Discussion Papers: 07-051/1. How does global aging affect the convergence in global economic development? Both the developing and developed world will be characterized for the coming decades by aging populations. Changes in the age distribution of a population are an important determinant of economic performance as they affect wealth accumulation and dependency burdens, yielding a demographic dividend of extra growth. During the twenty years from 1975 to 2005 Europe and the US have benefited from a strong demographic dividend. However, in the decades to come this effect will be reversed and the driving force behind the wealth of nations has to be sought elsewhere. Africa and, to some extent, India might benefit from the demographic dividend. However, this potential growth phase may well disappear if supporting conditions for growth are absent. Large-scale migration is not expected to be a sustainable solution to unbalanced global economic developments. Remittances, Foreign Direct Investment (FDI) and Official Development Assistance (ODA) will remain necessary capital flows for the developing world in the near future. Remittances offer no structural solution to reduction of poverty as these funds flow to a selective group of families and are allocated generally to consumption rather than to investment purposes. Migration of a temporary nature in conjunction with offshore outsourcing of services and production may offer a solution for the dilemmas of population and development, which OECD donors face in offering development assistance and designing immigration policy.
2007	F22	Rendon, Silvio, and Alfredo Cuecuecha. 2007. <i>International Job Search: Mexicans in and out of the US</i> . Stony Brook University, Department of Economics, Department of Economics Working Papers: 07-09. It is argued that migration from Mexico to the US and return migration are determined by international wage differentials and preferences for origin. We use a model of job search, savings and migration to show that job turnover is a crucial determinant of the migration process. We estimate this model by Simulated Method of Moments (SMM) and find that migration practically disappears if Mexico has American arrival rates while employed. Doubling migration costs reduces migration rates in half, while subsidizing return migration in \$300 reduces migration rates of older migrants but increases migration rates of younger migrants.
2007	F34	Broll, Udo, and Andreas Forster. 2007. "Economic Data on Ukraine." <i>Journal of European Economy</i> , 6(1): 49-59. Germany is Ukraine's second most important trade partner after Russia. Ukraine features a growing market for metallurgy products, machines and textiles. Along with this positive foreign trade development, which can potentially benefit Germany and the EU countries, one should take into account the macroeconomic development, such as a high inflation rate. Our article presents some empirical data on the economic development of Ukraine and discusses economic grounds for these processes.

2007	G18 O43	Philippon, Thomas. 2007. <i>Financiers vs. Engineers: Should the Financial Sector be Taxed or Subsidized?</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 13560. I study the allocation of human capital in an economy with production externalities, financial constraints and career choices. Agents choose to become entrepreneurs, workers or financiers. Entrepreneurship has positive externalities, but innovators face borrowing constraints and require the services of financiers in order to invest efficiently. When investment and education subsidies are chosen optimally, I find that the financial sector should be taxed in exactly the same way as the non-financial sector. When direct subsidies to investment and scientific education are not feasible, giving a preferred tax treatment to the financial sector can improve welfare by increasing aggregate investment in research and development.
2007	G31	Miao, Jianjun, and Neng Wang. 2007. <i>Investment, Consumption, and Hedging under Incomplete Markets</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 13250. Entrepreneurs often face undiversifiable idiosyncratic risks from their business investments. We extend the standard real options approach to an incomplete markets environment and analyze the joint decisions of business investments, consumption/savings, and portfolio selection. For a lump-sum investment payoff and an agent with a sufficiently strong precautionary savings motive, an increase in volatility can accelerate investment, contrary to the standard real options analysis. When the agent can trade the market portfolio to partially hedge against investment risk, the systematic volatility is compensated via the standard CAPM argument, and the idiosyncratic volatility generates a private equity premium. Finally, when the investment payoff is a series of flows, the agent's idiosyncratic risk exposure alters both the implied option value and the implied project value, causing a reversal of the results in the lump-sum payoff case.

2007	H11 H40 L50 L53	Erlandsen, Espen, and Jens Lundsgaard. 2007. <i>How Regulatory Reforms in Sweden have boosted Productivity</i> . OECD Economics Department, OECD Economics Department Working Papers: 577. The economic crisis in the early 1990s prompted action on reforming the Swedish welfare state and its institutions, including deregulation of a wide range of product markets. In that way, Sweden took early action compared to other OECD countries currently struggling with how to make public finances more robust in an ageing context. The reforms that were implemented during the 1990s are now paying off in terms of productivity and GDP growth. Empirical evidence suggests that deregulation has delivered a considerable "productivity dividend". Although significant progress therefore has been made, renewed regulatory reform is needed to safeguard Sweden's ambitious public policy goals. Efforts should focus on improving enterprise formation and labour utilisation, as well as on providing better value for money in the public sector by raising its efficiency and delivering high quality services.
2007	I20 Q40	Katsimi, Margarita, and Thomas Moutos. 2007. <i>Human Capital and the Feldstein-Horioka Puzzle</i> . CESifo GmbH, CESifo Working Paper Series: CESifo Working Paper No. 1914. In this paper we reexamine the Feldstein-Horioka finding of limited international capital mobility by using a broader view (i.e., including human capital) of investment and saving. We find that the Feldstein-Horioka result is impervious to this change.
2007	J08	Tapp, Stephen. 2007. <i>Lost in Transition: The Costs and Consequences of Sectoral Labour Adjustment</i> . Queen's University, Department of Economics, Working Papers: 1142. This paper demonstrates that factors which impede labour market adjustments can have first-order impacts on aggregate output and social welfare. While several studies find that individual workers can face large and persistent sectoral reallocation costs, this paper shows that these costs are important at the aggregate level. I use a search and matching model to isolate and quantify two factors that contribute to the costly and time-consuming adjustment process: search frictions and an inability to transfer match-specific skills to new jobs. I apply the model to examine Canada's sectoral labour adjustment after a global increase in commodity prices and associated exchange rate appreciation. These developments reorganized production to the resource sector and away from manufacturing. The model quantitatively captures both the sectoral employment and wage effects and the response of unemployment to changes in unemployment benefits. The model estimates that the costs of adjustment are economically important, accounting for up to three percent of output during the transition. These costs arise mainly in the first three years after the shock and are due largely to non-transferable skills. Finally, the analysis reveals important policy implications. Because changes to unemployment benefits affect sectors differently, these changes impact the economy's sectoral composition and aggregate productivity.
2007	K00	Llusa, Fernanda, and Jose Tavares. 2007. <i>Economics and Terrorism: What We Know, What We Should Know and the Data We Need</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 6509. In this paper we organize the literature on the economics of terrorism around seven different topics, offering a comprehensive view of the literature with a view to identifying questions that remain unanswered. The chosen topic areas are: The Measurement of Terrorist Activity, The Nature of Terrorists, The Utility Cost of Terrorism, The Impact of Terrorism on Aggregate Output, Terrorism and Specific Sectors of Activity, Terrorism and Economic Policy, and Counter-Terrorism. In a sense, we proceed from measurement issues to studies of the characteristics of terrorists and terrorist organizations, the consequences of terrorism on individual utility and, aggregate output and on specific sectors of activity, as well as the impact of terrorism on fiscal and monetary policies. We conclude with an examination of the economics literature on counter-terrorism measures. For each of the topics above, we present what the literature has achieved, the important questions that remain open and the type of data that would help researchers make progress. In our discussion, we identify the main papers in the literature and the issue(s) where each made a contribution, presenting a brief individual summary for these papers, organized along the topic areas.
2007	L00	Tang, Kam Ki, and Jie Zhang. 2007. <i>Morbidity, Mortality, Health Expenditures and Annuitization</i> . CESifo GmbH, CESifo Working Paper Series: CESifo Working Paper No. 2086. In this paper we explore the implication of a morbidity risk for the relationship between longevity and annuitization. We divide old-age life into two periods with uncertain survival from the end of the first to the end of the second. We show that a rise in the survival rate causes different patterns of change in annuitization, depending on the initial survival rate. When the initial survival rate is low (high), there is full (partial) annuitization. There is thus an inverse relationship between longevity and annuitization.
2007	L50	Fang, Lei, and Richard Rogerson. 2007. <i>Product Market Regulation and Market Work: A Benchmark Analysis</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 12891. Recent empirical work finds a negative correlation between product market regulation and aggregate employment. We examine the effect of product market regulations on hours worked in a benchmark aggregate model of time allocation. We find that product market regulations affect time devoted to market work in effectively the same fashion as do taxes on labor income or consumption. In particular, if product market regulations are to affect aggregate market work in this model the key driving force is the size of income transfers associated with the regulation relative to labor income, and the key propagation mechanism is the labor supply elasticity. We show in a two sector model that industry level analysis is of little help in assessing the aggregate effects of product market regulation.

Much of the increase in female labour force participation in the post-war period has come from the entry of married women with young children. Accompanying this change has been a rise in cultural acceptance of maternal employment. We argue that the concurrent S shaped rise in maternal participation and its cultural acceptance comes from generations of women engaged in Bayesian learning about the effects of maternal employment on children. Each generation updates their parents' beliefs by observing the children of employed women. When few women participate in the labour force, most observations are uninformative and participation rises slowly. As information accumulates and the effects of labour force participation become less uncertain, more women participate, learning accelerates and labour force participation rises faster. As beliefs converge to the truth, participation flattens out. Survey data, wage data and participation data support our mechanism and distinguish it from alternative explanations.

2007	Q54	Hallegatte, Stephane, and Michael Ghil. 2007. <i>Endogenous Business Cycles and the Economic Response to Exogenous Shocks</i> . Fondazione Eni Enrico Mattei, Working Papers: 2007.20. In this paper, we investigate the macroeconomic response to exogenous shocks, namely natural disasters and stochastic productivity shocks. To do so, we make use of an endogenous business cycle model in which cyclical behavior arises from the investment-profit instability; the amplitude of this instability is constrained by the increase in labor costs and the inertia of production capacity and thus results in a finite-amplitude business cycle. This model is found to exhibit a larger response to natural disasters during expansions than during recessions, because the exogenous shock amplifies pre-existing disequilibria when occurring during expansions, while the existence of unused resources during recessions allows for damping the shock. Our model also shows a higher output variability in response to stochastic productivity shocks during expansions than during recessions. This finding is at odds with the classical real-cycle theory, but it is supported by the analysis of quarterly U.S. Gross Domestic Product series; the latter series exhibits, on average, a variability that is 2.6 times larger during expansions than during recessions.
2007	Z10	Fernandez, Raquel. 2007. <i>Culture as Learning: The Evolution of Female Labor Force Participation over a Century</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 13373. Married women's labor force participation has increased dramatically over the last century. Why this has occurred has been the subject of much debate. This paper investigates the role of culture as learning in this change. To do so, it develops a dynamic model of culture in which individuals hold heterogeneous beliefs regarding the relative long-run payoffs for women who work in the market versus the home. These beliefs evolve rationally via an intergenerational learning process. Women are assumed to learn about the long-term payoffs of working by observing (noisy) private and public signals. They then make a work decision. This process generically generates an S-shaped figure for female labor force participation, which is what is found in the data. The S shape results from the dynamics of learning. I calibrate the model to several key statistics and show that it does a good job in replicating the quantitative evolution of female LFP in the US over the last 120 years. The model highlights a new dynamic role for changes in wages via their effect on intergenerational learning. The calibration shows that this role was quantitatively important in several decades.

2008	B53	Bundt, Thomas, and Robert P. Murphy. 2008. "Are Residual Economic Relationships Normally Distributed? Testing an Assumption of Neoclassical Economics." <i>Review of Austrian Economics</i> , 21(4): 329-40. In both theoretical and applied contexts, neoclassical economics typically assumes that residual economic relationships are mean-zero, finite-variance, normally distributed random variables. However, many have challenged this view, from various perspectives. The Austrian economists, specifically in the tradition of Mises and Rothbard, reject outright the effort to mathematically model human choices. This Austrian view is often derided as unscientific. However, some of the most mathematically sophisticated work in financial economics also rejects the orthodox bell curve. In this paper, we test Benoit Mandelbrot's "stable Paretian" hypothesis on ten major macroeconomic data sets and reject the normal distribution in nine of them. We further argue that the stable Paretian hypothesis (and, more generally, the field of "chaos theory") is far more compatible with the Austrian position than one might initially suspect.
2008	C31	Holly, Sean, and Ivan Petrella. 2008. <i>Factor demand linkages and the business cycle: Interpreting aggregate fluctuations as sectoral fluctuations</i> . Faculty of Economics, University of Cambridge, Cambridge Working Papers in Economics. This paper investigates the drivers of industry and aggregate fluctuations. We model the dynamics of a panel of highly disaggregated manufacturing sectors. This allows us to consider directly the linkages between sectors typical of any production system, in a framework where the sectors are fully heterogeneous. We establish that these features are fundamental for the propagation of the shocks in the aggregate economy. Aggregate fluctuations can be accounted for by small industry specific shocks. Moreover, a contemporaneous technology shock to all sectors in the economy, i.e. an aggregate technology shock, implies a positive response in both output and hours at the aggregate level. When this intersectoral channel is neglected we find a negative correlation as with much of the literature. This suggests that the standard technology driven Real Business Cycle paradigm is a reasonable approximation of a more complicated model featuring heterogeneously interconnected sectors.
2008	C91 C92	Ricciuti, Roberto. 2008. "Bringing Macroeconomics into the Lab." <i>Journal of Macroeconomics</i> , 30(1): 216-37. This paper reviews experiments in macroeconomics, pointing out the theoretical justifications, the strengths and weaknesses of this approach. We identify two broad classes of experiments: general equilibrium and partial equilibrium experiments, and emphasize the idea of theory testing that is behind these. A large number of macroeconomic issues have been analyzed in the laboratory: monetary economics, fiscal policy, international trade and finance, growth, lifecycle consumption, labor markets, search models and macroeconomic imperfections. In a large number of cases results give support to the theories tested. We also highlight that experimental macroeconomics has increased the number of tools available to experimentalists.
2008	F42	Beetsma, Roel, A. Lans Bovenberg, and Ward E. Romp. 2008. <i>Funded Pensions and Intergenerational and International Risk Sharing in General Equilibrium</i> . C.E.P.R. Discussion Papers, CEPR Discussion Papers: 7106. We explore intergenerational and international risk sharing in a general equilibrium multiple-country model with two-tier pensions systems. The exact design of the funded tier is key for the way in which risks are shared over the various generations. The laissez-faire market solution fails to provide an optimal allocation because the young cannot share in the risks. However, the existence of wage-indexed bonds combined with a pension system with a fully-funded second tier that pays defined wage-indexed benefits can reproduce the first best. If wage-indexed bonds are not available, mimicking the first best is not possible, except under special circumstances. We also explore whether national pension funds want to deviate from the first best by increasing domestic equity holdings. With wage-indexed bonds this incentive is absent, while there is indeed such an incentive when wage-indexed bonds do not exist.
2008	F47	Everaert, Luc, and Werner Schule. 2008. "Why It Pays to Synchronize Structural Reforms in the Euro Area across Markets and Countries." <i>IMF Staff Papers</i> , 55(2): 356-66. Simulations with the IMF's Global Economy Model, calibrated to the European

		Union, suggest that there are sizable long-term gains in output and employment from boosting competition in product and labor markets. Coordinating reforms across these markets in a given country is found to be beneficial: it reduces transition costs in the short run and generates synergies in the long run. However, to prevent a temporary fall in euro area consumption, synchronization across countries is needed if they are to benefit from a monetary policy reaction.
2008	G34	van Marrewijk, Charles, and Gus Garita. 2008. <i>Countries of a Feather flock together</i>. Tinbergen Institute, Tinbergen Institute Discussion Papers: 08-067/2. We analyze the economic forces underlying cross-border Mergers and Acquisitions (M&As) using a large bilateral panel data set. The frequent occurrence of "zero" observations provides essential information on the structure of M&A flows, which we model empirically using a two-stage procedure. At the first stage, an observation is either classified in the Passive Group (always zero) or in the (potentially) Active Group using a logit model. At the second stage, the size of M&A flows in the Active Group is modeled using a gravity-type negative binomial model. We find that: (i) market size (GDP) of both acquirer and target is more important for trade flows than for cross-border M&As, (ii) market development (per capita GDP) is more important for cross-border M&As than for trade flows, (iii) for M&As, the target's market, both in size and development, is more important than the acquirer's market, and (iv) the impact of distance is larger on trade flows than for M&As. Financial openness is a prerequisite for becoming active in M&As and positively influences the size of M&A flows. Our estimates on the direction, size, and significance of the main variables are robust for alternative specifications, incorporating lagged stock market value, black market premium, real interest rates, transparency, and exchange rate variability. Finally, we provide additional support and extend the recent results of Blonigen et al. (2007) on outside-market potential and of Bergstrand and Egger (2007) on Rest of World GDP.
2008	J16	Fogli, Alessandra, and Laura Veldkamp. 2008. <i>Nature or Nurture? Learning and the Geography of Female Labor Force Participation</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 14097. One of the most dramatic economic transformations of the past century has been the entry of women into the labor force. While many theories explain why this change took place, we investigate the process of transition itself. We argue that local information transmission generates changes in participation that are geographically heterogeneous, locally correlated and smooth in the aggregate, just like those observed in our data. In our model, women learn about the effects of maternal employment on children by observing nearby employed women. When few women participate in the labor force, data is scarce and participation rises slowly. As information accumulates in some regions, the effects of maternal employment become less uncertain, and more women in that region participate. Learning accelerates, labor force participation rises faster, and regional participation rates diverge. Eventually, information diffuses throughout the economy, beliefs converge to the truth, participation flattens out and regions become more similar again. To investigate the empirical relevance of our theory, we use a new county-level data set to compare our calibrated model to the time-series and geographic patterns of participation.
2008	J50	Stockhammer, Engelbert. 2008. <i>Wage Flexibility or Wage Coordination? Economic Policy Implications of the Wage-Led Demand Regime in the Euro Area</i>. Political Economy Research Institute, University of Massachusetts at Amherst, Working Papers. Wage shares have fallen substantially in Europe since the early 1980s. To some extent this is due to a macroeconomic policy package that encourages wage flexibility and wage competition. A system of wage coordination in the Euro area would facilitate a return to a productivity-oriented wage policy by reducing wage competition. In a recent study on the demand effects of changes in functional income distribution Stockhammer, Onaran und Ederer (2007) find that the Euro area is in a wage-led demand regime. According to their results a reduction of the wage share by 1%-point leads to a reduction of demand by around 0.2%-points of GDP. This finding has far reaching implications for economic policy. A stable wage share would help stabilize demand. The paper aims, first, at clarifying some conceptual issues in the design of a European system of productivity-oriented wage coordination and, second, it discusses the economic policy implications of wage coordination. The present policy package assigns wages the role of a shock absorber. However, as wage reductions do have negative demand effects in a wage-led demand regime, this policy has a deflationary bias. A system of wage coordination will thus have to be complemented by a more active nation fiscal policies and more fiscal redistribution within the EU. If so a regime of productivity oriented wage coordination will help to stabilize demand and it is consistent with price stability.
2008	J61 O18	Uhlig, Harald. 2008. <i>The Slow Decline of East Germany</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 14553. Fifteen years after German reunification, the facts about slow regional convergence have born out the prediction of Barro (1991), except that migration out of East Germany has not slowed down. I document that in particular the 18-29 year old are leaving East Germany, and that the emigration has accelerated in recent years. I document that low wages, high unemployment and increasing reliance on social security persist across wide regions of East Germany together with these migration patterns. To understand these patterns, I use an extension of the standard labor search model introduced in Uhlig (2006, 2008) by allowing for migration and network externalities. In that theory, two equilibria can result: one with a high networking rate, high average labor productivity, low unemployment and no emigration ("West Germany") and one with a low networking rate, low average labor productivity, high unemployment and a constant rate of emigration ("East Germany"). The model does not imply any obviously sound policies to move from the weakly networked equilibrium to the highly networked equilibrium.
2008	J80 M54	Moniz, Antonio. 2008. <i>The transformation of work? A quantitative evaluation of changes in work in Portugal</i>. Universidade Nova de Lisboa, IET-Research Center on Enterprise and Work Innovation, Faculty of Science and Technology, IET Working Papers Series: 07/2008. This report is made for the Work Package 15 of WORKS project and tries to develop more information on the Portuguese situation in the work structures changes in the recent years. It starts with an analysis of socio-economical indicators (Macro economical indicators, Employment indicators, Consumption, Technology at the workplace, Productivity), and then approaches the situation in terms of work flexibility in its dimensions of time use and New forms of work organisation. It traces employment in business functions with a sectoral and occupational approach, and analyses the occupational change in South Europe with particular relevance to Portugal (skill utilisation and job satisfaction, occupational and industrial mobility, quantitative evaluation of the shape of employment in Europe. Finally are analysed the globalisation indicators.

This paper is an update of CEPR's July 2007 overview of the Venezuelan economy, and includes the latest available data (at the time of publication) for growth, employment, poverty, budget information, and other data. The paper notes continued progress in economic growth, poverty reduction, employment, and health and education indicators.
2008	Q01 Q32	van der Ploeg, Frederick. 2008. <i>Why Do Many Resource-Rich Countries Have Negative Genuine Saving? Anticipation of Better Times or Rapacious Rent Seeking</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 7021. We investigate the Hartwick rule for saving of a nation necessary to sustain a constant level of private consumption for a small open economy with an exhaustible stock of natural resources. The amount by which a country saves and invests less than the marginal resource rents equals the expected capital gains on reserves of natural resources plus the expected increase in interest income on net foreign assets plus the expected fall in the cost of resource extraction due to expected improvements in extraction technology. Effectively, depletion is then postponed until better times. This suggests that it is not necessarily sub-optimal for resource-rich countries to have negative genuine saving. However, in countries with different groups with imperfectly defined property rights on natural resources, political distortions induce faster resource depletion than suggested by the Hotelling rule. Fractionalised societies with imperfect property rights build up more foreign assets than their marginal resource rents, but in the long run accumulate less foreign assets than homogenous societies. Hence, such societies end up with lower sustainable consumption and are worse off, especially if seepage is strong, the number of rival groups is large and the country does not enjoy much monopoly power on the resource market. Genuine saving is zero in such societies. However, World Bank genuine saving figures based on market rather than accounting prices will be negative, albeit less so in more fractionalised societies with less secure property rights.
2008	Q01 Q32	van der Ploeg, Frederick. 2008. <i>Genuine Saving and the Voracity Effect</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 6831. Many resource-rich countries have poor economic performance and suffer from negative genuine saving rates, especially if they have many rival factions and badly functioning legal systems. We attempt to shed light on these stylized facts by analyzing a power struggle about the control of natural resources where competing factions in society have a private stock of financial assets and a common stock of natural resources. We solve a dynamic common-pool problem and obtain political economy variants of the Hotelling rule for resource depletion and the Hartwick saving rule necessary to sustain constant consumption in an economy with exhaustible natural resources. The rate of increase in the price of natural resources and resource depletion are faster than demanded by the Hotelling rule. As a result, the country substitutes away from resources to capital so that it saves and invests more than a homogenous society. The power struggle boosts output. Nevertheless, fractionalization depresses aggregate consumption and social welfare and leads to negative genuine saving if properly corrected for common-pool externalities. Fractionalization induces, however, positive genuine saving as measured by the World Bank.
2008	Q56	Cairns, Robert D. 2008. "Value and Income." <i>Ecological Economics</i>, 66(2-3): 417-24. This paper argues that income is a flow of value to society; therefore, an economic modeler's choice of a concept of value imposes a concept of income. The argument is used to distinguish three concepts of national income. (1) In a discounted-utilitarian model, which is usually the basis for theoretic discussions of net national income, the formulation of value imposes a concept of income that is not observable and hence does not provide income statistics. (2) In a perfectly competitive economy, national income is, in principle, observable. Study of the competitive model provides a theoretic foundation for national accounting, with extensions to distorted economies. However, two unobservable components of ideal income, consumers' surplus and capital gains, are perforce neglected. (3) A maximin program is the mathematical representation of another value, sustaining an economy. It employs a method of intertemporal valuation that does not involve discounting. Income is sustained value. Since a maximin program is not expressed for a distorted economy, there is no observable indicator of whether an economy is being sustained.
2008	Q56	Di Tella, Rafael, and Robert MacCulloch. 2008. "Gross National Happiness as an Answer to the Easterlin Paradox?" <i>Journal of Development Economics</i>, 86(1): 22-42. The Easterlin Paradox refers to the fact that happiness data are typically stationary in spite of considerable increases in income. This amounts to a rejection of the hypothesis that current income is the only argument in the utility function. We find that the happiness responses of around 350,000 people living in the OECD between 1975 and 1997 are positively correlated with the level of income, the welfare state and (weakly) with life expectancy; they are negatively correlated with the average number of hours worked, environmental degradation (measured by SOx emissions), crime, openness to trade, inflation and unemployment; all controlling for country and year dummies. These effects separate across groups in a pattern that appears broadly plausible (e.g., the rich suffer environmental degradation more than the poor). Based on actual changes from 1975 to 1997, small contributions to happiness can be attributed to the increase in income in our sample. Interestingly, the actual changes in several of the 'omitted variables' such as life expectancy, hours worked, inflation and unemployment also contribute to happiness over this time period since life expectancy has risen and the others have, on average, fallen. Consequently the unexplained trend in happiness is even bigger than would be predicted if income was the only argument in the utility function. In other words, introducing omitted variables worsens the income-without-happiness paradox.

2009	A10 B40	Juselius, Katarina. 2009. <i>Time to reject the privileging of economic theory over empirical evidence? A Reply to Lawson (2009)</i>. University of Copenhagen, Department of Economics, Discussion Papers: 09-16. The present financial and economic crisis has revealed a systemic failure of academic economics and emphasized the need to re-think how to model economic phenomena. Lawson (2009) seems concerned that critics of standard models now will fill academic journals with contributions that make the same methodological mistakes, albeit in slightly different guise. In particular, he is rather sceptical to use of mathematical statistical models, such as the CVAR approach, as a way of learning about economic mechanisms. In this paper I discuss whether this is a relevant claim and argue that it is likely to be based on a misunderstanding of what a proper statistical analysis is and can offer. In particular, I argue that the strong evidence of (near) unit roots and (structural) breaks in economic variables suggests that standard economic models need to be modified or changed to incorporate these strong features of the data. Furthermore, I argue that a strong empirical methodology that allows data to speak freely about economic mechanisms, such as the CVAR, would ensure that important information in the data is not over heard when needed. Adequately applied such models would provide us with an early warnings system signalling that the economy is moving seriously out of equilibrium.
2009	C01 D45	Kleiner, Morris, and Alan Krueger. 2009. <i>Analyzing the Extent and Influence of Occupational Licensing on the Labor Market</i>. Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 1178. This study examines the extent and influence of occupational licensing in the U.S. using a specially designed national labor force survey. Specifically, we provide new ways of measuring occupational licensing and consider what types of regulatory requirements and what level of government oversight contribute to wage gains and variability. Estimates from the survey indicated that 35 percent

Year	DE	Title and Abstract
		of employees were either licensed or certified by the government, and that 29 percent were fully licensed. Another 3 percent stated that all who worked in their job would eventually be required to be certified or licensed, bringing the total that are or eventually must be licensed or certified by government to 38 percent. We find that licensing is associated with about 18 percent higher wages, but the effect of governmental certification on pay is much smaller. Licensing by larger political jurisdictions is associated with the higher wage gains relative to only local licensing. We find little association between licensing and the variance of wages, in contrast to unions. Overall, our results show that occupational licensing is an important labor market phenomenon that can be measured in labor force surveys.
2009	C01	Goldberg, Pinelopi, Amit Khandelwal, Nina Pavcnik, and Petia Topalova. 2009. <i>Imported Intermediate Inputs and Domestic Product Growth: Evidence from India</i>. Princeton University, Department of Economics, Center for Economic Policy Studies, Working Papers: 1179. New goods play a central role in many trade and growth models. We use detailed trade and firm-level data from a large developing economy--India--to investigate the relationship between declines in trade costs, the imports of intermediate inputs and domestic firm product scope. We estimate substantial static gains from trade through access to new imported inputs. Accounting for new imported varieties lowers the import price index for intermediate goods on average by an additional 4.7 percent per year relative to conventional gains through lower prices of existing imports. Moreover, we find that lower input tariffs account on average for 31 percent of the new products introduced by domestic firms, which implies potentially large dynamic gains from trade. This expansion in firms' product scope is driven to a large extent by international trade increasing access of firms to new input varieties rather than by simply making existing imported inputs cheaper. Hence, our findings suggest that an important consequence of the input tariff liberalization was to relax technological constraints through firms' access to new imported inputs that were unavailable prior to the liberalization.
2009	B45	THE SAME AS C01 Kleiner, Morris, and Alan Krueger. 2009. <i>Analyzing the Extent and Influence of Occupational Licensing on the Labor Market</i>. Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 1178.
2009	E64 H25 I18 J23	Baker, Dean. 2009. <i>Job Sharing: Tax Credits to Prevent Layoffs and Stimulate Employment</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. The unemployment rate is expected to average 10.2 percent for 2010, 9.1 percent for 2011, and 7.3 percent for 2012. With this in mind, this Issue Brief describes a job sharing tax credit, designed to provide a quick and substantial boost to the economy. It would use tax dollars to pay firms to shorten the typical workweek, while keeping pay constant. This should cause employers to want to hire additional workers. A rough estimate of the impact of this tax credit is between 1.3 and 2.7 million jobs created.
2009	E64 H25 I18	Sherman, Matt. 2009. <i>More Budget Belt-Tightening Means More Job Losses for States</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This paper looks at the problem of state budget shortfalls during the recession and calculates the number of jobs that would be lost (nationally and by state) if states utilize pro-cyclical spending cuts in an attempt to balance their budgets. This is an update to an earlier paper from December 2008, "Will Workers Survive State Budget Belt-Tightening?"
2009	E64 H25 I18	Sherman, Matt, and Nathan Lane. 2009. <i>Cut Loose: State and Local Layoffs of Public Employees in the Current Recession</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. In the current recession, millions of Americans have lost their jobs. Unemployment has increased nationwide to levels not witnessed since the 1980s. This issue brief tallies more than 110,000 jobs that have been shed from state and local governments in the last two years and breaks them down by state (and metropolitan area where available). Without the stimulus passed in February of this year, there would have been many more layoffs at the state and local level.
2009	E64 H25 I18	Baker, Dean, and Rivka Deutsch. 2009. <i>The State and Local Drag on the Stimulus</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This report shows that the \$787 billion included in the 2009 ARRA will not have as much of an immediate effect on the economy as initially anticipated. After subtracting the annual AMT patch and accounting for state level spending and tax cuts, the full effect of federal stimulus will equal a little more than 1 percent of GDP a year, falling far short of what is needed to re-ignite the economy. While the 2009 recovery act was a vital first step towards restoring the nations economic foundation, this paper puts some perspective on the immediate effects of the stimulus.
2009	E64 H25 I18	Baker, Dean. 2009. <i>Pay for Play? Tax Credits for Paid Time Off</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. Economists are increasingly coming to the recognition that the current downturn is likely to be longer and more severe than they had expected at the time the last stimulus package was approved in February. As a result, there is likely to be interest in additional stimulus in order to boost the economy and lower the unemployment rate. This paper briefly outlines a method for Congress to quickly boost demand in the economy, while at the same time promoting important public ends: an employer tax credit for paid time off. This paid time off can take the form of paid family leave, paid sick days, paid vacation, or a shorter workweek. This tax credit can both provide short-term stimulus and also provide an incentive to restructure workplaces in ways that are more family friendly. It is possible that many workplaces may leave in place changes made to take advantage of this tax credit even after it has expired.
2009	F16	Khraiche, Maroula. 2009. <i>Trade, Firm Structure, and Migration of Talent</i>. University of Connecticut, Department of Economics, Working papers: 2009-35. Throughout economic history there have been episodes in which the liberalization of trade has been accompanied by a positive flow of migrants. Such phenomena are notable because they contradict the basic Heckscher-Ohlin conclusion that trade and labor mobility are substitutes. Also notable is the fact that migrants to the U.S. have been largely skilled rather than unskilled. This paper links these two phenomena by pointing out the simple fact that increased trade can involve different types of firm structures and different types of goods being traded, which in turn have different effects on skilled and unskilled labor. The interaction between different frictions that impact labor movements, specifically the interaction between capital adjustment costs and trade costs, has a significant effect on the gap between the returns to labor in the South and North. Although the decrease in trade costs and increase in trade dampens labor movements, the existence of asymmetric capital adjustment costs in the North and South increases it. To show these results formally, this paper calibrates and solves a two-country, two-sector model of trade and migration, in which countries differ in skill endowments and capital adjustment costs and sectors differ in structures and capital intensities. Empirical analysis is then provided, with results supporting the main qualitative implications of the model.
2009	G01	Pindyck, Robert S., and Neng Wang. 2009. <i>The Economic and Policy Consequences of Catastrophes</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 15373. What is the likelihood that the U.S. will experience a devastating catastrophic event over the next few decades--something that would substantially reduce the capital stock, GDP and wealth? What does the possibility of such an event imply for the behavior of economic variables such as investment, interest rates, and equity prices? And how much should society be willing to pay to reduce the probability or likely impact of such an event? We address these questions using a general equilibrium model that describes production, capital accumulation, and household preferences,

Year	DE	Title and Abstract
		and includes as an integral part the possible arrival of catastrophic shocks. Calibrating the model to average values of economic and financial variables yields estimates of the implied expected mean arrival rate and impact distribution of catastrophic shocks. We also use the model to calculate the tax on consumption society would accept to reduce the probability or impact of a shock.
2009	G01	Barro, Robert J., and Tao Jin. 2009. <i>On the Size Distribution of Macroeconomic Disasters</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 15247. In the rare-disasters setting, a key determinant of the equity premium is the size distribution of macroeconomic disasters, gauged by proportionate declines in per capita consumption or GDP. The long-term national-accounts data for up to 36 countries provide a large sample of disaster events of magnitude 10% or more. For this sample, a power-law density provides a good fit to the distribution of the ratio of normal to disaster consumption or GDP. The key parameter of the size distribution is the upper-tail exponent, alpha, estimated to be near 5, with a 95% confidence interval between 3-1/2 and 7. The equity premium involves a race between alpha and the coefficient of relative risk aversion, gamma. A higher alpha signifies a thinner tail and, therefore, a lower equity premium, whereas a higher gamma implies a higher equity premium. The equity premium is finite if $(\alpha-1) > \gamma$. To accord with an observed average unlevered equity premium of around 5%, we get a point estimate for gamma close to 3, with a 95% confidence interval of roughly 2 to 4.
2009	G01	Jagannathan, Ravi, Mudit Kapoor, and Ernst Schaumburg. 2009. <i>Why are we in a recession? The Financial Crisis is the Symptom not the Disease!</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 15404. Globalization has brought a sharp increase in the developed world's labor supply. Labor in developing countries--countries with vast pools of underemployed people--can now more easily augment labor in the developed world, without having to relocate, in ways not thought possible only a few decades ago. We argue that the large increase in the developed world's labor supply, triggered by geo-political events and technological innovations, is the major underlying cause of the global macro economic imbalances that led to the great recession. The inability of existing institutions in the US and the rest of the world to cope with this shock set the stage for the great recession: The inability of emerging economies to absorb savings through domestic investment and consumption due to inadequate national financial markets and difficulties in enforcing financial contracts; the currency controls motivated by immediate national objectives; and the inability of the US economy to adjust to the perverse incentives caused by huge money inflows leading to a breakdown of checks and balances at various financial institutions. The financial crisis in the US was but the first acute symptom that had to be treated. A sustainable recovery will only occur when the natural flow of capital from developed to developing nations is restored.
2009	G01	Mian, Atif R., and Amir Sufi. 2009. <i>House Prices, Home Equity-Based Borrowing, and the U.S. Household Leverage Crisis</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 15283. Using individual-level data on homeowner debt and defaults from 1997 to 2008, we show that borrowing against the increase in home equity by existing homeowners is responsible for a significant fraction of both the sharp rise in U.S. household leverage from 2002 to 2006 and the increase in defaults from 2006 to 2008. Employing land topology-based housing supply elasticity as an instrument for house price growth, we estimate that the average homeowner extracts 25 to 30 cents for every dollar increase in home equity. Money extracted from increased home equity is not used to purchase new real estate or pay down high credit card balances, which suggests that borrowed funds may be used for real outlays (i.e., consumption or home improvement). Home equity-based borrowing is stronger for younger households, households with low credit scores, and households with high initial credit card utilization rates. Homeowners in high house price appreciation areas experience a relative decline in default rates from 2002 to 2006 as they borrow heavily against their home equity, but experience very high default rates from 2006 to 2008. Our estimates suggest that home equity-based borrowing is equal to 2.8% of GDP every year from 2002 to 2006, and accounts for at least 34% of new defaults from 2006 to 2008.

Contrary to popular perceptions, the United States has a much smaller small-business sector (as a share of total employment) than other countries at a comparable level of economic development,

Year	DE	Title and Abstract
		according to this new CEPR report. The authors observe that the undersized U.S. small business sector is consistent with the view that high health care costs discourage small business formation, since start-ups in other countries can tap into government-funded health care systems.
2009	I58 L43	Hannsgen, Greg, and Dimitri B. Papadimitriou. 2009. <i>Lessons from the New Deal--Did the New Deal Prolong or Worsen the Great Depression?</i> Levy Economics Institute, The Economics Working Paper Archive. Since the current recession began in December 2007, New Deal legislation and its effectiveness have been at the center of a lively debate in Washington. This paper emphasizes some key facts about two kinds of policy that were important during the Great Depression and have since become the focus of criticism by new New Deal critics: (1) regulatory and labor relations legislation, and (2) government spending and taxation. We argue that initiatives in these policy areas probably did not slow economic growth or worsen the unemployment problem from 1933 to 1939, as claimed by a number of economists in academic papers, in the popular press, and elsewhere. To substantiate our case, we cite some important economic benefits of New Deal-era laws in the two controversial policy areas noted above. In fact, we suggest that the New Deal provided effective medicine for the Depression, though fiscal policy was not sufficiently countercyclical to conquer mass unemployment and prevent the recession of 1937-38; 1933's National Industrial Recovery Act was badly flawed and poorly administered, and the help provided by the National Labor Relations Act of 1935 came too late to have a big effect on the recovery.
2009	Q23 Q51	Campos Palacin, Pablo, and Alejandro Caparros Gass. 2009. "La integracion del valor de cambio de los servicios ambientales en las cuentas verdes de las areas naturales. (Integrating the Exchange Value of Environmental Services in Natural Reserve Green Accounts. With English summary.)." <i>Informacion Comercial Espanola Revista de Economia</i> , 0(847): 9-22. In national accounts, market goods and services are measured in terms of their exchange values (price times amount), whereas the methods for assessing environmental services are based on consumer surplus or Hicksian variations. As a result, environmental values cannot be directly incorporated into national accounts. The present article proposes a methodology for such incorporation under standardized conditions, consisting in full market simulation (supply, demand and competitive context) for cost-free recreational visitor access. The output is a range of values. Methods are likewise proposed for estimating the exchange values of environmental services self-consumed by private owners. Two examples involving Spanish forests are discussed to illustrate the methodology.

2010	A23	Blinder, Alan. 2010. <i>Teaching Macro Principles after the Financial Crisis</i> . Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 1222. The stunning events of 2007-2009 both shook the world and piqued interest in economics. In the 30-plus years that I have been teaching macro principles, I have never seen the level of interest in students as high as what I observed last year rapt attention and no sleepers! Interest in economics has grown, and our students will want, expect, and deserve explanations of these events for years to come. This is truly a teaching moment, and that moment is going to be a long one. That's the good news. The bad news is that the current curriculum fails to give students even imperfect answers. This means that the macro principles course will have to be changed. Although we can't provide beginning students with complete answers, we can do a lot better than we have been doing.
2010	A31 D02	Blinder, Alan. 2010. <i>The Squam Lake Report: Fifteen Economists in Search of Financial Reform</i> . Princeton University, Department of Economics, Center for Economic Policy Studies., Working Papers: 1243. The Squam Lake Report is a volume by economists for economists. It offers the fruits of the labors of 15 top economists who met at Squam Lake, New Hampshire, to discuss financial reform. While somewhat disjointed, and avoiding many important issues, the book is nonetheless a tour du force. Its many recommendations derive from two basic principles: that reformers need to think systemically, and that third-party costs stemming from systemic risk need to be internalized. And its approach is just what you would expect from a group of academic economists. It asks (and answers) questions like: Where did incentives go wrong? What were the sources of market failure? How can we better protect society against negative externalities?
2010	C11	RUGE-MURCIA, Francisco J. 2010. <i>Estimating Nonlinear DSGE Models by the Simulated Method of Moments</i> . Universite de Montreal, Departement de sciences economiques, Cahiers de recherche. This paper studies the application of the simulated method of moments (SMM) for the estimation of nonlinear dynamic stochastic general equilibrium (DSGE) models. Monte Carlo analysis is employed to examine the small-sample properties of SMM in specifications with different curvature. Results show that SMM is computationally efficient and delivers accurate estimates, even when the simulated series are relatively short. However, asymptotic standard errors tend to overstate the actual variability of the estimates and, consequently, statistical inference is conservative. A simple strategy to incorporate priors in a method of moments context is proposed. An empirical application to the macroeconomic effects of rare events indicates that negatively skewed productivity shocks induce agents to accumulate additional capital and can endogenously generate asymmetric business cycles.

2010	G14	Angeletos, George-Marios, Guido Lorenzoni, and Alessandro Pavan. 2010. <i>Beauty Contests and Irrational Exuberance: A Neoclassical Approach</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 15883. The arrival of new, unfamiliar, investment opportunities is often associated with "exuberant" movements in asset prices and real economic activity. During these episodes of high uncertainty, financial markets look at the real sector for signals about the profitability of the new investment opportunities, and vice versa. In this paper, we study how such information spillovers impact the incentives that agents face when making their real economic decisions. On the positive front, we find that the sensitivity of equilibrium outcomes to noise and to higher-order uncertainty is amplified, exacerbating the disconnect from fundamentals. On the normative front, we find that these effects are symptoms of constrained inefficiency; we then investigate policies that can improve welfare in our model without any informational advantage on the government's part. At the heart of these results is a distortion that induces a conventional neoclassical economy to behave as a Keynesian "beauty contest" and to exhibit fluctuations that may look like "irrational exuberance" to an outside observer.

2010	L23	Syverson, Chad. 2010. <i>What Determines Productivity?</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 15712. Economists have shown that large and persistent differences in productivity levels across businesses are ubiquitous. This finding has shaped research agendas in a number of fields, including (but not limited to) macroeconomics, industrial organization, labor, and trade. This paper surveys and evaluates recent empirical work addressing the question of why businesses differ in their measured productivity levels. The causes are manifold, and differ depending on the particular setting. They include elements

Year	DE	Title and Abstract
		sourced in production practices--and therefore over which producers have some direct control, at least in theory--as well as from producers' external operating environments. After evaluating the current state of knowledge, I lay out what I see are the major questions that research in the area should address going forward.
2010	N42 N62	Gordon, Robert J., and Robert Krenn. 2010. <i>The End of the Great Depression 1939-41: Policy Contributions and Fiscal Multipliers</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 16380. This paper is about the size of fiscal multipliers and the sources of recovery from the Great Depression. Its baseline result is that 89.1 percent of the 1939:Q1-1941:Q4 recovery can be attributed to fiscal policy innovations, 34.1 percent to monetary policy innovations and the remaining -23.2 percent to the combined effect of the basic VAR dynamic forecast and innovations in non-government components of GDP. Traditional Keynesian multipliers assume that there are no capacity constraints to impede a fiscal-driven expansion in aggregate demand. On the contrary, we find ample evidence of capacity constraints in 1941, particularly in the second half of that year. As a result our preferred government spending multiplier is 1.80 when the time period ends in 1941:Q2 but only 0.88 when the time period ends in supply-constrained 1941:Q4. Only the 1.80 multiplier is relevant to situations like 2009-10 when capacity constraints are absent across the economy. Two sets of new insights emerge from a review of contemporary print media. We document that the American economy went to war starting in June 1940, fully 18 months before Pearl Harbor. We also detail the bifurcated nature of the 1941 economy, with excess capacity in its labor market but capacity constraints in many of the key manufacturing industries. By July 1941, the American economy was in a state of perceived national emergency.

2011	C00 G13	Casassus, Jaime, Peng Liu, and Ke Tang. 2011. <i>Relative Scarcity of Commodities with a Long-Term Economic Relationship and the Correlation of Futures Returns</i> . Instituto de Economía, Pontificia Universidad Católica de Chile., Documentos de Trabajo: 404. This paper finds that the long-term co-movement of commodity prices is driven by economic relationships, such as production, substitution, and complementary relationships. Such relationships imply that the convenience yield of a given commodity depends on its relative scarcity with respect to associated commodities. The economic linkage between two commodities creates a new source of positive correlation between the futures returns of both commodities. We build an empirical, multi-commodity maximal affine model that allows the convenience yield of a commodity to depend on its relative scarcity. We estimate the model using three commodity pairs: heating oil-crude oil, WTI-Brent crude oil and heating oil-gasoline. Our model allows for a flexible correlation term structure of futures returns that matches the upward-sloping patterns observed in the data. The high long-term correlation implied by an economic relationship reduces the volatility of the spread between commodities, which implies lower spread option prices. An out-of-sample test using short-maturity crack spread options data shows that our model considerably reduces the negative bias generated by traditional models.
2011	C23	Doszyn, Mariusz. 2011. "Econometric Analysis of the Impact of Propensities on Economic Occurrences: A Macroeconomic Perspective." <i>Folia Oeconomica Stetinensia</i> , 10(18): 138-54. The main aim of this article was the specification of problems connected with analysis of impact of human propensities on economic occurrences and also a proposition of econometric tools enabling the identification of this impact. According to the meaning of propensities in economics the current state of knowledge is mostly an effect of considerations presented by J.M. Keynes in his famous book "The General Theory of Employment, Interest and Money" where J.M. Keynes proposed such economic categories as the average and marginal propensities. One of the goals of the presented deliberations was to specify problems related with economic theory of propensities. Such propensities as a propensity to consume, to save, to invest and thesaurisation were particularly carefully analysed. The impact of these propensities on basic macroeconomic variables was considered with respect to the classical model, the neoclassical Solow-Swan model and the IS-LM scheme. In case of spatial data the effects of the impact of propensities could be analysed by means of models with dummy variables showing presence of given propensities. A procedure enabling the construction of such variables was proposed. In case of time series, conceptions delivered by the integration and cointegration theory could be applied. Especially such models as VAR and VECM could be useful. Models for panel data enable direct (models with fixed effects) or indirect (models with random effects) consideration of the impact of propensities on the analysed processes.
2011	C62	Gunn, Christopher M. 2011. <i>From growth to cycles through beliefs</i> . McMaster University, Department of Economics Working Papers. I present a theoretical model where the economy endogenously adopts the technological ideas of a slowly evolving technological frontier, and show that the presence of a "technological gap" between unadopted ideas and current productivity can lead to multiple equilibria and therefore the possibility that changes in beliefs can be self-fulfilling, often referred to as sunspots. In the model these sunspots take the form of beliefs about the value of adopting the new technological ideas, and unleash both a boom in aggregate quantities as well as eventual productivity growth, increasing the value of adoption and self-confirming the beliefs. Moreover, I demonstrate that the scope for these indeterminacies is a function of the steady-state growth rate of the underlying technological frontier of ideas, and that during times of low growth in ideas, the potential for indeterminacies disappears. Under this view, technology becomes important for cycles not necessarily because of sudden shifts in the technological frontier, but rather, because it defines a technological regime for the economy such that expectations about its value can produce aggregate fluctuations where in a different regime they could not.
2011	C62	BOUCEKKINE, Raouf, B. MARTINEZ, and J. R. RUIZ-TAMARIT. 2011. <i>Growth vs. level effect of population change on economic development: An inspection into human-capital-related mechanisms</i> . Université catholique de Louvain, Institut de Recherches Economiques et Sociales (IRES), Discussion Papers (IRES - Institut de Recherches Economiques et Sociales): 2011039. This paper studies the different mechanisms and the dynamics through which demography is channelled to the economy. We analyze the role of demographic changes in the economic development process by studying the transitional and the long-run impact of both the rate of population growth and the initial population size on the levels of per capita human capital and income. We do that in an enlarged Lucas-Uzawa model with intergenerational altruism. In contrast to the existing theoretical literature, the long-run level effects of demographic changes, i.e. their impact on the levels of the variables along the balanced growth path, are deeply characterized in addition to the more standard long-run growth effects. We prove that the level effect of the population rate of growth is non-negative (positive in the empirically most relevant case) for the average level of human capital, but a priori ambiguous for the level of per capita income due to the interaction of three transmission mechanisms of demographic shocks, a standard one (dilution) and two non-standard (altruism and human capital accumulation). Overall, the sign of the level effects of population growth depend on preference and technology parameters, but numerically we show that the joint negative effect of dilution and altruism is always stronger than the induced positive human capital effect. The growth effect of population growth depends basically on the attitude to intergenerational altruism and intertemporal substitution. Moreover, we also prove that the long-run level effects of population size on per capita human capital and income may be negative, nil, or positive, depending on the relationship between preferences and technology, while its growth effect is zero. Finally, we show that the model is able to replicate complicated time relationships between economic and demographic changes. In particular, it entails a negative effect of

Year	DE	Title and Abstract
		population growth on per capita income, which dominates in the initial periods, and a positive effect which restores a positive correlation between population growth and economic performance in the long term.
2011	C87 P44	Van Tongeren, J. W., and J. R. Magnus. 2011. <i>Bayesian Integration of Large Scale SNA Data Frameworks with an Application to Guatemala</i> . Tilburg University, Center for Economic Research, Discussion Paper: 2011-022. We present a Bayesian estimation method applied to an extended set of national accounts data and estimates of approximately 2500 variables. The method is based on conventional national accounts frameworks as compiled by countries in Central America, in particular Guatemala, and on concepts that are defined in the international standards of the System of National Accounts. Identities between the variables are exactly satisfied by the estimates. The method uses ratios between the variables as Bayesian conditions, and introduces prior reliabilities of values of basic data and ratios as criteria to adjust these values in order to satisfy the conditions. The paper not only presents estimates and precisions, but also discusses alternative conditions and reliabilities, in order to test the impact of framework assumptions and carry out sensitivity analyses. These tests involve, among others, the impact on Bayesian estimates of limited annual availability of data, of very low reliabilities (close to non-availability) of price indices, of limited availability of important administrative and survey data, and also the impact of aggregation of the basic data. We introduce the concept of 'tentative' estimates that are close to conventional national accounts estimates, in order to establish a close link between the Bayesian estimation approach and conventional national accounting.

2011	E16 I12	Sukati, Mphumuzi Angelbert. 2011. "The Analysis of the Possible Economic Effects of HIV/AIDS Using the SAM and CGE Models." <i>Asian-African Journal of Economics and Econometrics</i> , 11(1): 1-13. Swaziland does not have a social accounting matrix (SAM) in place and as such there are many shocks that affect that country's economy but which cannot be analyzed effectively. Most notable of this is the economic effects of the HIV/AIDS scourge that is affecting that country of which it has been difficult to determine the effects it has had on the economy in an objective manner. This paper will highlight the usefulness of the SAM and computable general equilibrium (CGE) models in analyzing the possible economic effects of HIV/AIDS in Swaziland. The absence of a SAM for Swaziland means that empirical analysis of the effect of the disease in the economy could not be undertaken but it is hoped that the arguments presented here will contribute to the use of these methods as tools for analyzing various shocks in an economy. The main aim of the paper is to lay the basic framework to help small developing countries develop practical SAMs that will become an important tool in analyzing the performances of their economies.
2011	E26	Georgiou, George M. 2011. "Measuring the Size of the Informal Economy: Some Critical Comments." <i>Journal of Interdisciplinary Economics</i> , 23(1): 85-107. There has been a burgeoning number of studies attempting to measure the size of the 'black' economy. These are based on a variety of methodologies and provide a range of estimates, not just across countries but within the same countries. This raises a number of issues. What is meant by the term 'black' economy? Is it an appropriate description? What is the theory underlying the estimates of informal economic activity? This paper examines these and other issues, and concludes that whilst the existence of what we prefer to call the 'informal' economy in most countries is incontrovertible, there is a lack of consensus on the appropriate methodology for estimating its size. More importantly, the large number of studies are simply exercises in measurement without theory, though we are sceptical that even with strong theoretical underpinnings it is possible to provide accurate estimates of a complicated web of informal activities.
2011	F01	Chen, Wenjuan. 2011. <i>On the Continuation of the Great Moderation: New evidence from G7 Countries</i> . Sonderforschungsbereich 649, Humboldt University, Berlin, Germany, SFB 649 Discussion Papers: SFB649DP2011-060. This paper employs a Markov regime-switching approach to investigate whether the Great Moderation is over since the start of the late 2000s recession. The results confirm that the recent financial crisis did cause a simultaneous high-volatility period among the G7 countries. However, the financial crisis may not mark the end of the Great Moderation. There is strong evidence that each G7 country has again returned to the low-variance state since 2009 or the beginning of 2010.
2011	F11	Baxter, Marianne. 2011. <i>International Risk Sharing in the Short Run and in the Long Run</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 16789. International risk-sharing has far-reaching implications both for economic policy and for basic research in economics. When countries do not share risk, individuals in those countries experience fluctuations in their consumption levels that are undesirable and possibly unnecessary. This paper extends and refines the study of international risk-sharing in two dimensions. First, this paper investigates risk-sharing at short vs. long horizons. Countries might, for example, pool risks associated with high-frequency shocks (e.g., seasonal fluctuations in crop yields) but might not share risks associated with low frequency shocks (e.g., different long-run national growth rates). Second, this paper studies bilateral risk-sharing, which is different from the approach taken in most previous studies. We find that there is evidence of substantial international risk-sharing at medium and low frequencies. There is evidence of high and increasing risk-sharing within Europe that is not apparent for other regions of the world.

2011	J12	Fernandez, Raquel, and Joyce Cheng Wong. 2011. <i>The Disappearing Gender Gap: The Impact of Divorce, Wages, and Preferences on Education Choices and Women's Work</i> . National Bureau of Economic Research, Inc. NBER Working Papers: 17508. Women born in 1935 went to college significantly less than their male counterparts and married women's labor force participation (LFP) averaged 40% between the ages of thirty and forty. The cohort born twenty years later behaved very differently. The education gender gap was eliminated and married women's LFP averaged 70% over the same ages. In order to evaluate the quantitative contributions of the many significant changes in the economic environment, family structure, and social norms that occurred over this period, this paper develops a dynamic life-cycle model calibrated to data relevant to the 1935 cohort. We find that the higher probability of divorce and the changes in wage structure faced by the 1955 cohort are each able to explain, in isolation, a large proportion (about 60%) of the observed changes in female LFP. After combining all economic and family structure changes, we find that a simple change in preferences towards work can account for the remaining change in LFP. To eliminate the education gender gap requires, on the other hand, for the psychic cost of obtaining higher education to change asymmetrically for women versus men.
2011	J33	Schmitt, John. 2011. <i>Labor Market Policy in the Great Recession: Some Lessons from Denmark and Germany</i> . Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This paper reviews the recent labor-market performance

Year	DE	Title and Abstract
		of 21 rich countries, with a focus on Denmark and Germany. Denmark, which was widely seen as one of the world's most successful labor markets before the downturn, has struggled in recent years. Germany, however, has outperformed the rest of the world's rich countries since 2007, despite earlier labor-market difficulties. Labor-market institutions seem to explain the different developments in the two economies. Danish institutions—which include extensive opportunities for education, training, and placement of unemployed workers—appear to perform well when the economy is at or near full employment, but have not been effective during the downturn. German labor-market institutions, which emphasize job security by keeping workers connected to their current employers, may have drawbacks when the economy is operating at or near full employment, but have performed well in the Great Recession. The paper also discusses lessons for U.S. labor-market policy.
2011	J33	Schmitt, John, and David Rosnick. 2011. <i>The Wage and Employment Impact of Minimum-Wage Laws in Three Cities</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This report analyzes the wage and employment effects of the first three city-specific minimum wages in the United States -San Francisco (2004), Santa Fe (2004), and Washington, DC (1993). We use data from a virtual census of employment in each of the three cities, surrounding suburbs, and nearby metropolitan areas, to estimate the impact of minimum-wage laws on wages and employment in fast food restaurants, food services, retail trade, and other low-wage and small establishments.

CERDI, Working Papers: 201103. This paper aims to ascertain the effects of convergence in governance on investment decisions among a sample of 43 developing countries, using dynamic system GMM estimations. In an increasingly interdependent economic world, regions with good governance are considered to be areas of higher investment, as a result of further integration and collaborative action among member states. Since its foundation, in 1992, Black Sea Economic Cooperation (BSEC) countries have gone through a transition process and, to a large extent, this is about institutional transformation. Good governance institutions are an assurance to guarantee property rights and minimize transaction costs, thus creating an environment conducive to investment and growth. In this paper, we investigate the impact of BSEC on its member countries regarding convergence of governance institutions. We show that convergence has occurred within the region with respect to bureaucratic quality, control over corruption, law and order, internal conflict, ethnic tensions, but not to government stability and democratic accountability. The paper also calculates how much capital accumulation the region would gain by reaching the average institutional standards of the EU-12. This study is the first attempt in the BSEC region to investigate the link between regionalization and institutional convergence, at the same time as to quantify its economic impact through investment.

2012	D03	Ahrens, Steffen, and Dennis J. Snower. 2012. <i>Envy, Guilt, and the Phillips Curve</i>. C.E.P.R. Discussion Papers, CEPR Discussion Papers: 8796. We incorporate inequity aversion into an otherwise standard New Keynesian dynamic equilibrium model with Calvo wage contracts and positive inflation. Workers with relatively low incomes experience envy, whereas those with relatively high incomes experience guilt. The former seek to raise their income, and latter seek to reduce it. The greater the inflation rate, the greater the degree of wage dispersion under Calvo wage contracts, and thus the greater the degree of envy and guilt experienced by the workers. Since the envy effect is stronger than the guilt effect, according to the available empirical evidence, a rise in the inflation rate leads workers to supply more labor over the contract period, generating a significant positive long-run relation between inflation and output (and employment), for low inflation rates. This Phillips curve relation, together with an inefficient zero-inflation steady state, provides a rationale for a positive long-run inflation rate. Given standard calibrations, optimal monetary policy is associated with a long-run inflation rate around 2 percent.

National Bureau of Economic Research, Inc, NBER Working Papers: 18417. We test the effectiveness of self-help peer groups as a commitment device for precautionary savings, through two randomized field experiments among 2,687 microentrepreneurs in Chile. The first experiment finds that self-help peer groups are a powerful tool to increase savings (the number of deposits grows 3.5-fold and the average savings balance almost doubles). Conversely, a substantially higher interest rate has no effect on most participants. A second experiment tests an alternative delivery mechanism and shows that effects of a similar size can be achieved by holding people accountable through feedback text messages, without any meetings or peer pressure.

Papers focus on psychology and economics—a historical perspective; social norms and macroeconomics; the nature of unemployment; some implications of equity for unemployment and inflation; some implications of loss aversion for unemployment and inflation; unemployment and inflation in the social welfare function; consumption and saving; the global financial crisis; economic growth and happiness; and income distribution and the underclass.
2012	D86	Strulovici, Bruno, and Martin Szydlowski. 2012. <i>On the Smoothness of Value Functions</i>. Northwestern University, Center for Mathematical Studies in Economics and Management Science, Discussion Papers: 1542. In dynamic models driven by diffusion processes, the smoothness of the value function plays a crucial role for characterizing properties of the solution. However, available methods to ensure such smoothness have limited applicability in economics, and economists have often relied on either model-specific arguments or explicit solutions. In this paper, we prove that the value function for the optimal control of any time-homogeneous, one-dimensional diffusion is twice continuously differentiable, under Lipschitz, growth, and non-vanishing volatility conditions. Under similar conditions, the value function of any optimal stopping problem is continuously differentiable. For the first problem, we provide sufficient conditions for the existence of an optimal control. The optimal control is Markovian and constructed from the Bellman equation. We also establish an envelope theorem for parameterized optimal stopping problems. Several applications are discussed, including growth, dynamic contracting, and experimentation models.

2012	E02	Benhabib, Jess, and Pengfei Wang. 2012. <i>Financial Constraints, Endogenous Markups, and Self-fulfilling Equilibria</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 18074. We show that self-fulfilling equilibria and indeterminacy can easily arise in a simple financial accelerator model with reasonable parameter calibrations and without increasing returns in production. A key feature for generating indeterminacy in our model is the countercyclical markup due to the procyclical loan to output ratio. We illustrate, via simulations, that our financial accelerator model can generate rich business cycle dynamics, including hump-shaped output in response to demand shocks as well as serial autocorrelation in output growth rates.
2012	F59 N36	Palma, Jose Gabriel. 2012. <i>Was Brazil's recent growth acceleration the world's most overrated boom?</i>. Faculty of Economics, University of Cambridge, Cambridge Working Papers in Economics. As soon as international financial markets felt reassured in 2003 by the surprisingly neoliberal orientation of President Lula's government, the 'spot-the-new-Latin-tiger' financial brigade became dazzled by Brazil--they just couldn't have enough of it. So much so, that they had little difficulty in turning a blind eye to the obvious fact that (except for several commodities, finance, and a small number of other activities) Brazil's economic performance since the beginning of neo-liberal reforms (c.1990) had been remarkably poor. This not only contrasted with its own performance pre-1980, but also with what was happening in Asia. I shall argue that the weakness of the new neo-liberal paradigm is rooted as much in its intrinsic flaws as in the particular way it was implemented. As in the rest of Latin America, Brazil's economic reforms were undertaken primarily as a result of its perceived economic weaknesses--i.e., there was an attitude of 'throwing in the towel' vis-a-vis the previous state-led import substituting industrialisation strategy, because most politicians and economists interpreted the 1982 debt crisis as conclusive evidence that it had led the region into a cul-de-sac. As Hirschman has argued, policy-making has a strong component of 'path-dependency'; as a result, people often stick with policies after they have achieved their aims, and those policies have become counterproductive. This leads to such frustration and disappointment with existing policies and institutions that is not uncommon to lead to a 'rebound effect'. An extreme example of this phenomenon is post-1982 Latin America, where the core of the discourse that followed ended up simply emphasising the need to reverse as many aspects of the previous development strategy as possible. This helps to explain the peculiar set of priorities, the rigidity and the messianic attitude with which the reforms were implemented in Brazil, as well as their poor outcome. As the then President of Brazil's Central Bank explained at the time, their main task was "...to undo forty years of stupidity." With this 'reverse-gear' attitude, this experiment in economic reform almost inevitably ended up as an exercise in 'not-very-creative-destruction'--especially vis-a-vis its manufacturing industry. Something very different happened in Asia, where economic reforms were often intended (rightly or wrongly) as a more targeted and pragmatic mechanism to overcome specific economic and financial constraints. Instead of implementing reforms as a mechanism to reverse existing industrialisation strategies, in Asia they were put into practice in order to continue and strengthen ambitious processes of industrialisation. Although the Brazilian economy has been unable to deliver sustainable productivity-growth since the beginning of economic reforms (just a few short growth-dashes), Brazilian-style neo-liberal capitalism became unrivalled when it came to offering world-class commodities, an abundance of precarious (mostly service) jobs, stylish retail, extremely lucrative finance, and the 'purity of beliefs.'
2012	J15 O31	Gordon, Robert J. 2012. <i>Is U.S. Economic Growth Over? Faltering Innovation Confronts the Six Headwinds</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 18315. This paper raises basic questions about the process of economic growth. It questions the assumption, nearly universal since Solow's seminal contributions of the 1950s, that economic growth is a continuous process that will persist forever. There was virtually no growth before 1750, and thus there is no guarantee that growth will continue indefinitely. Rather, the paper suggests that the rapid progress made over the past 250 years could well turn out to be a unique episode in human history. The paper is only about the United States and views the future from 2007 while pretending that the financial crisis did not happen. Its point of departure is growth in per-capita real GDP in the frontier country since 1300, the U.K. until 1906 and the U.S. afterwards. Growth in this frontier gradually accelerated after 1750, reached a peak in the middle of the 20th century, and has been slowing down since. The paper is about "how much further could the frontier growth rate decline?" The analysis links periods of slow and rapid growth to the timing of the three industrial revolutions (IR's), that is, IR #1 (steam, railroads) from 1750 to 1830; IR #2 (electricity, internal combustion engine, running water, indoor toilets, communications, entertainment, chemicals, petroleum) from 1870 to 1900; and IR #3 (computers, the web, mobile phones) from 1960 to present. It provides evidence that IR #2 was more important than the others and was largely responsible for 80 years of relatively rapid productivity growth between 1890 and 1972. Once the spin-off inventions from IR #2 (airplanes, air conditioning, interstate highways) had run their course, productivity growth during 1972-96 was much slower than before. In contrast, IR #3 created only a short-lived growth revival between 1996 and 2004. Many of the original and spin-off inventions of IR #2 could happen only once--urbanization, transportation speed, the freedom of females from the drudgery of carrying tons of water per year, and the role of central heating and air conditioning in achieving a year-round constant temperature. Even if innovation were to continue into the future at the rate of the two decades before 2007, the U.S. faces six headwinds that are in the process of dragging long-term growth to half or less of the 1.9 percent annual rate experienced between 1860 and 2007. These include demography, education, inequality, globalization, energy/environment, and the overhang of consumer and government debt. A provocative "exercise in subtraction" suggests that future growth in consumption per capita for the bottom 99 percent of the income distribution could fall below 0.5 percent per year for an extended period of decades.

2013	C13	Mitnik, Stefan, and Willi Semmler. 2013. <i>The Real Consequences of Financial Stress</i>. Sonderforschungsbereich 649, Humboldt University, Berlin, Germany, SFB 649 Discussion Papers: SFB649DP2013-011. We introduce a dynamic banking-macro model, which abstains from conventional mean-reversion assumptions and in which--similar to Brunnermeier and Sannikov (2010)--adverse asset-price movements and their impact on risk premia and credit spreads can induce instabilities in the banking sector. To assess such phenomena empirically, we employ a multi-regime vector autoregression (MRVAR) approach rather than conventional linear vector autoregressions. We conduct bivariate empirical analyses, using country-specific financial-stress indices and industrial production, for the U.S., the UK and the four large euro-area countries. Our MRVAR-based impulse-response studies demonstrate that, compared to a linear specification, response profiles are dependent on the current state of the

Year	DE	Title and Abstract
		economy as well as the sign and size of shocks. Previous multi-regime-based studies, focusing solely on the regime-dependence of responses, conclude that, during a high-stress period, stress-increasing shocks have more dramatic consequences for economic activity than during low stress. Conducting size-dependent response analysis, we find that this holds only for small shocks and reverses when shocks become sufficiently large to induce immediate regime switches. Our findings also suggest that, in states of high financial stress, large negative shocks to financial-stress have sizeable positive effects on real activity and support the idea of "unconventional" monetary policy measures in cases of extreme financial stress.
2013	C26 J13	Bagger, Jesper, Javier A. Birchenall, Hani Mansour, and Sergio Urzua. 2013. <i>Education, Birth Order, and Family Size</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 19111. We introduce a general framework to analyze the trade-off between education and family size. Our framework incorporates parental preferences for birth order and delivers theoretically consistent birth order and family size effects on children's educational attainment. We develop an empirical strategy to identify these effects. We show that the coefficient on family size in a regression of educational attainment on birth order and family size does not identify the family size effect as defined within our framework, even when the endogeneity of both birth order and family size are properly accounted for. Using Danish administrative data we test the theoretical implications of the model. The data does not reject our theory. We find significant birth order and family size effects in individuals' years of education thereby confirming the presence of a quantity-quality trade off.
2013	D22 D84	Bachmann, Ruediger, and Steffen Elstner. 2013. <i>Firms' Optimism and Pessimism</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 18989. Are firms' expectations systematically too optimistic or too pessimistic? Does it matter? We use micro data from the West German manufacturing subset of the IFO Business Climate Survey to infer quarterly production changes at the firm level and combine them with production expectations over a quarterly horizon in the same survey to construct series of quantitative firm-specific expectation errors. We find that depending on the details of the empirical strategy at least 6 percent and at most 34 percent of firms systematically over-or underpredict their one-quarter-ahead upcoming production. In a simple neoclassical heterogeneous-firm model these expectational biases lead to factor misallocations that cause welfare losses which in the worst case are comparable to conventional estimates of the welfare costs of business cycles fluctuations. In more conservative calibrations the welfare losses are even smaller.
2013	D63 H24	Yunker, James A. 2013. "The Basic Income Guarantee: A General Equilibrium Evaluation." <i>Basic Income Studies</i> , 8(2): 203-33. The potential economic effects of implementing a Basic Income Guarantee (BIG) in the United States are examined using a small-scale computable general equilibrium model in which labor and saving are the fundamental household decision variables. The social choice variables consist of BIG (termed herein "guaranteed minimum consumption") and public good expenditure. Assuming the model's benchmark values for the social choice variables are a reasonable approximation to the current situation, solution for the optimal social choice variables suggests that a much larger BIG would be preferable from a social welfare standpoint. This basic result is relatively insensitive to alterations in the model's parameters. However, there would be such a substantial reduction in aggregate output and saving from moving to the optimal position that the political feasibility of any such policy shift is doubtful, regardless of any indications from economic analysis.

2013	F37	Picillo, Giulia. 2013. <i>Exchange Rates and Asset Prices: Heterogeneous Agents at Work</i> . CESifo Group Munich, CESifo Working Paper Series: 4257. This paper merges two branches of the literature. On one hand we study a heterogeneous agents framework to model exchange rates and stock prices. On the other hand we model the relationship between these two series through a DSGE model. Investors choose one of two rules to form their expectations. One rule is based on an open economy model, which reacts to the information from the financial markets. The second rule follows a backward looking approach. We find that when DSGE agents misinterpret the information coming from the financial markets as exogenous productivity shocks they unknowingly amplify the volatility of these markets. The simulated series replicate the stylized facts of real data. We also estimate the DSGE and chartists expectations, and we find that our DSGE agents make output forecasts that are not qualitatively different than the DSGE forecasts from the recent Bayesian literature.
2013	F44	Engler, Philipp, and Simon Voigts. 2013. <i>A Transfer Mechanism for a Monetary Union</i> . Sonderforschungsbereich 649, Humboldt University, Berlin, Germany, SFB 649 Discussion Papers: SFB649DP2013-013. We show in a dynamic stochastic general equilibrium framework that the introduction of a common currency by a group of countries with only partially integrated goods markets, incomplete financial markets and no labor migration across member states, significantly increases volatility of consumption and employment in the face of asymmetric shocks. We propose a simple transfer mechanism between member countries of the union that reduces this volatility. Furthermore, we show that this mechanism is more efficient than anticyclical policies at the national level in terms of a better stabilization for the same budgetary effects for households while in the long run deeper integration of goods markets could reduce volatility significantly. Regarding its implementation, we show that the centralized provision of public goods and services at the level of the monetary union implies cross-country transfers comparable to the scheme under study.
2013	F50	Johnston, Jake, and Stephan Lefebvre. 2013. <i>Honduras Since the Coup: Economic and Social Outcomes</i> . Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This paper presents a broad overview of economic and social trends in Honduras since 2006, including the years following the military coup of June 2009. It finds that economic inequality in Honduras has increased dramatically since 2010, while poverty has worsened, unemployment has increased and underemployment has risen sharply, with many more workers receiving less than the minimum wage. While some of the decline was initially due to the global recession that began in 2008, much of it is a result of policy choices, including a decrease in social spending.

2013	N17 Q33	Plumb, Michael, Christopher Kent, and James Bishop. 2013. <i>Implications for the Australian Economy of Strong Growth in Asia</i> . Reserve Bank of Australia, RBA Research Discussion Papers. Strong growth in Asia, particularly in China, has had a profound impact on the Australian economy over the past decade. Most notable so far has been the boom in the resource sector, with commodity prices and hence Australia's terms of trade rising to historically high levels over a number of years. This has been accompanied by a sizeable appreciation of the exchange rate. While the terms of trade have passed their peak, the substantial investment in productive capacity of the resource sector in recent years is expected to provide a large boost to the production and exports of resources in coming years. In this paper we describe how the pattern of structural adjustment to the positive terms of

Year	DE	Title and Abstract
		trade shock has, to date, proceeded broadly in line with that suggested by a simple theoretical model that distinguishes between three broadly defined sectors: the resource sector, the 'other tradable' sector and the non-tradable sector. In particular, relative wages and prices adjusted in a way that facilitated the reallocation of factors of production towards the resource sector. While not all parts of the economy have benefited, the process of adjustment thus far has occurred relatively smoothly in a macroeconomic sense; inflation has remained within the target range, or not too far from it, unemployment has remained relatively low and output has grown at close to trend rates. This stands in stark contrast to some earlier episodes of terms of trade booms in Australia. We argue that macroeconomic adjustment to the current terms of trade shock has been facilitated by the appreciation of the exchange rate, the anchoring of inflation expectations and labour market dynamics whereby wage pressures in industries or regions experiencing strong conditions associated with the boom in resource investment have not spilled over to parts of the economy experiencing weaker conditions.
2013	N22	Field, Alexander J. 2013. <i>The Interwar Housing Cycle in the Light of 2001-2011: A Comparative Historical Approach</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 18796. This paper examines the interwar housing cycle in comparison to what transpired in the United States between 2001 and 2011. The 1920s experienced a boom in construction and prolonged retardation in building in the 1930s, resulting in a swing in residential construction's share of GDP, and its absolute volume, that was larger than what has taken place in the 2000s. In contrast, there was relatively little sustained movement in the real price of housing between 1919 and 1941, and the up and down price movements were remarkably modest, certainly in comparison with more recent experience. The paper documents the higher degree of housing leverage in 2001-2011. And it documents a rate of foreclosure on residential housing post 2006 that is likely higher than during the 1930s. It concludes that balance sheet problems resulting from a prior residential housing boom pose greater obstacles to recovery today than they did in the interwar period.

2013	Z12	Campante, Filipe R., and David H. Yanagizawa-Drott. 2013. <i>Does Religion Affect Economic Growth and Happiness? Evidence from Ramadan</i> . National Bureau of Economic Research, Inc, NBER Working Papers: 19768. We study the economic effects of religious practices in the context of the observance of Ramadan fasting, one of the central tenets of Islam. To establish causality, we exploit variation in the length of the fasting period due to the rotating Islamic calendar. We report two key, quantitatively meaningful results: 1) longer Ramadan fasting has a negative effect on output growth in Muslim countries, and 2) it increases subjective well-being among Muslims. We then examine labor market outcomes, and find that these results cannot be primarily explained by a direct reduction in labor productivity due to fasting. Instead, the evidence indicates that Ramadan affects Muslims' relative preferences regarding work and religiosity, suggesting that the mechanism operates at least partly by changing beliefs and values that influence labor supply and occupational choices beyond the month of Ramadan itself. Together, our results indicate that religious practices can affect labor supply choices in ways that have negative implications for economic performance, but that nevertheless increase subjective well-being among followers.

* Intersections with the micro categories marked in yellow appeared in 2014—2015.

* Пересечения с микрокатегориями, помеченными желтым, появились в 2014—2015 гг.

E20: Balance of Links

277	Links in 2005
122	New links in 2006-2013
423	Potential links at the end of 2013
822	Total

The date of final verification: November 12, 2016.

E20 — Contributors — Авторы

Baranov, Alexander O. — Баранов Александр Олегович — 0.5 AS²;
 Lychagin, Anton M. — Лычагин Антон Михайлович — 0.9 AS;
 Lychagin, Dmitry M. — Лычагин Дмитрий Михайлович — 0.3 AS;
 Lychagin, Mikhail V. — Лычагин Михаил Васильевич — 1.0 AS;
 Mkrtchyan, Gagik M. — Мкртчян Гагик Мкртичевич — 0.5 AS;
 Muhina, Irina K. — Мухина Ирина Константиновна — 0.5 AS;
 Popov, Ilya Y. — Попов Илья Юрьевич — 0.3 AS;
 Slepikova, Yuliya M. — Слепенкова Юлия Михайловна — 0.5 AS;
 Suslov, Victor I. — Суслов Виктор Иванович — 0.5 AS.

The total volume of derivative works for E20 is equal to 5.0 AS.

Общий объем раздела E20 — 5,0 авторских (уч.-изд.) л.

² AS — Author's Sheet — unit of measuring the volume of a literary work; equal to 40,000 characters (including the spaces between words), or 3,000 sq cm of illustrations (maps) like the table E20.E.

E21 Macroeconomics: Consumption; Saving; Wealth ¹

Year	DE	Title and Abstract
2006		
2006	D01	Merella, Vincenzo. 2006. "Engel's Curve and Product Differentiation: A Dynamic Analysis of the Effects of Quality on Consumer's Choice." <i>RISEC: International Review of Economics and Business</i> , 53(2): 157-82. The application of Engel's Curve in a single-product perspective may dramatically change the role of quality in affecting the dynamics of economic performance. This paper introduces a specification of preferences that regards quality as luxury, and quantity as necessary. The analysis is carried out by using a framework similar to Grossman's and Helpman's (1991), while quality is defined as in Stokey (1988). The resulting consumer's demand crucially depends on quality. Quality is potentially able to prevent the process, implied by neoclassical models, that leads the value of consumption goods to decline over time. By doing so, quality also affects the consumption bundle shares and the variety-specific consumption growth rates, thus influencing all dynamic quantitative variables of the economy.
2006	D86	CV; Kletzer, Kenneth M. 2006. "Sovereign Debt, Volatility, and Insurance." In <i>External Vulnerability and Preventive Policies</i> , ed. Ricardo J. Caballero, Cesar Calderon and Luis Felipe Céspedes, 327-51. Series on Central Banking, Analysis, and Economic Policies, vol. 10. Santiago: Central Bank of Chile.
2006	E39 H59	Erlandsen, Espen, Jens Lundsgaard, and Felix Hufner. 2006. <i>The Danish housing market: less subsidy and more flexibility</i> . OECD Economics Department, OECD Economics Department Working Papers: 513. While Denmark has fairly flexible labour and product markets in most respects, the housing market stands out with large direct and indirect subsidies for all types of housing and a highly regulated rental market hindering mobility, probably resulting in a mismatch between housing needs and use. In the current housing policy framework there is quite a contrast between the well-functioning market for transactions of owner-occupied housing (supported by the highly liberalised mortgage market) and the highly regulated rental housing market. This paper assesses the recent development in Danish house prices, followed by a discussion of ways of replacing the costly government intervention in the Danish housing market with more market-based mechanisms, thereby achieving policy objectives in a more efficient and targeted way. The paper reviews the main areas for reform, including overall subsidisation of housing, rent regulation, social housing, and how housing supply could be made more responsive.
2006	F24	Caceres, Luis Rene, and Nolvía N. Saca. 2006. "El mecanismo de transmisión de los efectos de las remesas en El Salvador. (The Transmission Mechanism of the Impact of Remittances in El Salvador. With English summary.)." <i>Comercio Exterior</i> , 56(10): 875-85. By means of a vast literary review on the economic impact of remittances and the construction of a self-regressive vectors model, the authors study the reasons behind the paradox of the coexistence of economic stagnation, decrease of investment, and national saving, with unprecedented figures of remittances income. In this sense, while analyzing the impact of remittances on certain money and real variables, they help to clarify the so-called "remittances syndrome".
2006	H59	THE SAME AS E39 Erlandsen, Espen, Jens Lundsgaard, and Felix Hufner. 2006. <i>The Danish housing market: less subsidy and more flexibility</i> . OECD Economics Department, OECD Economics Department Working Papers: 513.
2006	I28	Erdos, Tibor. 2006. "Growth Potential and Extensive Reform of Public Finances." <i>Development and Finance/Fejlesztés és Finanszírozás: Quarterly Hungarian Economic Review</i> , 0(2): 3-12. The size of the growth rate, that can be attained in a country in the long run, is always a disputed question. I have already dealt with the problem in issue 2004/3 of this journal. Now the sphere of the analysis is reduced: the point surveyed hereunder is the role, that may be played by the extensive reform of public finances in the long term rate of economic growth in Hungary.
2006	J82	Das, Satya P., and Rajat Deb. 2006. "A Dynamic Analysis of Child Labor with a Variable Rate of Discount: Some Policy Implications." <i>B.E. Journal of Economic Analysis and Policy: Contributions to Economic Analysis and Policy</i> , 5(1): 1-28. This paper analyzes the problem of child labor in an infinite-horizon dynamic model with a variable rate of time preference and credit

Year	DE	Title and Abstract
		constraints. The variability in the rate of time preference leads to the possibility of multiple steady states and a poverty trap. The paper considers the long-run and short-run effects of an array of policies like enrollment subsidy, improvement in primary education infrastructure, lump-sum subsidy, and variations in loan market parameters. We distinguish between policies that reduce child labor in the long run only in the presence of a variable discount rate and other policies which work whether or not the discount rate is variable. Credit-related policies belong to the former group. Policies that reduce child labor and increase family consumption in the long run may have an adverse effect of lowering consumption in the short run.
2006	L26	Bohacek, Radim. 2006. "Financial Constraints and Entrepreneurial Investment." <i>Journal of Monetary Economics</i>, 53(8): 2195-2212. There is a well documented interdependence between the investment and saving decisions of entrepreneurial households. I study this interdependence in a dynamic, general equilibrium model with heterogeneous agents and occupational choice. The simulated economy replicates U.S. data on the distribution of wealth and income, and the shares of wealth and income for each occupation. The dominant incentive behind the high level of savings of business households is the desire to relax a wealth constraint in financing entrepreneurial projects in order to operate their firms at an optimal size. Because successful firms grow over time, entrepreneurs enter business despite lower initial earnings than they would receive in paid employment.
2006	L26	Diss: Francis, Johanna. 2006. Savings, Investment, and the Entrepreneurial Decisions of the Wealthy. PhD diss. Johns Hopkins University.
2006	L67	Khaled, Mohammed, and Ralph Lattimore. 2006. "The Changing Demand for Apparel in New Zealand and Import Protection." <i>Journal of Asian Economics</i>, 17(3): 494-508. New Zealand import protection has been reduced from amongst the highest in the developed world in the 1980s to about the OECD average in 1999. At that point, Government stopped further reductions that had been planned. That policy has left import protection on apparel goods (clothing and footwear) at high levels and restricted imports from many important trading partners, particularly in Asia. Future import protection in apparel goods may need to be revisited as New Zealand continues negotiations on free trade agreements with China and other countries. This paper reports on consumer demand elasticities estimated over the last 20 years for apparel items purchased by New Zealand households that would be useful in evaluating further reductions in import protection.
2006	L71	Duly, Abby L., Jeffrey A. Harris, Ara M. Khatchadourian, Rozi T. Ulics, and Melissa C. Wolter. 2006. "Price and Expenditure Measures of Petroleum Products: A Comparison." <i>Monthly Labor Review</i>, 129(12): 56-65. A structural vector autoregression (VAR) model of supply and demand examines the effects of crude-petroleum price shocks on the market for plastics products. The VAR is estimated with monthly data from the Producer Price Indexes for Crude Petroleum, Organic Chemicals, and Plastics Products, as well as the Federal Reserve's indexes for plastics production and overall industrial production, from January 1974 through December 2003. The model reveals that positive (negative) price shocks to crude petroleum have a positive (negative) effect on prices for both organic chemicals and plastics products and a negative (positive) effect on the quantity of plastics products.
2006	N21	Guidolin, Massimo. 2006. "Pessimistic Beliefs under Rational Learning: Quantitative Implications for the Equity Premium Puzzle." <i>Journal of Economics and Business</i>, 58(2): 85-118. In the presence of infrequent but observable structural breaks, we show that a model in which the representative agent is on a rational learning path can generate high equity premia and low risk-free interest rates. When the model is calibrated to US consumption growth data, average risk premia and bond yields similar to those displayed by post-depression US historical experience are generated for low levels of risk aversion. Even ruling out pessimistic beliefs, recursive learning inflates the equity premium without requiring a strong curvature of the utility function. Simulations reveal that other moments of equilibrium asset returns are easily matched, like excess volatility, the presence of ARCH effects and long-run predictability. These findings are robust to a number of details of the experiments, such as the number and dating of the breaks.
2006	Q55	Kletzan, Daniela, Angela Koppl, Kurt Kratena, Stefan Schleicher, and Michael Wuger. 2006. "Towards Sustainable Consumption: Economic Modelling of Mobility and Heating for Austria." <i>Ecological Economics</i>, 57(4): 608-26. The paper focuses on economic modelling and empirical analysis of sustainable structures in private consumption and strives to extend conventional economic consumption models. The model analysis of sustainable consumption in the areas heating and transport for Austria attempts to depart from traditional measurement of consumption in national accounts and economic consumption models. The focus of the analysis is laid on consumer services derived from a combination of stocks (e.g. building stock, transport systems) and flows (mainly energy). This approach intends to illustrate that a concentration on flows in consumption models lacks important aspects of sustainable consumption. The economic analysis of sustainable consumption patterns aims to highlight the effects related to the substitution of flows by stocks in the consumption areas transport and heating (e.g. improvements in thermal quality of buildings, more energy efficient transport systems). Relevant too, in this respect, is the role that can be played by technological innovation (improvements in energy efficiency of stocks, the potential for specific incentives to promote new technologies). Two essential factors are crucial in the context of sustainable consumption: the demand shifts concerning the consumer services desired and the composition of the stock-flow mix necessary for the service provision.
2007		
2007	A10	Farhi, Emmanuel. 2007. <i>Capital Taxation and Ownership when Markets are Incomplete</i>. National Bureau of Economic Research, Inc. NBER Working Papers: 13390. This paper analyzes the theoretical and quantitative implications of optimal capital taxation in the neoclassical growth model with aggregate shocks and incomplete markets. The model features a representative-agent economy with proportional taxes on labor and capital. I first consider the case that the only asset the government can trade is a real risk-free bond. Taxes on capital are set one period in advance, reflecting inertia in tax codes and ruling out replication of the complete markets allocation. Because capital income varies with the state of the economy, capital taxation provides a state contingent source of revenues. I thus identify a novel potential role for capital taxation as a risk sharing instrument between the government and private agents. However, this benefit must be weighted against the distortionary cost of capital taxation. For a baseline case, the optimal policy features a zero tax on capital. Moreover, numerical simulations show that the baseline case provides an excellent benchmark. I next allow the government to hold a non trivial position in capital. Capital ownership provides the same benefit or risk sharing but without the cost of tax distortions. In a variety of quantitative exercises, I show that capital ownership allows the government to realize about 90% of the welfare gains from moving to complete markets. Large positions are typically required for optimality. But smaller positions achieve substantial benefits. In a business-cycle simulation, I show that a 15% short equity position achieves over 40% of the welfare gains from completing markets.
2007	B50	Stockhammer, Engelbert. 2007. <i>Some Stylized Facts on the Finance-Dominated Accumulation Regime</i>. Political Economy Research Institute, University of Massachusetts at Amherst, Working Papers. While there is an agreement that the Fordist accumulation regime has come to an end in the course of the 1970s, there is no agreement on how to characterize the post-Fordist

Year	DE	Title and Abstract
		regime (or if a such is already in place). The paper seeks put together various arguments related to financialization (in the broad sense) from a macroeconomic point of view and investigate the relevance of these arguments by means of an analysis stylized facts for EU countries. The paper discusses changes in investment behaviour, consumption behaviour and government expenditures, investigating to what extent changes are related to financialization. Households experience higher debt levels. Rising profits of businesses come with only moderate investment. The notion of a "finance-dominated" accumulation regime is proposed to highlight that financial developments crucially shape the pattern and the pace of accumulation. The finance dominated accumulation regime is characterized by a mediocre growth performance and by higher volatility. However, so far deregulated financial markets have not lead to major financial crises in advanced capitalist economies. A possible reason for this is that the size of the state sector has not been substantially reduced despite neoliberal attempts to do so.
2007	H71	Heim, Bradley T. 2007. "The Effect of Tax Rebates on Consumption Expenditures: Evidence from State Tax Rebates." <i>National Tax Journal</i> , 60(4): 685-710. This paper uses Consumer Expenditure Survey data to estimate the response to a sequence of state tax rebates implemented during 1995-2001. The results generally suggest that expenditures increased by one-fifth to one-fourth of the rebate amount, with positive effects on nondurable spending, spending on apparel, and among households with single respondents. However, the results vary depending on the sample, regressor, and expenditure component, with several variables entering insignificantly or with the wrong sign. Rebate announcements are estimated to have had a small and insignificant effect on the amount of spending, but may have shifted the composition of spending.
2007	H72	CV: Dar, Atul, and Sal AmirKhalkhali. 2007. "On the Saving-Investment Relationship and Government Spending in G-7 Countries." In <i>Proceedings of the Pennsylvania Economic Association 2007 Conference, May 31-June 2, 2007, Pennsylvania College of Technology, Williamsport, Pennsylvania</i> , ed. James J. Jozefowicz, 25-30. Williamsport, Pa.: Pennsylvania Economic Association.
2007	H72	CV: Sanders, William V. 2007. "Discussant Comments: The Saving-Investment-Current Account Relationship and Government Size: An Empirical Study of G7 Countries." In <i>Proceedings of the Pennsylvania Economic Association 2007 Conference, May 31-June 2, 2007, Pennsylvania College of Technology, Williamsport, Pennsylvania</i> , ed. James J. Jozefowicz, 31. Williamsport, Pa.: Pennsylvania Economic Association.
2007	I00	Ameriks, John, Andrew Caplin, Steven Laufer, and Stijn Van Nieuwerburgh. 2007. <i>The Joy of Giving or Assisted Living? Using Strategic Surveys to Separate Bequest and Precautionary Motives.</i> National Bureau of Economic Research, Inc, NBER Working Papers: 13105. Strong bequest motives can explain low retirement spending, but so equally can strong precautionary motives. Given this identification problem, the recent tradition has been largely to ignore bequest motives. We develop a rich model of spending in retirement that allows for both motives, and introduce a "Medicaid aversion" parameter that plays a key role in determining precautionary savings. We implement a "strategic" survey to resolve the identification problem between bequest and precautionary motives. We find that strong bequest motives are too prevalent to be ignored. Moreover, Medicaid aversion is widespread, and helps explain the low spending of many middle class retirees.

2007	I10	Gollin, Douglas, and Christian Zimmermann. 2007. <i>Malaria: Disease Impacts and Long-Run Income Differences.</i> University of Connecticut, Department of Economics, Working papers: 2007-30. The World Health Organization (WHO) reports that malaria, a parasitic disease transmitted by mosquitoes, causes over 300 million episodes of "acute illness" and more than one million deaths annually. Most of the deaths occur in poor countries of the tropics, and especially sub-Saharan Africa. Some researchers have suggested that ecological differences associated with malaria prevalence are perhaps the most important reason why some countries today are rich and others poor. This paper explores the question in an explicit dynamic general equilibrium framework, using a calibrated model that incorporates epidemiological features into a standard general equilibrium framework.
2007	I29	Gimenez, Jose Ignacio, Jose Alberto Molina, and Almudena Sevilla Sanz. 2007. <i>Household Division of Labor, Partnerships and Children: Evidence from Europe.</i> University of Oxford, Department of Economics, Economics Series Working Papers: 33. This paper complements conventional economic analysis and presents a social norms interpretation to explain cross-country differences in partnership formation rates, and the dramatic decrease in partnership formation rates in Southern Europe in particular. We argue that increases in female human capital - by raising the opportunity cost of entering a partnership - had a differential impact on partnership formation rates in Northern and Southern Europe due to the different social norms regarding the household division of labor. Social norms are modeled as a constraint on the allocation of household labor that (if binding) diminishes the gains to enter a partnership. Furthermore, highly educated women are less likely to form a partnership, because the utility loss when a partnership is formed is lower the higher the female opportunity cost. We test the predictions of the model using 7 waves of the European Community Household panel (1995-2001). For each country and year we construct the average of the female to male ratio of childcare time as an indicator of social norms regarding the household division of labor. The empirical findings support the predictions of the model. After controlling for the time and country variation in the data, as well as for permanent individual heterogeneity and other aggregate variables at the country level, the results suggest that more traditional social norms regarding the household division of labor negatively affect a woman's probability of forming a partnership. Thus, a woman living in a country with a more traditional division of household labor has, ceteris paribus, a lower probability of forming a partnership. Furthermore, as predicted by the theory, social norms have a stronger negative effect for highly educated women. To the extent that female education has increased over the years, and that Southern European countries have more traditional social norms, this latter finding may partly explain the dramatic decrease in partnership formation rates in Southern Europe.
2007	J08	Basu, Kaushik, and Annemie Maertens. 2007. "The Pattern and Causes of Economic Growth in India." <i>Oxford Review of Economic Policy</i> , 23(2): 143-67. This paper presents the broad macro parameters of the growth of the Indian economy since the nation's independence and a cross-country evaluation of where India stands, drawing out the patterns discernible in these aggregative statistics. The paper gives an overview of the on-going debate on the components of the Indian growth and the relative importance of the different policies in the 1980s and 1990s. It contributes to this debate by identifying the landmark years, and analysing the politics behind some of the economics. The paper also analyses the factors behind the changes in India's savings rate and the relation between growth and development, on the one hand, and the nature of labour market regulation, on the other.
2007	J08	Gustman, Alan L., and Thomas Steinmeier. 2007. <i>Projecting Behavioral Responses to the Next Generation of Retirement Policies.</i> National Bureau of Economic Research, Inc, NBER Working Papers: 12958. This paper examines retirement and related behavioral responses to policies that on average are actuarially neutral. Many conventional models predict that actuarially neutral policies will not affect retirement behavior. In contrast, our model allows those with high time preference rates to find that the promise of an actuarially fair increase in future rewards does not balance the loss from foregone current benefits. Using data from the Health and Retirement Study, we find that from age 62 through full retirement age, the earnings test reduces full-time work

Year	DE	Title and Abstract
		by married men by about four percentage points, or by about ten percent of married men at full-time work. Abolishing the requirements on many jobs that an individual work full-time or not at all, what we term a minimum hours constraint on employment, would induce more than twice as many people to enter partial retirement as would leave full-time work, so that total full-time equivalent (FTE) employment would increase, although by a modest amount. If all benefits from personal accounts could be taken as a lump sum, the fraction not retired at age 62 would fall by about 5 percentage points compared to a system where there is mandatory annuitization of benefits.
2007	J08	CV: Horn, Gustav A. 2007. "Structural Reforms and Macroeconomic Policy--The Example of Germany." 2007	K42	Dietz, Simon, Eric Neumayer, and Indra de Soysa. 2007. "Corruption, the Resource Curse and Genuine Saving." <i>Environment and Development Economics</i>, 12(1): 33-53. Genuine saving is a measure of net investment in produced, natural and human capital. It is a necessary condition for weak sustainable development that genuine saving not be persistently negative. However, according to data provided by the World Bank, resource-rich countries are systematically failing to meet this condition. Alongside the well-known resource curse on economic growth, resource abundance might have a negative effect on genuine saving. In fact, the two are closely related, as future consumption growth is limited by insufficient genuine saving now. In this paper, we apply the most convincing conclusion from the literature on economic growth--that it is institutional failure that depresses growth--to data on genuine saving. We regress gross and genuine saving on three indicators of institutional quality in interaction with an indicator of resource abundance. The indicators of institutional quality are corruption, bureaucratic quality and the rule of law. We find that reducing corruption has a positive impact on genuine saving in interaction with resource abundance. That is, the negative effect of resource abundance on genuine saving is reduced as corruption is reduced.
2007	L10	Gicheva, Dora, Justine Hastings, and Sofia Villas-Boas. 2007. <i>Revisiting the Income Effect: Gasoline Prices and Grocery Purchases</i>. National Bureau of Economic Research, Inc, NBER Working Papers: 13614. This paper examines the importance of income effects in purchase decisions for every-day products by analyzing the effect of gasoline prices on grocery expenditures. Using detailed scanner data from a large grocery chain as well as data from the Consumer Expenditure Survey (CES), we show that consumers re-allocate their expenditures across and within food-consumption categories in order to offset necessary increases in gasoline expenditures when gasoline prices rise. We show that gasoline expenditures rise one-for-one with gasoline prices, consumers substitute away from food-away-from-home and towards groceries in order to partially offset their increased expenditures on gasoline, and that within grocery category, consumers substitute away from regular shelf-price products and towards promotional items in order to save money on overall grocery expenditures. On average, consumers are able to decrease the net price paid per grocery item by 5-11% in response to a 100% increase in gasoline prices. Our results show that consumers respond to permanent changes in income from gasoline prices by substituting towards lower-cost food at the grocery store and lower priced items within grocery category. The substitution away from full-priced items towards sale items has implications for microeconomic discrete-choice demand models as well as for macroeconomic inflation measures that typically do not incorporate frequently changing promotional prices.

2007	L61	Focacci, Antonio. 2007. "Empirical Analysis of the Relationship between Total Consumption-GDP Ratio and per capita Income for Different Metals: The Cases of Brazil, China and India." <i>International Journal of Social Economics</i>, 34(9-10): 612-36. The main purpose of the paper is to propose an empirical analysis of the relationship between total consumption of different key metals (aluminium, copper, lead, nickel, tin and zinc) and per capita income of some important developing countries (Brazil, China and India) today present in the international scenario with very different perspectives from in the past. The research is carried out investigating a double aim. Mainly, whether the environmental Kuznets' Curve (EKC) model related to material consumption (and hence "renamed" as material Kuznets' Curve) could be used--in empirical terms--as a possible explanatory pattern of past and current trends for these three important countries. Second, whether the observable trends in industrialised countries is similar to those already implemented in the developing ones. After a brief, but ineluctable, premise considering the theoretical basic assumptions to define the issue and regarding general statements, the specific cases for Brazil, China and India are proposed. Results do not closely fit the theoretical expectations but, as has already been seen for industrialised countries in previous research work, there is a prevailing trend in the lowering of material intensities with rising per-capita income levels. Without pretending to be exhaustive, this paper can be useful in improving the understanding of such developing economies, considering features not yet included in the international literature.
2007	L68	Vu, Tam Bang. 2007. "An Alternative Approximation to Consumer Durables Expenditures." <i>Applied Economics Letters</i>, 14(7-9): 643-46. Consumer durables expenditures are normally assumed to be of linear form with additive error term. Hansen and Singleton (1983) derive the log linear form for consumption, but they do not employ a depreciation rate. In this article, we use a multiplicative error term to obtain a log linear AR(1) with a unit root as an approximate process that drives durables expenditure. The Box-Cox test rejects the linear form in favour of the log linear one. The Box-Jenkins model selection procedure and the augmented Dickey-Fuller test support an AR(1) in log linear form.
2007	L82	Lee, Sang-Woo, and David Waterman. 2007. "Theatrical Feature Film Trade in the United States, Europe, and Japan since the 1950s: An Empirical Study of the Home Market Effect." <i>Journal of Media Economics</i>, 20(3): 167-88. This article reviews the test of a home market model of international trade in media products using a movie industry database covering 6 major countries (the United States, Japan, Germany, Italy, France, and the United Kingdom) over the 1950 to 2003 period. In support of the model, this study finds a consistently positive relation between domestic theater box-office market shares and various measures of domestic movie spending or domestic movie attendance, and negative relations between domestic movie spending and the market shares of imported American film products. Based on these results, declining domestic film production industries in Europe and Japan after about the 1970s, along with growing dominance of the world film market by the United States, is attributed to a relatively rapid growth of domestic consumer spending on movies in the United States.
2007	N16 N26 N36	Ronchi, Veronica. 2007. <i>The Neoliberal Myth in Latin America: The Cases of Mexico and Argentina in the '90s</i>. Fondazione Eni Enrico Mattei, Working Papers: 2007.42. During the '90s most Latin American countries were submitted to neoliberal structural reform policies. Neoliberal policies imposed market supremacy, reduced the State's role in the economy and deregulated the markets. This paper aims at describing how these policies affected the most important macroeconomic indexes, with special emphasis on Argentina and Mexico, the two countries that suffered most from the economic crises of the '80s and '90s, and where the neoliberal policies were applied with greater orthodoxy. In spite of a slight improvement in some macroeconomic indexes, in

Year	DE	Title and Abstract
		Latin America neoliberalism failed to reduce poverty and unemployment, and was unable to guarantee a fair distribution of the wealth and improve welfare.
2007	O34	Dincer, Oguzhan. 2007. "The Effects of Property Rights on Economic Performance." <i>Applied Economics</i>, 39(7-9): 825-37. This study augments the neoclassical growth model proposed by Mankiw et al. (1992) to analyse the effects of the property rights protection on the levels of economic performance, measured by per capita gross domestic product (GDP), across countries. The augmented model predicts that (1) the accumulation of physical and human capital and therefore the level of per capita GDP in a country, is positively related with the degree of property rights protection as well as with the saving rates and (2) the effects of the saving rates on the level of per capita GDP in a country are positively related with the degree of property rights protection. Empirical evidence shows that the predictions of the augmented model are consistent with the variations in the levels of per capita GDP across countries.

2008	C34	Benitez-Silva, Hugo, Selcuk Eren, Frank Heiland, and Sergi Jimenez-Martin. 2008. <i>How Well do Individuals Predict the Selling Prices of their Homes?</i>. Department of Economics and Business, Universitat Pompeu Fabra, Economics Working Papers. Self-reported home values are widely used as a measure of housing wealth by researchers employing a variety of data sets and studying a number of different individual and household level decisions. The accuracy of this measure is an open empirical question, and requires some type of market assessment of the values reported. In this research, we study the predictive power of self-reported housing wealth when estimating sales prices utilizing the Health and Retirement Study. We find that homeowners, on average, overestimate the value of their properties by between 5% and 10%. We also find a strong correlation between accuracy and the economic conditions (measured by the prevalent interest rate, the growth of household income, and the growth of median housing prices) at the time of the purchase of the property. While most individuals overestimate the value of their properties, those who bought during more difficult economic times tend to be more accurate, and in some cases even underestimate the value of their house. This cyclical nature of the overestimation of house prices can provide some clues regarding the reasons for the difficulties currently faced by many homeowners.
2008	C62	Alonso-Carrera, Jaime, Jordi Caballe, and Xavier Raurich. 2008. "Can Consumption Spillovers Be a Source of Equilibrium Indeterminacy?" <i>Journal of Economic Dynamics and Control</i>, 32(9): 2883-2902. In this paper, we show that consumption externalities are a source of equilibrium indeterminacy in a growth model with endogenous labor supply. In particular, when the marginal rate of substitution (MRS) between an agent's own consumption and the others' consumption is constant along the equilibrium path, the equilibrium does not exhibit indeterminacy. In contrast, when that MRS is not constant, the equilibrium may exhibit indeterminacy even if the elasticity of the labor demand is smaller than the elasticity of the Frisch labor supply.
2008	C62	Kondo, Atsumasa. 2008. "On the Inefficacy of Temporary Policy in a Dynamic General Equilibrium with Money." <i>Japanese Economic Review</i>, 59(3): 324-44. We construct a dynamic economy with many consumers with money in their utilities. Two main results—a turnpike theorem and inefficacy of temporary policy—are established in a dynamic general equilibrium framework in which price effects generated through markets are explicitly factored in. Turnpike, which is perfectly independent from wealth distribution among the heterogeneous consumers, will be globally attractive. Temporary policy is not effective not only for the future but for the current economy if the long-run interest rate level is low. The inefficacy result coincides with an intuitive explanation by the standard permanent income hypothesis.
2008	C62	Levine, Paul, Joseph Pearlman, and Richard Piere. 2008. "Linear-Quadratic Approximation, External Habit and Targeting Rules." <i>Journal of Economic Dynamics and Control</i>, 32(10): 3315-49. We examine the linear-quadratic approximation of nonlinear dynamic stochastic optimization problems. A discrete-time version of Magill [1977a. A local analysis of N-sector capital accumulation under uncertainty. <i>Journal of Economic Theory</i> 15(2), 211-219] is generalized to models with forward-looking variables paying special attention to second-order conditions. This is the 'large distortions' case in the literature. We apply the approach to monetary policy in a DSGE model with external habit in consumption. We then develop a condition for 'target-implementation', a concept related to 'targeting rules'. Finally, we extend the approach to a comparison between cooperative and non-cooperative equilibria in a two-country model and show that the 'small distortions' approximation is inappropriate for this exercise.
2008	D03	CV: Jackson, Tim. 2008. "Sustainable Consumption and Lifestyle Change." In <i>The Cambridge Handbook of Psychology and Economic Behaviour</i>, ed. Alan Lewis, 335-62. Cambridge and New York: Cambridge University Press.
2008	F52	Lee, Cheng-Te, and Yo-Yi Huang. 2008. "Military Threats, Defense Resources, and Labor Adjustment. (In Chinese. With English summary.)" <i>Journal of Economics and Management</i>, 4(1): 1-24. We observe that the period between Cold War era and the event of 911, variation in foreign military threats leads to variation in defense resources and fluctuations in the labor market. Using an intertemporal optimization dynamic model, this paper explores the impacts of foreign military threats on the civilian consumption sector and on labor allocation. We show that an increase in foreign military threats could lead to a migration of labor from the civilian sector to the defense sector.
2008	G17	Gao, Paul P. J., and Kevin X. D. Huang. 2008. "Aggregate Consumption-Wealth Ratio and the Cross-Section of Stock Returns: Some International Evidence." <i>Annals of Economics and Finance</i>, 9(1): 1-40. We find that the short-term deviations from long-run consumption-wealth relationship (cay) forecast stock market returns and serve as a conditioning variable in the capital asset pricing model (CAPM) for explaining the cross-section of stock returns for the United Kingdom and Japan. Our cross-sectional regressions using cay as a conditioning variable as opposed to using an alternative variable, tay, constructed using calendar time in place of consumption indicate that it is unlikely to be a spurious variable and provides useful information concerning the economic fundamentals. We show that both a consumption-based capital asset pricing model (CCAPM) and a human-capital-augmented capital asset pricing model (HC-CAPM) in conjunction with this conditioning variable can explain much of the cross-section of stock returns in each of the two countries; yet, in terms of relative performance, our results tend to favor the conditional HC-CAPM over the conditional CCAPM for pricing U.K. and Japanese cross-sectional returns.
2008	K36	Luna, Libertad Gonzalez, and Berkay Ozcan. 2008. <i>The Risk of Divorce and Household Saving Behavior</i>. Department of Economics and Business, Universitat Pompeu Fabra, Economics Working Papers. We analyze the impact of an increase in the risk of divorce on the saving behaviour of married couples. From a theoretical perspective, the expected sign of the effect is ambiguous. We take advantage of the legalization of divorce in Ireland in 1996 as an exogenous increase in the likelihood of marital dissolution. We analyze the saving behaviour over time of couples who were married before the law was passed. We propose a difference-in-differences approach where we use as comparison groups either married couples in other European countries (not affected by the law change), or Irish families who did not experience a significant increase in the expected risk of

Year	DE	Title and Abstract
		divorce (such as very religious families, or single individuals). Our results suggest that the increase in the risk of divorce brought about by the law was followed by an increase in the propensity to save of married couples, consistent with a rise in precautionary savings interpretation. An increase in the risk of marital dissolution of about 40 percent led to a 7 to 13 percent rise in the proportion of married couples reporting positive savings.
2008	L24	Diss: Pal, Sudeshna. 2008. Essays on Evidence and Effects of International Movements of Capital and Labor. PhD diss. West Virginia University. This dissertation presents three essays on the evidence and effects of international mobility of capital and labor. Essay 1 explores the behavior of this coefficient in OECD countries over a thirty year period. The second and third essays focus on international movements of labor measured by immigration and outsourcing. The second essay theoretically examines the impact of low skill outsourcing on domestic tax rates, namely labor tax and profit tax. The third essay empirically shows the impact of low skilled immigration and outsourcing on labor tax rates in OECD countries. What follows is a summary of the essays. The first essay, Reassessing International Capital Mobility: The Feldstein-Horioka Puzzle Disappears examines how capital mobility changed over the years, especially during the 1990s often termed as the era of globalization. Feldstein-Horioka type regressions using pooled annual data for OECD countries show that savings-investment correlations fall continuously throughout the 1990s implying increasing capital mobility. This is in sharp contrast to the fairly stable behavior of the coefficient till late 1980s. Evidences show that the phenomenon is indeed global and not country specific. Current account data also confirms increased capital mobility. Developing countries too become financially integrated during the 1990s, but they had an earlier start than OECD nations. The second essay, Outsourcing and Domestic Tax Policy, is a theoretical depiction of the impact of foreign outsourcing on domestic tax rates. The model includes two types of workers, namely managers or high skilled workers who also own the firms and workers who are low skilled and are hired by the managers. An individual can choose to become either of the two given his innate ability and the cost of acquiring skills. In addition, we introduce outsourcing as a factor in a firm's decision making. The firms or managers can hire native workers and outsource jobs abroad. The government taxes both labor income and profit income and provides transfers. The tax rates are determined through a process of voting in which the median voter plays a pivotal role. Our model shows that if the domestic firms increase foreign outsourcing, labor tax rates decline and profit tax rates increase unambiguously in the home country. The third essay, Immigration, Outsourcing and Tax Policy: Evidence from OECD Countries studies effects of immigration and outsourcing on domestic labor tax rates. Immigration and outsourcing are typically portrayed as substitutes in production and in terms of their effects on the domestic economy. A political economy analysis shows that immigration and outsourcing may actually have very different impact on the domestic economy, so that they may not be viewed as substitutes anymore. A study on 15 OECD countries finds that while low skilled immigration increases tax burden on domestic labor, low skilled outsourcing may actually reduce it. Low skilled immigration may impose additional fiscal burden and thus lead to higher tax rates on labor. Outsourcing of low skilled jobs, on the other hand, does not make any claims on government transfers and therefore, may result in lower domestic labor tax rates.
2008	L32	Morck, Randall, Bernard Yeung, and Minyuan Zhao. 2008. "Perspectives on China's Outward Foreign Direct Investment." <i>Journal of International Business Studies</i>, 39(3): 337-50. Recent economic data reveal that, at the infant stage, China's outward foreign direct investment (FDI) is biased towards tax havens and Southeast Asian countries and are mostly conducted by state-controlled enterprises with government sanctioned monopoly status. Further examination of China's savings rate, corporate ownership structures, and bank-dominated capital allocation suggests that, although a surge in China's outward FDI might be economically sensible, the most active players have incentives to conduct excessive outward FDI while capital constraints limit players that most likely have value-creating FDI opportunities. We then discuss plausible firm-level justifications for China's outward FDI, its importance, and promising avenues for further research.
2008	L72	Kannan, R., and Sarat Dhal. 2008. "India's Demand for Gold: Some Issues for Economic Development and Macroeconomic Policy." <i>Indian Journal of Economics and Business</i>, 7(1): 107-28. India is the largest consumer of gold in the world. Gold is a major vehicle of saving for large number of low and middle income households in rural and urban areas. This study provides analytical and empirical perspectives while identifying the key drivers of India's gold demand during the period 1980-2005. Broadly, empirical findings suggest that India's gold demand is significantly influenced by real income and a set of variables pertaining to monetary, fiscal, and financial sector policies such as interest rate, exchange rate, personal income tax, government spending to ease economic and social uncertainty, and wealth (asset price), besides the relative price of gold. These findings have critical implications for development policy, financial intermediation and sold market in the Indian context.
2008	L85	Baker, Dean. 2008. <i>The Key to Stabilizing House Prices: Bring Them Down</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This report states that bringing about the rapid adjustment of house prices to trend levels is the best means of returning stability to the housing market. The paper also calls for the restriction of GSE capital in bubble-inflated markets, with the intent of forcing house prices in these areas to return to trend level. The removal of capital from bubble markets and the consequent infusion of loans into non-bubble markets would stabilize prices in these areas, thus preventing a downward price spiral and overshooting of trend-level prices on the negative side. The report also advocates mortgage appraisal based on a price-to-rent ratio of 15 to 1. As well, the paper suggests giving families facing foreclosure the right to rent their homes both to keep them in their houses and offer banks real incentives to avoid foreclosure.
2008	L85	Baker, Dean, and David Rosnick. 2008. <i>The Impact of the Housing Crash on Family Wealth</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This paper extrapolates from data from the 2004 Survey of Consumer Finance to project household wealth, by wealth quintile, in 2009 under three alternative scenarios. The first scenario assumes that real house prices fall no further than their level as of March 2008. The second scenario assumes that real house prices fall an additional 10 percent as a 2009 average. The third scenario assumes that real house prices fall an additional 20 percent for a 2009 average. The projections show that the vast majority of families will see a substantial reduction in wealth by 2009 in any of these scenarios and that the cohorts just approaching retirement will have very little to support themselves in retirement other than their Social Security. The projections also show that a large number of families will have little or no equity in their homes in 2009.
2008	L85	Baker, Dean, and David Rosnick. 2008. <i>The Housing Crash and the Retirement Prospects of Late Baby Boomers</i>. Center for Economic and Policy Research (CEPR), CEPR Reports and Issue Briefs. This paper extrapolates from data from the 2004 Survey of Consumer Finance to project household wealth, by wealth quintile, for the cohort that will be between the ages of 45-54 in 2009 under three alternative scenarios. The first scenario assumes that real house prices fall no further than their level as of March 2008. The second scenario assumes that real house prices fall an additional 10 percent as a 2009 average. The third scenario assumes that real house prices fall an additional 20 percent for a 2009 average. The projections show that the vast majority of families in these age cohorts will have little or no wealth by 2009 in any of these scenarios and that the cohorts just approaching retirement will have very little to support themselves in retirement other than their Social Security. The projections also show that a large number of families in these age cohorts will have little or no equity in their homes in 2009. Finally, the projections show that the renters within the same wealth quintiles in 2004 will have more wealth in 2009 than homeowners in all three scenarios.

2008	N27	der Eng, Pierre van. 2008. CONSUMER CREDIT IN AUSTRALIA DURING THE 20TH CENTURY. Australian National University, College of Business and Economics, School of Economics, ANUCBE School of Economics Working Papers. This article surveys the growth of consumer credit in Australia during the 20th century, particularly after World War II. Until the 1970s, the regulation of Australia's financial market caused formal consumer credit to be provided mainly by finance companies under hire-purchase contracts, largely for the purchase of cars and household durables. Deregulation of the financial market since the 1960s allowed banks to gain a dominant share in the market for personal loans. Quantification of long-term trends is difficult, but broad estimates suggest sustained growth in per capita indebtedness during 1945-2007.
2008	N84	CV: Onofri, Paolo, and Anna Stagni. 2008. "On the Hicksian Definition of Income in Applied Economic Analysis." 2009	C25	Jiang, Renna, Puneet Manchanda, and Peter E. Rossi. 2009. "Bayesian Analysis of Random Coefficient Logit Models Using Aggregate Data." <i>Journal of Econometrics</i>, 149(2): 136-48. We present a Bayesian approach for analyzing aggregate level sales data in a market with differentiated products. We consider the aggregate share model proposed by Berry et al. [Berry, Steven, Levinsohn, James, Pakes, Ariel, 1995. Automobile prices in market equilibrium. <i>Econometrica</i> . 63 (4), 841-890], which introduces a common demand shock into an aggregated random coefficient logit model. A full likelihood approach is possible with a specification of the distribution of the common demand shock. We introduce a reparameterization of the covariance matrix to improve the performance of the random walk Metropolis for covariance parameters. We illustrate the usefulness of our approach with both actual and simulated data. Sampling experiments show that our approach performs well relative to the GMM estimator even in the presence of a mis-specified shock distribution. We view our approach as useful for those who are willing to trade off one additional distributional assumption for increased efficiency in estimation.
2009	D02	Younas, Javed. 2009. "Does Institutional Quality Affect Capital Mobility? Evidence from Developing Countries." <i>Journal of Institutional Economics</i>, 5(2): 207-23. This paper uses an augmented Feldstein-Horioka savings-investment methodology to examine the impact of institutional quality on the degree of capital mobility in developing countries. A high correlation between domestic investment and domestic savings can arise from the presence of institutional rigidities restricting the movement of capital across borders. We find that including different aspects of institutional quality raises the coefficient of the savings rate, implying lower capital mobility. However, the improvement in institutional quality that strengthens the legal system, reduces investment risks, and ensures democratic accountability, increases capital mobility in developing countries. Inclusion of foreign aid also has a positive impact on the coefficient of the savings rate.
2009	D02	Han, Chang-Keun, and Michael Sherraden. 2009. "Do Institutions Really Matter for Saving among Low-Income Households? A Comparative Approach." <i>Journal of Socio-Economics</i>, 38(3): 475-83. This study aims to examine the extent to which competing theories explain saving of low-income households in individual development accounts (IDAs). Competing theories include the individual-oriented perspective, a social stratification perspective, and institutional saving theory. We use American Dream Demonstration (ADD) data collected at the Tulsa IDA program. Compared with the individual perspective and the social stratification perspective, institutional features explain a large part of the variance in saving outcomes measured by average monthly net deposit (AMND) and deposit frequency. Findings suggest that institutional structures encouraging low-income households to save may contribute to more inclusive asset-based policy.
